October 6th, 1854.

EDWIN FORCE, Sec.

**Clinical Assistants. — Two Vacancies**

having occurred in the HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, those Gentlemen who are desirous of becoming candidates for the vacant offices are requested to attend, with Testimonials, at the Hospital, on Monday, the 23rd inst., at Four o'clock. Testimonials as to moral character, as well as medical qualifications, are required.

Brompton, October 11th, 1854.

PHILIP ROSE, Hon. Sec.  
OSBORN CROSS, Sec.

**Western General Dispensary, New-**

ROAD, ST. MARYLEBONE. — A RESIDENT ASSISTANT to the Surgeon and Apothecary is required for this Institution, whose duties will be chiefly those of Dispensing and the care of the Dispensing Department. Candidates must attend a Meeting of the Medical Committee on Monday, November 6th, at Three o'clock, having previously forwarded their Testimonials and Qualifications. — Further particulars may be obtained at the Dispensary.

October 12th, 1854.

By order of the Board,

J. MARTIN, Secretary.

**Mineral Waters. — W. Best begs to**

inform the Nobility, Gentry, and the Faculty, that he has just received a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS of Europe, comprising — Friedrich's Hall, Carlsbad, Marienbad, Homburg, Kissingen, Vichy, Seidlitz, Pullna, Ems, Seltzer, Fachingen, &c., at his Eau-de-Colonne, Arquebuzad, and Foreign Mineral Water Depot, 22 B, Henrietta-street, Cavendish-square. — N.B. Balls and evening parties supplied with German and Struve's Artificial Seltzer Water on Advantageous terms.

N.B. Allsopp's and Bass's Pale Ale, and Guinness's Dublin Stout.

**Aërated Waters of sufficient and**

uniform strength. BLAKE, SANDFORD, and BLAKE, 47, Piccadilly, having given great attention to the manufacture of Mineral Waters, and feeling it important that medical men should be assured of the quantity of Alkali contained in each kind, beg to submit the following list of their preparations: —

Potash Water, 18 grains of the Bicarbonate in each bottle; Citrate of Potash, (a new and valuable auxiliary in Gout and Rheumatic affections,) 30 grains; Soda, 16 grains; Magnesia, 12 grains, and Ammonia, 10 grains.

B. S. & B. would especially recommend their Seltzer and Vichy Waters; the latter now bottled in half-pints as well as pints.

BLAKE, SANDFORD, and BLAKE, 47, Piccadilly.

TO THE PROFESSION.

**Mr. Bowmer, M.R.C.S. Eng., 50,**

LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

TO SURGEONS.

**Wanted, for a Vessel about to**

proceed to South America, a thoroughly-qualified SURGEON, who must be able to speak fluently either French or Spanish. — Address, S. W., care of Mr. Hammond, 27, Lombard-street.

**A Gentleman, who has entered**

University College, wishes for an Engagement where he could attend Lectures, &c., which, with board and lodging, would be considered equivalent to salary. — Address, W. T., care of Messrs. Westwood and Hopkins, 18, Newgate-street.

TRAVELLING TUTOR.

**A Clergyman, purposing to spend**

the winter months in the South of Europe, wishes to meet with a Pupil, for taking charge of whom he would require no further remuneration than the payment of his expenses. Address, M.A., Christ-church, Oxford.

**To be disposed of, in consequence of**

the continued indisposition of the proprietor, Mr. Elijah Pring, the Good-will, Stock, Fixtures, &c., of that well-known establishment, the MEDICAL HALL, No. 30, Westmoreland-street, Dublin, (established in 1821,) now in full working order, and to which a highly respectable and numerous connexion is attached. The business, until disposed of, will be carried on as usual. The fullest information can be had of Messrs. Herring and Co., 40, Aldersgate-street, London; of Mr. Graham, No. 12, Cope-street, Dublin; and of Messrs. Grattan and Co., Belfast; or at the premises. — 16th September, 1854.

**Country Practice without Purchase.**

An advantageous opportunity presents itself of acquiring a PRACTICE within a short distance of a favourite and fashionable Watering-place in South Wales. The neighbouring Collieries will yield an income of nearly £150 per annum, without any trouble or risk in its collection and payment; and in addition to the Collieries there is an opening for establishing an independent private Practice. Testimonials of fitness and respectability will be required, and a married man would be preferred. The neighbourhood is picturesque, and on the coast, and house-rent and provisions are cheap. Applications will only be received in writing, which may be forwarded, with testimonials, to the Secretary of the Pembrokehire Iron and (Anthracite Steam) Coal Company, 18, Gresham-street, London.

TO ANATOMISTS.

**Mr. J. C. Stevens will include in the**

Sale by Auction, at his Great Room, 38, King-street, Covent-garden, on Tuesday, October 24th, MARGAINT'S GRAND ANATOMICAL WORK, comprising Ninety Life-sized Coloured Plates, in Twenty-eight Maple-wood Frames, &c. Also, a Full-length Figure in Wax, illustrating Twenty-eight Diseases. — May be viewed the day prior to and morning of Sale, and Catalogues had of Mr. J. C. Stevens, 38, King-street, Covent-garden.

**Calne Union. — The Board of**

Guardians of this Union give notice, that on Wednesday, the 15th of November next, at noon, they will elect a MEDICAL OFFICER for the entire Union, who must be duly qualified according to the Commissioners' Order of 12th of March, 1842. He will be restricted from private practice, and will be required to devote his whole time and attention to the duties of his office, and keep a horse. The salary is £200 per annum, without extra fees for Surgical or Midwifery cases. Drugs, &c., will be provided at the charge of the Union, and assistance will be rendered in dispensing Medicines. Vaccination will be paid for at per successful case. Applications, accompanied by testimonials, to be made to the Clerk, on or before Tuesday, the 31st of October instant.

By order of the Board,

HENRY S. HEATH, Clerk.

Calne, Wilts, October 4th, 1854.

**Kendal Union. — Appointment of**

MEDICAL OFFICERS. — The Board of Guardians of the KENDAL UNION, will, at their Weekly Meeting, to be held at the Board-room, Kendal, on Saturday, the 4th day of November next, at Eleven o'clock in the Forenoon, proceed to the appointment of MEDICAL OFFICERS, (having the qualifications set forth in the Consolidated Order of the Poor-Law Commissioners of the 24th of July, 1847,) for the Burton District, Salary, £32 per annum; Scalthwaterigg District, £20 per annum. The Medical Officers will be paid in addition to the above salaries, for all ordinary Midwifery Cases, (where an Order from a competent authority has been given,) the sum of Ten Shillings per Case; they will be entitled to the remuneration specially awarded for operations; and services mentioned in article 177 of the aforesaid Consolidated Order; also for successful cases of Vaccination, pursuant to the 16 and 17 Vict., cap. 100. They will be required to keep the Medical Relief-book, and to make such medical returns as the Board of Guardians may call for from time to time, to attend all Meetings of Guardians when required, and to perform such other duties as may be prescribed by the aforesaid Order.

During the last three years, the average sum paid for extras, for Burton District, amounted to upwards of £14 per annum, and Scalthwaterigg District nearly £7 per annum.

\* \* \* Testimonials and Certificates of qualifications to be sent to the Clerk (under seal, free) on or before Friday, the 3rd of November, 1854.

By order of the Board,

JOHN MARX, Clerk to the Guardians.

Finkle-street, Kendal, 7th October, 1854.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS,

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.  
Office hours from 12 till 4.

**Receipts last year, £1250. Price,**

£1000, one year's Partnership Introduction to the best GENERAL PRACTICE in a large and influential eastern district of the Metropolis; lowest Midwifery fee, £1 1s. The double qualification indispensable.  
Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**Price only £250, an adequate Intro-**

duction to a GENERAL PRACTICE in a Railway Market Town, about three hours from London. Receipts last year, £500; at present decreasing, but have been £700, and may be raised to that again by a gentleman not much under thirty years of age with the double qualification. He would secure appointments of £100 yearly value.  
Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**Near Charing-cross. — A General**

PRACTICE and RETAIL, well established, and yielding between £500 and £800 a year, is for SALE. Price, to include valuable Lease, Stock, Fixtures, and such Introduction as may be wished, £850. Rent, by letting, may be made almost nominal.  
Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**An Old-established Private Asylum**

to be Disposed of.—The Income averages £1000 per annum; excellently situated a few miles from Town, near a Railway-station.—Apply, by letter, to P. P., the Porter's-lodge, Clifford's-inn, Fleet-street, London.

**A General Practice to be Disposed**

of, in Gloucestershire, for £175, including Surgery, Fixtures, Drugs, &c.—For particulars, address, post-paid, to W. B. H., care of Mr. Husband, Fore-street, Exeter.

TO MEDICAL PRACTITIONERS.

**Wanted immediately, by a Married**

MAN, a Situation as Dispensing ASSISTANT. Is of steady, quiet habits. Satisfactory References can be given.—Address C.D., The LANCET Office, 423, Strand.

**To be Disposed of, a General Medical**

PRACTICE in Devonshire, realising between £300 and £400 a year. The Advertiser is desirous of leaving at Christmas, and a lower premium than is usual will be taken for the Practice in consequence.—Apply by letter to L. R. Y., Tavistock Hotel, Covent-garden, London.

**Wanted immediately, in an old-**

established firm, an In-door ASSISTANT, experienced in Dispensing, and competent to Visit, and attend a case of Midwifery. Salary, £30 to £35 per annum.—Address, stating age and references, F.R.C.S., Post-office, Ramsgate.

MEDICAL.

**A Second-Year's Student at the**

Middlesex Hospital wishes for an Engagement with a Practitioner within half an hour's walk of that Institution, where he would have time to pursue his studies. Board and residence considered equivalent to his services.—Address, Studens, London Hospital, Mile-end.

**Wanted, by a Second-Year's Student**

in one of the Borough Hospitals, an Engagement with a Surgeon in that neighbourhood as DISPENSER, and occasionally to Visit Patients, attend Midwifery, &c. He would consider his board and lodging, with time to attend the Hospital, as remuneration.—Address P.M., care of Mr. Monney, Hoiler, 83, High-street, Bow.

**Partnership.—A Partner of a long-**

established and respectable General Practice in a pleasant Country Town in the North wishes to treat with a successor on the usual terms. About £800 will be required, or, in lieu of such sum, the successor (more particularly if a junior) only to receive one-fourth of the proceeds for the first seven years.—Apply to Corbyn and Co., 300, Holborn.

**Wanted immediately, by a General**

Practitioner, a DISPENSING ASSISTANT, competent to attend Midwifery and Visit occasionally. Address, stating age, salary required, and full particulars, to Messrs. Gale, Baker, Ward, and Oldfield, Wholesale Chemists, Boulevard-street, Fleet-street, London, at whose office an interview will be given on Monday next, Oct. 16th, at Four o'clock p.m. Also an APPRENTICE Wanted for three or five years; salary not an object.

TO SURGEONS ABOUT TO COMMENCE PRACTICE IN LONDON.

**A Chemist's Business for Disposal in**

the West-end, near Cavendish-square, and consisting of an extensive Prescribing and General Retail trade. Not one open Surgeon's Shop in the neighbourhood, and one is much required. Stock of Drugs large, and select. House in thorough repair. Rent moderate. Sum required, £500.—Apply to Mr. N. Jacobson, 37, Walbrook, Mansion House.

**Medical Transfer and Partnership.**

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**

and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RESIGN, (either wholly or in part,) and also to those about to COMMENCE practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

**Wanted, in a large General Practice,**

a qualified ASSISTANT, to Visit, Dispense, and attend Midwifery. Salary, £40 per annum.—Apply to Dr. Mackinder, Gainsburgh.

**Medical Practice.—To be Disposed**

of, a small, old-established PRACTICE in a Country Town. Premium moderate.—Address, A. B., Barks Chronicle Office, Reading. No Agents need apply.

MEDICAL.

**A Member of the College and Hall,**

of middle age, and general experience in the duties of the Profession, is desirous of a Re-engagement, or to conduct a Branch Practice.—Address, paid, Mr. Norreys, Mr. Churchill's, 11, New Burlington-street, London.

MEDICAL.

**A Gentleman, aged 21, who has for**

some time past been fulfilling the Office of ASSISTANT HOUSE-SURGEON and DISPENSER at a large Provincial Hospital, is desirous of meeting with a similar Engagement immediately. Unexceptionable testimonials can be given.—Apply, Medicus, 32, Wynn-street, Birmingham.

MEDICAL.

**A Student, who has had considerable**

experience in Midwifery, offers his services to a Surgeon, in return for Board and Lodging, with time for Hospital Studies; or would assist after five or six in the evening for a moderate salary.—Address, X. Y. Z., St. Thomas's Hospital.

MEDICAL.

**To be Disposed of, on liberal terms,**

an old-established and respectable PRACTICE, in London, returning about £800 per annum: or the Advertiser would be willing to Sell a Share in the above to a fully-qualified and competent party.—Address, with reference, to M. C., Messrs. Sangster and Roberts, Solicitors, 31, St. Swithin's-lane.

TO SURGEONS, &c.

**To be Disposed of, at a fair Valuation,**

a small PRACTICE, situated in the town of Maidstone, Kent. A good opportunity now presents itself for a Gentleman about to commence Practice. For further particulars, apply, by letter or personally, to Mr. Fowler, Surgeon, Week-street, Maidstone.

**A Parent is desirous of apprenticing**

his Son, now in his seventeenth year, to a Surgeon-Apothecary in good practice in London or some large town. During the three first years it is desired that the pupil shall board and lodge with his master, and the two last years shall be given up for attendance on Lectures and Hospital Practice.—Letters, stating terms and all particulars, to be addressed to C., care of Mr. John Procter, Penzance, Cornwall.

**Medical Residence and Practice,**

near Belgrave-square.—Immediate possession of a Medical Residence in a fashionable district can be obtained by purchasing the Lease and the appropriate Furniture and Fixtures at a fair valuation. A Practice of several years' standing can thus be acquired without premium.—Apply to Mr. Robert Reid, 48, Great Marlborough-street.

**A Gentleman, M.B. and M.R.C.S.,**

well up to the Practice of his Profession in its various branches, and with an experience of some years among both Union and Private Patients, wishes to meet with a Practitioner who, from age or ill health, requires assistance, and would be willing to give a Share in the Practice, in return for the performance of the more arduous duties of it.—Address, M. B., Mr. Banks, Chemist, 4, Lamb's Conduit-street.

**Medical Partnership Wanted. — A**

Gentleman, aged Thirty-two, fully qualified, experienced, married, and furnished with ample testimony as to his character, wishes to obtain a SHARE in a PRACTICE, in Town or Country. Any Gentleman who may desire to renounce the active prosecution of the Profession will find the Advertiser prepared to second him with industry and energy. The terms would be according to circumstances.—Address, Kappa, care of Mr. Jackson, 80, Hatton-garden, London.

**Apartment, (with Board if required,)**

NEATLY FURNISHED.—A Drawing-room, with one or two Bed-rooms, to be Let, near to the Strand and Charing-cross, in the House of a Medical Man, without family or lodgers, suitable for a Gentleman, an Invalid, or Two Friends.—For cards, apply to D., care of Mr. Glaxier, 41, Charing-cross.

Now ready, foolscap 8vo, cloth, 12s. 6d.

## A Manual of Pathological Anatomy.

Illustrated with numerous Engravings on Wood. By C. HANDFIELD JONES, M.B., F.R.S., Assistant-Physician to St. Mary's Hospital; and EDWARD H. SIEVEKING, M.D., Assistant-Physician to St. Mary's Hospital.

Mr. Churchill is happy to announce this additional volume to his Manuals, and believes it will be found fully to sustain the high reputation which the Series has attained.

London: John Churchill, New Burlington-street.

Ready next week, the Second Edition, foolscap, 8vo,

## What to Observe at the Bedside, AND AFTER DEATH.

Published by authority of the London Medical Society of Observation.

London: John Churchill, New Burlington-street.

Ready next week, Third Edition, 8vo,

## The Use of the Blowpipe in the

EXAMINATION OF MINERALS, ORES, AND OTHER METALLIC COMBINATIONS. By Professors PLATTNER and MUSPRATT. Illustrated by numerous Engravings on Wood.

This Edition has been most carefully revised by Professor Muspratt, and received from him considerable additions.

London: John Churchill, New Burlington-street.

Ready next Week, Second Edition, 8vo, cloth, 15s.

## Instruction in Chemical Analysis.

QUANTITATIVE. By C. REMIGIUS FRESENIUS. Edited by LLOYD BULLOCK.

London: John Churchill, New Burlington-street.

Ready next Week, 8vo,

## On the Topical Medication of the

LARYNX IN CERTAIN DISEASES OF THE RESPIRATORY AND VOCAL ORGANS. By EBEN. WATSON, A.M., M.D., Lecturer on the Institutes of Medicine in the Andersonian University, Glasgow.

London: John Churchill, New Burlington-street.

Just published, 8vo, cloth, 5s. 6d.

## Suggestions for the Future Provision

OF CRIMINAL LUNATICS. By W. CHARLES HOOD, M.D., Resident Physician and Superintendent of Bethlem Hospital.

London: John Churchill, New Burlington-street.

Just published, 8vo, price 2s.

## On the Relative Merit of the two

OPERATIONS FOR STONE. By FREDERIC C. SKEY, F.R.S., Professor of Anatomy and Surgery to the Royal College of Surgeons.

London: John Churchill, New Burlington-street.

Just published, Third Edition, with Additions, post 8vo, 8s. 6d.

## On Gout: Its History, its Causes,

AND ITS CURE. By WILLIAM GAIRDNER, M.D.

London: John Churchill, New Burlington-street.

Just published, post 8vo, 1s. 6d.

## On the Triple Aspect of Chronic

DISEASE; having especial reference to the Treatment of Intractable Disorders chiefly affecting the Nervous and Muscular System. By WILLIAM BAYES, M.D., Licentiate of the Royal College of Physicians, and Physician to the Brighton Dispensary.

London: John Churchill, New Burlington-street.

DEDICATED BY PERMISSION TO THE RIGHT HON. LORD VISCOUNT PALMERSTON.

Just published, Foolscap 8vo, cloth, 1s. 6d.

## On the Injuries Incidental to War-

FARE. Being the Substance of Three Lectures addressed to the Officers and Privates of the Royal London Militia. By G. BOBLASE CHILDS, F.R.C.S., Surgeon to the Corps.

London: John Churchill, New Burlington-street.

Just published, 8vo, cloth, 12s. 6d.

## Aural Surgery, and the Nature and

Treatment of Diseases of the Ear. By W. R. WILDE, F.R.C.S.I., Surgeon to St. Mark's Hospital.

"We have no hesitation in expressing our opinion, that the book is by far the best treatise on 'Aural Surgery' which has yet appeared in any language."—MEDICAL TIMES AND GAZETTE.

"A very excellent work, which we have placed on our shelves beside other standard treatises, the works of good, clear-headed, observing men, not 'specialists,' but sound, scientific practitioners, entitled to the confidence of the Profession."—ASSOCIATION MEDICAL JOURNAL.

"The work is practical and critical. Mr. Wilde's excellent work is among the first of the surgical publications of the day."—THE CRITIC.

"Of this valuable monograph we may most unhesitatingly say, that it will fill a void in our medical literature which has long been felt, and which no work published in this country has ever been adequate to fill. It is emphatically a good book."—PHILADELPHIA MEDICAL EXAMINER.

"Practitioners who occupy themselves with diseases of the Ear, will find here the most useful information on this branch of Pathology."—ANNALS D'OCULISTIQUE.

London: John Churchill, Dublin: Fennin and Co.

Just published, the Fourth Edition, 8vo, cloth, 24s.

## Principles of Comparative

PHYSIOLOGY. Illustrated with numerous Engravings on Wood. By W. B. CARPENTER, M.D., F.R.S.

"The whole work has been most carefully revised, and the Author ventures to think that the present Edition more completely represents the state of the Science at the period of its publication than any of its predecessors have done. He can honestly say, that he has spared no time or labour in its preparation which it has been in his power to bestow."—EXTRACT FROM PREFACE.

London: John Churchill, New Burlington-street.

Just published, 8vo, cloth, 7s. 6d., Illustrated with Lithograph and Woodcuts,

## Pathological and Surgical Observa-

TIONS: including an Essay on the Surgical Treatment of Hemorrhoidal Tumours. By HENRY LEE, F.R.C.S., Surgeon to the Lock Hospital.

London: John Churchill, New Burlington-street.

Just published, 24mo, cloth, 6s.

## The Book of Prescriptions: contain-

ing 2800 Prescriptions, collected from the Practice of the most eminent Physicians and Surgeons, English and Foreign. By HENRY BEASLEY.

London: John Churchill, New Burlington-street.

Just published, Second Edition, revised and enlarged, post 8vo, 8s.

## On the Physical Diagnosis of the

DISEASES OF THE LUNGS AND HEART. By HERBERT DAVIES, M.D., Senior Physician to the Royal Infirmary for Diseases of the Chest.

London: John Churchill, New Burlington-street.

Just published, 8vo, price 1s.

## A Memoir on Strangulated Hernia,

FROM CASES OCCURRING IN THE LONDON HOSPITAL. By NATHANIEL WARD, F.R.C.S., Assistant-Surgeon to the Hospital.

London: John Churchill, New Burlington-street.

Just published, Second Edition, 8vo, price 1s.

## On Syphilitic Eruptions, Ulcerations,

AND OTHER SECONDARY SYMPTOMS, WITH ESPECIAL REFERENCE TO THE USE AND ABUSE OF MERCURY. By THOMAS HUNT, F.R.C.S., Surgeon to the Western Dispensary for Diseases of the Skin.

London: John Churchill, New Burlington-street.

Just published, Third Edition, 8vo, cloth, 12s. 6d.

## On the Diseases of the Uterus. By

J. HENRY BENNET, M.D., late Physician-Accoucheur to the Western General Dispensary.

"We are firmly of opinion that in proportion as a knowledge of uterine diseases becomes more appreciated, this work will be proportionately established as a text-book in the profession."—THE LANCET.

"When, a few years back, the first edition of the present work was published, the subject was one almost entirely unknown to the obstetrical celebrities of the day; and even now we have reason to know that the bulk of the profession are not fully alive to the importance and frequency of the disease of which it takes cognizance. The present edition is so much enlarged, altered, and improved, that it can scarcely be considered the same work."—DR. RANKINE'S ABSTRACT.

London: John Churchill, New Burlington-street.

Third Edition, with 120 Illustrations on Steel and Wood, 8vo, cloth, 22s.

## The Principles and Practice of

OBSTETRIC MEDICINE AND SURGERY. By F. H. RAMSBOTHAM, M.D., Physician to the Royal Maternity Charity.

"This new edition of Dr. Ramsbotham's work forms one of the most complete and thoroughly useful treatises on midwifery with which we are acquainted. The entire work has undergone a careful revision, with additions. We have already given specimens of the work sufficient to justify our hearty recommendation of it as one of the best guides that the student or practitioner can follow."—BRITISH AND FOREIGN MEDICAL REVIEW.

"It is the book of midwifery for students—clear, but not too minute in its details, and sound in its practical instructions. It is so completely illustrated by plates, (admirably chosen and executed,) that the student must be stupid indeed who does not understand the details of this branch of the science, so far at least as description can make them intelligible."—DUBLIN JOURNAL OF MEDICAL SCIENCE.

"This is one of the most beautiful works which have lately issued from the medical press, and is alike creditable to the talents of the author and the enterprise of the publisher. As a work conveying good sound practical precepts, and clearly demonstrating the doctrines of obstetrical science, we can confidently recommend it either to the student or practitioner."—EDINBURGH JOURNAL OF MEDICAL SCIENCE.

"This book forms a very handsome volume. Dr. Ramsbotham has treated the subject in a manner worthy of the reputation he possesses, and has succeeded in forming a book of reference for practitioners, and a solid and easy guide for students. Looking at the contents of the volume, and its remarkably low price, we have no hesitation in saying that it has no parallel in the history of publishing."—PROVINCIAL MEDICAL AND SURGICAL JOURNAL.

London: John Churchill, New Burlington-street.

PRINTED BY THOMAS CHOATE SAVILL, at his Printing Office, No. 4, Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the county of Middlesex; and published for the Editor by GEORGE CHURCHILL, of No. 423, Strand, in the Parish of St. Martin-in-the-Fields, Westminster, in the said county, at No. 423, Strand, aforesaid; and sold by all Booksellers and News-vendors in Great Britain and Ireland and the Colonies.—Saturday, October 14, 1884.

Now ready at all the Libraries, in Three Vols.,  
**A Physician's Tale.**  
 By HEBERDEN MILFORD.  
 "A vast amount of thought and knowledge is displayed in this work, and talent of no inconsiderable kind reflects a light and lustre on its pages. Many various phases of society and different gradations of character are dexterously given to sight; and some of the prominent vices and follies of the day are brought under the notice of the reader in a striking manner. The variety of persons who are introduced on the scene impart a life and spirit which keep alive the attention and enchain the interest."—*REV.*  
 Hurst and Blackett, Publishers, Successors to Henry Colburn.

Second Edition, revised, in 3 vols., with Portrait, 21s.  
**Memoirs of John Abernethy, F.R.S.;** with a View of his WRITINGS, LECTURES, and CHARACTER. By GEORGE MACILWAIN, F.R.C.S.  
 "An acceptable and entertaining record of one of the most remarkable men in the annals of the healing art. It cannot fail to be read with deep interest."—*LITERARY GAZETTE*.  
 Hurst and Blackett, Publishers, Successors to Henry Colburn.

Now ready, price 6s. 6d., or free, by post, to any part of the United Kingdom price 6s., Fourth Edition, greatly enlarged and improved.

**A Grammatical Introduction to the LONDON PHARMACOPEIA, and a KEY to PHYSICIANS' PRESCRIPTIONS.** By S. F. LEACH.  
 "This little work will be found extremely useful to students who have received but an imperfect classical education."—*THE LANCET*.  
 Hughes and Butler, Medical Booksellers and Publishers, 15, St. Martin's-le-Grand.

**H. Silverlock's Medical Label Ware-** house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.  
 The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letter-press, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.  
 Catalogues of each sort of Labels are published separately, and will be sent per post on application.

**The Pen Superseded.**  
 The most elegant, easy, economical, and best method of MARKING LINEN, Silk, Books, &c., without the ink spreading or fading, is with the INCORRODIBLE ARGENTINE PLATES. No Preparation required. Any person can use them with the greatest facility. Name-plate, any style, 2s. 6d.; Initials, ditto, 1s. 6d.; Numbers, per set, 2s. 6d.; Crest, 5s. Sent, post free, with directions, on receipt of stamps or post order.

FREDK. WHITEMAN, Inventor and Sole Maker, 19, Little Queen-street, Holborn.

**Allen's Illustrated Catalogue, con-** taining size, price, and description of upwards of 100 articles, consisting of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes, Writing-desks, Dressing-cases, and other travelling requisites, forwarded on receipt of two stamps.

ALLEN'S TRAVELLING-BAG (patented) has the opening as large as the bag itself, and therefore possesses an immense advantage over all others.

ALLEN'S REGISTERED DESPATCH-BOX and WRITING-DESK, and their New Quadruple Portmanteau (containing four compartments), are the best articles of the kind ever produced.

J. W. and T. ALLEN, Manufacturers of Portable Barrack-room Furniture, and Military Outfitters, (see separate Catalogue,) 18 & 22, WEST STRAND.

 First Class Champagne, (Ay, Avize, Pierry, Verzenay, and Silery.) Sparkling and Still Moselle, Sparkling, Still, and Red Hoeks, and Bordeaux Wines, at very moderate prices.

These Wines are patronized and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples and List of Prices forwarded on application.

H. M. HAMMICK, Importer, 11, Pall-mall, London, opposite the "Travellers' Club."

# THE BRITISH MEDICAL DIRECTORY FOR 1855.

The Editors respectfully and gratefully acknowledge the receipt of a large number of "Returns" for this Directory.

The Editors have stated on previous occasions, that when the entries in the Directory for the current year (1854) are found to be correct, a mere intimation of that fact will be sufficient; but when alterations are required, they should be distinctly specified, and in all cases the Names should be written clearly, and at full length.

Lists of the Names of duly-qualified Practitioners resident in the several Cities, Towns, and Villages of the United Kingdom, will be thankfully received, as also information of the Death, Removal, or Appointment to a Public Office, of any duly-qualified Practitioner. In the Metropolis, and other Cities and large Towns, the streets and numbers of the Houses should be given.

Duly-qualified Practitioners who have already responded to these appeals would confer a favour on the Editors by inducing Professional friends and neighbours to make their "Returns" as quickly as possible, as delays might evidently cause some names to be omitted.

"The BRITISH MEDICAL DIRECTORY, for ENGLAND, WALES and SCOTLAND," to be published on the 1st of January, 1855, may be obtained of all Booksellers and Newsmen, price Six Shillings, (including One Shilling postage.)

OFFICE, 423, STRAND.

## GOLD CHAINS AND JEWELLERY.—PRIZE MEDAL.

Watherston and Brogden's Gold Chains, by troy weight, at realizable value, and the workmanship at wholesale manufacturer's prices.—The Great Exhibition having established the advantage of purchasing from the wholesale manufacturer wherever it can be accomplished, and thereby dispensing with an intermediate profit, WATHERSTON and BROGDEN beg to announce that, in obedience to the numerous calls made upon them, they have thrown open their Manufactory to the public at the same prices they have been in the habit (for the last half century) of charging to the trade in London, India, and the Colonies. The system of weighing chains against sovereigns being one of the greatest frauds ever practised on the public, WATHERSTON and BROGDEN guarantee the gold in their chains, and will repurchase it at the price charged,—the workmanship, according to the intricacy or simplicity of the pattern. Example:—Intrinsic value of a chain of 15 carat gold, weighing 1½ ounce, £3 19s. 7d.; supposing the workmanship to be £2—total, £5 19s. 7d. By this arrangement the purchaser will see at a glance the proportion charged for labour compared with the bullion in a gold chain, and being always able to realize the one, will have only to decide on the value of the other. An extensive assortment of jewellery all made at their Manufactory, 16, HENRIETTA-STREET, COVENT-GARDEN.—Established A.D. 1798.

## Metal Bed-Pan, Price 6s.—Acknow-

ledged to be the most convenient in form, and much more durable than any now in use.

To be had of the Manufacturer, J. LAWRENCE, 20, Great Charlotte-street, Blackfriars; or of Messrs. Gale, Baker, Wardle, and Oldfield, Bouverie-street, Fleet-street.

Orders from the Country must be accompanied by a Remittance.

## Improved Invalid Cot Carriages —

the greatest luxury and comfort ever introduced for removing invalids, being fitted up with the patent noiseless wheels. These carriages may be engaged, on moderate terms, for any journey, upon application to H. and J. READING, coachbuilders, 14, Riding House-lane, Cavendish-square.—N.B. A good assortment of new and second-hand carriages for sale or hire.

## Patent Perambulators.

C. BURTON, Inventor, Patentee, and Sole Manufacturer to Her Majesty by appointment.

The distinguished patronage, the flattering encomiums, and the increasing demand, are sufficient proofs of the utility and excellence of these fashionable, safe, and elegant Carriages for adults, children, and invalids, propelled from behind by the slightest effort. Country and Shipping orders. Illustrated Circulars.

OFFICE, 427, NEW OXFORD-STREET.

Also, C. BURTON'S PATENT PERAMBULATOR FOR THE MILLION. Price Two Guineas.

CAUTION.—To avoid unprincipled and dangerous imitations, look for Burton's Label on each Carriage.

## Dinneford's Pure Fluid Magnesia,

now greatly improved in purity and condensation.

"Mr. Dinneford's Solution may fairly be taken as a type of what the preparation ought to be."—PHARMACEUTICAL JOURNAL, May, 1846.

This excellent remedy, in addition to its extensive and increasing sale amongst the public, is now very largely employed in DISPENSING: for which the cheapest and most convenient form is in the STONK JARS; half-gallon, 5s. 6d.; gallon, 9s. 6d.; specially adapted for the use of Surgeons and Chemists. To be had from the manufacturers, DINNEFORD & CO., Chemists, 172, Bond-street, London; and all respectable Wholesale Druggists and Patent Medicine Houses.

## Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.  
Inspissated Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

Taraxacum (Davenport's Liquor, or Fluid Extract, prepared by Spontaneous Insipiation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

## Mathey Caylus' Gluten Capsules

contain the purest Copalba, either simple or combined with Citrate of Iron, Ratanhy, Cubebs, &c.; acknowledged by the London and Paris Hospitals; also by the Lock Hospital; M. Leseur, chef de Travaux Chimiques à l'Académie de Médecine; Drs. Ricord, Cullerier, &c., who have granted written attestations, to be the best prepared Medicine for the cure of certain diseases.

Extract of a Letter from Dr. Cullerier:—

"I cannot induce you too much to extend the use of your preparations; by so doing you will render a valuable service to the therapeutic of hemorrhagic affections."

"I am, &c.,

"CULLERIER,

"Chirurgien de l'Hôpital de Lourcine."

Sold in Bottles, at 2s. 6d. and 4s. 6d., sealed and stamped with the Government stamp, bearing the name of the Patentee. To be had wholesale and retail of Robert King, French and English Pharmaceutical Chemist, 21, Prince-street, Hanover-square; and all respectable Chemists in the United Kingdom.—Country agents required.

## Engineers' Masonic and Universal

MUTUAL LIFE ASSURANCE SOCIETY, 345, Strand, London.

During the prevalence of Cholera, Policies for three months (renewable, if required, at the expiration of that period) are granted by this Society, covering the risk, not only of Cholera, but of all other diseases. Rates may be obtained at the Office.

Annuitants admitted to a share in the Profits.  
No charge for Policy Stamps.  
Credit given for half the Premium.  
Assignments and Transfers of Policies registered free of charge.  
A liberal commission allowed to Solicitors and Agents on the introduction of business.

ANTHONY PECK, M.A., Actuary and Secretary.

## Family Endowment Life Assurance

AND ANNUITY SOCIETY.

12, CHATHAM PLACE, BLACKFRIARS, LONDON.  
ESTABLISHED 1835.  
CAPITAL, £500,000.

DIRECTORS.

William Butterworth Bayley, Esq., Chairman.  
John Fuller, Esq., Deputy-Chairman.

Lewis Burroughs, Esq. Edward Lee, Esq.  
Robert Bruce Chichester, Esq. Colonel Ouseley.  
Major Henderson. Major Turner.  
Charles Henry Latouche, Esq. Joshua Walker, Esq.

An Annual Bonus is allowed to parties who have made Five Annual Payments on Policies taken out on the Profit Scale. That for the current year is 20 per cent. in reduction of the Premium.

ENDOWMENTS AND ANNUITIES GRANTED AS USUAL.

INDIA BRANCH.

The extensive Assurance Business of the Agra and United Service Bank has been transferred to this Office, and the Society has Branch Establishments or Agencies at Calcutta, Madras, Bombay, Agra, and Hong Kong.

JOHN CAZENOVE, Secretary.

## Marylebone and General Life

ASSURANCE SOCIETY,

135, OXFORD-STREET, (near Cavendish-square,) LONDON.  
CAPITAL £100,000.

DIRECTORS.

Captain the Lord Frederick Kerr, R.N., CHAIRMAN.  
The Hon. and Rev. A. Duncombe, 40, Berkeley-square, and Calwich Hall, Ashbourn, Derbyshire.  
The Right Hon. Lord Dunboyne.  
Robert Johnston Douglas, Esq., of Locherbie, N.B.  
David Brandon Esq., 75, Great Russell-street, Bloomsbury-square.  
J. M. Fraser, Esq., Craven-hill, and Mark-lane.  
Win. W. Mackeson, Esq., 18, Westbourne-terrace-road.  
R. R. Robinson, Esq., 142, Westbourne-terrace.  
W. R. Vickers, Esq., 32, Baker-street, Portman-square.

CONSULTING ACTUARY—Jenkin Jones, Esq., F.I.A.

BANKERS—Sir Samuel Scott, Bart. and Co., 1, Cavendish-square.

SECRETARY—Lewis C. Hortalet, Esq.

The Business of this Society embraces:—  
Assurances on Single and Joint Lives, and the Survivor of Two or more Lives.

Payments of Fixed Sums at a specified Age, or sooner in case of Death.  
• Endowments to Widows and Children.  
• Annuities, Immediate, Deferred, and Survivorship.  
Special Policies to temporary or permanent residents in any part of the world.  
• Whole World Policies at small extra Premiums.

INDUSTRIAL POLICIES.—Premiums on Policies from £20 upwards received monthly, if required.  
Loans granted on Personal and other Securities.  
Premiums will be received by Half-yearly and Quarterly Instalments.

Half of the Premiums for Whole Life Assurances may remain unpaid for the first five years, or one-third during the Whole of Life.  
In addition to the ordinary business of a Life Assurance Office, the attention of the Medical Profession is especially directed to the following Table, showing the Yearly, Half-Yearly, and Quarterly Contributions for a Weekly Allowance of 2s. full pay, and 10s. half-pay, during Sickness, the payment of such Contributions ceasing at 60, 65, and 70 years of age:—

ALLOWANCE AND CONTRIBUTION TO CEASE AT																										
Age at Entry.	60 YEARS OF AGE.									65 YEARS OF AGE.									70 YEARS OF AGE.					Age at Entry.		
	Yearly Contributions.	Half-Yearly Contributions.	Quarterly Contributions.							Yearly Contributions.	Half-yearly Contributions.	Quarterly Contributions.							Yearly Contributions.	Half-yearly Contributions.	Quarterly Contributions.					
25	£. 15	s. 0	0	17	9	0	9	0		£. 19	s. 4	0	19	11	10	0	0		£. 6	11	3	30	11	9	25	
30	£. 19	s. 4	0	19	11	0	10	0		£. 4	8	1	2	7	0	11	5	3	£. 13	10	1	6	80	13	6	30
35	£. 5	s. 1	1	2	10	0	11	6		£. 11	10	1	6	2	0	13	3	3	£. 5	11	6	0	15	11	6	35
40	£. 13	s. 3	1	16	11	0	13	8		£. 1	5	11	0	0	15	9	3	£. 14	5	11	7	0	19	0	40

50	£. 4	s. 3	6	2	3	1	1	4		£. 14	12	7	6	1	4	0	5	£. 17	12	19	21	9	11	50	50	

Example.—By paying 20s. per Quarter, a person aged 30 may insure 40s. per week, or £20 per Quarter, during any sickness occurring before 60 years of age.

GREAT REDUCTION IN PRICE OF

## Sir William Burnett's Disinfecting

FLUID. Gallons, 5s.; Quarts, 2s.; Pints, 1s.; Half-pints, 6d.

This valuable Deodoriser and Disinfectant instantaneously destroys all BAD SMELLS without producing any itself. Its free use, as directed, PREVENTS CHOLERA and all CONTAGIOUS DISEASES.

Sold by all Chemists and Druggists, and at the Office, 19, Cannon-street, London-bridge.—N.B. Beware of a spurious imitation.

## Poultices superseded by the use of

MARKWICK'S PATENT SPONGIO PILINE.

As a substitute for common poultices and fomentations, the superiority of this article is unquestionable. It is strongly recommended by the most eminent of the Faculty for its cleanliness, economy, lightness, and general efficacy, and is now used in several of the hospitals. Also Markwick's Patent Piline, for Cholera Belts, Rheumatism, Chest Protectors, Respirators, Lumbago, &c.

Sold, retail, by Chemists and Druggists, and wholesale only by GEORGE TRIMBEY, 41, Queen-street, Chapside.

## W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible: also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atropo, Belladonna, Crotyleon Umbilicus, &c.) also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alternative), Liq. Parietarie (diuretic), and Liq. Belce (prepared from the Egle Marmelos, or Indian Bael), for Dysentery and Diarrhoea.

W. T. has a large supply of INDIAN BARK on hand.  
2, Edward's-street, Portman-square.

## Hooper's Juice of Taraxacum,

Inspissated by dry air, can be obtained in the following forms:—

The EXTRACT; dose, a tea-spoonful.

The FLUID EXTRACT; dose, a dessert-spoonful.

The LIQUOR, with CORTICAL ESSENCE of SARSAPARILLA; dose, a dessert-spoonful.

With Seltzer Water, either of these preparations forms a pleasant draught, and with which their effects are greatly augmented.

"For emaciated constitutions, I know of no medicine equal to Hooper's Taraxacum and Sarsaparilla."—Dr. JOHNSON.

For Affections of the Liver, Kidneys, Jaundice, Indigestion, Cutaneous Affections, and Constipation, these preparations have long been prescribed by the most eminent of the Faculty with the best results. The above Extracts of Taraxacum, when mixed with water, produce a milky appearance, similar to the juice in its fresh state.

"So valuable a preparation as your Taraxacum can need no recommendation from me; still I feel bound to say its beneficial effects have surpassed my most sanguine expectations. My mother, who is in her 78th year, and who through the greater part of her life has been a martyr to liver complaint, appears to have had ten years added to her life by a three months' use of it."

"I remain, yours truly,

"ARTHUR LEAPINGWELL.

"To Mr. Hooper, 7, Pall-mall East."

"Haydon Vicarage, Sleaford.

BRIGHTON SELTZER WATER, 4s. per doz. Other factitious Mineral Waters, at a reduction of 25 per cent.

HOOPER, Operative Chemist, 55, Grosvenor-street, and 7, Pall Mall East, London. Laboratory, Great Scotland-yard.

## Mr. Hooper's Water Mattresses or

BEDS, and CUSHIONS for AIR or WATER, for placing on an ordinary Bedstead. Being made of India-rubber, without the admixture of cloth materials, leakage is avoided. (Extract from THE LANCET, Jan. 25, 1861.)

CUSHIONS FOR BED-SORES.—Whether threatened with Sloughing, or in which Sloughing has taken place, Fractures, Diseased Joints, Spasms, Lassitude, Typhoid and other Fevers, Rheumatic Affections, Dropsy, Coldness of the Stomach and Feet, Consumptive and all Bed-ridden Patients. They are simply to be placed on an ordinary bedstead. These Cushions and Beds are not affected by Heat or Cold, and will bear water at any temperature.

Finsbury-square, February 27, 1863.

I have in several instances employed Mr. Hooper's Water Cushions and Mattresses; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water Bed.

JOH. PERRIN, M.D., Physician to the London Hospital.

Infirmary, Chichester, March 21, 1863.

Sir,—We are all much pleased with your Cushions, and still more so with the Mattresses.

Yours truly,

THOS. NEWHAM, House-Surgeon.

HOOPER, 7, PALL MALL EAST, and 55, GROSVENOR-STREET.

## LETTSONIAN LECTURES

## On Surgery.

DELIVERED BEFORE THE FELLOWS OF THE  
MEDICAL SOCIETY OF LONDON,

DURING THE SESSION 1853-54.

By JOHN BISHOP, Esq., F.R.S.

## LECTURE I.

## DISEASES OF THE BONES.

*Physical properties of bone; elasticity and strength; influence of their organic and inorganic constituents. Theory of Dr. Stark examined and refuted. Flexibility of bones; rickets; mollities ossium; caries, or ulceration of bone; psoas abscess.*

GENTLEMEN,—There is, perhaps, no subject of greater interest to the practical surgeon than that of the human skeleton, both in a state of health and disease. It is from these considerations that I have selected this branch of surgery for the Lettsomian Lectures on the present occasion. Within the space of a few years, great progress has been made in the pathology of the bones, which has been very greatly aided both by chemical and microscopical researches. As, however, the pathology of the bones, taken as a whole, presents far too wide a field to be compressed into the space of three lectures, I have selected such points as appear to me most worthy of interest.

If we take into consideration the human skeleton with relation to its laws of formation, or its general conformation with reference to its several offices in the animal economy, we cannot avoid being struck with the perfection of its mechanism. In their normal condition, the bones have but little sensibility; but when inflamed, they become exquisitely sensitive. By the nature of their organization and nutrition they partake more or less of all the changes in health or disease that are incidental to the human constitution; they are, consequently, liable generally to many of the diseases by which the soft parts are affected, as well as to the special effects of mechanical violence. They are capable of being renewed in part when broken or destroyed by disease; and even the whole of a bone, under special circumstances, may be reproduced after the old bone has been removed. As the skeleton is designed for the protection and support of the soft parts, it must necessarily possess certain mechanical and physical properties peculiar to bone. However, many of the physical characters of the bones are in common with those of inorganic bodies—such, for example, as rigidity or strength, and elasticity, brittleness, and pliability. As these physical properties exert a great and important influence in protecting and supporting, and in removing the body from one place to another, the changes that take place in these qualities must necessarily be of great interest to the practical surgeon, and more especially with respect to the theory and treatment of fractures and distortions. As these points have not yet received that consideration which they appear to merit, I propose in this lecture to enter more fully into this branch of the subject.

In a state of health, the bones appear admirably calculated, not only to protect and sustain the soft parts, but also to resist the shocks and pressures to which they are liable in the various occupations of the human family. If we contemplate the human skeleton as a piece of machinery destined to perform certain offices, and if we consider the number of its parts and the structure of the several kinds of joints by which it is held together, we at once perceive that it is designed and endowed to perform its functions with great precision, and that the full comprehension of its whole properties involves the most profound researches. The conditions which determine the form and structure of the skeleton, and the play of the vital forces in effecting its development, are problems of great obscurity connected and associated with the origin of man himself. During the development of the bones, from the period of infancy to old age, they are continually changing their chemical elements and physical properties. This is apparent both from physiological investigation and pathological research. Let us now turn our attention to those physical changes which the bones suffer in consequence of variations in the proportion of their organic and inorganic constituents; and, in the first place, let us investigate in what manner the elasticity and

strength of bones vary contemporaneously with their chemical differences. By *elasticity*, in physics, is meant the property which bodies possess of recovering their primitive form and dimensions after the external force by which they have been extended, compressed, or bent is withdrawn; and *strength* is understood to mean the resistance offered by bone, or by any other solid body, to a force directed to break or fracture it. It is these two physical properties just defined which confer on the bones their capability of performing their offices. Both the elastic and rigid properties are often severely tested by the action of powerful muscles, and we know they are sometimes overcome by external violence, so that fractures ensue.

It will be proved, as I proceed, that it is the inorganic matter of the bones which confers on them their elasticity and strength, and the organic constituents which confer on them their cohesive properties and flexibility; this is apparent, inasmuch as if we take away the inorganic portions, the organic portions become inelastic, and bend with their own weight. On the other hand, if we abstract the whole of the organic portions, the bone becomes brittle, will not bend, and falls to pieces with a very slight blow. From these circumstances we are led to conclude that, in the state of health, the bones must be so constituted that the proportions of the inorganic and organic matter are such as to confer on them the greatest possible amount of elasticity and strength. After a most extensive analysis of the components of bone, pursued through a large series of the animal kingdom, and consisting of no less than 232 experiments, Dr. Stark found that the mean proportion of the inorganic to the organic substances was as 66.09 : 33.91, or very nearly as 2 : 1, and both Dr. Stark and Von Bibra found that the proportion of inorganic and organic matter is nearly the same in the bones of all the classes of mammalia; but as there are great differences in their hardness, Dr. Stark concludes that the hardness and strength of bones do not depend on the differences in the proportions of their earthy constituents, but simply on the differences in the organic structure of the bones. He further states that there is no difference between the earthy and the organic constituents of the several portions of the skeleton, and that the spongy portions of bone do not differ in chemical composition from the solid portions; but a mere glance at the tables will show the fallacy of these assertions.

It will be seen that there is a considerable difference between the laminated and spongy structures; and also that, according to the latest researches and the best chemical authorities, there are very sensible differences in the composition of different portions of the skeleton. Mr. Stanley and Mr. Paget seem also to have been misled by Dr. Stark; for they both concur in his views, and state, after him, that the strength of bones depends on their structure, and not on the quantity of earthy matter entering into their composition. These views, however, appeared so entirely at variance with our preconceived notions of the mechanical effects of the composition of bone, that I determined to test the truth of these assumptions; and this appeared the more necessary from their practical bearing on the treatment of affections of the bones. In order, therefore, to determine whether the elasticity and strength of bone really do, or do not vary, when the chemical components vary, and (if such be the case) what really is the smallest quantity of inorganic matter consistent with the efficient strength and elasticity of bone to protect and support the body, it is only necessary to remove by degrees from a lamina of a given weight of healthy bone, certain quantities of its inorganic constituents by means of dilute hydrochloric acid, and then to fix one end of the lamina firmly, and suspend at the other end a given weight, sufficient to bend it into a curve; having then measured the degree of curvature, if the elasticity is unimpaired, the bone will, as soon as the weight is removed, return to its primitive form. This process may be had recourse to a second, third, or greater number of times, and the elasticity estimated by the degree of curvature produced in each case with the same weight. It must be obvious, even to those who are unacquainted with the mechanical details of the strength and elasticity of bodies in general, that the body which is most bent under the same weight, (all other things being the same,) must be the weakest. With the object before-mentioned in view, I selected a rectangular plate of bone cut by a circular saw from the shaft of the femur of an ox, and after having carefully weighed the portion of the bone, its weight was found to be seventy-six grains. One end of it was then fixed firmly in a vice, a string was passed over the other end, to which a weight equal to 14,815 grains, or 2.11643 pounds, was suspended. It was allowed to remain in this state several days, when, on the weight being removed, the bone immediately recovered its primitive form, showing that its

elasticity was unimpaired. The curve it made under the weight is seen in Fig. 1. The same bone was then plunged

FIG. 1.

into a weak solution of hydrochloric acid. After remaining about two hours, it was taken out of the solution, and suffered to become dry; it was then again weighed, and was found to have lost 15 grains of its inorganic materials, thus reducing the weight of bone from 76 to 61 grains. The bone when dried was then again fixed, and the same weight being applied as before, the curve it then formed is seen in Fig. 2. On the

FIG. 2.

weight being removed, the bone in a few seconds resumed its original form, showing that it still retained its elasticity. The bone was again put into the acid, and suffered to remain a short time, when it was taken out, dried, and weighed as before. It was now found to have lost five grains more of its mineral components, the weight being reduced from 61 grains to 56 grains. On being again fixed, and the same weight applied, it bent into the curve as seen in Fig. 3. On this

FIG. 3.

occasion, however, on the removal of the weight, it no longer recovered its former figure, but remained in a bent state; it therefore had not only its elastic properties reduced, but the greater degree of curvature shows it had also been very sensibly impaired in strength; and as the proportion of the animal to the earthy matter, when the bone had its elasticity so far diminished, was very nearly as 2:3, we may consider this proportion as indicating the amount of deficiency of earthy matter, such as will render a bone, if distorted by pressure, incapable of returning to its primitive form. But, as it might be supposed by some persons that the loss of strength was due simply to the loss of material, and not to the chemical difference between the earthy and organic components of the bones, a similar rectangular piece was cut from the same bone, and ground down to precisely the same weight as the bone that had been acted on chemically, when they severally formed, under the same weight, the curves seen in Figs. 4, 5,

FIG. 4.

FIG. 5.

From this it will be obvious that the loss of strength is entirely and specially due to the loss of the inorganic matter, and not simply to the loss of the general substance of the bone.

It is not a little curious to observe how sensibly the elasticity of bones may be affected by small changes in their chemical relations, and it was observed that the lamina of bone, which weighed fifty-six grains, and formed the curve already mentioned, (fig. 3,) had, after the lapse of several days, become drier, and on being again weighed it was found to have sustained a further loss of 2.5 grains, the waste being now of the animal matter. On being subjected to the same weight, it made the curve seen in fig. 4, which, when compared with the curve it formerly made, (fig. 3,) shows how small a difference in the components will alter sensibly its mechanical properties. However, this increase of elasticity by drying is not peculiar to bones, for Mr. Hodgkinson found that the strength and elasticity of many kinds of wood are greatly augmented by drying. In the process of preparing bones for mechanical and chemical experiments, it is usual to strip off the periosteum, and remove the fat; the oily matter will then pass off by drying, after which no very great difference will take place in the chemical properties of bone, even after the lapse of centuries. In order rigidly to compute the elasticity of any body by means of the curve it forms when it is bent in the manner now under consideration, would require a mode of analysis which it would be quite impossible to explain in a lecture; but it will be sufficient on this occasion to take the line (A B) in the several curves as inversely representing the comparative differences of the elasticity of the bones in their several states.\*

There is no doubt but that the specific gravity of bones differs in degrees corresponding to differences in the amount of their components, and also that the elasticity varies according to the specific gravity. This point, however, I have not yet investigated sufficiently to justify my occupying the time of the Society with a statement of the result. Care, however, must be taken not to substitute the *strength* of the bones as if it were identical with their *elasticity*, inasmuch as these properties are very disproportionate to one another in some bodies, some of the most elastic substances, such as glass, for example, being as we well know, very brittle.

The strength of bones, then, is a most important property belonging to their structure, and is essentially necessary for the healthy performance of the functions of the human system. It has been already seen how much the *elasticity* of bone depends on its chemical composition; and the same is also true with respect to their *strength*, as may be inferred from the curve made with the same weights, to which I have already invited attention. As there seems to be nearly a constant proportion in the components of bone in the health and vigour of life throughout the orders of mammalia, and as this proportion is very nearly as 2 to 1, between the inorganic and the organic materials, it may be concluded that this relation is the one which confers the greatest strength consistent with the functions they have to perform. The force necessary to crush a piece of solid bone is very great. According to the researches of Professor Robinson, it is twice as great as with oak; and as the latter requires, according to Professor Hodgkinson, from 6484 to 10,058 lbs., we can easily imagine the immense weight it must require to crush bone. It has been remarked by Von Bibra, that those bones which are subjected to the greatest action have the largest proportion of earthy constituents. We find the same thing occurring in the enamel of the teeth, in which, in order to fit them for their offices, the proportion of the earthy phosphates is very large.

Enamel.

\* In these figures—

- O is the point of the origin of the curve.
- OA is the tangent.
- OB is the curve made by the bone.
- AB is the measure of the elasticity.

The line A B in the figures represents only the comparative elasticity of the bones in the several curves; but the actual amount of elasticity may be obtained by the following simple formula:—

$$E = \frac{w}{k \delta^3}$$

And if we designate the strength by S, then

$$S = \frac{l w}{\delta^2}$$

In which—

- E is the elasticity.
- k " measure of the line A B.
- w " weight in pounds.
- δ " breadth } in inches.
- δ " depth }
- l " length }

Independently of the excess of phosphate and carbonate of lime, there is also found a small quantity of the fluoride of calcium, and to its presence Lehmann ascribes the fine polish and extraordinary hardness of the enamel.

Though the structure of ivory is very different from that of bone, yet it contains nearly the same chemical components. The strength and elasticity of these two substances appear nearly equal, as may be seen in the similarity of the curves they make when bent by equal weights (Figs. 6, 7.) Besides

FIG. 6.

FIG. 7.

the difference arising from chemical composition, there is great difference in the strength of bones according as they vary in their form. The flat bones—such as the cranial and scapular for example: the former of which are expanded into discs for forming the dome of the skull; and the latter presenting an extensive surface for the attachment of muscles—are not so strong as the more solid forms of the bodies of the lower vertebræ: and, again, the cylindrical bones of the extremities are much stronger, on account of their being hollow instead of solid cylinders; for it is found, that with the same quantity of matter strength may be doubled, by the interior diameter of the tube being to the exterior as 100:71·66. In many parts of the skeleton considerable differences exist in the proportion of the constituents of the compact, the cancellated, and the spongy portions of the bones; and it must be manifest that the cancellated and spongy tissues are not adapted to confer on the bones as much strength and elasticity as the laminated structure; yet they perform several important physical offices. In the solid bones, such as the bodies of the vertebræ, the tarsal, and carpal, the spongy portions prevail, and give extension to the surface, without adding too much weight. The ethmoid plates being very thin, are composed entirely of laminae.

Having now given an outline of the two mechanical properties of bone, elasticity and strength, we shall be prepared to consider their opposite abnormal and pathological qualities—namely, flexibility and softening.

In the first place, we find in early age—that is, from one to four years—that during the process of teething the phosphate of lime is partially consumed in the formation of the teeth. The tibia and fibula are then often so flexible as to be unable to support the weight of the body; this often occurs in children of healthy constitution, and who are quite free from rickets. The bones are not in a state of disease, but merely destitute of the quantity of inorganic matter necessary to enable them to bear the weight imposed on them. It is in this state of the bones that some mechanical support is desirable, inasmuch as if, during the curvature of the bones, they acquire the proportion of earthy matter sufficient to confer on them the elastic property common to normal bone, they remain distorted during life, and no mechanical contrivance that can be borne by the patient seems to be adequate to restore the bone to its normal figure. The rehardening of the bones of the lower extremities, when there is no organic disease, appears to take place in children about the age of four years. That in a great number of children the bones regain their figure without the interposition of any support, there is no doubt; but that other children remain distorted through life we have every-day evidence. The annexed figure of a girl about seventeen years old is an illustration of a case in which the bones have regained their elasticity before the restoration of their figure, and no force that could be employed was sufficient to correct the distortion. (See Fig. 8.)

Other cases of a similar nature have been under my care, and have been attended with like results. Cases similar in their mechanical nature to these affections of the lower extremities occur later in life to the bones of the vertebral column, about the age of puberty, and more frequently in the female sex. The vertebræ, from this period until they arrive at the age of twenty years, are, in many young persons of a delicate constitution, so soft and compressible, that if they are unequally pressed on for lengthened periods by placing the body in any peculiar attitude, they give way, and, being inelastic, do not recover their form; and if the attitude tending to alter the

FIG. 8.

shape of the vertebræ continue until the bones regain their normal proportions of inorganic matter, the distortion of spine will resist any treatment, and deformity is established for life. The period for attention to these cases, then, should never be neglected; but if the proper time of treatment is taken advantage of, these cases of distortions of the spine do not present much difficulty of cure; for it is very easy to remove the cause of the unequal pressure on the bodies of the vertebræ by correcting the attitude.

It will be seen by the following analysis of the bones by Von Bebra, that of all the bones of the skeleton, (the sternum excepted,) the vertebræ have the largest proportion of organic matter, being as 45·75:54·25, and consequently are the most easily compressible:—

We know, anatomically, that the spinal column rests on the sacro-lumbar articulation, which presents but a small surface, as a base, in proportion to the height and the weight of the column it has to support, and that, moreover, it is inclined forwards towards the upper edge of the symphysis pubis,

at an angle of 30°, and it is obvious that the vertebral column must necessarily partake of all the movements and inclinations to which the base of support is subjected. The only position in which all the forces acting on the spine are in the state of the least action, is the erect position of the body; the sacro-lumbar articulation is then, on each side, at equal heights from the ground, and the vertebrae are equally pressed on by the superincumbent weights. In all other positions of the base of support, the vertebrae are subjected to unequal pressure, which, in the treatment of distortions of the spine resulting from mechanical causes, it is the great object to prevent. Any distortion of the legs, any unequal forces between them, or any difference in their extension in standing, all tend to give a lateral inclination to the sacro-lumbar articulation, and produce lateral curvatures of the spinal column. But in order to make this more apparent and incontrovertible, from the well-known structure of the pelvis, we may deduce that when the line Z Z, (fig. 9,) passing through the axes of the heads of the femurs, is

FIG. 9.

horizontal, the line Y Y, parallel to the surface of the sacro-lumbar articulation, will be also horizontal, and consequently the line in the direction of X, and in the mesial plane of the vertebral column must be vertical. From these considerations it is seen of how great consequence it is to the vertebral column to preserve the integrity of the figure and the force of the lower extremities at the period of life when the treatment is most effective.

The softening of the bones, which we have been considering, is that state in which there is no organic disease of the skeleton, but merely a disproportion between the quantities of their organic and inorganic constituents, without any great degree of constitutional disturbance.

(To be continued.)

## CASE OF CALCULUS VESICÆ IN A GIRL.

By HENRY THOMPSON, Esq., F.R.C.S., M.B.,

SURGEON TO THE ST. MARLYBONE INFIRMARY, ETC.

THE infrequent occurrence of calculus in the female sex, as compared with its appearance in the male, is a matter of common notoriety to the profession. Contrary, however, to that which is observed in patients of the latter class, it would appear, when affecting the female, to be much more rare in childhood than in adult age. We are familiar, both in our literature and practice, with the complaint as it occurs in the adult, and also with various kinds of surgical treatment employed for its removal; but there are very few reports in existence of cases in which young girls have been observed to suffer from stone, and still fewer in which any operative proceedings have been necessary in order to extract it.

It is customary to attribute the comparative immunity of the female to the very different character of the urinary passage, as regards its extent and complexity, when compared with that which belongs to the apparatus of the male; and this is probably in great part sufficient to account for the rapid ejection from the body of those minute crystalline aggregations

which are doubtless produced in both sexes with equal frequency, but which, when detained in the bladder for a sufficient period of time, often become the nuclei of larger formations. The pyriform shape of the bladder in children, and its high situation behind the pubes, altogether above the level of the internal urethral outlet, is very favourable to the expulsion of a foreign body, particularly where the passage is short; but the advantage gained to the female child by this position of the bladder is lost to boys, by the small size of their urethra, and the little dilatability which it possesses; and probably it is on this account that the bladder in such becomes more liable to retain a foreign body, and is consequently more obnoxious to stone than in after life, when the capacity of the urethra has trebled.

I have recently had under my care, at the Marylebone Infirmary, a little girl with calculus in her bladder, whose case it appears desirable to record, not only on the ground of its rarity, but also on account of the complete success which has followed the treatment adopted.

C. P.—, aged nine years, a healthy-looking, quick, and lively child, has been the subject of most infantile diseases, but all occurred before she was six years old, and she has apparently enjoyed good health until very lately. Twelve weeks ago she had "an attack of fever," which confined her to bed for a week. During her convalescence, signs of urinary irregularity were first observed by the mother. The woman being from circumstances more than usually absent from her children during the day, cannot be certain that some symptom may not have existed before the time mentioned. She states that the child complained of a pain in the side, of too frequently requiring to make water, of difficulty in the act, of total inability to resist sudden desires to micturate, and, more recently, of frequent fits of retention. Two or three weeks ago, the catheter was rendered necessary for their relief four times during seven days. In consequence of the increasing severity of these symptoms she was admitted to the Marylebone Infirmary in the beginning of July, 1854.

I saw her first about the 12th, and sounded her, with my friend Mr. Filliter, the resident surgeon of the infirmary. The bladder had become unnaturally capacious, containing, when distended, fully a pint of water. Its walls were manifestly rugose, from development of the muscular parietes, a condition which was easily recognised by the sound. There was a little difficulty in detecting the stone, and in obtaining an audible click. It was movable, and lay deeply behind and below the internal meatus. The clitoris was considerably enlarged, while both it and the surrounding parts were unnaturally red, and slightly excoriated. She was in the habit of putting her hands constantly to the part, complaining much of the pain she felt there.

During the succeeding three or four days she was kept quiet, in order that her symptoms might be watched and noted. Urine, rather pale, abundant; slight alkaline reaction; deposits a small precipitate, which, under the microscope, proves to be chiefly crystals of the triple phosphate, with a very few pus corpuscles; no appreciable amount of albumen.

On the 15th, a sudden fit of retention having occurred, Mr. Filliter was called by the nurse to see her, and discovered, by passing a probe, that the internal meatus was occluded by the calculus, having apparently become fixed there, as if grasped by it or by the neck of the bladder. He made efforts to extract it at once, but found this impracticable.

July 18th.—Having concluded that lithotripsy offered the safest and most certain method of removing the calculus, I directed, having first emptied the bladder, the insertion of a small compressed sponge tent, of taper form, about two inches in length, and the fifth of an inch in average diameter, into the urethra, the larger end being securely fastened to a disc of cork, to prevent all possibility of its slipping into the bladder, and the whole kept in position by a bandage. About three hours afterwards I removed this; it had swelled to three times its original size, and had acted well on the urethra.

July 19th.—Another tent was inserted in the morning. About four hours afterwards, the child was placed on her bed in a good light, and had chloroform administered to her by Mr. Filliter, my friend Mr. Erichsen kindly favouring me with his assistance. I then withdrew the tent, and introduced an ordinary screw lithotrite. On this occasion it was not easy to find the stone, and some minutes elapsed before its presence was recognised; but after some patient and careful sounding, I succeeded in finding and effectually crushing it. A few fragments passed after injecting the bladder with warm water.

20th.—A quantity of detritus has come away. She has suffered no pain, and but little smarting, since the operation. Urine clear and abundant. The calculus appears to have been

about five-eighths of an inch in diameter, and was composed of uric acid and urate of ammonia, the former constituting the nucleus, with a slight incrustation of phosphates upon its surface.

22nd.—Says she has nothing whatever to complain of. Runs about the ward, and passes urine in a natural manner; urine healthy.

25th.—Perfectly free from any symptom, except a slight degree of incontinence during sleep; none at any other time.

September 23rd.—Quite well. For two or three nights after last report she did not wholly retain her urine, but since that time she has been perfectly free from that or any other symptom of urinary complaint.

The foregoing case suggests one or two points of remark in relation to the practical management of calculus in the female bladder, which appear to me to be important:—

The methods which have commonly been adopted for the extraction of stone in the cases of adult females (and our recorded experience of any other age, as before mentioned, is exceedingly small) are—dilatation of the urethra and neck of the bladder alone; dilatation in combination with incisions; and incisions of various kinds, usually commencing in the urethra, and adequate to permit the passage of the stone. Against all of these the very serious objection of a resulting incontinence of urine is confessedly held to lie. There is no question at all amongst practical surgeons as to the occurrence of this infirmity in a certain, and probably not very small, proportion of cases so operated on. Hence it has been proposed to substitute the employment of the lithotrite for these procedures, although, judging from published reports, it does not seem by any means to be very commonly resorted to. At the same time, the only objection urged against it, as far as I have been able to learn, is a degree of difficulty, arising from the alleged inability on the part of the bladder, on account of the shortness of the urethra, to retain a quantity of fluid sufficient for the purpose of the lithotritist. The objection, if valid, certainly presents an obstacle to the successful issue of the operation in one point of view; but on the other hand, it should not be forgotten that for obvious reasons the manipulation of the lithotrite is more easy in the female than in the male bladder. Owing to the shortness and extensibility of the urethra in the former case, a far greater freedom of motion is permitted to the instrument, both in regard of the direction of which the axis of the shaft is capable, and in the general character of the movements themselves, which are not retarded or modified by close contact and friction with the walls of a long urethral canal, as in the male. Consequently a smaller expenditure of time, as a rule, will be necessary for the performance of the operation under these more favourable conditions. But further, I conceive that it would be by no means impossible to exercise a degree of pressure around the external meatus of the urethra, either by the fingers of the left hand or by some other means, which should be sufficient to prevent the escape of fluid. Indeed, whenever an expulsive effort was made by my patient, as did occasionally happen, I found no difficulty in retaining the fluid, by applying the left thumb and finger to the urethral orifice, and compressing it temporarily around the shaft of the lithotrite. But this occurrence in her case was, I believe, due to the fact that I had employed rather more distending force, by means of the sponge tent, than was really necessary. The introduction of one, instead of two tents, would probably have been sufficient to permit the introduction of the lithotrite with ease, but having had no previous experience of their effect upon a child's urethra, it was not possible to foresee this. Of course, in operating for the ordinary cases of adults, dilatation of the urethra would be unnecessary as a preliminary step; on the contrary, it is not improbable that the objection just alluded to as lying against the use of crushing instruments might be overcome, if not entirely, at least to a considerable extent, by employing them of larger size than those which are adapted to the male; in short, by taking care always to use such as will adequately fill or slightly distend the urethra of the patient.

I am inclined to think that there are not many cases of calculus in the female to which the lithotrite would not be preferable to any operation by dilatation or incision. Its applicability to children has been shown by the case just reported, the first, I believe, on record, in which it has been successfully resorted to, if not the first in which it has been employed. In adults a certain amount of irritability, or mucous discharge from the bladder, should not necessarily contra-indicate an attempt to extract the calculus by crushing, because of the peculiar facilities, already referred to, which the female passages offer to the operator. I cannot but think that the unhealthy condition so described is apt to be regarded with unnecessary apprehension

in some of these cases. A stone which can be detected without difficulty may be very readily seized and crushed, with nearly if not quite as little disturbance to the bladder as that occasioned by the efforts commonly employed in dilating the neck, in grasping the calculus with the forceps, and in forcibly extracting it through the passage. In neither case does there appear to be any objection to the use of chloroform for the purpose of subduing the pain of the operation. When there is reason to believe that the nucleus of the stone consists of some foreign body which can neither be crushed nor removed by means of the lithotrite, other means must be resorted to, and these will generally be determined by the nature of the individual case. Neither can any absolute rule be laid down as to the method of dealing with a stone in relation to its size. Probably there are not many calculi of purely natural origin sufficiently large to render incisions absolutely necessary, more especially as the larger formations are more commonly phosphatic in their composition, and consequently extremely friable, often possessing a consistency little more firm than that of mortar. Nevertheless, there are doubtless a few which are not amenable to the grasp of the lithotrite.

On the whole, then, I am anxious that we should recognise fully the advantages of a method which promises to accomplish the end in view without entailing on the patient the subsequent evil of urinary incontinence. If lithotrity is admitted to be an operation of superior efficiency and safety in many cases of calculus in the male subject, liable as it is to become the occasion of serious contingencies, arising from his sexual formation, it must surely be, *a fortiori*, a more desirable proceeding than the operation by the knife, or three-bladed dilator, in a very large proportion of those cases which are presented in the female.

Wimpole-street, Cavendish-square, 1854.

## ON THE LAW OF MORTALITY AND SICKNESS OF THE LABOURING CLASSES OF ENGLAND.

By THOMAS ROWE EDMONDS, Esq.,

ACTUARY TO THE LEGAL AND GENERAL LIFE ASSURANCE SOCIETY.

THE mortality, according to age, of the general population of England in all localities, was first satisfactorily determined for the period of seven years ending with the year 1844. The observations and results were published by the Registrar-General in the year 1849; and in the following year I was allowed the opportunity of exhibiting in *THE LANCET* (vol. i. 1850, pp. 297, 330) the principal results in new combinations, with my conclusions therefrom. The knowledge thus obtained of the mortality of the general population (with distinction of town from country districts) is valuable for testing the correctness of independent observations made on the mortality of classes of the labouring population, such as are contained in "Friendly Societies," whose mortality and sickness it is now proposed to discuss.

Within the last few years a very great addition has been made to the previously existing small stock of observations on the mortality and sickness experienced by members of Friendly Societies. In *THE LANCET* of April, 1839, (vol. i., p. 185,) was published an observation made by me on the members of a metropolitan benefit society, in which observation was comprehended the deaths and sickness, distributed according to age over 30,000 years of life. At that time there existed only two similar observations; one of these was contained in the report of the Highland Society, and embraced 85,000 years of life: the other was made by Mr. Ansell, and embraced 25,000 years of life. Since the time mentioned, we have had large additions made to this department of knowledge from three sources, to the extent of two and a half-millions of years of life observed. The first of these additions is due to Mr. Neison, and embraces more than one million years of life observed during the five years ending with 1840. The next addition proceeded from a very large friendly society, called the "Manchester Unity of Odd Fellows," and embraced about 600,000 years of life, observed during the three years ending with 1848; this observation having been made by the corresponding-secretary of that society, Mr. Ratcliffe. The third and last addition to this department of knowledge has been made by authority of the British Government, the results having been published within the last half-year. Mr. Finlaison, junr., has been employed to make this observation, which extends over the five years ending with 1850 and embraces about 800,000 years of

life. This last observation, like that of Mr. Neison, is founded on official returns, which all registered Friendly Societies are required by Act of Parliament to make once every five years.

The three observations on Friendly Societies made respectively by Mr. Neison, Mr. Ratcliffe, and Mr. Finlaison, jun., yield each its specific law of mortality and sickness. The three laws of mortality obtained are in accordance with the general law, which in all other observations regulates, in adult life, the increase of mortality according to age. The general law is this—that the rate of mortality increases, from puberty to the age of about 53 years, at the rate of 3 per cent. (.02991) for every advance of one year in age; and after that age, increases at the rate of 8 per cent. (.07969) for each year of age until the end of life. There exist innumerable specific laws of mortality, appropriate to particular masses of population, but all these specific laws differ from each other only in two characteristic points,—one characteristic being the particular age at which the period of “florescence” terminates and the period of “senescence” begins, and the other being the absolute mortality at any specified age.

Previously to the publication of the three observations now under consideration, there existed grounds for believing that, in adult life, the increase according to age in the amount or duration of sickness suffered in each year of life was regulated by the same two numbers which regulate the increase of mortality in the periods of “florescence” and “senescence” respectively. In the year 1832, I published Sickness Tables, founded upon such unity of law. The present three observations confirm the view then acted upon, and may be said to establish the fact of identity between the constants of mortality and the constants of sickness. There is, however, a remarkable discrepancy between the three observations as to the particular age at which the period of florescence is divided from the period of senescence. In the three observations on mortality, and the three observations on sickness, the limiting age is either at 53 years or at 46 years. According to Mr. Finlaison's observation, the limit dividing the two periods is at the age of 53 years, both for mortality and sickness; according to Mr. Ratcliffe's observation, the line of separation is at the age of 46 years, both for mortality and sickness; but, according to Mr. Neison's observation, the limits of division for mortality and sickness are different, that for mortality being at 53 years, and that for sickness being at 46 years of age. This difference of seven years in the position of the limit dividing the period of florescence from that of senescence occasions a difference of 40 per cent. in the relative mortality or relative sickness at ages above 53 years compared with ages below 46 years. For example, assuming (as is not far from the truth) the mortality and sickness stated by all three observers to be equal at ages below 46 years, it will ensue, from the difference in the position of the limits just mentioned, that at any specified age above 53 years, the mortality observed by Mr. Ratcliffe is 40 per cent. greater than the mortality observed by Mr. Neison and Mr. Finlaison, and that the sickness observed by Mr. Ratcliffe is equal to that observed by Mr. Neison, but 40 per cent. greater than the sickness observed by Mr. Finlaison.

The discrepancies just mentioned are of such magnitude as to detract considerably from the value of the results of all three observations at any age exceeding 53 years. In order to extract a useful result from the apparently contradictory observations, it is necessary to devise some principle of reconciliation which will explain the inconsistencies. Such a principle is found in the assumption, that one particular class of facts has been treated in three different ways by the three observers, whether designedly or not. The class referred to, is that of members retired on the Superannuation or Sick-Pension List. It appears highly probable that Mr. Ratcliffe, in his observation, has treated all on this list as sick, and added their deaths to the general amount of deaths. On the other hand, it appears highly probable that Mr. Finlaison has treated nearly the whole of this class as pensioners in good health, and removed them from observation, whether as regards sickness or mortality.\* To reconcile the third observation with the two just mentioned, it is necessary to assume that Mr. Neison has designedly reckoned all superannuation time as sick time, and that he has unavoidably omitted the deaths of the same class of members, because they were omitted in the returns from Friendly Societies submitted to him.

It may be useful here to remark, that Friendly Societies in general make these returns very reluctantly, and are careless as to their correctness or completeness. A very large proportion of the total returns from these societies has been rejected

by Mr. Neison and Mr. Finlaison as unavailable, through obvious defects arising from negligence, wilful or otherwise. As regards the adopted residue of the returns containing no obvious defects, the results which they indicate cannot be entitled to much confidence, unless they are consistent with one another, and corroborated by other observations founded upon facts better attested. It is fortunate for the public that there exists such an extensive and well-authenticated observation as that of Mr. Ratcliffe, with which can be compared the observations of Mr. Neison and Mr. Finlaison. From his position in connexion with the “Manchester Unity,” we have, in Mr. Ratcliffe, responsibility for facts as well as conclusions; whilst Mr. Neison and Mr. Finlaison are responsible for arithmetical conclusions only, founded upon alleged facts, whose correctness they had no power of testing.

There is another way of treating the discrepancies mentioned, which is, to assume that the statements of all three observers are of equal weight, and that the true statement is the mean of all three statements. This plan of proceeding is found highly successful, as will be seen on inspection of Table III. It will there be perceived that the results of the combined observations can be closely represented by assuming the age of 48 years to be the point of separation of the period of “florescence” from that of “senescence,” for mortality as well as for sickness. Out of twenty-four points of comparison of sickness and mortality, at decennial intervals of age, there will be seen 23 points of agreement, whilst the only point of divergence (which is in “city” mortality between the ages of 55 and 65 years) is a specialty hereafter explained, in which all three observations agree in departing from the theoretical numbers.

In the “Manchester Unity,” at ages above 53 years, the mortality (shown in Table I.) is 15 per cent. greater than the mortality of the total male population of England. This higher relative mortality is such as might have been anticipated from this society, containing less than the average proportion of members resident in rural districts, and more than the average proportion of members resident in town and city districts. According, however, to the observations of Mr. Neison and Mr. Finlaison, at ages above 53 years the mortality in Friendly Societies (containing the due proportion of rural town and city members) is 20 per cent. less than the mortality of the total male population of England. This is an unexpected result, which is open to doubt, more especially from the fact that there is a discrepancy in the statements of sickness at the same ages, respectively made by Mr. Neison and Mr. Finlaison, which discrepancy, when converted into its proportional amount of deaths, would be just sufficient to make up the suspected deficiency of 20 per cent. The sickness suffered, at ages exceeding 53 years, is 40 per cent. greater according to Mr. Neison than it was according to Mr. Finlaison. The alleged mortality being equal in the two cases, it would follow that the sickness of a population can be greatly increased without the deaths being simultaneously increased—a conclusion opposed to all experience. It is nearly certain that the extra 40 per cent. of sickness observed by Mr. Neison represents the lifetime of all superannuated members, which life-time is altogether excluded from his observation by Mr. Finlaison. If one-half of all superannuation time be true sickness, Mr. Neison's observation, as compared with Mr. Finlaison's, will contain an extra 20 per cent. of true sickness, without any extra per centage of deaths. If, however, an addition to the deaths (for omissions in the returns) be made proportionate to the extra per centage of the true sickness observed by Mr. Neison, the resulting mortalities of all three observations will be in harmony with each other, and conformable to expectation.

It is also to be remarked, that if the mortality of members of Friendly Societies is influenced by “selection,” as is probably the fact, there will be additional reason for doubting the truth of the statement in question; for the statement of Mr. Neison and Mr. Finlaison is, that in Friendly Societies the mortality in the period of florescence, as well as in the period of senescence, is 20 per cent. less than that of the total male population of England of the same age. The former part of this statement is probably true; but the latter part is inconsistent with the former part, and the known ordinary effects of selection of good lives from the general mass. In Friendly Societies the great majority of members are admitted below the age of 35 years, so that the effect of selection (being limited to about 15 years from admission) does not extend to the period of age exceeding 53 years. Assuming the reduction of 20 per cent. in the mortality during the period of florescence to be caused by “selection,” there ought to be no difference, in the period of senescence, between the mortality of members of Friendly Societies and the mortality of the classes from which the mem-

\* The interpretation here suggested of “Sickness” has been confirmed by Mr. Finlaison in the second part of his Official Report since published.

TABLE I.

SHOWING, for Quinquennial Intervals of Age, the Rates of Mortality and Sickness experienced by Members of Friendly Societies, according to three several observations; with which are compared the Results from the Theoretical Tables, one of which represents the Annual Mortality of the Total Male Population of England, according to the latest Observations.

bers have been selected. It may be useful here to remark, that a reduction through selection of 20 per cent. in the mortality for the period of florescence is equivalent in appearance to a retrogression of four years in the limit at which the period of senescence commences. If, as is the fact, this limit in the total male population of England is at the age of 53 years, the corresponding position of this limit in Friendly Societies affected by selection in the degree mentioned would be at the age of 49 years.

In the three several observations, the members are distributed into three classes, according to their residence in "Rural," "Town," or "City" Districts; and the rates of mortality and sickness at different ages are separately stated for each class. The general result of all the observations, is, that the mortality of the town is 25 per cent. greater than the mortality of the rural districts; and the mortality of the city 25 per cent. greater than that of the town districts. In Mr. Ratcliffe's observation, the mortality of the aggregate population is greater than the mortality of his town population; but in Mr. Neison's and Mr. Finlaison's observations, the mortality of the aggregate is considerably less than that of their town population. These variations are accidental, and arise from the absence of any settled principle regulating the distribution of the members into the three classes. Mr. Ratcliffe has distributed his numbers equally amongst the three classes of rural, town, and city residents; and has formed his rural class from residents of townships or parishes whose total population is less than 5000 of all ages and both sexes. Mr. Neison (who has been followed by Mr. Finlaison) has distributed his numbers, so that the rural, town, and city residents are in the proportions (nearly) of 4, 2, and 1 respectively; and Mr. Finlaison (with Mr. Neison probably) has formed his rural class from residents in townships or parishes whose total population is less than 3000. Instead of these classifications, without any apparent principle, it appears to me that the preferable course would have been, to comprehend in the "town" class about one-half of the total numbers, and so to have adjusted the limits of magnitude of the places designated as "towns" as to render the mortality of the class resident in towns coincident in amount with the mortality of the aggregate population observed. Having thus fixed the intermediate "town class," the two extremes of rural and city classes would be simultaneously fixed. I acted upon the opinion now expressed, in forming a system of Theoretical Life Tables, which I published twenty-two years ago. I divided the population into three classes, and gave to the three degrees of mortality the designations, "Village," "Mean," and "City." The names of the two extreme classes were indicative of extreme rarity or extreme density of population; the intermediate term was used to indicate, either a population of mean density, or the aggregate population independent of density.

Both Mr. Neison and Mr. Finlaison have, in their observations, made an important subdivision of the residents of rural districts into two classes, whose mortalities differ from one another in as great a degree as the mortality of town districts differs from that of rural districts in general. One of these two subdivisions is a class consisting chiefly of agricultural labourers, the other subdivision is a class consisting of the residue of all residents in rural districts. According to both observations, the mortality of agricultural labourers is less than the mortality of the residue of the rural class in the proportion of 4 to 5, which is the relation of rural to town, and of town to city mortality. Attempts have been made to subdivide the "town" and the "city" members of Friendly Societies into classes suffering similarly well marked different degrees of mortality, but, apparently, hitherto without success. This failure of the investigation, so far as regards town and city districts, affords, however, no ground for doubting, what is evidently the fact, that the range of mortality between classes occupying the extremes of good health and bad health is much greater in city than it is in rural districts.

The mortality experienced by members of Friendly Societies resident in "City" Districts, according to the observations of Messrs. Neison, Finlaison, and Ratcliffe, approaches nearly to the mortality of the male population of large towns of England of the healthiest class, such as York, Sunderland, Plymouth, Brighton, &c. (See Table II., hereunto annexed, and THE LANCET, vol. i. 1850, p. 330.) The result has been obtained by combining together the members of Friendly Societies resident in large towns, of the first, second, and third degrees of health. Liverpool and Manchester represent large towns or cities of the third or lowest degree of health in England; the mortality of these large towns being 50 per cent. greater at most ages than that of the healthiest class of large towns just mentioned; and 100 per cent. greater than the mortality of the

four healthiest Registrar's divisions, which comprehend one-third part of the total population of England. It may also be seen, on comparing together the first and last columns of Table II., that the least mortality observed between the ages of 35 and 65 years, is one-third part only of the greatest mortality observed in England at the same interval of age,—the least mortality being that of agricultural labourers, observed by Mr. Neison. The true range of mortality is, however, considerably greater than the observed range of 1 to 3. For it is nearly certain that, in all towns of great magnitude, there exist two large classes, occupying the extremes of good and bad health, one of which suffers a mortality one-third less, and the other a mortality one-third greater, than the average mortality of the whole population of the town. Whence we are justified in concluding that, in the least healthy class of large towns of England, there exists a considerable portion of the population suffering a mortality four times as great as that which has been observed to exist in a class formed by selection from agricultural labourers.

All three observers, in their statements of "city" mortality at ages above 55 years, agree in presenting a similar anomaly. According to all three statements, city mortality is considerably greater than town mortality at all ages under 55 years, whilst at ages above 55 years, the relation is reversed, though in a less degree. On inspection, however, of the three last columns of Table II., exhibiting the rates of mortality according to age of three classes of the largest towns of England, arranged according to their degrees of healthiness, there will be found no such anomalous appearance. It will there be seen, that at ages above 55 years, the unhealthiness of either class of towns is as strongly indicated by increased mortality, as it is at ages below 55 years. There is thus no countenance afforded to the paradox presented by Messrs. Neison, Finlaison, and Ratcliffe, that as the unhealthiness of large towns increased, the mortality of the population at ages above 55 years, proportionally diminished.

The anomalous appearance in question is probably attributable to the mixing together in one observation of classes resident in cities, whose mortalities are widely different. All three observers have formed their "city" class out of residents in large towns whose mortalities, for their total populations, differed from one another as much as 50 per cent. as already stated. In the case of such combination of two classes differing greatly in mortality, the result exhibited at the early ages will be the mean of the rates of mortality for the healthy and the unhealthy parts of the population. At the higher ages, however, the rate of mortality belonging to the healthier portion of the population will alone appear, by reason of the previous extinction by death of the portion subject to the higher of the two rates of mortality. The error arising from defective classification is much greater in city than it is in town or rural populations; but it can never be altogether avoided. In deducing the mortality of the total population of England, a defect of the nature alluded to must exist through the difficulty of forming classes of people whose mortalities are nearly on an equality. The mortality of a combination of correctly constituted classes will never increase according to age, so rapidly as the mortality of the classes observed separately would increase. In the total male population of England, the line which apparently divides the period of florescence from that of senescence is at the age of 53 years. It is not improbable that the true line of division for the separate classes is at 51 years of age, the difference of two years being the effect of the combination of various classes whose amalgamation is necessarily imperfect.

(To be continued.)

## A CASE OF GREAT HYPERTROPHY OF THE HEART.

By WILLIAM SEDGWICK, Esq., M.R.C.S. & L.S.A.,  
LATE SURGEON TO THE NORTH DISTRICT OF ST. MARYLEBONE.

THE following case has been selected for publication from a large number of cases of heart disease that have come under my notice, as a striking instance of the great size this organ may attain at a comparatively early age. It is probably, for the age of the patient, the largest heart of which there is any definite record. The circumstances attending the death of the patient will be found to possess peculiar interest, as tending to prove that the heart, "by the simple vehemence of its action," does not kill, the immediate cause of death in this case being inflammatory softening of the brain, passing into suppurative, which is not an unfrequent effect of dilated hypertrophy of the left side of the heart.

M. A.—, aged twenty-six, a dressmaker, short, full-faced, and having a very youthful appearance. The cheeks are of a deep purplish-red colour, which has been persistent for some years past, and does not disappear on her becoming faint or exhausted. She has never menstruated; at the time when menstruation was expected to occur, she began to suffer from severe pains in the head, which she states "were worse than headaches." These pains have continued more or less severe ever since, and she has often felt "as if the bones of the head were separating." She has suffered from "rheumatism and chalk gout," which commenced in the hands about ten years ago; the joints of the fingers were swollen, and little lumps formed there. She consulted two or three medical men without, she says, deriving much benefit from their advice. The pains in the joints continued to return at intervals, but without being at any time severe, or attended with much fever. The chest was not examined by any of the medical men who saw her. Her heart used to beat so as to trouble her "more than ten years ago," but its action was far from being so violent and distressing as it has been during the last six years, since which time, in consequence of the excessive palpitation which has come on whenever she has made any exertion, she has been obliged to keep very quiet, and during the last two years has not been able to do needlework, or to exert herself in the slightest way, without the palpitations of the heart being most distressingly increased. In the autumn of 1851 she had an attack of erysipelas in the face; the inflammatory symptoms were severe, and she was subjected to very active treatment.

I was requested to attend her on April 2nd, 1852, in consequence of her being taken alarmingly ill. On my arrival, I found her propped up in bed, breathing with great difficulty, and referring all her sufferings to the chest, which appeared to be in constant movement, from the violent and tumultuous action of the heart. On laying bare the chest, the heart could be seen beating over the whole of it in front in a very violent and confused manner, the walls of the chest being heaved up by the force of the impulse, which appeared irregularly diffused, so that the point at which the apex beat could not be made out. The sensation communicated, on applying the hand to any part of the chest in front, was that of an irregular, galloping movement, which appeared to be so excessive and unnatural as to lead me to suppose that the patient could not long survive, if it continued unabated. On percussing the chest in front, it sounded generally dull, except at the upper part of each lung, where there was marked resonance: behind, at the lower part of the left lung, it was dull; the upper part of the left lung and all the right lung was resonant. At the lower part of the left lung, behind and laterally, I detected small crepitation; elsewhere, behind, exaggerated breath-sound. Pain was complained of in the lower part of the left side of the chest; there was a short, hard cough; the expectoration thin, rusty-looking, and streaked slightly with blood; the pulse very weak, and difficult to count, about 128 in the minute; bowels costive; and great pain, with a burning sensation, was complained of in the head, which was not hot to the touch. Fourteen leeches were applied to the left side, and some opening medicine given, followed by a saline antimonial mixture every five hours.

April 3rd.—The leeches had sucked well, and the bites had continued to bleed for some hours afterwards. The pain complained of in the left side of the chest is much relieved. Since my visit yesterday she has spat up a good deal of blood, and this morning about a mouthful came up at one time, since which there has been no hæmoptysis. The first dose of the mixture produced sickness, but not the subsequent ones. Ordered to continue the medicine, with a dose of blue pill and opium night and morning.

4th.—Improving.

5th.—At half-past seven A.M. the patient "was seized with a fit, during which she was strongly convulsed." I saw her at two P.M., and found her comatose, the mouth open, the breathing laboured and gasping, the pupils much dilated, the skin of the body generally cold and clammy, and the feet and hands quite cold. Mustard plasters were applied to the lower extremities without effect. She died at three P.M. the same day.

*Post-mortem examination, three days after death.\**—The body thin, but not emaciated. The face still presents that purplish flush which it always had when I had seen her during life, and the cheeks are rather full. The chest is well formed, rather prominent, with no inequality of the two sides.—Head: Dura mater healthy. Arachnoid opaque in some places, espe-

cially posteriorly; the amount of serous fluid considerable. In the posterior lobe of the left hemisphere of the cerebrum is an irregularly-shaped cavity, about the size of a large walnut, filled with a brownish pulsatous matter, intermixed with the softened and disorganized structure of the brain; it is bounded by softened brain, having a whitish appearance, and is situated so close to the surface of the lobe, that in opening the head the thin partition between it and the exterior of the brain was partly destroyed. Under the microscope, the brownish matter presents an immense number of exudation-corpuscles, mixed with those of pus in smaller quantity, some blood-corpuscles, and oil-globules. The rest of the brain appears healthy. The quantity of fluid in the ventricles is moderate, but somewhat more than usual.—Chest: On removing the sternum and costal cartilages, the heart, with the pericardium, is found occupying nearly the whole of the space, a very small portion only of lung being seen on each side above. The pericardium is very dense and fibrous, with a large quantity of fat spread out over its surface. On attempting to remove the pericardium from the heart, it is found to be universally adherent, the adhesions being of old standing. There is considerable engorgement of the smaller vessels supplying these parts. In some places, where the pericardium can be separated by means of a scalpel, its surface presents a closely reticulated appearance, especially towards the inferior and posterior portions, from the immense number of small arborescent vessels filled with dark purple blood. Elsewhere the separation of the pericardium cannot be effected. Having removed as much of the pericardium as is possible, the surface of the immense heart is now brought into view, occupying a horizontal or slightly oblique position across the chest, the right auricle being under the right mamma. The surface of the heart is much streaked with fat, which in some places is accumulated in large masses. The veins supplying the heart are much enlarged, and distended with blood.—Size of the heart: Its length from base to apex is nine inches; its weight, after being emptied of blood and fibrinous clots, and with the vessels cut close, is 3lbs. 2½oz. avoirdupois, (50½oz.)—Right side of the heart: The right auricle and right ventricle are both much enlarged, and the auricle is distended with dark gelatiniform blood; the lining membrane throughout healthy.—Left side of the heart: The left auricle contains a large and loose fibrinous clot; the lining membrane, chiefly around the base of the mitral valve, is roughened with fibrous deposit. The left ventricle is dilated and very much thickened; the walls at the thickest part measure rather more than one inch and six lines; the lining membrane is roughened with fibrous deposits, which on the ventricular surface of the semilunar valve are aggregated together, so as to give it a very irregular and coarsely nodulated appearance. On testing the integrity of this valve, by pouring water into the aorta, it is found to be entire. The mitral valve is very much puckered and nodulated, especially the right curtain of the valve, in which the fibrous deposit is accumulated towards the free edge in considerable masses, so as to render it thick and rigid, and thus prevent its being brought into apposition with the other curtain. The whole of this valvular apparatus is much hypertrophied, and the chordæ tendineæ, particularly those connected with the right curtain, are remarkably thick and strong. The aorta, beyond being much increased in diameter, does not present any other abnormal appearance. Both pleurae are healthy and free from adhesions.—Lungs: The right lung is emphysematous. Left lung: The upper lobe is very emphysematous; the lower lobe is the seat of recent and acute pneumonia; the greater part of this lobe is in a state of intense engorgement; at the lowest part of the lobe hepatization has commenced, but has not proceeded far.—The abdominal and pelvic viscera, on superficial examination, appear healthy.

*Remarks.*—Numerous cases have been recorded of unusually large hearts, which in a few instances appear to have even exceeded the one under notice; but, generally speaking, the statements on record, respecting their size or weight, are vague and unsatisfactory, the writers contenting themselves with saying that the heart was as large as a bullock's—a favourite form of comparison—or simply that it was enormous. Cruveilhier\* states that he has seen cases in which the heart has occupied at least half the cavity of the thorax. In the museum of St. George's Hospital there is a heart (E. 11) which is said to weigh five pounds; the patient from whom it was taken was a middle-aged man, who had been known to suffer from disease of the heart for some years, but no history of the case is recorded. This is the largest heart that I am acquainted with. Amongst other instances of large hearts, is the one observed by

\* Mr. Squire, and the late Mr. Grant, of the St. Marylebone Infirmary, kindly favoured me with their able assistance on the occasion.

\* Traité d'Anat. Pathol. Gén., 1852, tom. II. p. 692.

Otto,\* which weighed forty-two ounces; the case recorded by Lobstein,† of a man, aged fifty-four, whose heart was found to weigh two pounds; and the case described by Dr. Ritchie,‡ of a girl, aged twenty-three, whose heart weighed thirty-two ounces and a half. The heart of Gustavus Adolphus weighed twenty-five ounces.

On comparing this heart with the heart of a healthy adult female of the same age, it may be stated that the weight, 50½ ounces, is rather more than six times the average, which, according to Dr. Clendinning,§ is 8½ ounces; and that the thickness of the left ventricle, one inch and six lines, is about 5½ times above the average, according to the observations of M. Bizot,|| who gives 3¼ lines as the average thickness in the healthy state. The extreme length of the heart from base to apex was nine lines; in the healthy state it would measure about five lines, but this is liable, as is well known, to great variation.

The causes which may be considered to have contributed to produce this enormous enlargement of the heart were—1st, valvular disease; 2nd, adherent pericardium; and 3rd, non-appearance of the catamenia. The valvular disease probably commenced soon after the first attack of rheumatism, when the patient was about the age of fifteen or sixteen. The most serious lesion was that of the mitral valve, giving rise to mitral regurgitation; the deposit on the surface of the semilunar valve no doubt produced obstruction at the aortic orifice, but this probably contributed less to the hypertrophy than the diseased condition of the mitral orifice. Adhesion of the pericardium, (which has been observed in nearly all cases of great hypertrophy of the heart, and in this case was of old standing,) is said by some writers on the subject to have no tendency to produce hypertrophy; but it does not seem unreasonable to conclude that, as it must impede the free play of the heart, it would consequently lead to increased development. Suppression of the menses, by producing cardiac congestion, would also tend to the same result.

Park-place, Upper Baker-street.

## A Mirror OF THE PRACTICE OF MEDICINE AND SURGERY IN THE HOSPITALS OF LONDON.

Nulla est alia pro certo noscendi via, nisi quam plurimas et morborum et dissectionum historias, tam aliorum proprias, collectas habere et inter se comparare.—MORGAGNI. *De Sed. et Caus. Morb.* lib. 14. Proœmium.

### ST. GEORGE'S HOSPITAL.

#### AMPUTATION OF THE THIGH: HÆMORRHAGIC DIATHESIS.

(Under the care of Mr. CÆSAR HAWKINS.)

THERE is at the present time, in this hospital, a patient who offers a very good illustration of the hæmorrhagic diathesis, the tendency to loss of blood having become manifest after amputation of the thigh for disease of the knee-joint. We need hardly say, as the attacks of bleeding have now regularly recurred for several years, that most of the means at the disposal of the surgeon have been used to control the diathesis, and this circumstance puts in a stronger light the obstinate nature of the hæmorrhagic tendency. It is well known that this propensity will become manifest upon very slight solutions of continuity, and it will therefore not be surprising to find that so serious a surgical measure as amputation should have given full scope to the natural disposition of the patient, who certainly presents the principal characteristic feature of the diathesis—namely, a white, thin, and almost transparent skin.

And yet, when the numerous general astringent remedies, and the equally considerable number of local styptics at our command are considered, it seems at first sight absurd to suppose

that with such weapons we could not conquer the enemy. But it must unfortunately be confessed that the powerful means which we possess have only a temporary influence, and that in general the perilous tendency to hæmorrhage is not long in again becoming clearly manifest.

Pathologists are quite agreed that the blood escapes principally from the capillaries, and that the cause may also be the deficiency of the fluid in the due proportion of fibrin. That blood, where serum predominates, should not freely coagulate, can easily be understood, as also that weak capillaries should have no power of retraction when cut; but what is not so clear, is the inability of the system of such patients of taking up the large amount of fibrin which is generally administered, in various forms, by the surgeon. This might perhaps be explained by a want of power in the process of assimilation, the nitrogenous elements not finding their way to the proper set of tissues. Whether the corpuscles are also deficient in number, or whether there is a peculiar power in the *liquor sanguinis*, in such cases, of dissolving the corpuscles, is not accurately known; and this is one of the problems (amongst a pretty large number of others) which modern chemistry has not yet as solved. The urine of a group of these patients should be carefully examined during a given period of time; and it will perhaps be discovered that some of the constituents deficient in the blood are carried off by the kidneys, or possibly by the skin.

At all events, we should, in the meanwhile, as practical men, pay much attention to prophylaxis; and, above all, warn the individuals affected with the hæmorrhagic diathesis against incurring any solutions of continuity, or using any great effort. But it sometimes happens, as will be seen by the case to which we are drawing attention, that nothing, up to a certain period, indicates the hæmorrhagic diathesis; an operation of much importance, as an amputation for instance, is required and performed, and the tendency becomes manifest.

In such cases, the surgeon will always begin by taking a certain amount of blame to himself; for when a bleeding stump is to be treated, the operator is apt to suspect imperfect deligation of arteries, improper dressing of the stump, an erroneous line of regimen, a bad position, inappropriate internal medicines, &c. When the stump finally becomes conical, he begins to think that the soft parts were cut too short, that the bone was not sawn sufficiently high, that the stump was ill-placed in bed, &c. And yet both hæmorrhage and the conical stump may simply be owing to the above-mentioned tendency which, before the operation, was not known to exist. Mr. Hawkins's patient affords a case in point.

Louisa C—, aged thirty-four years, unmarried, and usually residing at Hammersmith, was admitted May 17th, 1854.

About twelve years before her admission, this patient had the left thigh amputated at the junction of the middle with the lower third, for disease of the knee-joint. This latter affection had lasted several years; but neither during the course of the malady, nor before it broke out, had any signs of hæmorrhagic diathesis been observed. The stump healed very slowly, and not completely, a portion of the cicatrix remaining imperfect for a long time. At last, a twelvemonth after the operation, when the wound was almost closed, bleeding occurred for the first time, and has annoyed the patient at various intervals up to her admission in this hospital—that is to say, for a period of twelve years.

The stump (very probably owing to insufficiency of fibrinous elements) assumed a conical form, and when the loss of blood had, by continual trickling, become very perilous, a surgeon in the country, suspecting the presence of dead bone, cut down upon the femur, and removed some necrosed osseous particles.

After this procedure the patient went on for several years in a weakly state of health, the stump not cicatrizing, becoming more and more conical, and the bleeding now and then occurring in the same trickling manner as heretofore. The most effective hemostatic means, and one which she of course mostly had to use herself, was cold water.

Years thus passed away, the patient now and then repairing to the country, when she finally, twelve years after the amputation, placed herself under the care of Mr. Hawkins.

About one month after admission, the patient was brought into the theatre, for the purpose of having her stump, which was extremely conical, rectified by removal of the bone and adjustment of the soft parts. The operation did not present any difficulties, though apprehensions were entertained that hæmorrhage might be more considerable than with ordinary patients. About two inches of bone were removed, and the soft parts so brought together as to favour the formation of a good stump. The number of vessels which had to be tied was not so great as was expected, and the patient was carried into her ward in very good condition.

\* Pathological Anatomy, translated by South, 1831, p. 265.

† *Traité d'Anat. Pathol.* Paris, 1833, tom. ii. p. 419.

‡ *Edin. Med. Journal*, 1850, p. 290.

§ Croonian Lectures for 1834. *Med. Gaz.* p. 446.

|| *Mémoires de la Soc. Méd. d'Observation de Paris*, tom. i. p. 262. 1836.

Her progress was pretty satisfactory for some time after the operation, but in a few weeks the old hæmorrhagic tendency became again manifest, and bleeding occurred from the stump. The cicatrix did not, in consequence of this attack, form in the expected firm and satisfactory manner; the bone again showed a propensity to protrude; and Mr. Hawkins was obliged, about eight weeks after the first operation, to remove a further portion of bone, and adjust the soft parts in the way best calculated to conduce to a better stump. But the diathesis was not conquered, and attacks of bleeding recurred after this second operation.

It is plain, from the details given above, that the tendency to bleeding is, in this patient, of the most inveterate kind, and not likely to be removed by the usual means; but it may perhaps be conjectured that a great disturbance and radical change in the action of the part might lead to a more favourable state of things. This disturbance has actually occurred, in the shape of sloughing phagedæna, with which the stump has been attacked. This destructive process went on at a rapid rate for some time, but was finally arrested, and the patient is now fast recovering.

This is certainly an instance of hæmorrhagic diathesis well worthy of record; it shows very forcibly that the tendency may remain latent for a great number of years, and be made manifest by the infliction of a wound of more or less extent.

This reiterated and obstinate reappearance of the same symptom leads us to mention another case, also under the care of Mr. Hawkins, which sets in a very strong light the uncontrollable nature of some recurring tumours of the breast.

#### CYSTIC TUMOUR OF THE BREAST: REMOVAL OF THE TUMOUR, WHICH HAD RECURRED FOR THE EIGHTH TIME.

(By Mr. CÆSAR HAWKINS.)

It is now some time since we had occasion to mention this case, an account of which will be found in a former "Mirror," (*THE LANCET*, vol. i. 1853, p. 177;) but it will surprise none of our readers that it should again be brought forward, since the propensity to recurrence of these tumours is generally known. Still it should not be passed unnoticed that the growth has reappeared as many as eight times, without the patient's health being affected, and without the glands of the axilla becoming enlarged.

It will be recollected that the patient is a tall, robust looking woman, who came under the care of Mr. Hawkins as much as eight years since, when the breast, affected with a cystic tumour, was removed. At that time, as well as after every operation which has since been undertaken, the intimate nature of the growth was carefully investigated, but no traces of malignant disease could be found. And were even the means of ascertaining by the microscope the actual structure of the diseased parts less perfect, it would be sufficient, for classing the tumour amongst the benign group, to observe the unshaken good general health of the patient after such frequent recurrences as we have above alluded to.

On October the 5th, the patient appeared in the theatre for the eighth time, the growth having sprung up again at one of the angles of the cicatrix, and reached the size of a small orange. It may easily be imagined in what state must be the mammary region of this patient on the side affected. It presents, in fact, an extensive radiated cicatrix, firmly adhering to the ribs beneath, almost all the soft parts being seemingly removed, and none but a thin scar tissue being left, which presents the usual puckering and colour of new texture.

After the tumour had been removed, Mr. Hawkins stated that he considered this case of much importance, as showing the almost unlimited power of reproduction which these cystic tumours exhibit. There was no evidence of malignancy in the different growths which had been removed, and he saw no chance of prolonging life but by removing the tumours as they reappeared. A time would, nevertheless, come when it would be impossible to have again recourse to surgical procedure.

We sincerely hope that the disease will, as it is commonly called, wear itself out, though it must be confessed that what has already occurred is not encouraging for the future; the most satisfactory feature being, at the same time, that the general health does not suffer.

Mr. Hawkins mentioned, after this eighth operation, that the tumours had mainly consisted of imperfectly arranged cysts found in the ducts. Of course the structure must have been considerably modified by the frequent recurrences; still it would appear that the general outline is each time reproduced. The peculiar tendency of recurrence in this kind of mammary tumours is not, as far as we could find, clearly alluded to in some of the late works on the subject.

## LONDON HOSPITAL.

### FATTY TUMOUR OF THE THIGH: LOCAL ANÆSTHESIA BY MEANS OF DR. JAMES ARNOTT'S FREEZING MIXTURE: REMOVAL OF THE TUMOUR.

(Performed by Mr. CRITCHETT.)

THE fatal consequences which have, in several instances, followed the inhalations of chloroform, make it very desirable that means should be found to produce local anæsthesia; it is, therefore, very natural that efforts should be made to find an agent capable of rendering the soft parts insensible to cutting instruments. Dr. Hardy, of Dublin, has succeeded in benumbing the cervix uteri in cancer, by means of an ingenious apparatus, with which chloroform or ether may be doused against the affected organ, and deaden its sensibility. This favourable result was hailed with enthusiasm in Paris, and the problem of local anæsthesia was thought to be solved. Numerous experiments were made in hospitals, very clever improvements upon Dr. Hardy's apparatus were introduced, (especially for obtaining instantaneous evaporation,) and, after a short exultation, the legitimate hopes were not realized.

It would thus appear that, as far as we have gone, local anæsthesia is not to be obtained to a satisfactory degree, except by congelation. Under these circumstances, we naturally turn to Dr. James Arnott, the persevering advocate of the ice and salt mixture; and the question arises whether, by freezing the integuments and subcutaneous cellular tissue, we can save patients the pain accompanying surgical operations, without exposing them to the risk of an overdose of chloroform.

This question, we are inclined to think, may be readily answered by those who have seen a few operations performed upon congelated parts; and it amounts to this: that all surgical procedures in which the knife reaches no further than the skin and cellular tissue, may be undertaken without giving the patient any pain; but that the freezing mixture can do no more. Hence it is clear that Dr. Arnott's plan is extremely valuable in some cases, especially abscesses, and gatherings of all kinds where the escape of the accumulated fluid is desirable, as in dropsy, &c.

We suspect that, in private practice, the freezing mixture will be largely used when surgeons have become familiar with the necessary manipulations, and chloroform need in fact be employed but when the knife is expected to enter the muscular and other tissues.

Mr. Critchett's patient is a man about forty years of age, who presented on the upper part of the left thigh a fatty tumour about the size of two fists. A mixture of ice and salt, pounded together in a linen bag, was placed on the tumour, on the 22nd of September, and in about two minutes the skin covering the swelling was quite white and hard, no expression of uneasiness having escaped the patient.

The usual longitudinal incision was now made, the part being quite insensible and tough, this circumstance rendering the dissection somewhat laborious. When, however, the knife was made to sweep between the inner aspect of the cellular tissue and the fatty mass, severe pain was experienced by the patient, and this continued more or less until the adipose accumulation had been quite removed.

This case, and some others of the same kind, seem to set the matter at rest, and to prove that congelation, though very successful in some instances, cannot be thought of when the operation goes deeper than the skin.

## Reviews and Notices of Books.

*The Science and Art of Surgery.* By JOHN ERICHSEN, Professor of Surgery in University College, and Surgeon to University College Hospital. 8vo, pp. 951. 1853. London: Walton and Maberly.

THE activity of the medical mind and of the medical press at the present day is so great that one might be disposed, at first thought, to believe a desideratum in our literature a thing not readily to be discovered; or, at all events, that amidst the "new books" and "announcements of forthcoming works" with which the journals teem, and which now render the initial and concluding pages of a popular one so important a portion of its sheets, no very serious void in the supply of our actual literary necessities could be found. Nevertheless, it is a fact that such an one has been felt for some time past, and that to an inconvenient extent.

A little consideration, and above all an examination of the literature of the day, will serve to show that the rapid progress of surgical science which has characterized the present century has, in a great measure, been developed through the agency of numerous labourers, each bestowing undivided attention upon some particular branch, the result of which has been the production of many valuable monographs, so that a well-stocked library can scarcely fail to furnish a respectable author and a goodly octavo upon any of the numerous subjects which demand the consideration of the surgeon. Meantime, it must be confessed that the wants of those who, after all, form the great bulk of readers—viz., those who either have not the means of possessing a library, or have not the leisure to consult one, or who, as students, are necessarily bewildered and uninformed from its very amplitude and extent—have not of late years been at all adequately provided for. Fifteen or twenty years ago, thanks to the untiring industry of the never-to-be-forgotten Samuel Cooper, such an allegation could not have been made. The students of that day possessed, indeed, a very bible of Surgery in his "first lines," and a rich commentary in his "Dictionary;" but in the onward march of improvement, the old and favourite author of our pupillage has been, by the laws of human progress, left behind. Up to the present time that book has never been replaced on our shelves. We have volumes enriched with the practical experiences of their writers, and we have manuals, but we have not one that does, or that is intended to, supply an extended view of the subjects of which it treats.

It is, then, with great pleasure that we receive "The Science and Art of Surgery" from the pen of Mr. Erichsen, Professor of Surgery in University College; because we are bound to say, after a careful examination of its comprehensive pages, that this gentleman, occupying as he does the chair once filled by Cooper and Liston, has most worthily supplied the want alluded to in the foregoing remarks.

Our limits necessarily confine us to a very brief sketch of the nature and scope of the work. We learn from the Preface that it is designed to form a text-book to Mr. Erichsen's systematic course of Surgical Lectures, omitting those relating to Ophthalmic and Cutaneous Diseases. It is divided into three parts—viz., the First Principles of Surgery, Surgical Injuries, and Surgical Diseases; forming altogether sixty chapters, and occupying nearly 1000 pages of very close letter-press.

Under the first head, the author enters fully into the subject of Increased Vascular Action, its Pathology and Treatment, embracing all that has resulted from the most recent investigations on this important subject. Three chapters, replete with valuable matter in relation to Operations, but chiefly to Amputations, follow, in which are reviewed the general considerations, the directions for the performance of each, and their statistical and other results; and here we at once recognise the teachings of experience.

The second division treats, in seventeen chapters, of Wounds and Injuries of all kinds: first, of their general or constitutional effects; and secondly, as they affect special tissues, organs, and localities of the body. Those which relate to the vascular and osseous systems we feel especially called upon to notice. The chapters on Wounds of Veins and Arteries, including some original observations by the author on the admission of air into veins, open the extensive and important subject of Vascular Pathology, which is pursued at considerable length through six chapters in the third division; on the Diseases of Vessels, embracing the history of Aneurism and a consideration of its several forms—a portion of the work which exhibits marks of great research and extended observation.

In like manner, the Injuries and Diseases of Bone have evidently occupied a large share of the author's attention. He advocates most uncompromisingly M. Seutin's starch bandage in the treatment of fractures, and respecting it states as follows:—

"During the last year I have followed Seutin's plan in a great number, at least in fifty or sixty cases, of fractures of all kinds, putting the limb up in the starch apparatus *immediately* on the occurrence of the injury, and have found the practice an extremely successful one, even in fractures of the thigh; so much so that at the hospital I now rarely use any other plan of treatment." (p. 173.)

The practical application of the bandage, both in cases of simple and compound fracture, is fully detailed and illustrated. Having ourselves witnessed the excellent results which follow the proper application of this mode of treatment, both here and in Paris, we are gratified by its introduction into the practice of British surgery.

Passing over a variety of topics, we are not surprised, from our author's well-known connexion with this subject, to meet with a section devoted to the treatment of Asphyxia, full of excellent practical hints, a subject which perhaps generally receives from surgical writers less attention than its importance demands, considering the frequency with which emergencies of this order arise, and the incalculable value of prompt and efficient treatment. A remark by Mr. Wakley, whose experience in such cases is extensive, has been introduced in reference to the infantile form, occurring in what is called "overlying by the mother," (p. 289.) We recommend a careful perusal of these pages to every practitioner.

In the third division, relating to Surgical Diseases, the subject of Hernia is treated with great perspicuity, and at full length. The same may be said of Syphilis, of Calculus Vesicae, and of the Diseases of the Genito-Urinary Organs generally, both in the male and female. Under the head of Urethral Stricture, it may be observed that Mr. Syme's operation of external division is advocated in certain cases of the worst kind. Mr. Erichsen's experience also in rhino and cheilo-plastic operations, lends additional value to his remarks thereon, and to the description given of his practice, from which we have ourselves witnessed some admirable results.

In this very brief notice of Mr. Erichsen's book, it has been only possible to call attention to some of those parts which appear to us to deserve especial commendation. Regarded as a whole, we recommend it as the best compendium of Surgery in our language. The clear and easy style of composition, and the excellent illustrations, in number more than 260, independently of its other merits, will tend to make the work a favourite both with students and practitioners. Rarely is it our province to speak in such unqualified terms of praise; and rarely indeed is it our lot to meet with an author who, to the possession of a large and sound practical experience, adds a thorough acquaintance with the domains of modern Pathology, and a comprehensive intimacy not only with the British, but also with the foreign literature of our profession.

## THE TREATMENT OF CLUB FEET.

[LETTER FROM MR. SOLLY.]

To the Editor of THE LANCET.

SIR,—I think Mr. Lonsdale would have shown more judgment if he had waited until he had the opportunity of reading the details of the case, the treatment of which he presumes to criticise.

The tone and language of his letter will be appreciated by all who read it.

The surgical profession is not prepared to give up the practice of orthopaedic surgery to the surgeons of the Orthopaedic Hospital, and an attempt to monopolize it would be a sorry return for the liberal support which that hospital has received from the London surgeons.

I intend, as I stated in my introductory address, to publish the details of the case, and the profession will then be enabled to judge for themselves, whether the operation to which I alluded was inadvisable. Mr. William Adams was accidentally present at the operation, but was not consulted regarding it. I remain, yours faithfully,

October, 1854.

SAMUEL SOLLY, F.R.S.

## THE LANCET.

LONDON: SATURDAY, OCTOBER 21, 1854.

THE uninformed opinion of the public upon all matters relating to State-Medicine, and the imperfect convictions of those legislative bodies which are presumed—and, in this instance, perhaps rightly presumed—to represent the feelings of the nation, have imposed upon the President of the Board of Health a course of action, or rather of inaction, not less absurd than pernicious. If we were to imagine the country to be invaded by a foreign army; that we had supinely suffered the enemy to land in our sea-ports before taking any measures to prevent or oppose his disembarkation; that we had then, with the enemy on our soil, slowly and frugally organized an inadequate force to wage petty and ineffectual battle against him when he had taken possession of every town and district of the empire; that we had, with the stupidity of terror, or the recklessness of indifference, watched the gradual decimation of the people, and the ruin of our commerce; that we had suddenly ceased every effort, and abandoned all operations against the enemy the moment he gave evidence of retreat; that even before the country was freed from his presence, whilst he was still, like the Parthian bowman, dealing destruction and conquering even in his flight; that we, having by our ignominious pusillanimity, invited his speedy return, had disbanded our army, neglected the most obvious measures for future safety, and given ourselves up to a shameful and illusory security—if we imagine all this, we should have present to our minds a faithful counterpart of our conduct in dealing with the pestilence now oppressing the land.

Last year the Cholera appeared in the ill-fated town of Newcastle. It raged with unexampled violence. The warning was ominous enough: it could scarcely be unheeded. But it had to be repeated before we could be goaded into defensive measures. The pestilence had slowly gained a footing in the Metropolis, and week by week the number of its victims was augmenting, before Parliament was moved. At length the Board of Health was remodelled. Sir BENJAMIN HALL was put at the head of our sanitary department; but, by an unaccountable perversity, the means of action were denied him. He was a minister without power; a general without an army and without money. He was at liberty to do all that science could suggest; all that his known public zeal and administrative ability should prompt him to attempt; but—laws that were sure to neutralize his efforts were suffered to remain; Boards of Guardians, animated by petty local interests, and views circumscribed by parish boundary-lines, were allowed to control or to reject every measure that the President, having in view the safety of the public at large, might recommend; and his active operations were speedily brought to a stand by the exhaustion of his scanty pecuniary allowance. The Cholera has been treated much on the same principle as we treat a case of pneumonia or a fractured limb. A man is exposed to cold, or meets with an accident: the physician or the surgeon is called in to cure the resulting inflammation of the lungs or the broken leg; and he takes his leave when the cure is effected. No prophylactic measures that he can recommend will guarantee

his patient against another attack of inflammation, or another broken leg. In either case he has had to deal with an isolated malady, the whole consequences of which begin and end with the individual affected. The pneumonia will not spread to the patient's neighbours; broken legs are not epidemic. The duty of the medical practitioner is at an end. The Cholera, we have said, has been dealt with in a similar spirit. No steps, generally speaking, were taken to prevent the attack or the spread of the pestilence. We have waited until we were struck. We have then, as the penalty of our supineness, been compelled to contend against the malady in detail; we have had to encounter individual cases one by one; our skill and our energies have been exhausted in efforts to cure that which might have been prevented; and, as the climax of folly, we have concluded that particular cases of Cholera being cured or dead, we could do no more. We have even retreated whilst the enemy was still in possession of the field.

Notwithstanding the lessons that have been incessantly taught us, by the Reports of the Registrar-General; notwithstanding that those lessons have been repeatedly confirmed, and proved with all the certainty of mathematical demonstration, we are still deaf to the conclusions of science, and the voice of experience. Throughout a period of sixteen years this country has enjoyed a superiority in the accumulation of those facts upon which the Law of Life is based. Down to the present day the invaluable knowledge we possess has borne no fruit. In vain has Dr. FARR, week by week, and year by year, produced every variety of proof that zymotic, or epidemic and preventible diseases, annually carry off greater numbers of our fellow-citizens, to a greater extent impair the productive force of the country, and add more to our local and general taxation, than do sporadic, or accidental and individual diseases. Neither the public nor the Legislature have yet comprehended the GREAT TRUTH, that epidemic diseases are to be encountered, not in detail, not case by case, but in the aggregate. Epidemics are to be prevented. Prevention consists in timely action. That action only is timely or wise which is exerted steadily and continuously. At present we submissively bow before the Cholera—we fall as passive victims under its periodical ravages as our forefathers did under the annual raids of the Danes. The pestilence declines, and we consecrate our stupidity, and our object cowardice, by thanking Heaven for having withdrawn from us that scourge which a better-interpreted Theology would teach us was intended to arouse mankind to the nobleness of self-exertion and the active duty of self-amelioration.

This is the time, not for premature congratulations that the present epidemic is retreating, but for organising the means of preventing another attack. All who have attained a conviction of the power of scientific sanitary medicine, should bestir themselves now. We have already, in the present generation, witnessed three epidemics of Asiatic Cholera. The last epidemic was divested, by familiarity, of some portion of its terrors. The next will probably be witnessed with still less dread. When there is no fear of instant danger, the public will with difficulty be roused to the exertion necessary for self-preservation. Typhus fever, malignant scarlatina, puerperal fever, and other scarcely less fatal zymotic diseases are endemic amongst us: they annually consume hecatombs of victims; we are accustomed to their perennial presence; they would never rouse us to sanitary exertion. It is not too much to say that, but

for the terror inspired by the Cholera, a Board of Health would never have been thought of. Let us at least have the wisdom to deduce profit from our calamities. Let us consolidate our sanitary forces before the Cholera shall have ceased to be an object of dread. Let the public be well impressed with this—that the Asiatic Cholera will return again and again; that the periods of its recurrence will, in all probability, be closer and closer; that it may come before many years to be a permanent guest amongst us; that it will take rank with typhus and scarlatina, become naturalized in the West, and claim the name of ENGLISH by right of conquest.

Such is the danger in full prospect before us. Can it be averted? In all reasonable human calculation, it can. Let not the ignorant sneer, or the timid despond. Observation, guided by science, has discovered, if not the essential cause of Cholera, enough concerning the laws and conditions of its development and propagation to furnish principles of action that cannot fail, if properly applied, to reduce its ravages within comparatively inconsiderable limits. Let those who are disposed to question the utility of human exertions consider the immunity of Birmingham, and contrast that with the fatality that has marked the progress of the disease in other towns. The local advantages which have secured the salubrity of Birmingham in the midst of other communities which have been desolated, are known. In that town, we are informed, there is no stagnation of sewerage in the soil; the inhabitants enjoy an abundance of pure water. Some of their advantages they undoubtedly owe to their favourable geographical position; but many of them may be obtained more or less completely for communities planted in the most unfavourable situations. What one advantage alone—pure water—will do to keep off disease may be seen from the history of the epidemic on the southern shore of the Thames. The inhabitants of that district, it is well known, have suffered more severely than those of any other part of the metropolis. But the acute observation of the Registrar-General has detected differences in the mortality of different portions of that district. In all respects but one the conditions are precisely similar. Soil, elevation, drainage, crowded dwellings, air, present the same unfavourable characters in all. In the water-supply alone there is an essential disparity. In this district, the Southwark Company distributes the sewage-water taken out of the Thames at Battersea; the Lambeth Company supplies a comparatively pure water from a less contaminated part of the river. The influence of the pure and foul water is accurately traced almost from house to house by the mortality of cholera. The total number of houses supplied by the Southwark Company is stated to be 40,046; by the Lambeth Company to be 26,107. What has been ascertained by diligent inquiry is this: in six weeks there were fifty-seven deaths in every thousand houses supplied by impure water, and eleven deaths in the same number of houses supplied by the comparatively pure water. Evidence of this kind places beyond a doubt the value of sanitary inspection.

There is one aspect of Cholera which should ever be diligently insisted upon. It is not only to be resisted on its own account, but also because in expelling Cholera we are taking the surest steps to diminish the mortality from all cognate epidemics, and to improve the general healthiness of the country. The presence of Cholera in a locality is a test of the degree of its salubrity. It is a sanitary barometer that

speaks indeed fearfully, but truthfully. It indicates with unerring certainty the favourite abodes of typhus, scarlatina, and all those zymotic diseases and health-depressing agencies which swell the death-returns, and diminish the sum of health amongst the living.

The voice of the medical profession must, on a question affecting the public health, speak with irresistible force. The medical practitioners of the country must, of necessity, be the chief instruments in any well-adjusted scheme of sanitary government. They have long been convinced, by painful experience, of the hopelessness of effecting any real good by maintaining the present absurd system by which the Guardians of the Poor are suffered to be also the conservators of the public health. Let them lend the weight of their support to the cause of Sanitary Reform; let them strive for the consolidation of an efficient Sanitary Department in the State, under which they may assume the position that is their due. There is now presented to them a splendid opportunity of emancipating themselves from a degrading thralldom, and of rendering the most signal service to their country.

It has become painfully evident that the medical arrangements for the army of the East have been most inadequate, both as regards the provision against cholera and epidemic disease, and the attendance upon the wounded in battle. We quite agree with Mr. GUTHRIE, (whose letters we publish at p. 343,) that the care of the sick and wounded of our fleets and armies ought not, in any degree, to be left to the spontaneous philanthropy of the public. These things should be matters of foresight and previous arrangement, or our sick must suffer from graver horrors than even those necessarily incident to war and slaughter. If our troops went out really to fight, nothing has occurred at Alma, or elsewhere, that might not have been anticipated; and when the troops left their native shores, it was well known that a pestilence impended over Europe, and would probably visit our sailors and soldiers. Under these circumstances a grave responsibility rests somewhere for the inefficient arrangements which were made to meet such emergencies. We are sure it has not rested with the medical officers of the Army and Navy engaged in the East. It is sufficiently notorious that the conduct of the Admiralty officials, for some years past, has deterred medical men from entering the Navy; and the ridiculous regulations of the Army Medical Service have rendered it impossible to send out the full complement of medical officers with the troops engaged in the East. Our men have died in numbers of their wounds on the field of battle, or crowded, without attendance, in transport ships and hospitals, because, forsooth, a sufficient number of qualified medical men could not be found who had attended the requisite number of lectures on insanity, logic, or midwifery! We consider that a Commission of Inquiry ought to be issued forthwith, to ascertain with whom rests the real responsibility of the grave mistakes which have been committed. Everything promises another Walcheren, with additional horrors. The medical staff of our fleets and armies have to fight our sailors against disease, and the other casualties of war, which cost more men than bullets and bayonets; but the medical officers are thought almost as little of by generals and officials as the drummers and fifers. It must have struck every one with surprise that, in the despatches of Lord RAGLAN, not one word could be found of

pity for the dead or wounded, and not one word of praise for the medical men, who must have slaved night and day in their vocation immediately after the battle of the Alma. If this be not a culpable forgetfulness, it is a gross inhumanity. Surely it would inspirit military surgeons and medical men, to receive their meed of praise with the rest of the Army; and it would be some consolation to the friends of those who have fallen in battle to know that they received, as no doubt they did, the devoted attention and skill of the limited number of surgeons which our country has placed at the service of its heroic soldiers and sailors.

In the first instance, our men were sent to the swamps of the Danube to die by thousands of cholera and fever, in defiance of all medical knowledge and experience. Military men said this was to inure the men to the dangers and diseases of the climate, as though exposure to disease were really a meritorious matter! When they went into action, so little surgical provision had been made, that the wounded had to be sent from the Crimea to Constantinople for treatment, many falling a sacrifice on the passage, and afterwards there is a cry of sending to England for lint and old linen to dress the wounds made some two thousand miles off. It appears that the whole of the medical regulations of our fleets and armies should come under revision. At present they are most imperfect, and tend to a large and unnecessary sacrifice of life amongst our troops. Surgeons, assistants, and nurses are not forthcoming when they are wanted. Sick individual officers are allowed to monopolize the services of the best surgeons, and the sooner an inquiry is made into the matter the better. If this should be delayed till after the meeting of Parliament, Government may depend upon it that loud censures will be uttered by the public voice.

It may be quite true—and we have no wish to call in question the zeal or the foresight of Dr. ANDREW SMITH—that all necessary surgical and medical appliances have been sent in abundance, or even in superfluity, to the East. But were they in readiness at the right time and at the right place? It may be quite true that there is *in the army* one medical officer to every 100 men. But will it be maintained that surgeons were present in that proportion on the field of battle at Alma, or that a sufficient medical staff was ready to take charge of the sick and wounded after that murderous engagement? Was there sufficient hospital accommodation at hand? Has it been found that four or more hospital ships, fully equipped for the reception of the wounded, were waiting off the scene of action, ready to carry them off without delay to some more fitting asylum? We shall be glad to hear that these questions can be satisfactorily answered; but we greatly fear that, however brilliant the courage and glorious the achievements of our soldiers, it will have to be recorded as a reproach against the administrative authorities and the leaders of the expedition, that inadequate provision had been made for the care of the sick and wounded. Not only this, but the history of the present campaign will also show that our government and our generals have scarcely advanced a step beyond those Homeric chiefs who, some thousands of years ago, fought on nearly the same ground, in their practical estimation of the paramount necessity of preserving the health of the troops, although obviously one of the first objects to be provided for in the conduct of a war.

We again insist upon what we urged at the commencement

of the campaign, that Medicine, in its higher sanitary applications, has hitherto found no encouragement in the public services. The subject is one of immense and obvious importance. The general question as to the mode of securing for our armies and fleets all the aid that the resources of Medicine and Surgery can give, as well as the particular shortcomings in the medical department during the present war, must form the subject of a searching inquiry.

## Medical Societies.

### MEDICAL SOCIETY OF LONDON.

MR. HEADLAND, PRESIDENT.

SATURDAY, OCTOBER 14TH, 1854.

THE first meeting of the Society for the session was held on Saturday last. The room was crowded. On taking the chair, the President alluded to the alterations which had been made, and eulogised the committee on the pains and labours they had taken to improve the premises, and add to the comfort of the fellows. The room had been lowered considerably, and a complete system of ventilation, on Dr. Chowne's plan, carried out.

A paper was read by the PRESIDENT, entitled  
SOME REMARKS UPON THE NATURE OF THE DISEASE CALLED CHOLERA.

He commenced by stating that it had at first been his intention to write a paper upon "Certain Forms of Hypochondriasis," but the subsequent occurrence of the terrible epidemic of cholera had diverted his thoughts from that channel, and suggested the propriety of offering to the fellows, at the commencement of the session, some few remarks upon a subject which must for some time past have more or less occupied every mind. And he did this, not so much as wishing to lay stress upon any opinions which he might himself entertain, but rather with the hope of eliciting some of the opinions and experience of others upon so important a subject. The facts to be dealt with, so far as the history and prominent characters of this disorder are concerned, were succinctly enumerated. Its first appearance in India about half a century ago; its terrible destructiveness, and the consternation produced throughout the East by its uncontrollable outbreaks—matters which were at length summed up in the Government Reports upon Cholera; the appearance of the disease at Sunderland in November, 1831, and its rapid spread through England in the year 1832; the second epidemic in 1849, and the third in 1854, in all of which medical men had been taken at a disadvantage, because unresolved and at variance as to the real nature of the malady, and the proper mode, if any were feasible, of meeting so destructive a disease. The probable causes of this indecision were next inquired into. Is not much of it to be attributed to the unfortunate name which has been selected for it,—a name which does not remind us of its essential characters, and which had been previously used to denote another disease long known in England, and chiefly characterized by aggravated vomiting and purging? Though these symptoms also strongly attract our notice in Asiatic cholera, they are not perhaps so worthy of remark as the very peculiar signs of the cholera-collapse, the coldness and blueness of the skin, the pulselessness, and arrest of the secretions of the liver and kidneys. One very prominent and yet very natural result of the attention which has been paid to the evacuations, as if they alone were the cause of death, is, that of the immense number of remedies proposed and actually used in Asiatic cholera, including a large proportion of the available *materia medica*, the great majority have been aimed chiefly at the arrest or control of the vomiting and purging. It has apparently been supposed also, that cases of ordinary diarrhoea, if neglected, would be apt to degenerate into real cholera. Here the President expressed a decided opinion that such a consequence was comparatively a rare result; in fact, that diarrhoea could no more produce cholera than any other agent which lowered the system, and so far rendered it more liable to the inroads of an epidemic poison. Diarrhoea would be just as likely to terminate in scarlet fever or small-pox, if the poisons of those disorders were abroad. No hope could be

entertained of discovering, by chemistry or otherwise, the exact nature of the influence which produces cholera, any more than that which operates in any of the other terrible disorders which afflict mankind. But though we must despair of detecting its essence, an idea as to the working of this poison might perhaps be ventured. In its epidemic nature and in the general character of its symptoms, cholera is evidently a blood disease. A serious impression of some sort is made upon this fluid. The suddenness of the attack, its frequent rapidity of progress, and the speedy development in many cases of fatal symptoms, seem all to point to the more vital part of the blood as being impressed in the first instance—i. e., the blood corpuscles, and not the liquor sanguinis. And there are some other indications of this which would seem to come nearer to the nature of proof. It has been justly observed that the coldness and blueness of the state of collapse are amongst the most characteristic of the symptoms of cholera. The process is impaired by which the animal heat is maintained. This function is generally admitted amongst physiologists to reside in the blood corpuscles. The collapse symptoms may occur before the blood has been thickened by the copious discharge from the bowels. It has been even observed by Heller, a German microscopist, that the red corpuscles at this period appear "hacked and mutilated," as if physically injured. The lacteal and lymphatic glands, organs engaged mainly in the manufacture of the corpuscles of the blood, are found, after death from cholera, to be softened and disorganized. Add to which that Virchow and others have discovered in the right side of the heart large whitish coagula entangling multitudes of white corpuscles, from which it would seem as if these had been somehow prevented from undergoing their normal development into the red cells. The blood-corpuscles being thus injured or arrested in their development, not only are the functions which are essential to life fundamentally and fatally disturbed, but the plasma apparently becomes itself affected in the second place. Now the corpuscles, being solid, cannot be ejected from the system, but the plasma is capable of excretion. Next, then, it is passed out by the mucous membrane of the bowels, as if it were a foreign material, constituting the characteristic colourless or "rice-water" discharges, which contain serum and salts, with mucous and fibrinous coagula. This theory is offered as apparently explaining the phenomena of this disease, which no other notion appears to do satisfactorily. The idea of a morbid poison to be eliminated seems hardly sufficient—the discharges, in their non-feculent character, being so much unlike those of any instance of diarrhoea observed in other diseases. The fact, that the ingeniously devised injections of saline fluids into the veins in the latter stage of cholera have never succeeded in reviving the patient for more than a brief period, seems to indicate that the thickening of the blood is not to be considered as the sole cause of death, which is probably rather to be attributed to the extensive devitalization of that fluid. The fatality of an attack of cholera no doubt depends less upon the means which are adopted in the treatment, none of which have been found to control it effectually, than upon the previous condition of the patient himself, rendering him more or less obnoxious to the full effect of the poison. Some have their blood in that peculiar condition which is most likely to be influenced by this. Those who are most impressible are attacked the first, and die the fastest. Afterwards those sicken who are liable in the next degree, none of whom recover. Again, towards the end, those who are least liable, who will escape most easily of all. The epidemic, having then few or none left whose systems it can invade, takes its departure for a season, only to return again when the way is once more prepared for it. By this means we can explain what is always observed, but is at first sight difficult to understand: the terrible mortality of the first outbreak; and the lessening severity of the disease, as though it had become amenable to remedies, remarked at the close. It has been stated on good authority that the absolute rate of mortality is not increased by the epidemic of cholera; but that on taking the average of five years, two before and two after the outbreak of this disease, the real number of deaths is about the same as usual; from which it would seem as though those who are stricken with cholera would, at no long distance of time, have perished of other blood diseases had the opportunity been left to them. This notion of blood liability seems far preferable to the idea of its being a contagious disease. Were the latter the case, it would seem strange that the disease should not spread more regularly, and remain longer at a place, instead of departing so suddenly as it does. (Several facts were here adduced as bearing decidedly against the doctrine of contagion.) The occurrence of the disorder in each case is probably to be

accounted for by two distinct things—an epidemic influence, and a pre-existing wrong in the blood of the person attacked. An atmospheric change co-operates with a systemic wrong; we need not define either, but we must admit their agency. Neither of these causes will suffice by itself. Thus a bar of soft iron will not attract a bar of steel; but if we pass a galvanic wire round the former, converting it into a temporary magnet, it will acquire a power which it had not before. The iron and the electricity together will co-operate in effecting what either alone would be powerless to do. We may learn from this conclusion that the cause of the disease is in great part a pre-existing wrong, as well as from the fatal nature of the malady when it has once fully developed itself,—how important it is to take preventive measures in anticipation of the outbreak. These measures should no doubt mainly consist in all those means which may ameliorate the condition of the poor, or which may serve to counteract those noxious and baneful influences which render the lower and more densely-populated quarters of our large towns the very hot-beds of all epidemic diseases. For this disorder is not one which is equally distributed to all classes. It is shown by the returns of the cholera deaths in 1849, that by far the largest proportion of deaths occurred amongst the labouring classes, and more of the tradesmen died than of the gentry. We may, then, well display our zeal, and evince our real interest in the welfare of our fellow-creatures, by labouring earnestly in the removal of those depressing causes which tend so fatally to shorten their lives and to thin their numbers. In remarking, in conclusion, upon the prolific subject of treatment, the President insisted strongly upon the erroneous character of the notion, so commonly entertained, of the connexion between cholera and ordinary diarrhoea. As an illustration of the strongly-marked nature of the symptoms of the former disease, he narrated the history of the first case which happened to him in the present epidemic, the character of which was such as to defy all treatment. He concluded by expressing a hope that we might, by judicious sanitary measures, be enabled to render the re-occurrence of this terrible malady more unlikely than it seems at present to be.

Dr. CRISP, although agreeing with the author of the paper on some points, differed from him in the main question, concerning the disintegration and destruction of the blood-corpuscles. He moreover thought, that the statistics adduced respecting the influence of rank and occupation did not warrant the inference drawn from them; for when the relative numbers were considered, it would be found that the proportion of cases amongst the mechanics was not greater than amongst the gentry and tradesmen. The assumption, too, that the human constitution was degenerating was disproved by the fact, that the general longevity was never so great as at the present time. Mr. Headland supposed that the white corpuscles of the blood were converted into the red, and that the blood-corpuscles were formed in the lymphatic glands. Dr. Crisp believed that at present no sufficient proof could be given of this. A few weeks since he had injected some saline fluid into the veins of a patient suffering from cholera in its worst form. He examined the blood which flowed from the vein under the microscope, before it was dry, and with the exception of a greater number of red corpuscles, and their more intimate aggregation on some parts of the glass, no important difference was perceptible between this and the blood of a healthy man. Some of the dried corpuscles were now visible, and probably would be so a hundred years hence. In the examination of the blood of a great number of the lower animals he had found, in many instances, more examples of disintegration than in cholera-blood. As regarded the preliminary diarrhoea, he (Dr. Crisp) thought that it would be as rational to say, "that *scarlatina simplex* was not *scarlatina*," as to assume that this diarrhoea was not "*choleraic*," probably half the members present had had cholera in a modified form, as shown by cramps, aching of the legs, and by diarrhoea of a peculiar kind. One fact he thought was indisputable—viz., that thousands of cases of cholera had been cured in the early stage, and what, he would ask, became of the poison, or supposed poison? Chalk, opium, astringents, and calomel, had no specific power over it; but, yet, if you lock it up in the system, the patient is generally cured. He (Dr. Crisp) thought that in the later stages of the disease we had made no progress in the treatment, nor had our knowledge advanced respecting the cause of cholera.

Dr. WINN remarked, that in India the disease usually travelled in straight lines, frequently affecting only one locality, and passing in some instances through the centre of an army.

A MEMBER considered that there must be a predisposition in an affected person to contract cholera, combined with a specific condition of the atmosphere. The disease occasionally affected one side of the street, or one block of houses, but usually chose

the most crowded, and the worst ventilated and lighted neighbourhoods, and persons dissipated in habit. He eulogised the employment of the nitrate of silver in this complaint, which not only acted as an astringent on the mucous membrane of the bowels, but had a beneficial influence on the nervous system.

Mr. HUNT regarded diarrhoea and cholera as essentially different, and remarked that cholera might be wholly without premonitory symptoms. Sixty such cases had come under his notice.

Dr. RISDON BENNETT would not enter into the theory which had been advanced by the author of the paper, which was not new, and did not appear to be supported by facts: these appeared indeed to be against the assumption of any disintegration of the blood in cholera. If it were a poison, in his opinion it operated as a shock upon the nervous system, the influence being exerted on the great sympathetic, the solar plexus chiefly being affected. Two or three facts which had come under his notice during the present epidemic, seemed to show that the disease did not depend on the presence of a poison in the blood, which was attempted to be, or was, carried off by purgation. In St. Thomas's Hospital two patients, one affected with typhoid fever, the other with acute rheumatism, were seized with cholera, from the collapse of which they recovered, and after the reaction consequent upon it, went through their original diseases just as if no cholera had intervened. He thought these cases, with others of a similar kind which he had seen, were opposed to the opinion, that cholera was a blood disease, the poison of which was carried off by purgation; if it were so, the poison of the fever and the rheumatism would also have been eliminated in the same manner.

Mr. DENDY believed that the blood was much altered in cases of cholera, as he had found, after bleeding cholera patients in 1832, as ordered by the then Board of Health, great difficulty in washing away the fluid from his hand. Diarrhoea might, or might not exist as a premonitory symptom. By reducing the system, it might be a predisposing cause of cholera, such a cause, as also an exciting one, being necessary in all cases. With respect to treatment, castor oil only reduced the patient lower. The treatment should be directed to the arrest of the flux, the binding up of the exhalents, and stimulation of the absorbents. He reprobated the system of medical practitioners communicating their opinions to the political journals, the medical periodicals being their legitimate means of communication with the profession.

Dr. SNOW considered that the cholera poison acted upon the alimentary canal, and not on the blood or nervous system. In every case which he had seen, the evacuations had been sufficient to account for the collapse, without reference to any other cause. There was no poison in the blood in a case of cholera; in the consecutive fever, as it was called, the blood became poisoned from urea getting into the circulation in consequence of the kidneys not acting, but not from any poison having been present from the beginning. There was nothing in the atmosphere to account for the spread of cholera, which he believed was spread from person to person; and that in all cases it could be traced in this manner. If atmospheric, why did it attack one or two persons only in a locality, and these having direct communication with each other? Such cases he had seen at Sydenham, where there had been only two instances of the disease. The first case in the outbreak of 1849 had occurred to a sailor in Bermondsey; the second affected person was the successor to the sailor in the room in which he died. He thought he had collected evidence enough to show that in all cases cholera was propagated by swallowing some portion of the evacuations of an affected person. These, as was well known, flowed into the bed, &c., and persons attending on the sick might easily take the poison unawares. With respect to the class of persons affected by the disease, he believed that the very poor and vagabonds suffered less, in proportion, than decent, respectable persons. He regarded the cholera and diarrhoea, as lately prevalent, to be the same disease in different degrees of intensity. We observed the same difference in scarlatina and other diseases.

Dr. RICHARDSON remarked that, as death in cases of cholera resulted from the loss of fluid from the system, and as it had been found that injections into the veins did no permanent good, he suggested that the peritonæum should be injected with water. He had found, from numerous experiments on animals, that such a proceeding, if care were taken, was not fatal, and he believed it might act beneficially in cholera. He inquired if members had observed cholera to be connected with hysterical symptoms, several such cases having come under his own observation.

Mr. JABEZ HOGG had made some observations on the state

of the atmosphere during the prevalence of cholera, and had found it to abound in small animalculæ—the vibriones—the powers of life in which were so great, it was almost impossible to kill them. If the air examined had been collected over sewers, the animals were found to be larger and more tenacious of life.

On the motion of Dr. LANKESTER, seconded by Mr. C. CLARK, the debate was adjourned.

## Correspondence.

"Audi alteram partem."

### TREATMENT OF CHOLERA BY CASTOR OIL.

To the Editor of THE LANCET.

SIR,—In a little tract published in 1832, entitled "Suggestions submitted to the Medical Practitioners of Edinburgh on the Characters and Treatment of the Malignant Cholera," by John Abercrombie, M.D., the following passage appears: "I have conversed with the intelligent captain of a merchant vessel, who, when the disease broke out in his ship, soon after he sailed from Cronstadt, treated himself, and four or five of his crew who were affected, by large doses of castor oil. He commenced by clearing their stomachs with warm water, then gave his doses of castor oil, generally twice a day, and all his patients recovered. It is right to add," continues Dr. Abercrombie, "that the use of castor-oil, in doses of half an ounce, combined with fifteen or twenty drops of laudanum, is a practice which is said to have been employed in India with very considerable success." And if you will refer to THE LANCET of September 15th, 1832, you will find three letters, addressed to the secretary of the Central Board of Health, on "The Treatment of the Malignant Cholera with Purgatives," by John M'Divitt, Esq., Kegworth, Leicester, in which he solicits the attention of the Board to the propriety of using, in the early stage of the disease, and even after collapse has commenced, the most powerful purgatives, instead of attempting to restrain the bowels by opiates and other astringent medicines. Do not suppose, from my calling your attention to the above circumstances, that I approve of the use of castor oil or any other purgative as a remedy in cholera, for no one can be more decidedly opposed to such treatment than I am. Indeed, on several occasions, both in 1832 and 1848, when cholera prevailed so fearfully in this town, I was called to cases which had immediately followed a dose of purgative medicine.

I am, &c. &c.,

ARCHIBALD BLACKLOCK,  
Late Surgeon R.N.

Dumfries, October, 1854.

### THE PROVINCIAL MEDICAL ASSOCIATION AND DR. CORMACK.

To the Editor of THE LANCET.

SIR,—The enclosed letter I forwarded to the Editor of your contemporary, the *Association Journal*, a fortnight ago. It has not (for obvious (?) reasons) been inserted therein, nor has its receipt been acknowledged in any "Answers to Correspondents." Now this latter is a courtesy which few journals deny to those who address them. It does not, however, seem to accord with Dr. Cormack's notions of editorial propriety, even although he holds his present post by the individual voices of those whom he treats (as it seems to me) so disrespectfully, to yield an individual acknowledgment of that which is transmitted to him for publication.

I venture, therefore, Sir, to solicit from you, as a favour, what I might almost have demanded from your less courteous brother Editor as a right,—the insertion in your next week's impression of the accompanying letter.

I am, &c.,

EDGAR SHEPPARD, M.R.C.S. & L.S.A.

Enfield, October, 1854.

To the Editor of the *Association Journal*.

MY DEAR SIR,—I trust I may be permitted to convey my sincere thanks, through the medium of our *Journal*, to the members of the Provincial Medical and Surgical Association, for the respectful tribute which they so recently paid at Manchester to the services and memory of my late father. It will be as gratifying to his widow, and to the daughter so feelingly alluded to by Mr. Bartrum, to hear, in a far off country, of the

estimation in which he was held by his professional brethren, as it is to his unworthy son to acknowledge their kindness and consideration.

And here I must take leave to observe, that it is with very great regret that I close, by this letter, my connexion with the Association and its *Journal*. But I feel so strongly opposed to the changes which have been effected at Manchester, and I am so confident that they will prove (and deservedly so) a death-blow to that Society, the very name of which some of its oldest members (of whom better things might have been expected) are now ashamed of, that I cannot countenance them by continuing on the roll of its supporters.

That an association founded by a provincial physician, and nurtured in its early struggles by his provincial brethren, should have its provincial character so merged in metropolitanism as its history during the past year has too surely predicated, and, during the last fortnight, clearly demonstrated, is, to my mind, anything but matter for congratulation.

The bitter spirit which has often animated many of its members, as manifested in the pages of the *Journal*; the unseemly and unnecessary differences which have year by year been growing worse at our annual gatherings; the jealousy which obtains here, and the rivalry which exists there—all these things, Sir, have so changed the pristine character of our Association, that its best friends might fail to recognise it. I, for one, do not recognise it, and therefore I had better leave it.

The results which I am now deploring, I foresaw, in a measure, at the Oxford meeting, when so many were led away by the fluency and "ready reckoning" of Dr. Cowan. Has the *Journal*, as a literary or commercial speculation, justified the bombastic predictions of that ardent gentleman? Not in the least. It is not one fraction better than it was when published at Worcester. One of the chief reasons urged by Dr. Cowan for its removal to London was, that the metropolis was the centre of civilization and of news; that intelligence of the most recent date would be at the command of the editor on the day of publication, and so be disseminated far and wide to his provincial brethren.

Now, if there is one thing of all others by which the *Association Journal* has been distinguished since its immigration to London, it is by the absence of that most important element—news. This is, or should be, no mean feature in the conduct of a journal which is intended for circulation amongst hundreds, in remote districts, who rely almost entirely upon it for their medical and general information as to what is weekly being enacted amongst the busy herd. They would rather know something, after their professional fatigues, of the doings of the learned in modern Babylon, than have to wade through heavy papers, unrelieved by ought else but a squabble on that eternal and nauseating subject, Medical Reform, or the abuse of a rival journal and its publisher. I have no hesitation in affirming that either *THE LANCET* or the *Medical Times and Gazette* contain more news and general information in one week than the *Association Journal* contains in four. The instances which I have noted down at various periods (and which I should have detailed to the meeting had I been able to attend at Manchester) of omissions in the way of appointments, deaths, medical and multifarious news, have been numberless, and such as to call for unqualified censure. These things interest the generality of practitioners more than the height of the barometer at two o'clock in the day at Uckfield or Grantham. I do not mean to underrate the importance of meteorological observations; but I think it is unfair that atmospheric pressure should have a weekly page devoted to it, and "pressure" of a more general kind be poked into any hole and corner if there is room for it, or be omitted altogether if there is not.

Well, then, if the *Journal* of our Association be so deficient in much that should characterize it, it is likely to be improved by the thrusting upon its Editor additional and most onerous duties? This experiment of joint Editor and Secretary has been tried before, and failed. Why, then, should it be tried again? Why, too, should the emoluments of the Society be all thrust upon one individual, who only dates his membership from 1847, and who attended an annual gathering for the first time (correct me, and I apologise if I am wrong) in 1850 or 1851? The stone of this edifice, Sir, was laid in 1832. Are there none who first enlisted under Sir Charles Hastings, and fought for this Association through evil report and good report, as capable of editing its *Journal* and conducting its finances as Dr. Cormack? I do not, believe me, Sir, mean anything personally disrespectful to yourself; such is far from my intention. But I really do feel indignant when I see the founder of this Association compelled, by the wanton acts of

so many of its members, to resign the offices which, for more than twenty years, he has held with so much honour. It is to be regretted that he consented to withdraw such resignation, upon the soft flattery of "undiminished confidence."

Nor do I think it right that a gentleman who has been so long attached to the Association as Dr. Williams, of Worcester, and who has so ably carried on the duties of secretary for the last few months, should be pushed aside to make room for Dr. Cormack and his "paid commercial assistant."

These ill-advised measures, which I have dilated on, herald, I most assuredly believe, the disruption of that Society which has germinated from the "little band" which met two-and-twenty years ago in the Board-room of the Worcester Infirmary. Already is she seeking to enlarge her borders, and increase her waning influence by fabulous statements of her numerical strength; and some of her members, forgetful of their first love, are endeavouring to supplant her baptismal name. But the "British Medical and Surgical" will never live as long, nor be so much respected, as the "Provincial Medical and Surgical Association;" and no large and bombastic parade of unpaid members will suffice to bolster up for more than a brief period the *status* of an institution which began with a few firm and steady friends, (all honour to Dr. Conolly, Sir John Forbes, Mr. Soden, and the few staunch remaining ones!) and whose usefulness was felt to be in proportion to its harmony and unanimity.

What of harmony and unanimity now?

I have to apologise for trespassing so largely upon your space; but I did not feel satisfied in taking leave of that to which I, and those very dear to me, have been so long attached, without stating my reasons for so doing; and I am sure that your love of truth and impartiality will insure the insertion of this letter in your columns.

I have the honour, &c.,

Enfield, Sept. 25th, 1854.

EDGAR SHEPPARD.

## HEALTH OF THE PRISONERS IN THE HOUSE OF CORRECTION, WANDSWORTH-COMMON.

THE number of prisoners who have been admitted into the House of Correction, on Wandsworth-common, during the past year, has been—3675 males, and 1495 females; total, 5170: of which number 359 males, and 166 females, were in ill-health, and required medical treatment upon their reception. The general health of the prisoners, whilst confined in prison, has been tolerably good, when it is considered that the majority enter these walls with ruined constitutions, from a life spent either under a succession of imprisonments, or, when at liberty, in drunkenness and debauchery.

By far the most prevalent disorder has been "diarrhoea," 297 having been placed on the sick list with that disease; not one case passed into the choleraic form: the other most prevalent disorders have been venereal, 131; boils and abscesses, 102; itch, 95; slight fever, 58; dyspepsia, 37. Under the head of "more serious cases" appeared epilepsy, 16; consumption, 7; typhus fever, 3; diseased heart, 2. The number placed upon the sick-list during the past year, has been 890 males, and 340 females; total, 1233.

Six children were born in the female's prison.

Under the head of "Deaths," only 3 cases are reported to have occurred during the year, 2 males and 1 female; the two former from consumption: one of them was brought into prison in a dying state. The female died from typhus fever.

Out of five attempts at suicide reported, four were feigned; the fifth was a serious one, from the prisoner having inflicted upon himself a severe wound of the throat by means of a razor. It was almost a miracle his life did not pay a forfeit to his rashness. He has completely recovered.

The sanitary means taken to avert the approach of cholera have been—strict attention paid both to the cleanliness of the prison, as well as to the persons of the prisoners; repeatedly flushing the water-closets and drains; the free use of Sir William Burnett's deodorizing fluid; the constant fumigation with sulphurous acid vapour; the strict daily attention paid both to the wholesomeness as well as to the proper cooking of provisions; and frequent whitewashing.

The surgeon paid willing testimony to the ready assistance he had ever received, both from the governor and matron, in carrying out these sanitary measures. There had not been a single case of cholera amongst the prisoners, although prisoners had been daily received from districts deeply infected with that disease.

October, 1854.

## THE WAR.

## THE WOUNDED AT CONSTANTINOPLE.

THE following important letters from Mr. Guthrie appeared in *The Times* of Monday and Tuesday last.

To the Editor of "*The Times*."

SIR,—I take the liberty of addressing you, under the belief that the benevolence of the public is about to take a wrong direction in providing a supply of what are technically called "medical comforts and surgical materials" to be sent forthwith to the army in the East.

During the latter part of the war in the Peninsula, the private soldier when in hospital had every comfort which could be procured for him, without restriction, and at any price. Fowls were purchased as high as 3s. 6d. each; and after the battle of Toulouse, in which the numbers of killed and wounded were about equal with those who suffered at the battle of the Alma, the hospitals were models of perfection, both in medical comforts and surgical attendance. It was found necessary to supply the officers as well as the privates of the army in a similar manner, and the junior ones should never be left to their own resources, if they require such assistance, for everything necessary should be supplied at the public expense.

I have no doubt that at this moment medical comforts and stores of every kind are in the Bosphorus in sufficient quantity; and if they are not, the War Minister will, I am satisfied, have already taken steps to forward them, although they will be too late to be of use to the wounded at the battle of the Alma; for before they can arrive, one-third of the wounded will be about to return to their regiments fit for duty, most of those who were fated to die will have died, and the remainder, I have no hesitation in saying, will have (the hurry of the moment being over) every ordinary comfort and attendance they stand in need of. If they want for anything at Scutari, it will be the fault of the principal medical officer in charge.

It appears to me to be an error to relieve a Government from any part of its duties by public charity; for, if the public interfere, the Government will in future rely on such aid, which will always be too late to assist in saving life, although it may be useful in alleviating protracted suffering.

Far be it from me to discourage private charity on an occasion like this, when so much is owing to the brave fellows who have suffered in the service of their country; but I venture to suggest that the subscriptions received, and the further moneys which may be collected, should be applied for the relief of the widows and orphans of the soldiers and sailors who have fallen in the East, including those of the merchant service who served with them, and that it should be a fund separate from all others.

G. J. GUTHRIE,  
President of the College of Surgeons.

To the Editor of "*The Times*."

SIR,—I am too well aware of the difficulty, to say nothing of the probable danger, of attempting to oppose your views in your own paper, and in refraining from doing so I will beg your courtesy to a final remark.

I am totally unacquainted with anything the Government have done for the service of the sick and wounded in the East. Bandages or rollers are worth one penny each; lint is about 10s. a pound, and I presumed that such articles were sent out in profusion. That these and other more essential things were not, however, in the right place at the right time is evident, provided the different statements published in your paper are true.

A rigid inquiry should therefore take place on this subject, as well as on the state of the medical departments of the army and navy—not for the purpose of finding fault, or of punishment, but that the public may know and be prepared to pay for what ought to be done for the preservation of the sick and wounded of their fleets and armies. Nothing has occurred on the Alma of which her Majesty's Government have not been forewarned, and if such evils as those alluded to in *The Times* have occurred, and are to continue to occur, the public should be made aware they must be endured and cannot be obviated. I know they may be prevented.

G. J. GUTHRIE.

## MEDICAL SUPPLIES FOR THE ARMY IN THE EAST.

Army Medical Department, 13, St. James's-place, Oct. 18th.

Dr. Smith, Director-General of the Army and Ordnance Medical Department, presents his compliments to the editor of *The Times*, and, as much misapprehension seems to exist as

to the sufficiency of medical attendants and of medical stores and supplies with the army and in the hospitals in the East, and as great anxiety has thereby been caused to the relatives of the sick and wounded, he sends the lists, showing the number of medical officers and the quantity of medicine and hospital stores which have been forwarded from this country at different times since the 24th of February last.

In a memorandum respecting medical stores supplied to the army in the East, the Director-General also states that—

"The number of medical officers with the British forces in the East at the time of the battle of the Alma was 276, being 1 to every 97 of strength. In the Peninsula the number of medical officers was 1 to every 154 of strength. At the present moment there are 30 more medical officers on their way to Constantinople, and 15 more are waiting embarkation. Dr. Smith is happy in being able to state confidently that the medical officers at Scutari (he believes 21 in number) have at their command everything necessary to the treatment of the wounded soldier; hence there is no necessity whatever for any effort being made by the public to send out to Constantinople lint, old linen, &c."

## Departmental Memorandum.

The list of medicines, surgical instruments, surgical materials, medical comforts, hospital stores, and means for the conveyance of sick and wounded, is furnished to enable the medical officers of the army in Turkey

1. To ascertain the provision which has been made to meet the wants of sick and wounded and the *matériel* which is with the army available for that purpose.

2. To report to me, through the Inspector-General of Hospitals, what other articles, if any, may be advantageously applied to the supplies which have been forwarded.

Special attention is requested to the carts and waggons which have been furnished for the conveyance of sick and wounded. No doubt many defects will be discovered in both; therefore, the medical officers serving with the army will, in all probability, have an opportunity of improving upon appliances that are known theoretically only to the British army, though practically to the French since 1792, when a supply of light waggons, accompanied by a corps of disciplined attendants, was sent into the field on the recommendation of the late renowned Baron Larrey. But notwithstanding the French have used so long what we are now only beginning to employ, still there is reason to believe much must yet be effected before we shall be able to consider the object in view to have been satisfactorily attained.

Medical officers will, therefore, be pleased to report, through the Inspector-General of Hospitals, whatever defects they may discover in the vehicles which have now been supplied; and also suggest whatever alterations, additions, &c., they may think calculated to render them more suitable and efficient.

ANDREW SMITH, M.D., Director-General.

Army and Ordnance Medical Department,  
13, St. James's-place, June 20, 1854.

MR. GUTHRIE begs leave to forward to the Editor of *THE LANCET* the accompanying letter from an officer who has particularly distinguished himself in India:—

"MY DEAR SIR,—I was very glad to read in yesterday's *Times* your letter, endeavouring to stem the torrent of reproach falling upon the medical department for seeming neglect or inefficiency. As your voice always commands the public attention in these matters, I hope you will force forward an inquiry for the purpose of discovering who are the parties to blame that the immense stores of medical and surgical means and appliances sent to the East were not forthcoming when required. I make no doubt the result of the inquiry would be, not only the acquittal of the surgeons of all neglect, but it would also appear that the fault lay in the want of power of independent action on the part of the heads of the medical department. With respect to the mysterious absence of stores sent out in such abundance, I believe the deficiencies in our hospitals in the East, as compared with the French hospitals, are to be explained thus: the French Government gave their Army Medical Department two ships, covering, I suppose, the amount of tonnage required by the chief of that department. These ships were entirely under the order of the chief of the medical department. He knew, therefore, not only in what part of the fleet to look for his stores, but in what part of the ship to find what he immediately wanted. He had the crew and boats of his vessels to send his stores on shore; his ambulance men to convey the stores from the landing-place to the hospitals. That medical chief is independent—at least,

he can only be foiled by winds and waves. He not only tells his staff and regimental surgeons what they *should* have, but he tells them what they *are* to have, and how and when they are to obtain things. Now what is the case in our medical department? Dr. Smith, I believe, calculates what tonnage he requires, and sends a requisition to the Admiralty for the same. He receives an order to send his stores to the store-keepers at the Tower for shipping as opportunity offers. Dr. Smith sends invoices of these stores to the inspector-general and the apothecaries with the army. The packages are numbered in the invoice, showing the contents of each; but neither Dr. Smith, nor the inspector, nor the apothecaries know in what ships the packages are distributed; for, being taken to fill up odds and ends of tonnage, the medical stores are in, perhaps, a dozen ships. How is Dr. Hull or Mr. Read ever to get these stores? It is impossible. I know it by experience even in the small fleet that went to Burmah; and such was the difficulty there of getting commissariat people to look to the interests of the sick, that I advocated the establishment of a branch of commissariat department especially to concern themselves with those interests. The commissariat must have pork, beef, rum, and also hay, corn, &c., for the horses of commanding and other officers. Whilst an army is marching, and fighting going on, this supplying of the effective is all they will, and perhaps can, attend to. The medical department is served last, perhaps not at all. The commissariat officer risks that. If he does the others well he is safe enough; and besides, the public don't see how the efficiency of the medical department hangs upon the commissariat. We must have independence of action to be efficient; we must be trusted with a little expenditure. As you have remarked, the public at once give their confidence to chiefs of other departments. But to those with whom they will trust their lives they will not trust their purses. Now, I think the public would give us their confidence in pecuniary matters, and here is a time when the expediency of that confidence might be made apparent. If the department is ever to meet the expectation of the public and the demands of the field, it must be able to move independent of the commissariat of the effective force. I represented this to Dr. Smith, from Burmah, early in that business, and I pointed to the experience of the Sutlej and the Punjaub as confirming the necessity of a commissariat for the medical department, or for the ineffective force. Lord Hardinge felt that necessity after Ferozshah, and appointed a special commissariat officer for the hospitals, and that officer had daily to visit each hospital, and personally ascertain from the medical officer in charge that every comfort required for the sick had been supplied. Lord Hardinge, partly, I suppose, to keep that officer in countenance, and partly to show his sympathy and remembrance of the sick, sent his aide-de-camp round the hospitals at Christmas to hand a mince-pie to each wounded man. Let me tell you that a mince-pie at that time was a luxury, and an attention beyond belief. I pleaded for one myself, and can therefore answer that they were worthy of the Governor-General's *cuisine*. But I have digressed from the subject, which is the necessity of power of independent action in the medical department, or a branch of commissariat for the ineffective force. Dr. Kenny, now President of the Medical Board, Bengal, recommends such a measure in his 'Report of the Campaign of the Punjaub, 1848-49.' I could adduce instances showing the expediency of the arrangement here recommended; but I dare say you will think I have already shown impertinence enough in saying as much as I have already said to one so experienced as yourself. Let the present case be investigated, and measures taken accordingly. They will, I feel persuaded, advance the credit and status of the medical department with the service and with the public.

"Believe me, my dear Sir, yours very faithfully,  
"October 17th, 1854"

"AN OLD PUPIL."

**FRENCH AND ENGLISH HOSPITALS AT CONSTANTINOPLE.**—A correspondent of a morning paper, writing from Constantinople, in speaking of the general arrangement and management of the French and English hospitals, says—"I was really quite delighted to witness to-day, with my own eyes, the order, cleanliness, and, I may say, magnificence of their (the French) hospital at Medjidie, and declare that there is not in London or Paris any establishment better conducted; and in thus providing for the wants of the wounded, all praise is due to the forethought, humanity, and munificence of the French Government. Three or four thousand iron bedsteads, with comfortable mattresses, blankets, pillows, and all the *et ceteras*—even mosquito nets for the officers—were provided full three months ago, and which, I must confess, would not ill become any lord-

ling's mansion. I visited subsequently our hospital at Selimie, and I am sorry to say I found everything the very reverse of what I have related in respect to the French hospital of Medjidie. I was really quite shocked, but do not attribute any part of the blame to the medical staff, who are all endeavouring to do their best. I did not observe a single bedstead in the wards; and the narrow miserable mattresses, supplied apparently from the berths of transports, for want of better, were all laid, with the unfortunate sufferers, on a brick flooring. The coverlets, and everything else, were of the most wretched description possible; and I even saw the Russian General Goginoff, in an almost hopeless state, not better supplied than others in this respect. I have neither time nor any wish to develop this dismal theme at present, but promise, if matters should not mend, to give you a full and true account of all, for the edification and comfort of the British public."

**REPREENSIBLE NEGLECT OF THE GOVERNMENT.**—A wounded soldier of the Guards, in a letter to a friend, remarks:—"We have got to Scutari at last, but I thought we should not have brought any men at all, as the men kept during their voyage quickly dying of their wounds; there were only three surgeons on board to dress and look after 600 men. My dear fellow, England has a good deal to answer for in not having sufficient medical men to attend the wounded soldiers who risked their lives and bled for their country's honour. I never had my arm looked at by a doctor from the day I received the wound till yesterday; but, thank God, from previous experience, I was able to look after it myself, and the wounds of others also. During our stay on board the ship, many a bright man lost his life through want of medical attendance; we threw about eighty or one hundred overboard coming down the Black Sea, but it is just as bad at Scutari."

**AN ENTHUSIASTIC SURGEON.**—A private letter from the East states—"That Mr. R. J. Mackenzie was so much attracted by the prospect of active service in the present campaign, that he resigned a first-rate private practice, and went out to Turkey, furnished by the Earl of Aberdeen with a letter of introduction to Lord Raglan, who at once appointed him a temporary Army-surgeon, and attached him to the 79th Highlanders. In addition to the fatigue and hardship, and of the privations incident to such a life of campaigning, Mr. Mackenzie penetrated to Widdin, Schumla, and Silistria, and after the raising of the siege he assisted at a great many surgical operations in the relief of the numerous wounded in the Turkish hospitals at that place." Mr. Mackenzie is a member of many of the medical societies of the northern capital, and held several important appointments there. According to the "British Medical Directory" for 1854, we find that he is an F.R.C.S. Edin.; Surgeon to the Royal Infirmary; Medical Officer to the New Town Dispensary; late Surgeon to the Look Hospital; Lecturer on the Principles and Practice of Surgery at the Ext. Academical School; Member of the Medico-Chirurgical Society, Edinburgh; Ext. Member of the Medical Society, Edinburgh; and Member of the Medical Statistical Association of the same place; besides being the author of several contributions in the Edinburgh medical journals.

**SURGEONS FOR THE EAST.**—The following medical officers left England for the seat of war in the East on board the *Valorous*, which sailed from Sheerness on last Saturday afternoon:—T. F. Longhead, M.D.; E. P. Boyle, M.D.; C. H. Tovey, M.D.; A. Hawkins, M.D.; A. Salter, M.D.; W. J. Pahologus, M.D.; William Grant, M.D.; — Grange, M.D.; — Biddle, M.D.; — Erskine, M.D.; and four other gentlemen, whose names we have been unable to learn. They will proceed direct to their respective appointments with all possible expedition.

During the week, twelve additional surgeons have been despatched from Ireland to the East to attend on the wounded.

On Monday last, a vast quantity of medical stores and comforts for the wounded at Alma, was taken out of the Tower of London, and forwarded to Liverpool, for immediate conveyance to the head-quarters of the medical department of the expeditionary army. Amongst the articles are a number of woollen serge gowns and trousers for the use of convalescents.

**NURSES FOR THE EAST.**—The institution for training nurses at St. John's House, Queen-square, Westminster, are sending out a number of trained nurses for the camp hospitals of the Crimea.

**OBITUARY.**—On the 23rd ult., on board one of her Majesty's ships, off Alma river, in the Crimea, John Mitchell, M.D., Staff-Surgeon in Lord Lucan's division of Cavalry, only son of the late J. Mitchell, Esq., of Montrose.

## THE CHOLERA.

RELATIVE to the progress of cholera in the metropolis, we condense the following from the "Weekly Return" of the Registrar-General for the week ending October 14th:—

Districts.	Elevation above water mark.	Population (1851).	Deaths from Cholera.
Northern (Marylebone, &c.)	135 feet	490,396	14
Central (St. Giles, &c.).....	49 "	393,256	24
Western (Kensington, &c.)	28 "	376,427	46
Eastern (Shoreditch, &c.)...	26 "	485,522	50
Southern (St. Saviour's, } Lambeth, &c.) }	6 "	616,635	115
			249

Of these, 71 were below fifteen years of age; 14 between fifteen and sixty; 38 were above sixty years old. 102 persons are stated to have died of diarrhoea.

The deaths from cholera were registered in the last two weeks in the five divisions of London, in the following proportions: In the Western Districts, 59 and 46; in the Northern, 26 and 14; in the Central, 31 and 24; in the Eastern, 95 and 50; and on the South side of the river, 200 and 115. In the second week of October, 1849, the deaths reported as caused by cholera were 110.

## INFLUENCE OF THE WATERS OF LONDON ON THE MORTALITY OF CHOLERA.

*Deaths by Cholera in Six Weeks in the Houses of the South Districts of London, supplied with Water from various Sources.*

HONOURS FOR MEDICAL MEN IN FRANCE.—The *Moniteur* contains a notification that the first physician-in-chief of the navy, M. Cauvergne, has been promoted to the rank of Officer of the Legion of Honour; and two surgeons, MM. Macret and Lambert, have been appointed Chevaliers of the Legion of Honour, for their devotedness to the sick during the fearful visitation of cholera at Toulon.

## Medical News.

ROYAL COLLEGE OF SURGEONS.—The following members of the College were admitted Fellows at the meeting of the Council on the 12th instant:—

BRIDGE, STEPHEN FRANKLIN, Wellington, Somerset, diploma of membership dated December 18th, 1812.  
COLES, HENRY, Hammersmith, June 27th, 1828.  
SCOTT, HENRY, Adelaide, Australia, May 25th, 1832.  
SHIPMAN, ROBERT, Grantham, July 1st, 1839.  
VETICH, JOHN TOSWILL, Jermyn-street, July 5th, 1839.  
WESTALL, EDWARD, Croydon, March 4th, 1831.

The following gentlemen, having undergone the necessary examinations for the diploma, were admitted Members of the College at the meeting of the Court of Examiners on the 13th inst.:—

EDWARDS, HENRY, Solihull, Warwick.  
FOY, CHRISTOPHER, Calcutta.  
FOY, JAMES AUGUSTUS, Calcutta.  
LAWRENCE, JAMES ELI, East India-road, Poplar.  
VERNON, HENRY HANNOTTE, Cambridge.  
WEST, JAMES FITZJAMES, Kennington.

APOTHECARIES' HALL.—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, October 12th, 1854.

BANNING, ROBERT JOSEPH, Fairfield, near Liverpool.  
DAVIES, ROBERT, Llanfair, Talhaiarn Abergall.  
GANGE, FREDERICK ABNER, Dover, Kent.  
LA FARGUE, PETER AUGUSTUS, Warwickshire.  
SEGAR, JOHN, Ainsdale, near Southport, Lancashire.  
TAYLOR, EDMOND, Urnston, near Manchester.

THE CITY OF LONDON COURT OF SEWERS.—Mr. Thomas Abrahams, Surgeon, New Broad street, has given notice of the following motion in the City of London Court of Sewers:—"That the present mode of ventilating the sewers by air-holes in the public streets is prejudicial to the public health, and that it be referred to a Committee, to consider and report to this Court whether it be advisable to substitute for the air-holes ventilating-shafts affixed to the houses, in cases in which the owners and occupiers give their permission, or whether any improvement can be made upon the present mode of ventilation."

APPOINTMENT.—George Lowdell, Esq., F.R.C.S., of Cannon-street, Brighton, was elected on Wednesday week to the office of surgeon to the Sussex County Hospital, in the room of Mr. Benjamin Vallance, who retires, from continued ill health. Mr. Vallance has held the office for many years, having been elected upon the opening of the charity in 1828. Mr. Lowdell was formerly house-surgeon to the same institution.

THE CHOLERA AT BRISTOL.—Owing, perhaps, to the sanitary regulations which were wisely adopted after the last visitation of cholera, in which Bristol suffered severely, this city had enjoyed comparative immunity from the destructive disease which has proved so fatal elsewhere. Within the past week, however, there have been twelve or thirteen deaths from cholera, and one amongst them has spread quite a gloom over the city—viz., Dr. Evans, the head master of the City Grammar School. So rapid was the progress of the disease in his case, that, although two eminent practitioners were summoned with all despatch, collapse ensued, and within three hours after the deceased was first attacked with choleraic symptoms he was no more.

HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, OCTOBER 14TH.—The Returns for the last week from the metropolitan districts furnish evidence of a steady, if not a rapid, improvement in the public health. The deaths, which numbered 1532 in the previous week, declined to 1394 in that which ended last Saturday. But the mortality still exceeds the average of former years by more than 300 deaths, and it is also greater than the mortality of the same week in 1849, when the number had fallen to 1075. Last week cholera was fatal to 249 cases, diarrhoea in 102. Scarletina prevails to some extent in London, and the mortality from it exhibits a weekly increase. In the last three Returns this disease numbered 88, 105, and 112; this is considerably more than the average.

The births of 779 boys and 763 girls, in all 1542 children, were registered last week in London. In the nine corresponding weeks of the years 1845–53 the average number was 1287.

## TO CORRESPONDENTS.

**J. H. C.**—Such a qualification does not confer any legal right in this country. We would strongly urge our correspondent, as well as all other legally qualified members of the profession, who have not yet made their Returns for the *BRITISH MEDICAL DIRECTORY*, to forward them to the Editors of that work without the delay of a single day. It is to the *BRITISH MEDICAL DIRECTORY* that the credit is due of withholding from the view of the public the titles and qualifications of a host of quacks, whose insulting and disgusting pretensions defaced the pages of the *London and Provincial Directory*, and inflicted a great scandal and degradation on the profession. If the "Returns" are not made forthwith, the names of many qualified practitioners may be omitted from the *BRITISH MEDICAL DIRECTORY* for 1865.

**J. P.**—The following are the regulations respecting the diploma of members of the Royal College of Surgeons:—

"Candidates will be required to produce certificates—1. Of being twenty-one years of age. 2. Of having been engaged during four years in the acquirement of professional knowledge. 3. Of having studied Practical Pharmacy during six months. 4. Of having attended at a recognised hospital or hospitals in the United Kingdom the Practice of Physic during one winter and one summer session. 5. Of having attended, during three winter and two summer sessions, the Practice of Surgery at a recognised hospital or hospitals in the United Kingdom. 6. Of having studied Anatomy and Physiology, by attendance on lectures and demonstrations, and by dissections, during three winter sessions. 7. Of having attended, during two winter sessions, lectures on the Principles and Practice of Surgery. 8. Of having attended, during one summer session, lectures on Materia Medica, and lectures on Midwifery; Practical Midwifery to be attended at any time after the conclusion of the session. 9. And of having attended one course of lectures on the practice of Physic, and one course on Chemistry."

**Ego.**—Admission to the museum is by an order from a member of the College. "*A Clergyman*" must take the trouble to authenticate his communications. *THE LANCET* is not likely to shrink from "its duty," but will scarcely be urged to action by the remarks of an anonymous correspondent. The work referred to has not escaped our notice.

**Nemo.**—The review appeared in *THE LANCET*, vol. ii. 1853.

**A Young Surgeon.**—A gentleman holding only the diploma of the Royal College of Surgeons cannot recover an account for attendance or medicines in a medical case. The defendant in an action for medical attendance may demand particulars, and the charges may be subjected to the judge or jury, who have the power to decide upon their fairness. But a *surgeon* cannot recover for either attendance or medicines when he practises as an apothecary—that is, when he "attends, prescribes, and dispenses medicine in a medical case."

## "WEBBER OF NORWICH" AGAIN.

**A Correspondent** has forwarded to us the *Ipswich Journal*, containing the account of a fatal gun-shot accident at Bacton. Every possible attention was paid to the wounded gentleman by surgeons of acknowledged ability in the neighbourhood. An inquest was held, and a verdict of "accidental death" recorded. The *Journal* says:—

"It should be added that, just after the jury were sworn, a letter was put into the hands of the coroner by the parish constable, impeaching the mode in which the case had been treated by the principal surgeon. The letter, which was signed 'W. Webber,' and was dated 'Norwich, Sept. 29th,' had been dropped in the morning from a railway train as it passed Finsingham station, and was picked up by the station-master. The coroner read the letter to the jury. The latter said 'they had had enough of it,' all being thoroughly satisfied that the deceased had received proper attention; the coroner, at the same time, deprecating the fact of such a letter having been so written and so forwarded, and stating that he should place it in the hands of the surgeon whose treatment it was attempted to impeach."

Our correspondent remarks, "that such a letter could, from the quarter whence it issued, be treated only with supreme contempt."

**A. B. C.** is thanked for forwarding "the begging letter from the Association." It is unnecessary to publish his remarks upon it. It was shown at the annual meeting that the *Journal* was upwards of £1000 in debt. Mr. Sheppard's letter states the case fairly. It is probable that every member is individually responsible.

**Anti-Specialist** has omitted to authenticate his communication. Unless our correspondent's name was attached to the letter, we could not allow it to appear.

**A Working Man, &c.**—A physician who has made Hmacy his especial study would be the best person to consult. We do not give advice.

**N.**—Two years since.

**M. H.**—It is possible that the charter will pass next session. All persons holding British degrees would be entitled to the extra licence by the payment of a fee.

**Dr. J. C. Atkinson's** paper shall be published next week.

**A Military Surgeon.**—Several interesting letters on the subject will be found at page 343.

**A Friend, (Lincolnshire).**—Full justice was done to the subject in *THE LANCET* at the time. Dr. Charlesworth's statue, erected upon the spot where his benevolent labours had so marked an influence upon the well-being of his patients, is not the most enduring monument to his fame.

**An Old Lancet.**—Draw attention to the point in a note to the editors.

**Juvenis.**—Such cases are by no means uncommon, and are easy of cure. The object of "the advertising quack" is to frighten, and then victimize. Any respectable surgeon will treat the case with success.

**Independent.**—It probably depends on an irritation of the stomach. We never prescribe in *THE LANCET*. Apply to a regularly qualified medical practitioner.

**A Student.**—Information may be obtained from the registrar.

**A Subscriber.**—1. There is no preliminary classical or mathematical examination required of candidates for the diploma of member of the Royal College of Surgeons.—2. We should say that the authorities at the Admiralty will only be too happy to find any respectable candidates applying for appointments as assistant-surgeons at any time. If our correspondent seriously intends entering the service, he may learn all particulars as to the pay and other advantages connected with it, by applying to the Medical Department at the Admiralty. The disadvantages he will not be so slow to discover when he has been appointed.

**Mr. Segor** will perceive that his request has been complied with.

## THE HUDDERSFIELD MEDICO-ETHICAL SOCIETY.

We have been acquainted by a member of this Society with the following particulars:—

"It embraces a country about fourteen miles in extent—that is, we have medical gentlemen at that distance united with us. It was established in June, 1852, to suppress quackery in all its forms, and to uphold the dignity of our honourable profession against *homoeopathy*, &c. The present office-bearers are—President, Dr. Wm. Turnbull; Vice-President, George Robinson, Esq.; Treasurer, Samuel Booth, Esq.; Secretaries, G. W. Rhodes, Esq., and Dr. — Scott.

"The following conditions disqualify from membership:—

"Any practitioner who may act in opposition to the principles involved in the six succeeding laws shall not be eligible to the membership of this Society; and, if already a member, he shall, on infringing the same, be liable to expulsion.

"1. No member shall practise, professedly or exclusively, *homoeopathy*, *hypnotism*, or *mesmerism*.

"2. No member shall, by advertisement or other improper means, solicit private practice.

"3. No member shall give testimonials in favour of any patent or proprietary medicine, or in any way recommend their public use.

"4. No member shall be the proprietor of, or in any way derive advantage from, the sale of any patent or proprietary medicine, or in any way recommend their public use.

"5. No member, who may keep an open shop, shall sell patent medicines, perfumery, or other articles than pharmaceutical drugs and preparations.

"6. No member shall enter into compact with a druggist to prescribe gratuitously, and at the same time share in the profits arising from the sale of the medicines.

"We have many other laws under various sections, as a code of medical etiquette, adjudication of medical disputes, &c. &c. We have found them of essential service. One case lately would have terminated in a York trial if we had not had a court of medical etiquette in Huddersfield, and by that means prevented many hundreds of pounds being spent amongst the lawyers, and obviated a disgrace to our noble profession."

"\* \* We cordially recommend the formation of similar associations in all parts of the kingdom.

**W. B.**—The preliminary examination at Apothecaries' Hall is not compulsory. It is desirable, however, that every intending candidate for the licence should submit to it.

**Mr. Chalmers Miles'** letter shall appear next week.

**A Stranger.**—Foreign medical works can be obtained by an order from any medical publisher.

**Mr. Thomas Collins.**—The fee for a post-mortem examination made by the order of the coroner is two guineas. This includes the medical evidence.

**A Student, (St. George's Hospital).**—Thanks. We will attend to the request.

## BIRMINGHAM GENERAL HOSPITAL.

To the Editor of *THE LANCET*.

**SIR,**—Your correspondent, who signs himself "Anti-Bellman," as if ashamed of his name, (*THE LANCET*, October 13th.) has made a mistake with regard to the number of beds in this hospital. The hospital contains 230 beds, as stated in your students' number. During the last year, 1853, the average number of patients each day in the hospital has been 178. None of the wards are likely to be closed. We could fill more beds if we had them.

I am, &c.,

D. JOHNSON, House-Surgeon.

The General Hospital, Birmingham, October, 1854.

**Mr. Knaggs.**—The communication shall receive close attention on the part of the Editor.

**ERRATA.**—In Dr. Ayre's paper on the "Treatment of Cholera by Calomel," in the last *LANCET*, page 311, 1st col. 3rd line, *for* reported, *read* reprinted; 2nd col., 14th line from the break, *for*, *read* on; 3rd col., 16th line from bottom, *for* measure, *read* medicine; 4th col., last line, *for* presented, *read* prescribed.

**COMMUNICATIONS, LETTERS, &c.,** have been received from—Dr. Robert Lee; Mr. Boly; Dr. Dundas Thomson; Mr. D. Johnson, (General Hospital, Birmingham); Mr. Chalmers Miles; Dr. Lever; A First Year's Student; A Young Surgeon; J. P.; A Clergyman; Mr. Abrahams; Anti-Specialist; Dr. Williams, (Brighton); Mr. J. Berry; Mr. Cotton; A Surgeon at Alma; A Subscriber to *THE LANCET*; Dr. Edwards, (Cheltenham); Mr. Potter; W. S.; One Present; R. W., (Cairn College, Cambridge); Mr. A. Bolton, (Infirmary, Newcastle-upon-Tyne); A Subscriber, (Edinburgh); Dr. J. C. Atkinson; M. H.; Dr. Fraser, (Wolverhampton); Mr. G. Woolcott; Mr. T. Collins; An Old Militia Surgeon; Mr. Braithwaite; A Reader of Twenty Years; A Student, (St. George's Hospital); Mr. Martin; A Junior Medical Officer, (Varna); Veritas; Mr. A. Blacklock, R.N.; Mr. G. S. Morris, (Glasgow); Mr. T. Holmes, (with enclosure); Mr. J. Mackintosh, (Huddersfield, with enclosure); Mr. A. Spalding, (with enclosure); Rev. A. F. Thomson, (Kilburn, with enclosure); J. H. C.; A Correspondent; A. B. C.; A Working Man; Independent; An Old Lancet; Dr. J. C. Atkinson; Nemo; A Military Surgeon; A Friend, (Lincolnshire); Juvenis; A Student; Ego; W. B.; N.; A Stranger; A Subscriber; Mr. Segor; Mr. Knaggs; &c. &c.

## Orthopædic Mechanism.—

Mr. HEATHER BIGG begs to invite the attention of the Faculty to an entirely new principle he has discovered for constructing the various apparatus for deformities of the Feet, Spine, &c. It combines mechanical power with free muscular action; avoids the least chance of abrasion or suppurative, (so often resulting from the mechanical appliances hitherto used,) and assists in every respect an increase of development.

Mr. H. Bigg will most gladly show any medical gentlemen, who may be interested in the perfection of such contrivances, instruments adapted for Talipes Varus, Valgus, Equinus, Spasmus, and Calcaneus; also for lateral, Posterior, and Anterior Curvatures of the Spine, &c. &c.

All cumbersome mechanisms being dispensed with, the cost is lessened and the weight diminished at least one half.—PATENTED.

29, LEICESTER-SQUARE.

## New Spinal Support.—Mr. H. Bigg,

29, Leicester-square, particularly invites the attention of the Faculty to his newly invented SPINAL APPARATUS, which is constructed on a principle never before employed. It entirely dispenses with cumbersome mechanism, and having a force analogous to muscular motion, allows the body to move freely in every direction. When applied its action resembles the pressure of the hands against the curvature, accompanied by a gentle uplifting of the drooping side.

It is remarkably light; has a self-adjusting pelvic part; can be applied to every variety of spinal deformity; and arranges itself so perfectly as to escape the closest observation. Patented.

To be had only of the Patentee, 29, Leicester-square.

## New Spinal Support.—Fr. G. Ernst,

Lamb's Conduit-street, Foundling Hospital, begs to draw the attention of the Faculty to his recently-invented SPINAL APPARATUS, which, after some months of trial, has proved superior to any of the various kinds hitherto used, and produced the most satisfactory results. This appliance, being self-adjusting, free bodily motion is permitted; thus, while equal and necessary support is given to the wearer, all injurious or painful pressure is avoided, and a great amount of comfort and benefit consequently yielded. It can be modified so as to suit any FORM OF SPINAL DEFLECTION; its weight is comparatively trifling, and from its capacities for nice adaptation elicits no observation when on the body.

To be had only of the Inventor, 48, Lamb's Conduit-street.

TO THE MEDICAL PROFESSION.

## Fr. G. Ernst, Anatomical Machinist

and MANUFACTURER OF SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF OF BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam Exner (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &c.

## Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 2.

FIG. 1. THE BELT AND AIR-PAD FOR FEMORAL HERNIA.—Mr. Bourjeaud begs to state that this has been extensively tried, and has met with great approbation, especially at Guy's and St. Bartholomew's Hospitals. (See THE LANCET, Jan. 10th, 1863, page 49; and March 13th, 1863, page 267.) The air-pad is carefully adjusted, so that it may exactly rest on the femoral ring, the tube and stopcock being free, to allow of the pad being subjected to more or less insufflation. The belts in all these apparatuses possess the great advantage of encompassing the abdomen without distressing the patient, and of giving such support to the intestines as to lessen the chance of hernial protrusion. It is, in fact, extremely erroneous to confine the pressure to the rings; the whole abdominal mass should be well supported, and the pressure on the rings will then be effectual, without being exerted with the violence so often connected with the steel trusses.

FIG. 2.—APPARATUS FOR UMBILICAL HERNIA.—The belt is of the same kind as those figured in the other diagrams, but an air-pad sufficiently large is here fixed to the centre of the belt, and has the advantage, by its yielding and resilient properties, to fill, in some degree, the umbilical ring; thereby preventing protrusion, and leading the way, especially in children, to the final closure of the ring. Mr. Bourjeaud has had several cases of radical cure with young subjects. (See THE LANCET, July 12th, 1861, page 33; and Feb. 12th, 1863, page 153.)

## Mr. T. H. Wakley's Stricture Instru-

MENTS. Complete Sets of these Instruments may now be had of WEISS & SON, 62, Strand, London.

## Mr. Edwin Osborne, of 24, Savile-

ROW LONDON, begs to apprise the patrons of the late Firm of Dodge and Osborne, that he is now the Sole Licencee and Maker of PALMER'S PATENT (American) LEO; and, having had great experience in its manufacture, feels confident of giving comfort and satisfaction to those persons who may favour him with their patronage. References given (if required).

## Dissecting and Post-Mortem Instru-

MENTS, New and Second-hand. Surgical Instruments of the best description; A. URE'S New Urethrotome for Stricture; New Uterine Compress; Newly Improved Pessary; Instruments for Army and Navy Surgeons; DARTNELL'S Patent Truss; Trusses for Union Surgeons; Enema Syringes; New Syphon Enema, as supplied to the Army; New Spinal Machine, pronounced the best ever invented—at

PRATT'S, Surgical Instrument Maker, 480, Oxford-street.

## Henry Bigg, 9, St. Thomas's-street,

Borough, Surgical Instrument-maker to Guy's and St. Thomas's Hospitals, begs to call the attention of the Medical Profession to the following valuable instruments, made from designs and suggestions kindly given by the Gentlemen whose names are attached—viz., Mr. Le Gros Clark's Talipes Instrument; Mr. Bransby Cooper's Ovarian Trocar; Mr. Cock's Recto-Vesical Trocar; Mr. Cooper Forster's Ear Speculum; Mr. Hilton's Speculum Ani; Dr. Lever's Midwifery Instruments; Mr. Solly's Elastic Catheter, with Catgut Director. These Instruments being constructed on the premises secure their excellence and perfect finish.

9, St. Thomas's-street, Borough, London.

## M. Pillischer's Newly-Constructed

REASONABLE PRICE, surpasses any Microscope hitherto made by any English or Continental maker. The Student's Microscope, with coarse and fine adjustments, single mirror, one eye-piece, a one-inch and one-quarter-inch French achromatic object-glasses of best quality, the whole packed in mahogany case, 7in. by 6in., £5 10s.; or with M. Pillischer's own-made, 1in. of 16 degs. angular aperture, and 4in. of 60 degs., £7.

The above stand with lever stage, extra eye-piece, double mirrors, animalcule case, &c., £8; or with Pillischer's glasses, £9 10s.

A list of prices will be sent free on application to M. Pillischer, 83, New Bond-street.

## A New Discovery.—Mr. Howard,

Surgeon-Dentist, 52, Fleet-street, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without springs, wires, or ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will never CHANGE COLOUR OR DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed teeth rendered sound and useful in mastication.

52, Fleet-street. At home from Ten till Five.

## Teeth.—Mr. Alfred Jones, of Gros-

venor-street, has recently completed a new and important improvement in the construction of ARTIFICIAL TEETH. The superiority of their appearance, and the unerring accuracy with which they are fitted to the mouth, without wires, springs, or ligatures, and the lightness of their construction, gives greater facility in mastication and freedom to the speech, and imparts a more youthful appearance to the countenance than has hitherto been attained; they support any teeth that may be loose, and have been tested by many of the most flatteringly acknowledged of success. Supplied only by Mr. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of Gloucester, her late Royal Highness the Princess Augusta, and his late Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street, Grosvenor-square.—At home from Eleven until Five.

## ELECTRICITY.

FOR NERVOUS, FUNCTIONAL, AND RHEUMATIC DISEASES.

MEINIG'S New and Greatly Improved GALVANIC ELECTRO-GENERATOR, for supplying vito-functional energy to any organ in want of the same, and to the system generally, may now be had at the Establishments, 103, Leadenhall-street, and at 213A, Piccadilly. All wet and metallic

contact with the Body is entirely obviated; it acts with water alone, without acid, the action lasts more than twenty-four hours after each damping, and can be renewed and regulated without undressing, the Generator, enclosed in an envelope, being carried in the pocket or suspended from the neck.

THE EXTRAORDINARY CURATIVE VIRTUES OF THESE MILD CURRENTS OF ELECTRICITY ARE NOW FULLY ESTABLISHED BY EXPERIENCE. The Prospectus (to be had gratis, or by post for two stamps) contains the names of more than 600 persons cured within the last eighteen months, and this remedy is now adopted in nearly all the Hospitals, and by the most eminent practitioners. Sold at 5s. and upwards, according to power, at C. MEINIG'S, 103, Leadenhall-street, and 213A, Piccadilly.

N.B.—In the first stages of CHOLERA the continuous current from the colon to the abdomen has been found eminently successful in checking the further progress of the disease.

POCKET-BATTERIES for Medical Practice on the same principle. (Intensity of 120 cells within the space of a small pocket-book.)

103, LEADENHALL-STREET and 213A, PICCADILLY (near Regent-circus.) Prospectus gratis, or by post for two stamps.

## Infants' New Feeding Bottles.—These

celebrated Nursing Bottles, the best Artificial Mother ever invented, enabling the most delicate infant to feed from its birth with the greatest comfort and ease, are adapted to milk, biscuits, and all kinds of food. The Nipple, of novel material, is elastic, soft, durable, very clean, and so beautiful an imitation of nature, that no infant ever refuses it.—BENJAMIN ELAM, 198, Oxford-street.—7s. 6d.—Each is stamped with my name and address.

## The Pure Warm Air Charcoal

RESPIRATOR, invented by Dr. Stenhouse, of St. Bartholomew's Hospital, for preventing and alleviating diseases of the Throat and Lungs, and also as a safeguard against Fevers and other Infections, which no other will do, is in appearance like the ordinary respirator, but half its weight. When the breath is fetid, which is the case under many forms of dyspepsia, &c., the disagreeable effluvia are absorbed by the Charcoal, and pure air alone is inspired. There are three kinds—one Oral, price 8s., 6d. extra post free; and two Orinatal, one for infected atmospheres, the other for Chemical and Manufacturing establishments.

W. ROOFF, Manufacturer, 8, Willow-walk, Kentish-town.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

## Important Saving, by Pre-payment, in the PURCHASE of

NEW WHITE MOULDED VIALS.

APSLEY PELLATT and CO. submit the following PRICES of VIALS, for PRE-PAYMENT only:—

1 oz., 1 oz., & 1 1/2 oz. per Gross, 8s.	
2 oz. " 7s.	
3 oz. " 8s.	
4 oz. " 10s.	
6 oz. " 15s.	
8 oz. " 18s.	
4 1/2 oz. graduated in 3 doses 12s. 6d.	

In quantities of not less than Six Gross, assorted to suit the convenience of the purchaser, delivered to carriers in London. No charge for Package. Breakage at risk of Purchaser.

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,

APSLEY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

## Every excellence which the

Surgeon can require—viz., Lightness, Durability, Strength, and Economy—is realized by HUXLEY'S SURGICAL STOCKINGS, KNEE-CAPS, ANKLETS, &c. H. and Co. have much pleasure in informing the Profession that they have perfected an ABDOMINAL BELT of new construction, which, acting diagonally, is not liable to displacement; its weight is only four ounces. Price 18s. Diagrams and particulars forwarded by post. Every kind of Surgical Stocking made. Spiral Stockings at a great reduction. Measure required for Stockings: Circumference at A, B, C, D, and E; length from A to D, and D to E.

HUXLEY and CO., 8, Old Cavendish-street,  
late 5, Vere-street, Oxford-street.

## Huxley's Fulcrum

ABDOMINAL BELT will be found, from its mechanical arrangement, (acting diagonally), and producing the required support for the lower part of the Abdomen, to be the most complete and comfortable arrangement ever invented. It is extremely light, weighing only 4oz. Price 18s.

Measures required.—Circumference at A, B, and C; depth from A to C.

A discount of 20 per cent. to the profession.

HUXLEY and CO., 8, Old Cavendish-street,  
late 5, Vere-street, Oxford-street.

## Ladies' Belts.—Bailey's

ELASTIC LADIES' BELTS are found to be some of the most useful articles in his establishment. They are worn by those who are delicate in constitution, as they support the Back and Abdominal Muscles, giving the greatest possible comfort before and after Accouchement. They are without Buckles or any Incumbrances, and easily adjusted. Prices, 18s., 32s., and 42s.

Those without Elastic are much used by Surgeons for persons immediately after Accouchement, and called Bailey's Compressing Belts. Price 10s. 6d., 15s., and 25s.

Hospitals and Lying-in Institutions supplied. Females in attendance, and private rooms for trying on. Elastic Stockings and Knee-caps.

Address, WM. HUNTLY BAILEY, 418,  
Oxford-street, London.

## Mineral Waters.—W. Best begs to

inform the Nobility, Gentry, and the Faculty, that he has just received a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg, Kissingen, Vichy, Seidlitz, Pullna, Ems, Seltzer, Fachingen, &c., at his Eau-de-Cologne, Arquebuzard, and Foreign Mineral Water Depot, 22s, Henrietta-street, Cavendish-square.—N.B. Balls and evening parties supplied with German and Struve's Artificial Seltzer Water on Advantageous terms.

N.B. Allsopp's and Bass's Pale Ales, and Guinness's Dublin Stout.

## Aërated Waters of sufficient and

uniform strength. BLAKE, SANDFORD, and BLAKE, 47, Piccadilly, having given great attention to the manufacture of Mineral Waters, and feeling it important that medical men should be assured of the quantity of Alkali contained in each kind, beg to submit the following list of their preparations:—

Potash Water, 18 grains of the Bicarbonate in each bottle; Citrate of Potash, (a new and valuable auxiliary in Gout and Rheumatic affections), 30 grains; Soda, 15 grains; Magnesia, 12 grains, and Ammonia, 10 grains.

B. S. & B. would especially recommend their Seltzer and Vichy Waters; the latter now bottled in half-pints as well as pints.

BLAKE, SANDFORD, and BLAKE, 47, Piccadilly.

## Hare-Lip.—Extraordinary Application and CURE.

Communication from Mr. BROADBENT, Surgeon, Ferry Hill, Durham.

MR. BENJAMIN NICKELS,  
Sir,—I wish to state concerning your Plaster to the following effect. About ten days after an operation for Hare-lip, the boy fell against a stone step and ruptured the lip. The day previously I had received your Elastic Plaster, and on being summoned to the boy, (without much hope of success,) I applied three strips of the Plaster, extending from ear to ear, bringing the ruptured edges into apposition. Seven days after, the Plaster retained the cheeks in the position I had left them on the day of application. Fresh strips were then applied, and the edges ultimately united. In my opinion, no other plaster could have answered the intention, and I think it specially adapted to wounds on the face.

I remain yours obediently.

(Signed) G. W. BROADBENT.

NICKELS'S PATENT ELASTIC ADHESIVE PLASTER, and ELASTIC ADHESIVE BANDAGES, which are made on quite a new principle, rendering them a cheap, efficient, unvarying support as a spiral covering, or stocking (without the trouble of lacing), for varicose veins, sprains, weak joints, and all rheumatic affections. These Bandages may also be cut and applied as ordinary strapping.

The Patentee has had the honour of receiving the highest testimonials in approbation of his ELASTIC PLASTERS from the following most eminent Members of the Profession, and many other Gentlemen, by whom they are patronized and used in their hospital and private practice:—J. C. W. LEECH, M.D., Physician Accoucheur, Guy's Hospital. Mr. KINGSTON, Surgeon to his Royal Highness Prince Albert, Prof. Surgeon, King's College, London; Surgeon King's College Hospital. Mr. HURON, Surgeon, Guy's Hospital, Surgeon to the City of London Hospital for Diseases of the Chest.

THE PATENT ELASTIC COURT PLASTERS are found most superior both in appearance and quality.

Sold by all principal Chemists in the United Kingdom, and by Mr. BENJAMIN NICKELS, Surgical Plaster Manufacturer, 9, Camberwell-green, London.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lyttæ P.L., easily applied and removed, and will not produce strangury or troublesome after-sores. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing twelve square feet, 6s. 6d.; and small Cases of six square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing twelve square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1853.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.,

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown."

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction."

60, Grosvenor-street, London.

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. Brown's BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicator, when carefully applied, and has not been productive of any degree of Strangury."

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. Brown, Druggist, Handsworth, Birmingham."  
Prepared by Thomas B. Brown, Pharmaceutical Chemist, 43, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignees, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

## Soyer's Aromatic Mustard. — "M.

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration." — THE LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

## To Invalids and those desirous of

**PRESERVING HEALTH.**—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO.'S HOMEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

## Cocoa of the finest quality, prepared

in the best possible manner.—Our PURE GRANULATED COCOA was pronounced by the Analytical Chemists employed by THE LANCET, in their memorable researches into the Adulterations of the Food of the People, to be free from any admixture whatever. The Invalid, and Cocoa-drinkers in general, are requested to make trial of it. In pound packets, 1s. each. Arrow-root, genuine as imported, at 4d. per lb., 6d. per lb., 8d. per lb., 1s. per lb., 1s. 4d. per lb., and the very finest Bermuda in the Kingdom, 1s. 8d. per lb.; 7 lbs. of that at 8d. per lb., or any higher quality, packed in tin canisters, without extra charge. Good Ceylon Coffee, 1s. per lb.; Java Coffee, a rich and useful article, 1s. 4d. per lb. Good Congou Tea, 3s. per lb.; very excellent ditto, 3s. 4d. Orders to the amount of 40s., for any of the above articles, covering a remittance for amount of same, forwarded, carriage free, to the nearest railway station.

HANDFORD & DAVIES, 61, High Holborn.

## DOMESTIC ECONOMY

## H. Sparrow and Co. beg to announce

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.  
Fine Souchong, 3s. 4d., 3s. 8d., and 4s.  
Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.  
Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.  
Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 6d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

## Pure as well as Fine Tea.—

Tea, when pure, is well-known to produce a most wholesome beverage; the impolicy of allowing it to be coloured by the Chinese is fully set forth by the Analytical Sanitary Commissioners, in THE LANCET, and also in *The Times*, (October 6th, 1852). The fact, therefore, is now familiar to most, that artificial colour is used to give the *Spring crop* and the spent *Autumn gathering* the same appearance. If this practice were discontinued, a twofold benefit would arise: first, the fine qualities would have all the fragrance and strength unimpaired; and, secondly, the inferior faded leaves could not then be passed off as good, causing the flat, insipid infusion, so frequently the subject of complaint. The uncoloured Tea imported from China, by HORNIMAN and Co., London, is perfectly pure; the Green, from the absence of the usual artificial colouring, is of a natural olive hue. The Black, and also the Green, are exclusively of the *Spring product* from young and vigorous plants, which yield not only more strength, but the full degree of fragrance which FINE Tea, when purely natural, and seasonably selected, alone possesses; ONE TRIAL induces a continued preference. The prices are REDUCED:—

Finest Congou, 3s. 8d. Finest Lapsang Souchong, 4s. and 4s. 8d.  
Fine and Pure Green, 3s. 8d., 4s., and 4s. 8d.

HORNIMAN and CO., Wormwood-street, London, Importers of the most approved Teas in general use, but free from the objectionable artificial colour on the surface.

Agents in London, PURSELL, 80, Cornhill; and ELPHINSTONE, 227, Regent-street, and 366, Oxford-street.

Sold by authorized Firms in all Towns, in 1 lb.,  $\frac{1}{2}$  lb., and  $\frac{1}{4}$  lb. packages only.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

## Robinson's Patent Barley, for making

superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than thirty years, have been held in constant and increasing public estimation as the purest farina of the oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.

The proprietors of ROBINSON'S PATENT BARLEY and PATENT GROATS, desirous that the public shall at all times purchase these preparations in a perfectly sweet and fresh condition, respectfully inform them that every packet is now completely enveloped in the purest Tin-foil, over which is the usual and well-known paper wrapper.

Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets at 6d. and 1s., and in Family Canisters at 2s., 5s., and 10s. each.

## Allsopp's Pale Ale in Bottle, as

supplied to the CRYSTAL PALACE; also in casks of 18 gallons Recommended by BARON LIEBIG.

Address, HARRINGTON PARKER and CO., 54, Pall-Mall, London.

## Pale India Ale and Stout, 4s. 6d.

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts. Delivered free within four miles of London, and carriage free to all railway stations in England at 6d. per dozen extra.

WOOD & WATSON, 18, Clement's-lane, City.

## Allsopp's Pale Ale.—Medical gentle-

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1853, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTTY, 132, Upper Thames-street, London.

## Metcalfe and Co.'s New Pattern

TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfumery for the toilet.—At METCALFE, BINGLEY, and CO.'S only establishment, 130 n and 131, Oxford-street, second and third doors west from Holles-street. Metcalfe's Alkaline Tooth Powder, 2s. per box.

SAMUEL BROTHERS' Stock of OVERCOATS

for the present Season is worthy of your inspection.

## Memorial of the late Dr. Roupell.—

It is proposed that a Portrait of the much-lamented Dr. ROUPPELL, now in the possession of Mr. Pickersgill, R.A., should be purchased, and placed in the Hall of the Medical College of St. Bartholomew's Hospital, as a testimonial of respect for Dr. Roupell's memory. Dr. Burrows, Mr. Stanley, Dr. Baly, and Mr. Paget, have formed themselves into a Committee for carrying this object into effect, and will receive subscriptions in furtherance of it. The subscription is limited to One Guinea.

St. Bartholomew's Hospital, October, 1854.

## The Queen's Hospital, Birmingham.

A Vacancy has occurred in the Office of RESIDENT MEDICAL OFFICER. He is provided with board, lodging, and washing, and receives a salary of £100 per annum. The Candidates, who must be Members of the Royal College of Surgeons, and Licentiate of the Apothecaries' Company, are requested to send in their testimonials of qualification to the Secretary on or before Saturday, the 4th of November.

October 9th, 1854.

JOHN YATES, Secretary.

## Kendal Union. — Appointment of

MEDICAL OFFICERS.—The Board of Guardians of the KENDAL UNION, will, at their Weekly Meeting, to be held at the Board-room, Kendal, on Saturday, the 4th day of November next, at Eleven o'clock in the Forenoon, proceed to the appointment of MEDICAL OFFICERS, (having the qualifications set forth in the Consolidated Order of the Poor-Law Commissioners of the 24th of July, 1847,) for the Burton District, Salary, £32 per annum; Scalthwaite District, £20 per annum. The Medical Officers will be paid in addition to the above salaries, for all ordinary Midwifery Cases, (where an Order from a competent authority has been given), the sum of Ten Shillings per Case; they will be entitled to the remuneration specially awarded for operations and services mentioned in article 177 of the aforesaid Consolidated Order; also for successful cases of Vaccination, pursuant to the 16 and 17 Vict., cap. 100. They will be required to keep the Medical Relief-book, and to make such medical returns as the Board of Guardians may call for from time to time, to attend all Meetings of Guardians when required, and to perform such other duties as may be prescribed by the aforesaid Order.

During the last three years, the average sum paid for extras, for Burton District, amounted to upwards of £14 per annum, and Scalthwaite District nearly £7 per annum.

Testimonials and Certificates of qualifications to be sent to the Clerk (under seal, free) on or before Friday, the 3rd of November, 1854.

By order of the Board,

JOHN MAW, Clerk to the Guardians.

Finkle-street, Kendal, 7th October, 1854.

AT THE CRYSTAL PALACE.

## "The Duobus," a cheap close Carriage

for a "Country Practice," having all the comfort and convenience of a Brougham, with the weight of an ordinary Gig. Price £42. This Carriage can be seen at the new Crystal Palace, and sketch and particulars obtained on application to T. R. Storey, Coachmaker, Nottingham.

## Ten Thousand Stoves.—The Tenth

Thousand of the PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, and CO., 46, King William-street, London-bridge, and may be obtained of most ironmongers. The Improved Patent Ventilating Stove, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded, post free.

## Purification of Linen.—Prevention of

DISEASE.—J. BOILEVE, 55, King William-street, City, London, solicits the attention of the Nobility and Gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

69, Marylebone-lane, London, Feb. 2nd, 1854.

SIR,—I have much pleasure in informing you, that I am entirely satisfied with the performance of your No. 3 Calorifere, lately put up for warming my manufactory; it has been in operation for a month, and I believe it to be the best and most economical means of drying yet invented, and particularly suited to my business, as there is no dust arising from its use, as there is from the old stoves. The consumption of coke is about one bushel per day.

I am, Sir, yours truly,

SAMUEL HUBERT.

To J. Boileve, Esq. Firm of JOHN WOOLLAWS and Co., Paper-stainers

## Warming and Ventilating by Hot

AIR, CHURCHES, HOSPITALS, TOWN-HALLS, and other PUBLIC BUILDINGS.—J. BOILEVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

New Independent Chapel, Longsight, Manchester, January 10th, 1853.

SIR,—I am instructed by the building committee of the above Chapel to order one of your No. 3 Calorifere, for heating and ventilating the School in connexion therewith. As the sub-committee, upon examination of most of the public buildings, churches, and chapels in the town, find such general dissatisfaction with the existing apparatus and their imperfect heating and ventilation, they have examined your Calorifere in operation, and believe it best adapted to meet their wants. It is intended, should it prove successful, to apply another apparatus to the chapel.

To J. Boileve, Esq.

SAMUEL RIGBY, Secretary.

New Independent Chapel, Longsight, Manchester, April 12th, 1854.

DRAWN SIR,—I am authorized to inform you that the No. 4 Calorifere, erected to warm the Longsight Independent Chapel, is in every respect satisfactory to the committee and the congregation.

Yours respectfully,

To J. Boileve, Esq.

ROBERT BURNETT, Chairman.

TO THE PROFESSION.

## Mr. Bowmer, M.R.C.S. Eng., 50,

LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

aged twenty-four, a neat and accurate Dispenser, and accustomed to Visiting and Obstetric Practice, requires a Situation with a General Practitioner, either in town or country. No objection to Union Practice. The most satisfactory references as to capabilities, &c.—Address, prepaid, to A. B., Post-office, Littlehampton, Sussex.

**To be disposed of, a good General**  
PRACTICE, with Retail Returns, £800 per annum. The above is situate in a wealthy and populous district, four hours' ride from Town, is well established, and will bear the strictest investigation. A good introduction will be given, and the Purchaser will receive the full value of his Purchase Money, it is therefore requested no person will apply who cannot command the sum of £800.—Address, Medicus, care of Mr. Gilbert, 95, Oxford-street, London.

# DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY,  
AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM,  
AND ALL SCROFULOUS DISEASES.

Approved of and recommended by **BERZELIUS, LIEBIG, WOEHLER,**  
**JONATHAN PEREIRA, FOUQUIER,** and numerous other distinguished scientific Chemists.

Prescribed by the most eminent Physicians, and supplied to the leading Hospitals of Europe.

Specially rewarded with Medals by the Governments of Belgium and the Netherlands.

Has almost entirely superseded all other kinds on the Continent, in consequence of its proved superior power and efficacy—  
effecting a cure or alleviating symptoms much more rapidly.

Contains iodine, phosphate of lime, volatile acid, and the elements of the bile—in short, all its most active and essential  
principles—in larger quantities than the Pale Oils made in England and Newfoundland, deprived mainly of these by their  
mode of preparation.

*The following Extracts are selected from some of the leading Medical and Scientific Testimonials in favour of*  
**DR. DE JONGH'S COD-LIVER OIL:—**

**BARON LIEBIG,**

Professor of Chemistry at the University of Giessen, &c. &c.

"You have rendered an essential service to science by your researches, and  
your efforts to provide sufferers with this Medicine in its purest and most genuine  
state must ensure you the gratitude of every one who stands in need of its use."

The late

**Dr. JONATHAN PEREIRA,**

Professor at the University of London, Author of the "Elements of Materia  
Medica and Therapeutics," &c. &c.

"I know that no one can be better, and few so well, acquainted with the  
physical and chemical properties of this medicine as yourself, whom I regard  
as the highest authority on the subject. The Oil which you gave me was of  
the very finest quality, whether considered with reference to its colour, flavour,  
or chemical properties; and I am satisfied that for medicinal purposes no finer  
oil can be procured."

**Dr. FOUQUIER,**

Professor at the University of Paris, Physician to his late Majesty  
Louis Philippe, &c. &c.

"You have preserved to science the use of a medicine that might have  
fallen into utter discredit, in consequence of its unaccountable inaction in  
some cases."

**Dr. R. RIEGEL,**

Of Karlsruhe, Grand Duchy of Baden.

"This analysis has convinced me that Dr. de Jongh's Oil is not only pre-  
pared with greater care than the ordinary Cod-liver Oil, but that it contains in  
larger quantities those principles which are generally admitted to be most  
active and essential, so that it ought to be considered the most efficacious  
kind."

**Dr. SEGNIETZ,**

Of Gelnhausen, Duchy of Hessen.

"I am bound to state that this Oil is greatly superior to all other kinds  
previously used by me, and that, therefore, the object aimed at by the use of  
this remedy is more surely attained by this Oil than by any other kind."

The

**INTENDANT OF THE CIVIL LIST OF BELGIUM.**

"The King has charged me to return you his very particular thanks for the  
homage done to him, by the presentation of your most valuable researches  
concerning the Cod-liver Oil: as an expression of his utmost satisfaction, he  
has given me the order of presenting you with the accompanying large Gold  
Medal."

**Dr. VAN DEN BYNDEN,**

Emmerich.

"I CAN conscientiously recommend it to my colleagues as being superior to  
all other kinds."

The

**MINISTER OF THE INTERIOR OF HOLLAND.**

"I HAVE the honour of bringing to your knowledge, that it has pleased  
the King to grant you, by his Decree of the 20th January, 1854, No. 101, a  
Silver Medal with an appropriate honorary inscription, as a testimony of his  
Majesty's high approbation for your efforts in securing to this country a  
supply of the most efficacious Cod-liver Oil from Norway. I have given the  
necessary orders for the execution of this Medal."

**THE ROYAL POLICE OF PRUSSIA.**

"THE Royal Police of Prussia (Königliches-Polizei-Præsidium) has the  
honour of informing you that it has caused the sample which you have  
forwarded to be submitted to an official investigation, and that the result of  
such investigation has proved it to be not only the genuine Cod-liver Oil, but  
still further, that it is of a kind which distinguishes itself from the Cod-liver  
Oil in ordinary use, alike by its taste and chemical composition."

**"THE LANCET,"**

(July 29th, 1854.)

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de  
Jongh gives the preference to the Light-brown Oil over the Pale Oil, which  
contains scarcely any volatile fatty acid, a smaller quantity of iodine, phos-  
phoric acid, and the elements of bile, and upon which ingredients the efficacy  
of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the Pale  
Oil are attributable to the method of its preparation, and especially to its  
filtration through charcoal. IN THE PREFERENCE OF THE LIGHT-BROWN  
OVER THE PALE OIL WE FULLY CONCUR."

"WE HAVE CAREFULLY TESTED A SPECIMEN OF THE LIGHT-BROWN COD-  
LIVER OIL, PREPARED FOR MEDICAL USE UNDER THE DIRECTION OF DR. DE  
JONGH, AND OBTAINED FROM THE WHOLESALE AGENTS, MESSRS. ANSAR,  
HARFORD, AND CO., 77, STRAND. WE FIND IT TO BE GENUINE, AND RICH IN  
IODINE AND THE ELEMENTS OF BILE."

**"THE MEDICAL TIMES,"**

(August 5th, 1854.)

"We believe that the profession are much indebted to Dr. de Jongh for his  
laborious researches into the composition and properties of this Oil; and we  
have the high authority of Baron Liebig and the late Dr. Pereira, in testimony  
of the value of these labours. In his zeal for investigating the properties of  
the Oil, Dr. de Jongh made a journey to Norway, and carefully examined its  
varieties, its mode of preparation, and its adulterations."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S Stamp and Signature, by

**ANSAR, HARFORD, & CO., 77, STRAND, LONDON,**

Sole Consignees and Agents for the United Kingdom and British Possessions, and may be obtained from  
respectable Chemists and Druggists in Town and Country, at the following prices:—

HALF-PINTS ... .. 2s. 6d. | PINTS ... .. 4s. 9d. | QUARTS ... .. 9s.

**IMPERIAL MEASURE.**

\*. Hospitals and other Charitable Institutions requiring large quantities may be supplied on  
considerably reduced terms.

PRINTED by THOMAS CHUTE SAVILL, at his Printing Office, No. 4, Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the  
county of Middlesex; and published for the Editor by GEORGE CHURCHILL, of No. 423, Strand, in the parish of St. Martin-in-the-Fields, Westminster,  
in the said county, at No. 423, Strand, aforesaid; and sold by all Booksellers and News-vendors in Great Britain and Ireland and the Colonies.—  
Saturday, October 21, 1854.

## MEDICAL HANDBOOKS

PUBLISHED BY MR. S. HIGHLEY.

### Mr. S. Highley's Publications may

be seen and obtained of his English Agents:—Mr. Graham, Oxford; Messrs. Macmillan and Co., Cambridge; Messrs. Simms and Denham, Manchester; Mr. J. H. Bellby, Birmingham; Deighton and Loughton, Liverpool; Mr. C. Heald Thomas, Gloucester; Fletcher and Alexander, Norwich; Mr. Leng, Hull; Messrs. Sutherland and Knox, Edinburgh; Mr. Hadden, Glasgow; Mr. J. A. Wilson, Aberdeen; Messrs. Hodges and Smith, Dublin; and Gentlemen remote from Towns may procure any Work contained in this Catalogue by forwarding a Post-office Order for the Price specified. All works above 5s. in price will be sent Carriage Free to any part of Great Britain and Ireland.

**A CLINICAL HANDBOOK OF AUSCULTATION AND PERCUSSION.** From the German of WEBER. By JOHN COCKLE, A.M., M.D., Physician to the City Dispensary. Illustrations. Price 5s. [Just published.]

"Notwithstanding our already valuable manuals, this is one for which the student will be thankful."—THE LANCET.

"This is an excellent manual for the student. It unfolds in clear language—assisted by expressive woodcuts—the elementary principles of Auscultation and Percussion."—ASSOCIATION MEDICAL JOURNAL.

**MANUAL OF AUSCULTATION AND PERCUSSION.** Principally compiled from Meriédec Laennec's Edition of LAENNEC's great Work. By J. B. SHARPE, M.B.C.S. Third Edition. 1s.

**THE MICROSCOPE, its Applications to Clinical Medicine.** By Dr. LIONEL BEALE, Professor of Physiology and Anatomy in King's College, London. 233 Illustrations, and one Chromo-Lithograph. Price 10s. 6d. [Just published.]

"A want in English medical literature, much felt for some years back by both the student and the practitioner, is here well supplied by Dr. Beale."—DUBLIN JOURNAL OF MEDICAL SCIENCE.

"A work that ought to be in the hands of every medical student, and in the library of every medical practitioner. The information in it is excellent, and well arranged."—EDINBURGH NEW PHILOSOPHICAL JOURNAL.

"This, though a small volume, is the most complete work on the application of the Microscope to clinical medicine hitherto published in this country. We do not see how in the present state of clinical medicine any but the mere routine empiric can dispense with such a book as this."—ASSOCIATION MEDICAL JOURNAL.

**CLINICAL MEMORANDUM BOOK.** Oblong. Price 4s.

"To the frequenter of the clinical wards of hospitals it will be found an invaluable companion."—MEDICAL GAZETTE.

**THE EQUIVALENTS OF THE ELEMENTARY BODIES,** arranged on cards in duplicate, and designed to Facilitate the Study of Chemical Composition and Decomposition. By JOHN GORHAM, Surgeon. Price in envelope, 2s. 6d.; in divided box, 5s.

London: S. HIGHLEY, 32, Fleet-street.

Just published, 8vo, price One Shilling.  
**Painless Tooth-Extraction, without**  
 CHLOROFORM; with Observations on Local Anæsthesia by Congelation in General Surgery. By WALTER BLUNDELL, Surgeon-Dentist.  
 London: John Churchill, New Burlington-street.

Just Published,  
**How to Use Midwifery Instruments;**  
 written in the form of Dialogue. By JOHN ROBERTSON, formerly Senior Surgeon in Ordinary to the Manchester and Salford Lying-in Hospital.  
 Printed for John and Wm. Wood, Surgical Instrument Makers, 74, King-street, Manchester; and sent by them free on receipt of eighteen stamps.

KNOWLEDGE FOR THE YOUNG.  
 In 18mo, with Woodcuts, price One Shilling,  
**The Stepping-Stone to Animal and**  
 VEGETABLE PHYSIOLOGY. By MARY SHIELD.  
 London: Longman, Brown, Green, and Longmans.

NEW EDITION OF NEVINS'S PHARMACOPEIA.  
 The Second Edition, carefully revised throughout; in post 8vo, with many Woodcuts, price 18s.  
**Dr. Nevins's Translation of the New**  
 LONDON PHARMACOPEIA, including also the NEW DUBLIN and EDINBURGH PHARMACOPEIAS; with a full Account of the Chemical and Medicinal Properties of their Contents: forming a complete Materia Medica.  
 London: Longman, Brown, Green, and Longmans.

The Third Edition, in One Volume, 8vo, price 14s.  
**Lectures on the Diseases of Infancy**  
 AND CHILDHOOD. By CHARLES WEST, M.D., Physician to the Hospital for Sick Children, and Physician-Accoucheur to St. Bartholomew's Hospital. The Third Edition, revised throughout and enlarged.

By the same Author, in 8vo, price 6s.  
**AN INQUIRY INTO THE PATHOLOGICAL IMPORTANCE OF ULCERATION OF THE OS UTERI.**  
 London: Longman, Brown, Green, and Longmans.

Just published; price 6s. Illustrated with numerous Engravings on Wood.  
**The Eye in Health and Disease.**  
 With a description of the Oculometer, for the adaptation of Spectacles, for Impaired, Defective, or Aged Sight. Being the substance of Lectures delivered at the Central London Ophthalmic Hospital. By ALFRED SMEE, F.R.S., Surgeon to the Bank of England, Surgeon to the Central London Ophthalmic Hospital, &c. Second Edition; to which is added a Paper on the Stereoscope and Binocular Perspective.  
 Longman and Co., Paternoster-row; Home, Thornthwaite, and Wood, 123, Newgate-street.

Now ready; price 5s.  
**The Dublin Quarterly Journal of**  
 MEDICAL SCIENCE, for NOVEMBER.

ORIGINAL COMMUNICATIONS.  
 On a Calculus Meter and Sound for the Child. By Dr. FLEMING.  
 On Unsoundness of Mind in its Medical and Legal Considerations. By Dr. WELLS.  
 Reports in Operative Surgery. By Mr. BOWEN.  
 On Scandies. By Dr. LEE.  
 On Syphilis in Pregnant Females. By Dr. JONES.  
 Case of Femoral Aneurism cured by Compression. By Dr. COOPER.  
 The Proportion of Carbonic Acid exhaled in Phthisis Pulmonalis. By Dr. MALCOLM.  
 On Cholera at Finglas. By Dr. CHARLES F. MOORE.  
 Notes on Cholera in London. By Dr. KING.

REVIEWS AND BIBLIOGRAPHICAL NOTICES.  
 Insanity, and Hospitals for the Insane—BUCKLER on Fibro-Branchitis and Rheumatic Pneumonia—DEGRAFFON on the Treatment of Prolapsed Uteri—GRAVE'S Notes of Travel—BROWN on the Surgical Diseases of Women—PRINCE SANTA on Medical Education in Yucatan—MASON on the Diseases of the Fœtus in Utero—SCOTT'S Anatomical and Physiological Observations—DRAY on Syphilis in New-born Children—BELL on the Circulation and Nervous System—CASES on the Injuries incidental to Warfare—GILBERT'S Jahresbericht—EAL SHAWKOP'S Discourse on Medical Botany—WARD on Strangulated Hernia—GRAVILL on Sudden Death—MOORE on Improvements in Sewerage.

NOTES ON LIST OF BOOKS RECEIVED.—Lee's Guides to Spain, Nice, and the Watery Places of England; Milton on Spermatorrhœa and Impotence; Moffat's Walks and Wells; Tanner's Practice of Medicine; Clarke on Consumption; Harvey on the Ear; Peddie on Delirium Tremens; Cutler's Guide to Spa; Pereira's Lectures on Polarized Light; Lizars on Tobacco; Tunstall on the Climate of Bath; Transactions of the Pathological Society of London.

MEDICAL MISCELLANY.  
 Transactions of the College of Physicians of Ireland—Illustrations of French Operative Surgery: 1. MAISONNEUVE'S Extirpation of an Ivory Exostosis; 2. M. JOBERT'S Intra-Uterine Speculum; 3. M. JOBERT DE LAMALLE'S Hemorrhoidal Capsule; 4. M. MAISONNEUVE on a New Method of Urethrotomy—Dr. CHEVANDIER on Terebinthinated Vapour Baths—MOURGON on Oculometer—QUERVEN on the Medicinal Action of Iron.  
 Index to Vol. XVIII.

Dublin: Hodges and Smith, Grafton-street. London: Longman and Co., and Simpkin, Marshall, and Co.

Now ready at all the Libraries, in Three Vols.  
**A Physician's Tale.**  
 By HERBERT SPENCER.  
 "A story full of incidents of the most extraordinary character, told in a vigorous and animated style, in which the human heart is exhibited in every variety of aspect. The reader will rise from it no less instructed than entertained. From first to last the interest never flags for a moment."—JOURN. BELL.  
 "This story is well written. It has sufficient merit to render it a popular novel, the moral and instructive tendencies of which cannot be questioned."—MORNING HERALD.

Hurst and Blackett, Publishers, Successors to Henry Colburn, 13, Great Marlborough-street.

Now ready; large 12mo, 4s. 6d. cloth.  
**On Pain after Food; its Causes and**  
 TREATMENT. By EDWARD BALDARD, M.D., Lond.; Lecturer on the Practice of Medicine at the School of Medicine adjoining St. George's Hospital; Author of the "Physical Diagnosis of Diseases of the Abdomen."  
 London: Walton and Maberly, Upper Gower-street, and Fry-lane, Paternoster-row.

One Volume 8vo, illustrated by 250 Engravings on Wood, £1 8s.  
**The Science and Art of Surgery;**  
 a Treatise on Surgical Injuries, Diseases, and Operations. By JOHN ERICHSEN, Professor of Surgery in University College, and Surgeon to University College Hospital.  
 "Recommended as a whole, we recommend it as the best compendium of surgery in our language. The clear and easy style of composition, and the excellent illustrations, in number more than 250, independently of its other merits, will tend to make the work a favourite both with students and practitioners."  
 —THE LANCET.  
 London: Walton and Maberly, Upper Gower-street, and Fry-lane, Paternoster-row.

Just published, Second Edition, price 1s.  
**A Hint and a Help to form a just**  
 DIAGNOSIS OF DISEASE; to which are now added a Brief Treatise on the Physiognomy of Diseases, and a Synopsis of Thoracic Diseases; with the Alphabet of Auscultation. [For the use of Students.] By GEORGE CORPE, M.D., Middlesex Hospital, Author of "A Series of Papers on Semiotics; or, Twenty-five Years' Hospital Practice."  
 London: Houlston and Stottman, 65, Paternoster-row; Kimpton, Medical Bookseller, Wardour-street. Of whom may be had, by the same Author,  
**THE PHYSIOGNOMY OF DISEASES.**  
 Cloth, with Plates, 2s.; ditto, without Plates, 4s.

Now ready, in 8vo, cloth, price 12s. 6d.  
**Hooper's Physician's Vade-Mecum;**  
 or, a Manual of the Principles and Practice of Physic. Fourth Edition, much enlarged and improved. By Dr. GUY, of King's College.  
 London: Henry Benschaw, Whitaker and Co.; Simpkin and Co.; J. Churchill; S. Highley, Houlston and Co. Edinburgh: A. and C. Black; Macbeth and Co. Dublin: Feeney and Co.

Now ready, Sixth Edition, foolscap, cloth, price 12s. 6d.  
**Druitt's Surgeon's Vade-Mecum.**  
 A Manual of Modern Surgery. The Sixth Edition, re-written, enlarged, much improved, and illustrated by 300 Wood Engravings.  
 London: Henry Benschaw, 356, Strand; and John Churchill, New Burlington-street.

On November 1st, in 18mo, cloth, sewed, price 5s.  
**The Practitioner's Pharmacopœia**  
 and UNIVERSAL FORMULARY, containing 2000 Classified Prescriptions, selected from the Practice of the most eminent British and Foreign Medical Authorities; with an Abstract of the three British Pharmacopœias, and much other useful information for the Practitioner and Student. By JOHN FOOTE, M.B.C.S. Lond.  
 London: Henry Benschaw, 356, Strand; and Simpkin, Marshall, and Co., Stationers'-court.

In fcap. cloth, price 7s.  
**The Diseases of the Fœtus in Utero,**  
 with an Outline of Fœtal Development. By HENRY MADGE, M.D., M.B.C.S., &c.  
 "Valuable, inasmuch as it brings together in the smallest compass the most important part of what is known on the subject."—MEDICAL TIMES AND GAZETTE.  
 "This effort to bring into one view the materials scattered abroad on this interesting subject deserves much praise."—MEDICAL CIRCULAR.  
 London: Henry Benschaw, 356, Strand.

Just published, foolscap 8vo, cloth, price 9s.  
**Manual of Diseases of the Skin.**  
 From the French of M. CAZENAVE. Second Edition, thoroughly revised, much improved, and considerably enlarged, by the addition of all the recent improvements in Cutaneous Pathology. By THOMAS H. BURGESS, M.D.  
 London: Henry Benschaw, 356, Strand.

Just published, in fcap. 8vo, cloth, price 7s.  
**A Treatise on Hooping-Cough: its**  
 Complications, Pathology, and Terminations; with its Successful Treatment by a New Remedy. By GEORGE D. CHAMBERLAIN, M.D.  
 London: Henry Benschaw, 356, Strand.

In cloth, sewed, price 2s. 6d.  
**The Pharmacopœia of the Royal**  
 COLLEGE OF PHYSICIANS for 1851. Translated by a PHYSICIAN.  
 London: Henry Benschaw, 356, Strand.

# THE BRITISH MEDICAL DIRECTORY

## FOR 1855.

The Editors respectfully and gratefully acknowledge the receipt of a large number of "Returns" for this Directory.

The Editors have stated on previous occasions, that when the entries in the Directory for the current year (1854) are found to be correct, a mere intimation of that fact will be sufficient; but when alterations are required, they should be distinctly specified, and in all cases the Names should be written clearly, and at full length.

Lists of the Names of duly-qualified Practitioners resident in the several Cities, Towns, and Villages of the United Kingdom, will be thankfully received, as also information of the Death, Removal, or Appointment to a Public Office, of any duly-qualified Practitioner. In the Metropolis, and other Cities and large Towns, the streets and numbers of the Houses should be given.

Duly-qualified Practitioners who have already responded to these appeals would confer a favour on the Editors by inducing Professional friends and neighbours to make their "Returns" as quickly as possible, as delays might evidently cause some names to be omitted.

"The BRITISH MEDICAL DIRECTORY, for ENGLAND, WALES and SCOTLAND," to be published on the 1st of January, 1855, may be obtained of all Booksellers and Newsmen, price Six Shillings, (including One Shilling postage.)

OFFICE, 423, STRAND.

### Mayall's Daguerreotype Portrait

GALLERIES, 224, Regent-street, (corner of Argyle-place,) and 433, West Strand.

Mr. Mayall begs to invite inspection of his extensive collection of DAGUERREOTYPE PORTRAITS OF EMINENT MEDICAL, SCIENTIFIC, and LITERARY MEN, Panoramas from Nature, and Views of the late Exhibition; together with specimens of every improvement in the art. The originals of THE LANCET PORTRAITS on view.

### H. Silverlock's Medical Label Ware-

house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.

The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letter-press, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent per post on application.

**If you require Family**

ARMS, send Name and County to the HERALDIC OFFICE. Fee for Search and Sketch, 3s. 6d., or postage-stamps; Crest Engraved on Seal, Signet Rings, &c., 8s. 6d.; Arms, with Name, on plate, for books, £1 1s.; Arms Painted, Engraved, and Quartered.

TESTIMONIALS, Memorials, Addresses, and Votes of Thanks written, Illuminated, and Emblazoned on Vellum.

H. SALT, Lincoln's-inn Heraldic Office, Great Turnstile, Lincoln's-inn-fields.

**The Pen Superseded.**

The most elegant, easy, economical, and best method of MARKING LINEN, Silk, Books, &c., without the ink spreading or fading, is with the INCORRODIBLE ARGENTINE PLATES. No Preparation required. Any person can use them with the greatest facility. Name-plate, any style, 2s. 6d.; Initials, ditto, 1s. 6d.; Numbers, per set, 2s. 6d.; Crest, 5s. Sent, post free, with directions, on receipt of stamps or post order.

FREDK. WHITEMAN, Inventor and Sole Maker, 19, Little Queen-street, Holborn.

### Allen's Illustrated Catalogue, con-

taining size, price, and description of upwards of 100 articles, consisting of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes, Writing-desks, Dressing-cases, and other travelling requisites, forwarded on receipt of two stamps.

ALLEN'S TRAVELLING-BAG (patented) has the opening as large as the bag itself, and therefore possesses an immense advantage over all others.

ALLEN'S REGISTERED DESPATCH-BOX and WRITING-DESK, and their New Quadruple Portmanteau (containing four compartments), are the best articles of the kind ever produced.

J. W. and T. ALLEN, Manufacturers of Portable Barrack-room Furniture, and Military Outfitters, (see separate Catalogue,)

18 & 22, WEST STRAND.

AT THE CRYSTAL PALACE.

### "The Duobus," a cheap close Carriage

for a "Country Practice," having all the comfort and convenience of a Brougham, with the weight of an ordinary Gig. Price £42. This Carriage can be seen at the new Crystal Palace, and sketch and particulars obtained on application to T. R. Starey, Coachmaker, Nottingham.

### Metcalf and Co's New Pattern

TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfumery for the toilet.—At METCALFE, BINGLEY, and CO.'S only establishment, 130B and 131, Oxford-street, second and third doors west from Holles-street. Metcalfe's Alkaline Tooth Powder, 2s. per box.

### Cholera Prevented! Rettie's Patents.

SELF-ACTING SEWER AND SINK TRAPS, for Streets and Kitchen Sinks, to prevent all effluvia from Drains, Cesspools, and Urinals. Damp Houses cured at Fourpence per day, giving a dry, warm temperature, for sick or invalids.

PORTABLE CHAMBER CLOSETS, free from all effluvia.

Orders to E. M. and M. Rettie, 7, Brompton-road. (Enclose Stamp.)

N.B.—Beware of imitations on the above Patents.

### Metal Bed-Pan, Price 6s.—Acknow-

ledged to be the most convenient in form, and much more durable than any now in use.

To be had of the Manufacturer, J. LAWRENCE, 20, Great Charlotte-street, Blackfriars; or of Messrs. Gale, Baker, Warde, and Oldfield, Bonverie-street, Fleet-street.

Orders from the Country must be accompanied by a Remittance.

### Poultices superseded by the use of

MARKWICK'S PATENT SPONGIO PILINE.

As a substitute for common poultices and fomentations, the superiority of this article is unquestionable. It is strongly recommended by the most eminent of the Faculty for its cleanliness, economy, lightness, and general efficacy, and is now used in several of the hospitals. Also Markwick's Patent Piline, for Cholera Belts, Rheumatism, Chest Protectors, Respirators, Lum- bago, &c.

Sold, retail, by Chemists and Druggists, and wholesale only by GEORGE TRIMBEY, 41, Queen-street, Cheapside.

### Mathey Caylus' Gluten Capsules

contain the purest Copiba, either simple or combined with Citrate of Iron, Ratanhy, Cubeba, &c.; acknowledged by the London and Paris Hospitals; also by the Lock Hospital; M. Lesueur, chef de Travaux Chimiques à l'Académie de Médecine; Drs. Ricord, Cullerier, &c., who have granted written attestations, to be the best prepared Medicine for the cure of certain diseases.

Extract of a Letter from Dr. Cullerier:—

"I cannot induce you too much to extend the use of your preparations; by so doing you will render a valuable service to the therapeutic of hemorrhagic affections."

"I am, &c.,

"CULLERIER,

"Chirurgien de l'Hôpital de Lourcine."

Sold in Bottles, at 2s. 9d. and 4s. 6d., sealed and stamped with the Government stamp, bearing the name of the Patentee. To be had wholesale and retail of Robert King, French and English Pharmaceutical Chemist, 21, Princes-street, Hanover-square; and all respectable Chemists in the United Kingdom.—Country agents required.

## New Equitable Assurance Company,

(Incorporated by Act of Parliament, 7 and 8 Vict. cap. 110.)

CHIEF OFFICES—449, STRAND, LONDON.

BRANCH OFFICES.—SAVINGS BANK, WORCESTER.

CAPITAL, £100,000.

### TRUSTEES.

SIR JAMES DUKE, Bart., Ald., M.P.  
WILLIAM FERGUSSON, Esq., F.R.S.  
SIR CHARLES HASTINGS, M.D., D.C.L.  
GEORGE JAMES GUTHRIE, Esq., F.R.S.

### DIRECTORS.

SIR CHARLES HASTINGS, M.D., D.C.L., Chairman of the Board.  
GEORGE BEAMAN, Esq., M.D., F.R.C.S., Deputy Chairman.

### MEDICAL PRACTITIONERS.

THE DIRECTORS ACKNOWLEDGE AND CONSULT ALL DUTY-QUALIFIED MEDICAL PRACTITIONERS AS THE MEDICAL ADVISERS OF THE COMPANY, AND UNIFORMLY PAY A FEE OF TWO GUINEAS FOR EVERY MEDICAL REPORT, WHEN THE PROPOSAL FOR ASSURANCE IS FOR £200 AND UPWARDS, AND A PROPORTIONATE FEE FOR A SMALLER AMOUNT.

MEDICAL PRACTITIONERS ARE ALSO ENTITLED TO TEN PER CENT. COMMISSION ON FIRST-YEAR'S PREMIUMS, AND FIVE PER CENT. ON ALL SUBSEQUENT PAYMENTS, FOR ASSURANCES EFFECTED THROUGH THEIR INTERMEDIATION.

### EVERY DESCRIPTION OF LIFE ASSURANCE BUSINESS TRANSACTED.

Prospectuses, Forms for Proposals, and any further information, may be had on applying to the Resident Director, or Secretary, at either Office, or of the Company's Agents.

N.B.—Active and Influential AGENTS wanted.

## Elastic Supporting Belts, of the same

beautiful fabric as Pope and Plante's Elastic Stockings for Varicose Veins. Those for ladies' use, before and after accouchement, are ADAMANTLY ADAPTED FOR GIVING ADEQUATE SUPPORT WITH EXTREME LIGHTNESS—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed.

Instructions for measurement and prices on application, and the articles sent by post from the manufacturers, POPE and PLANTÉ, 4, Waterloo-place, Pall Mall, London.

## Dissecting and Post-Mortem Instruments.

MENTS, New and Second-hand. Surgical Instruments of the best description; A. URE'S New Urethrotome for Stricture; New Uterine Compress; Newly Improved Pessary; Instruments for Army and Navy Surgeons; DARTNELL'S Patent Truss; Trusses for Union Surgeons; Enema Syringes; New Syphon Enema, as supplied to the Army; New Spinal Machine, pronounced the best ever invented—at

PRATT'S, Surgical Instrument Maker, 420, Oxford-street.

## Henry Bigg, 9, St. Thomas's-street,

Borough, Surgical Instrument-maker to Guy's and St. Thomas's Hospitals, begs to call the attention of the Medical Profession to the following valuable instruments, made from designs and suggestions kindly given by the Gentlemen whose names are attached—viz., Mr. Le Gros Clark's Talipes Instrument; Mr. Bransby Cooper's Ovarian Trocar; Mr. Cock's Recto-Vesical Trocar; Mr. Cooper Forster's Ear Speculum; Mr. Hilton's Speculum Ani; Dr. Lever's Midwifery Instruments; Mr. Solly's Elastic Catheter, with Catgut Director. These instruments being constructed on the premises secure their excellence and perfect finish.

9, St. Thomas's-street, Borough, London.

## M. Pillischer's Newly-Constructed

STUDENT'S MICROSCOPE, which, for solidity, portability, and reasonable price, surpasses any Microscope hitherto made by any English or Continental maker. The Student's Microscope, with coarse and fine adjustments, single mirror, one eye-piece, a one-inch and one-quarter-inch French achromatic object-glasses of best quality, the whole packed in mahogany case, 7 in. by 6 in., £5 10s.; or with M. Pillischer's own-made, 1 in. of 18 degs. angular aperture, and 1 in. of 60 degs., £7.

The above stand with lever stage, extra eye-piece, double mirrors, animalcule cage, &c., £8; or with Pillischer's glasses, £9 10s.

A list of prices will be sent free on application to M. Pillischer, 88, New Bond-street.

## Hooper's Waterproof Sheeting, for

protecting Bedding from Sloughing Sores, Incontinence of Urine, Hemorrhage, &c.

MR. HOOPER has succeeded in obtaining Waterproof Sheeting, at a great reduction in price, soft, and inodorous; it is not affected by Urine, Heat, nor Cold, Acids, nor Alkalies, and may be washed as family linen.

Also, IMPROVED INVALID URINALS, with Valves, for sitting, lying, or travelling, in any position.

### FOR EPILEPSY.

COTYLEDON UMBILICUS.—The introduction of this valuable agent has proved a valuable discovery. The satisfactory accounts Mr. HOOPER has received have induced him to pay great attention to its collection and preparation. He cautions medical men against the use of worthless preparations, passed off for his, and as prepared for Mr. Salter, &c. Mr. Hooper has instructions to state that Mr. Salter has never used any but that obtained from him. A copy of Mr. Salter's reports in the "Medical Gazette" sent free by post.

GALIUM APARINE (HOOPER'S) FOR CUTANEOUS DISEASES, PSORIASIS, &c.—Dr. Winn, of Finsbury-square, having published in "The Medical Gazette," October 4th, 1861, an account of the peculiar properties of the Galium Aparine in Cutaneous Diseases, Lepra, Psoriasis, &c., Mr. Hooper has given his attention to preparing it in various forms. Dr. Winn finds the inspissated juice the most efficient preparation, which can be had from Mr. Hooper, or direct through the Wholesale Houses.

HOOPER, Operative Chemist, Pall Mall East, and Grosvenor-street.

## DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY,

AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

*The most effectual Remedy for Consumption, Bronchitis, Asthma, Gout, Chronic Rheumatism, and all Scrofulous Diseases.*

Approved of and recommended by BERZELIUS, LIEBIG, WOHLER, JONATHAN PEREIRA, FOQUIER, and numerous other distinguished scientific chemists.

Prescribed by the most eminent physicians, and supplied to the leading Hospitals of Europe.

Specially rewarded with Medals by the Governments of Belgium and the Netherlands.

Has almost entirely superseded all other kinds on the Continent, in consequence of its proved superior power and efficacy—effecting a cure or alleviating symptoms much more rapidly.

Contains iodine, phosphate of lime, volatile acid, and the elements of the bile—in short, all its most active and essential principles—in larger quantities than the pale oils made in England and Newfoundland, deprived mainly of these by their mode of preparation.

*The following Extracts are selected from some of the leading Medical and Scientific Testimonials in favour of Dr. de Jongh's Cod-liver Oil.*

### BARON LIEBIG,

Professor of Chemistry at the University of Giessen, &c. &c.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this Medicine in its purest and most genuine state must ensure you the gratitude of every one who stands in need of its use."

### The late

### DR. JONATHAN PEREIRA,

Professor at the University of London, Author of the "Elements of Materia Medica and Therapeutics," &c. &c.

"I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this Medicine as yourself, whom I regard as the highest authority on the subject. The Oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

### "THE LANCET,"

(July 29th, 1864.)

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de Jongh gives the preference to the Light-brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. IN THE PREFERENCE OF THE LIGHT-BROWN OVER THE PALE OIL WE FULLY CONCUR.

"WE HAVE CAREFULLY TESTED A SPECIMEN OF THE LIGHT-BROWN COD-LIVER OIL, PREPARED FOR MEDICAL USE UNDER THE DIRECTION OF DR. DE JONGH, AND OBTAINED FROM THE WHOLESALE AGENTS, MESSRS. ANSBAR, HARFORD, AND CO., 77, STRAND. WE FIND IT TO BE GENUINE, AND RICH IN IODINE AND THE ELEMENTS OF BILE."

### "THE MEDICAL TIMES,"

(August 6th, 1864.)

"We believe that the profession are much indebted to Dr. de Jongh for his laborious researches into the composition and properties of this Oil; and we have the high authority of Baron Liebig and the late Dr. Pereira, in testimony of the value of these labours. In his zeal for investigating the properties of the Oil, Dr. de Jongh made a journey to Norway, and carefully examined its varieties, its mode of preparation, and its adulterations."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S stamp and signature, by

## ANSBAR, HARFORD, AND CO.,

77, STRAND, LONDON,

Sole Consignees and Agents for the United Kingdom and British Possessions, and may be obtained from respectable Chemists and Druggists in Town and Country, at the following prices:—

HALF-PINTS ... 2s. 6d. | PINTS ... 4s. 9d. | QUARTS ... 9s.

### IMPERIAL MEASURE.

\* Hospitals and other Charitable Institutions requiring large quantities may be supplied on considerably reduced terms.

# Lectures ON DISEASES OF THE JOINTS.

*Delivered at St. Mary's Hospital.*

By WILLIAM COULSON, Esq.

SURGEON TO THE HOSPITAL.

## LECTURE VIII.—(Concluded from p. 272.)

### ON SUPPURATION OF THE JOINTS FROM INFECTION OF THE BLOOD.

WHEN the disease occurs in puerperal females, it often presents certain characters which have induced obstetric physicians to describe it as a distinct complaint, or confound it with the phenomena of puerperal fever. This I believe to be an error. Puerperal women are often attacked by purulent inflammation of the joints, without any of the symptoms which really indicate puerperal fever; but the constitutional symptoms of the purulent infection on which the articular disease depends have been mistaken for those of anomalous puerperal fever, which they resemble to a certain degree. On the other hand, puerperal fever, as you well know, is frequently complicated with purulent inflammation of the veins of the uterus, pelvis, &c.; and in such cases we may have secondary articular disease, excited, not by the fever, but by the inflammatory condition of the veins which accompanies it as a complication. Here we have purulent infection of the blood superadded to puerperal fever; the disease is a complicated one; the symptoms peculiar to each element become masked, and they may be readily confounded: yet, by remembering the course and symptoms of uncomplicated purulent infection, we can generally find our way through a labyrinth which were otherwise inextricable. That purulent inflammation of the joints does not essentially depend on puerperal fever, but on some other condition, is shown by the fact that it occurs after abortion in the early months of pregnancy, when improper means have been employed to evacuate the uterus, and when nothing resembling puerperal fever occurs. Here we have all the essential symptoms of purulent infection followed by articular disease; and although these unfortunate cases, from obvious reasons, are seldom investigated after death, yet the symptoms during life leave no doubt of their identity with purulent infection of the blood.

The state of the joints in patients cut off—I will not say *by*, but *during* these puerperal affections—is pretty nearly the same as in other cases, but the peculiarities of the puerperal state, or the complication with puerperal fever, may modify the morbid appearances in a slight degree. It would seem to be established that the puerperal disease has a great tendency to attack several joints in rapid succession. There is not, I believe, a case on record in which the inflammation was confined to a single joint. The cartilages, also, are more apt to suffer in this form; in many cases they have entirely disappeared, the ends of the bones being denuded, rough, and perhaps ulcerated. Serum and pus are more frequently found in the tissues outside the joint; and the muscular structures are very often involved, particularly the muscles of the calf of the leg and back of the fore-arm, which may be infiltrated with pus, or be entirely disorganized. Another peculiarity of this form is the oedematous condition of the limb, resembling phlegmasia dolens. The skin covering the affected joint is sometimes of a natural colour; sometimes with a blush of redness over the swollen parts; but the joint never presents the solid rounded form of white swelling, or the elastic feel of synovial effusion. The pain is occasionally slight, but more frequently it is severe, and increases suddenly in a manner quite disproportionate to the changes apparently taking place in the joint. We should, however, form a very incorrect idea of the nature and dangerous character of this disease if we were to confine our examination to the affected joints. In the great majority of cases which have been submitted to careful and minute examination after death, traces of purulent effusion have been found in the internal organs, and in various parts of the body. I even think it probable that pus-globules might be detected in the blood during life; and I am led to this conclusion by the results of the examination instituted by Mr. Gulliver and Mr. Dalrymple, at my request, in the case of Mary L., which I have already related. However this may be, it is certain that circumscribed abscesses or purulent infiltrations are almost always found in the lungs, liver, kidneys, or brain, in the

No. 1626.

heart, in the cellular tissue or muscles, in the uterus or some of its appendages, and finally in the minute veins of the spongy tissue of bones. The symptoms during life will often indicate the precise organ in which we may expect to find these collections of pus. They take place more readily in the lungs and liver than anywhere else; after them, in the muscles, the heart, and brain.

Before describing the general symptoms which accompany this acute purulent affection of the joints, I will say a few words relative to its origin or exciting causes. It commences under circumstances quite different from those which excite other forms of articular disease. Peculiar states of the constitution, such as those arising from gout, rheumatism, syphilis, scrofula, &c., have no influence here; nor can it be traced to any of the immediate causes of ordinary synovial inflammation, as external violence, cold, moisture, &c. It often attacks the healthiest individuals in the prime of life, after amputation of a limb, for example, which has been performed in consequence of some severe accident. Unlike other articular diseases of constitutional origin, it is never chronic, but always of a most acute character, and when connected with the puerperal state it may appear to be epidemic.

The general symptoms are various and irregular, because numerous important viscera may be involved during the course of the disease, as the post-mortem appearances show; still the irregularity is rather one of degree than of kind, and any one who has seen a few cases of the disease cannot fail to detect it. In a great many cases the constitutional symptoms are ushered in by shiverings, which are so severe, and recur in such a manner from day to day, as successive depositions of pus take place, that inexperienced practitioners have mistaken the disease for intermittent fever. The rigors continue sometimes for half-an-hour, and are followed by slight perspiration, they may recur at determined intervals, but generally cease on the second or third day, after which they appear at very uncertain periods, or are noticed no longer. These rigors are immediately followed by fever of a very peculiar kind. It has been said to resemble strongly typhoid fever, but no medical man accustomed to watch the slow development and gradual progress of true typhoid fever could ever be deceived by the points of resemblance. In the form now referred to, the pulse rises rapidly to 120 or even 140, it is however extremely variable, and often weak; the skin is hot, though from time to time the temperature is little above the natural standard, being probably reduced by the partial sweats which break out. The countenance becomes anxious and sunken at a very early period, and there is often a dull, yellowish tinge of the face. The stupor and delirium of typhus fever never exist at the commencement, still the patient's expression soon becomes wild from anxiety, and there is low muttering delirium, from which he is easily roused. As the disease advances various symptoms supervene, and many of these probably depend on the fact, revealed by dissection, that important internal organs are successively implicated in it. Thus, in some cases, the delirium becomes extremely violent, in others we find vomiting of bilious matter, with a sense of oppression at the pit of the stomach; in a far greater number of cases, however, the respiratory organs are involved, the breathing becomes accelerated and in paroxysms, there is a dry, hacking cough, with sub-crepitating rale, and in some few cases with the exhalation of a purulent odour from the breath. These paroxysms of oppressed and hurried breathing, with short dry cough, are extremely characteristic; they are very often preceded, at each return, by rigors, and I consider them as indicative of successive depositions of pus in the substance of the lungs. As the disease progresses the symptoms of exhaustion become more marked, the patient lies in a low, debilitated state, interrupted by agitation and delirium, the tongue becomes brown, the teeth covered with sordes, the pulse is rapid and tremulous; the abdomen is tender on pressure, the leaden yellowish hue extends over the body, and the patient sinks between the fourth and eighth days in a state of extreme exhaustion. In a few cases, however, the struggle is prolonged for several weeks, and nature triumphs over the malady, an event that may probably depend on the rare circumstance of the purulent deposits being confined to the cellular tissue of the external parts of the body. For I ought to have mentioned that signs of articular inflammation or of purulent deposit about various joints, or in the cellular tissue in the calves of the legs, &c., very frequently appear in the course of the disease, and their occurrence after rigors, prostration, low delirium, and paroxysms of oppressed breathing, with short, dry cough, should leave no doubt as to the true nature of the complaint.

The description which I have now given of the constitutional symptoms which accompany purulent inflammation of the

joints from infection of the blood, is a general one, but it can be readily understood how the symptoms may be modified according to the peculiar circumstances under which the disease may have been developed in the first instance. It may arise, for example, after injuries of the brain, when the early symptoms will be complicated with, and masked by, those of cerebral irritation or of actual inflammation of the meninges. In cases of this kind, the secondary deposit often occupies the substance of the liver to a great extent, and if the cerebral symptoms be absent or slight, the disease may be mistaken for an acute affection of the liver. On the other hand, this articular affection frequently accompanies the puerperal state. Here an important distinction must be drawn, without which the disease becomes inexplicable. In many cases it appears as a complication of puerperal fever, especially of that form depending on uterine phlebitis, and then we find all the early symptoms masked by those of the puerperal fever, from which it is almost impossible to separate them. But in other cases, although the woman has been recently delivered, she does not present the ordinary symptoms of the fever just mentioned, she appears to be doing well for several days; there is no tenderness or tumefaction about the lower part of the belly; but after a few paroxysms of shivering, with anxiety of countenance and acceleration of the pulse, the joints suddenly become painful, the tongue gets dry, and the symptoms of purulent infection follow the course I have already described. In this uncomplicated state the disease receives no peculiar stamp from the puerperal state, but presents exactly the same symptoms, and runs the same course, as it does when affecting males after injuries to, or operations on, the genito-urinary organs. There is, however, this difference in the results, that the disease is of a much more fatal character in puerperal females than in males,—a fact admitting of explanation from the circumstance of its being so frequently complicated in the female with puerperal fever, whereas, in the male, it arises from laceration of the urethra, irritation of that canal or of the bladder, and from other injuries which are not in themselves of a dangerous character.

I will say a few words to you here of suppurative inflammation of the eye-ball connected with the disease now under consideration. It existed in the case of Mary S—, which I related to you at the commencement of this lecture. It was first noticed, I believe, by Dr. Marshall Hall and Mr. Higginbottom, who published five fatal cases in the thirteenth volume of the *Medico-Chirurgical Transactions*; but from not having extended their post-mortem examinations to the great cavities of the body, they had no idea whatever of the true nature of the attack, and were unable to explain its uniformly fatal tendency. We now know that this affection of the eye is not peculiar to the puerperal state; it occurs in males as well as in females; and its history, as well as the results of post-mortem examination, clearly show that it is simply one of the manifestations of purulent infection of the blood; the eye becomes affected just in the same way as the joints, the lungs, the liver, or any other part of the body.

Purulent synovitis occurring in recently-delivered women is an extremely fatal disease, or, to speak more correctly, the affection, of which the articular disease forms but a part, generally terminates in death. This is the opinion of most obstetric physicians. Dr. Merriman states, that he never saw a case recover; and the experience of M. Cruveilhier, at the Lying-in Hospital, at Paris, confirms this unfavourable opinion. Still we sometimes find exceptions, and it is highly important to remark that the chance of recovery is greatly increased according to the interval which may have elapsed between delivery and the time of attack. The tendency to purulent inflammation appears to decrease in proportion as the uterus resumes its natural condition and its vessels become contracted. Amongst the few examples of recovery, I may allude to an interesting one, published by Mr. McWhinnie, in the twenty-first volume of the *Medico-Chirurgical Transactions*. In this case the delivery was premature, and, curious to say, the disease commenced in the eye, which became inflamed on the second or third day, and was soon lost. Three weeks afterwards, the right lower extremity began to swell, and matter collected about the knee-joint, and also about the wrist. Soon afterwards the calf of the leg became the seat of purulent deposit: the matter was evacuated by incision. On the thirty-fifth day, effusion took place into the right knee-joint, and the cartilages became absorbed to such an extent that the articular surfaces admitted of being sub-luxated in all directions. Several abscesses also formed external to the joint. These were opened, and although the patient was reduced to the lowest extremity, she ultimately recovered, with loss of the eyeball and a stiff knee-joint.

I have now, gentlemen, described to you the manner in which this purulent affection of the joints originates, the symptoms which accompany it, and the post-mortem appearances discovered, not only in the joints themselves, (for these are insignificant,) but in the principal cavities and viscera of the body. It remains for me to explain the view which I take of the nature of the disease. It is the same as that which I published many years ago, when I said that "the contamination of the blood appears to me the most probable explanation of the varied phenomena of these affections;" but I would add, from further experience, that I now believe the contamination of the blood to depend on the admixture of pus, as such, circulating with the vital fluid. The pus is not absorbed, but admitted directly into the circulation through some breach of surface. In the great majority of cases the formation of pus in some tissue primarily affected can be proved by dissection. A few cases, it is true, are on record, where no trace of pus could be discovered in those tissues supposed to be the primary seat of disease, and hence it has been argued that these cases are sufficient to justify us in removing the disease from that class under which I have comprised it—viz., purulent infection of the blood. To this I would answer that the identity of cause, symptoms, and results in various cases, naturally leads to the inference of an identity of the immediate cause, and that as our knowledge extends under the influence of more careful and accurate post-mortem examinations, numerous cases are now shown to belong to this class of purulent infection, whereas formerly they were either inexplicable or referred to causes from which no rational explanation of their phenomena could be obtained. Thus, to take Dr. Marshall Hall's cases of puerperal affection of the eye, even that acute physician was unable to understand why the eye should become inflamed after parturition, and still less, why inflammation of the globe should prove rapidly fatal. We now explain these points satisfactorily, by showing that such inflammation of the eye is not peculiar to puerperal females, but that it occurs in other cases of purulent infection. Again, the typhoid symptoms under which many patients sink after amputation, after trephining, &c., and the abscesses discovered after death in the lungs, livers, &c., did not admit of explanation, until it was shown that suppurative inflammation existed, in all these cases, in the cancellous structure of the bones. Let us consider also the case which I have related from the practice of M. Velpeau. A superficial examination of the body would not have led to a discovery of the cause of the disease; if the urethra alone had been opened, the surgeon might have said, "here is a case of purulent infection without any trace of inflammation of the veins." But on going a little further he discovered the cause in the veins of the prostate. The same remark applies to the few cases in which puerperal disease of the joints existed without any morbid alteration in the structure of the uterine veins. This exemption of the uterine veins has been considered sufficient by accoucheurs to reject the theory of purulent infection; but the surgeon, not accustomed to confine his investigations to the uterus alone, would not have remained satisfied unless every other organ in the pelvis, and the whole genito-urinary system, had been carefully examined. Inflammation of the mammary veins, or of those of the rectum, are just as capable of exciting purulent infection as inflammation of the vessels of the uterus or its appendages. But even admitting that some cases do exist in which no trace of purulent secretion can be detected after death, I hold it more rational—considering how very limited the number of such cases is—to conclude, either that the seat of the secretion has escaped our notice, or that it has been of so fugitive a nature, and so limited in extent, as to leave no trace after death. From the appearances of the joint during life, and the sensations of the patient, there can be little doubt of its having been the seat of inflammation; yet in many cases, when the disease has lasted for a few days, all trace of inflammation has disappeared, and if the joint were an open cavity no pus or other effect of acute inflammation could be discovered in it. The doctrine which I now advance is the one most conformable to all we observe in relation to this disease, both during life and after death, and I feel persuaded that the time is not far removed when it will be universally adopted.

If these views be correct, it is evident that the local treatment of purulent synovitis from infection of the blood becomes a very secondary consideration. Still, while directing our attention chiefly to general means, we must not neglect the assistance afforded by local remedies. The acuteness of the attack, and the inflammatory symptoms which accompany it in many cases, would naturally point out the propriety of our having recourse to the local abstraction of

blood by leeches or cupping. When the joints have been much swollen, and extremely painful, I have often thought that benefit was derived from the application of leeches; at all events they mitigate the most urgent symptoms. But in the use of bloodletting, whether general or local, we should never forget, that the articular affection is not a mere local inflammation, but the result of a constitutional disease, which the injudicious abstraction of blood may render more rapidly fatal. In cases where the state of the patient evidently contradicted the local abstraction of blood, warm opiate fomentations may be had recourse to, with the object of relieving pain; but, for my own part, I should place more reliance on the application of blisters to the affected joints than on any other method. Should the deposit of pus be confined to the cellular tissue external to the joints, there is some hope of our efforts proving useful; the abscesses should be freely opened, and the wound covered with warm poultices. We have no reason, however, to believe that the articular affection has any influence on the result of the constitutional disease, and it is evident that the only chance of saving the patient's life depends on the energetic and prompt use of such remedies as are best calculated to counteract the general affection. Experience unfortunately shows that, like most other diseases arising from contamination of the blood, it is little if at all amenable to medical treatment. Not many years ago, when surgeons attributed the constitutional symptoms of this dangerous affection to a febrile attack, they employed both general and local bloodletting in a very energetic manner. Dupuytren always had recourse to this method, yet it never led to much good—a result which we can now understand. Laennec was a partisan of tartar-emetic in large doses—a practice followed by Sanson, Breschet, and many other French surgeons, but without success. The nature of the disease is such as to leave little hope of benefit from the use of antiphlogistic measures; and if general bleeding were to be recommended under any circumstances, it could only be in cases where the patient is very robust and the pulse strong and full; at all events bleeding should not be attempted except in a very early stage of the disease. More benefit appears to be derived from active purgatives at this period. Quinine has been tried very extensively, and it is, perhaps, the remedy on which most reliance is to be placed. In my own practice, I am in the habit of combining it with diffusible stimulants. It is a curious fact that this powerful remedy often arrests the periodical rigors of which I have already spoken; yet in many cases where this effect has been observed, the disease has continued unchecked to its fatal termination. In the puerperal form, the rapid introduction of mercury into the system appears to be the best method of treatment which the practitioner can adopt. Calomel should be administered every two or three hours, by the mouth, and mercurial ointment rubbed in over the abdomen until the gums are touched. The few examples of cure on record have been obtained by this treatment, and it would be interesting to ascertain how far it might be extended with advantage to other forms of purulent infection of the blood. In cases of consecutive abscess and disease of the joints from infection of the blood, Dr. Copland advocates the use of chlorate of potash in combination with cinchona, serpentaria, or camphor, having tried this remedy in several instances with success.

## OBSERVATIONS

ON THE

## GANGLIA AND NERVES OF THE UTERUS.

By ROBERT LEE, M.D., F.R.S.,

FELLOW OF THE ROYAL COLLEGE OF PHYSICIANS, LONDON; PHYSICIAN TO THE BRITISH LYING-IN HOSPITAL, AND OBSTETRIC PHYSICIAN TO ST. GEORGE'S HOSPITAL.

(Continued from p. 308.)

"I CANNOT finish this subject," observes a celebrated writer, "without again repeating, that the anatomy of the gravid uterus is the very foundation of the art of midwifery. A knowledge of this is the security of the accoucheur amidst all the dangers of practice, and his surest guide in every difficult situation. I surely am not saying too much when I affirm, that every rule of practice, every precept in midwifery, arises solely from the anatomy and physiology of the uterus; and

that he who is well acquainted with these points, and possessed of a common share of understanding to deduce the necessary conclusions from his knowledge, requires no other assistance."

This very foundation of midwifery as a science and an art could not be considered as laid in a solid and satisfactory manner, until the nervous system of the uterus, on which its sensibility and contractile power depend, had been demonstrated. It was not by vague conjectures, erroneous and unfounded assertions and contradictions, that the ganglia and nerves of the uterus could be brought to light: this could only be accomplished by the most minute, laborious, and repeated dissection.

The investigation of the nervous system of the unimpregnated and gravid uterus, which I had commenced in 1838, was continued without intermission during the whole of 1839 and 1840, at the close of which year I had completed ten dissections of the uterine ganglia and nerves. All these dissections were made whilst the parts were immersed in strong alcohol, which hardened, but did not alter, the structure of the neurilemma. A lens magnifying six diameters was always employed, which enabled me with unerring certainty to distinguish cellular membrane, bloodvessels, and absorbents from the ganglia and nerves, and to remove them completely with fine forceps and needles. The neurilemma, being considered an important and essential constituent part or tissue of the ganglia and nerves, as it had been regarded by all preceding anatomists, was not broken up or torn, but preserved with the utmost care in a state of perfect integrity. Whilst engaged in making these dissections, I discovered that the neurilemma was the constituent tissue of the ganglia and nerves which chiefly enlarged during pregnancy.

Every preparation was examined in the most public manner, and the truth was thereby well authenticated. But there were several teachers of anatomy, physiology, and midwifery in London who refused to look at these dissections, like the famous professor of Padua, who, though repeatedly and urgently requested to look at the moon and planets through Galileo's telescope, pertinaciously refused to do so, and reviled his labours.

There were a few others actuated by a different spirit, who not merely carefully examined, but came forward boldly in defence of the truth. Dr. Hodgkin was one of these. On the 29th of March, 1840, he inspected the dissections, and he had no doubt that the new structures displayed were nervous structures, and he went and told Sir Astley Cooper that such was his opinion. After this, Sir Astley never called the nervous structures of the uterus, enlarged by pregnancy, the "cart-ropes and chain-cables" of the organ.

On the 4th of April, 1840, Mr. Samuel Solly wrote to me as follows:—"I have taken up my pen for the purpose of expressing to you in writing my firm conviction that the filaments which I saw this morning, ramifying on and into the substance of the uterus, in two preparations at your house, are nerves; and that you have therefore shown by these dissections a far greater number of nerves supplying the uterus than had hitherto been discovered. The deep physiological interest of this discovery I need not dwell upon now."

On the 28th of February, 1840, Dr. Hake, of Bury St. Edmund's, well known as an accurate microscopical observer, examined with the compound microscope portions of the plexuses of the gravid uterus under the peritoneum, and compared them with undoubted nervous structures—the hypogastric plexuses. He assured me that he could discover no difference whatever between them. Dr. Hake further stated, that he considered these plexuses under the peritoneum to be nerves for the following reasons:—"There is continuity of substance with the spermatic and hypogastric nerves; there is a similar mode of distribution; they have a plexiform appearance, which no other structure but nerves could be made to assume; and they are similar in form and colour. Under the microscope, when examined with a low power, there is the same indistinct fibrous surface. When separated into their component parts by the assistance of needles, they are resolved into fibrils, exactly similar in form, connexion, and arrangement, and which answer to the distinct characters of the nervous fibrils given by microscopic observers."

Professor Grant repeated the examination with the compound microscope, and arrived at the same conclusion.

Several eminent practical anatomists—not microscopical anatomists—on whose judgment I could safely rely, examined all the dissections repeatedly, and were of opinion that the new structures displayed were unquestionably the ganglia and nerves of the gravid uterus enlarged by pregnancy.

On the 16th of April, 1840, Dr. Marshall Hall examined these preparations of the gravid uterus of six and nine months

and in the mara. "I have no doubt," he said, "that you have made out the existence of a new system of nerves and ganglia—the special nervous system of the uterus. Never doubt this for a moment, whatever opposition or contradiction you may encounter. I cannot doubt that these great plexuses on the body of the uterus are nervous plexuses. Mr. Watt was careful to render justice to others in all literary matters," added Dr. Hall on this occasion, "and exacted the same from others to himself. Let us follow his example. Scientific fame must be earned; it is not to be bought at the Stock Exchange, or anywhere else."

On the 26th of June, 1840, Dr. Prout examined two of these preparations, and a second time on the 4th of July. He said, "There could be no doubt about the necessity for such a system of nerves. There could be no doubt the new structures were nerves; they had all the characters, and were continuous with nervous structures." He ridiculed the idea that they were gelatinous tissue, which he said was nothing but cellular membrane. These nerves give both motion and sensation to the coats of the uterus, as the organic nerves do peristaltic action to the intestines. Could the intestines move without nerves? No more can the uterus. Dr. Prout thought the best plan was to employ an artist to make drawings, and publish a separate work on the nerves of the uterus, which recommendation I determined to follow.

On the 3rd of November, 1840, I called upon Mr. Kiernan, and informed him that I had made fresh dissections of the nerves of the uterus, and requested him to examine them. This he refused to do. I then requested him to state the grounds upon which, as referee of the Committee of Physiology of the Royal Society in 1839, he had decided with the microscope that the new structures were not nervous structures. This he also refused to do in a still more peremptory manner. Subsequently I addressed the following note to Mr. Kiernan:—

"DEAR SIR,—You would oblige me by stating shortly what the microscopic characters are of the tissues taken from the gravid uterus of nine months which you examined with Mr. Owen at the College of Surgeons. I am now preparing for publication an account of my dissections of the nerves of the uterus, and I am anxious to be able to state clearly the reasons which induced you to conclude that the plexuses on the body of the uterus, though continuous with the spermatic and hypogastric nerves, are elastic tissue."

To this no answer was returned. I made the same request to Mr. Owen, with which he immediately complied.

"The tissue of the broad, white, reticularly-intercommunicating bands of fibrous matter, resembling nerves," observed Mr. Owen, "consisted of minute fibres, which were solid, smooth, equal-sized, cylindrical, and nearly transparent, irregularly interblended in their course; their diameter does not exceed  $\frac{1}{1000}$  of a line. These bands correspond in structure with the fibrous modification of cellular tissue. The component fibres did not form tubes, nor were their interspaces filled with the primitive granules or cells of the nervous tissue."

"In the nerves of the spinal system, the primitive fibres of the neurilemma, which closely resemble those of the ordinary cellular and fibrous tissues, are arranged in the form of tubes, and can be distinguished into cylinder and contents. The same structure, on a minute scale, exists, according to Valentin, in the sympathetic nerves; but, according to the observations of Remak and Schwann, the component fibres form solid bands, and are of a more transparent character than in the spinal nerves, but marked occasionally with swellings, and have granules in the interspaces."

"I consider that the difference between the nerves of the sympathetic and the fibrous cellular tissue to consist, as regards their microscopic character, in the greater proportion of the granules or cells in the interspaces of the fine reticularly-interwoven component fibres of the nervous band; and this difference I believe to exist between the two nerves of the sympathetic system and the white bands of fibrous matter which connect the peritoneum with the muscular substance of the womb, and which resemble a plexus of nerves."

The unequivocal and undisputed continuity of the spermatic, hypogastric, and sacral nerves with the ganglia and plexuses on the body of the uterus, which Sir A. Cooper, Mr. Swan, Mr. Mayo, Mr. Kiernan, and Mr. Owen, had all been compelled to admit, is here passed over by Mr. Owen in total silence, or absolutely ignored. The evidence upon which I solely relied was the continuity of these structures with undoubted nervous structures.

On the 1st of January, 1841, having resolved to take the entire responsibility upon myself, "The Anatomy of the Nerves of the Uterus" was published, with three engravings. In this

work I described the appearances observed in ten dissections of the nerves of the uterus—1. Nerves of the gravid uterus in the seventh month. 2. Nerves of the gravid uterus in the sixth month. 3. Nerves of the gravid uterus in the ninth month. 4. Nerves of the gravid uterus in the ninth month. 5. Nerves of the gravid uterus in the fourth month. 6. Nerves of the gravid uterus in the third month. 7. Nerves of the uterus ten days after delivery. 8. Nerves of the unimpregnated uterus. 9. Nerves of the virgin uterus. 10. Nerves of the uterus in the mara. "These dissections," I observed, "prove that the human unimpregnated uterus possesses a great system of nerves, which enlarges with the coats, bloodvessels, and absorbents during pregnancy, and which returns after parturition to its original condition before conception takes place. It is chiefly by the influence of these nerves that the uterus performs the varied functions of menstruation, conception, and parturition, and it is solely by these means that the whole fabric of the nervous system sympathizes with the different morbid affections of the uterus. If these nerves of the uterus could not be demonstrated to exist, its physiology and pathology would be completely inexplicable."

I received the following letter from the late Mr. Dalrymple a few months after the publication of "The Anatomy of the Nerves of the Uterus":—

"6, Holles-street, April 21st, 1841.

"MY DEAR SIR,—After having seen and very carefully examined, some weeks since, your very beautiful preparations of the nerves of the impregnated uterus; and after having felt convinced, by their continuity, colour, texture, and mode of distribution, that they really were nerves, I was a good deal surprised to hear from you and others that their identity had been doubted. I was aware that it would have been worse than useless to have asked you for a portion of such suspected cords to submit to the microscope, knowing that they had been very many months immersed in strong alcohol. It would neither have been fair to you, nor satisfactory to me, to have made such an attempt at solving the question."

"Being anxious, however, to satisfy myself upon the subject, I obtained an uterus, (unimpregnated,) and while it was quite recent, I traced several nerves, which I recognised, from their situation round the ureter, and upon the body of the uterus, to be similar to some you had previously pointed out to me. These filaments I submitted to the microscope, and used a very beautiful eighth-of-an-inch object-glass, made by Ross. I found that it was impossible, with the most careful dissection, to detach any filament of nerve, without including a quantity of cellular and elastic tissue; so that although the tubular portion indicating the nerve was distinct, yet it was surrounded by innumerable extremely minute threads, coiled and contorted, such as one finds in the component of elastic tissue, and the ultimate element of cellular membrane."

"Under slight pressure, however, the tube was plainly discernable, containing granular matter, not uniformly distributed, but collected in minute masses at intervals. Small bloodvessels were also seen here and there, with blood-discs within them, which served to indicate the difference between the nervous and vascular tubes, and thus to avoid the possibility of error."

"Being, however, aware that some of the most distinguished foreign microscopic anatomists had differed as to what was the real characteristic of nerves of the sympathetic system, I should not have troubled you with this communication had I stopped here."

"Feeling, from this discordance of opinion, that there was no absolute test, or at least one which was not open to cavil, I thought to try a comparison of the uterine nerves with those that undeniably belonged to the ganglionic system. I traced, therefore, some nerves upon the surface of the stomach, up to the great ganglion that gave them origin; and I selected some, also, from the small intestine. These I submitted to the same microscopical power, and under the same circumstances of light, pressure, and medium."

"In all of these I observed the tubular part filled with granular matter, and similarly collected in minute masses."

"I also observed that each tube was surrounded by the minute serpentine threads before described. In fact, so closely did they agree, in every particular, with the appearances presented by the uterine nerves, that it would have been impossible to distinguish the one from the other."

"Thus, by comparing the unknown with the known, despite the want of any absolute test, I feel perfectly satisfied of the true nervous character of the very beautiful plexuses you have so patiently, and with so much labour, developed."

"Admitting, then, this intricate structure to be really nervous, it is a matter of no marvel that they increase in size during pregnancy. It would, indeed, be wonderful if the

F.G. 1.

nerves alone remained stationary, while the muscular and cellular, the serous and mucous, and the vascular tissues increased (as it is notorious those structures of the uterus do) during the period of child-bearing.

"If, as is also indisputable, nerves shrink and atrophy when the function of an organ they supplied is lost or destroyed, is it singular that the uterine nerves should increase when that

organ rouses itself from inaction to one of the most extraordinary exemplifications of temporary functional vigour that the animal economy can anywhere exhibit?

"Pardon me this prolixity, and believe me,

"My dear Sir, yours very faithfully,

"To Dr. Robert Lee, F.R.S."

"JOHN DALRYMPLE."

[For description of Engraving, see next page.]

FIG. 1 Represents the ganglia and nerves of the uterus in the sixth month of pregnancy.

- A. Posterior surface of the fundus and body of the uterus.
- B. Left ovarium.
- C. Right ovarium drawn up to the fundus uteri.
- D. Peritoneum covering the back part of the cervix uteri.
- E. Left ureter.
1. Aortic plexus of the great sympathetic nerve, which was situated over the last lumbar vertebra, at the bifurcation of the aorta.
2. Right hypogastric nerve.
3. Left hypogastric nerve dividing into branches to form the left hypogastric plexus.
4. Filaments from the left hypogastric plexus to the left ureter.
5. A nerve proceeding from the same plexus, which passes between the ureter and uterus to a plexus of nerves, surrounding the uterine artery and vein.
6. A plexus of nerves around the trunk of the uterine vein, from which branches proceed to the superior part of the uterus along with this vessel.
7. Filaments of nerves ramifying on the bloodvessels and muscular coat of the uterus, and on the inner surface of the peritoneum.
8. A branch of the spermatic veins which anastomoses on the side of the uterus with the principal uterine vein.
9. Third sacral nerve, sending branches to the posterior part of the ganglion at the cervix uteri.
10. The trunk of the left hypogastric nerve prolonged through the hypogastric plexus to the ganglion.
11. The ganglion at the cervix, from which
  - a. The right hypogastric nerve and plexus.
  - b. Ganglion at the cervix drawn away from the uterus, and all the small soft nerves which passed from it to the cervix removed.
  - c. Sacral nerves entering the ganglion.
  - d. Nerves from the ganglion and hypogastric plexuses spreading out on the posterior surface of the uterus, and ramifying under the peritoneum, and upon the muscular coat.
  - e. Trunk of the right uterine vein, with the nerves accompanying it to the upper part of the uterus.
  - f. A great plexus extending across the posterior surface of the uterus, with nerves from the ganglion and hypogastric plexus entering it.
  - g. Termination of this plexus in the anterior plexus.
  - h. Nerves passing from the anterior plexus into the nerves accompanying the uterine vessels.
  - i. Branches of these nerves passing behind the vein to the fundus uteri.
  - j. Branches from the spermatic nerves joining the posterior plexus.
  - k. Slender filaments passing from the anterior and posterior plexus to the ovarium.
  - l. Spermatic bloodvessels, nerves, and absorbents.

(To be continued.)

## ON THE TREATMENT OF CHOLERA WITH CALOMEL.

### WITH A REPORT OF A CASE INTERRUPTED BY DELIVERY.

By JOHN MACKINLAY, M.D., Isleworth,  
MEDICAL OFFICER TO THE BRENTFORD UNION INFIRMARY.

From the first week in August to the present period, thirty cases of cholera have been treated in the infirmary attached to the Brentford Union, of which eleven patients have died. With two exceptions, (inmates of the house,) they chiefly consisted of poor Irish persons, employed in the gardens, and brought from the low, filthy lodging-houses in Brentford; some were the remnants of families who had perished from the disease, and a few were brought from barges in the river; but in almost all the cases, accompanied with a certificate from the district medical officer, of being in the second or last stage of collapse.

Appropriate wards and attendants having been provided for such cases, the initiatory treatment consisted generally in a mustard emetic, a mustard foot-bath, and sinapisms or turpentine epithems to the chest and abdomen, the patient being placed in warm dry blankets; but no other artificial means of heat, which I consider useless, preferring an open window, with a free circulation of air. Moderate stimulants of ether and ammonia, or diluted brandy, at intervals, and in quantities according to circumstances. The main treatment commenced by the employment of calomel, in most cases according to the plan of Dr. Ayre, in small and frequent doses, which, even in apparently the most desperate cases, proved to be eminently successful. The first change exhibited after a perseverance in this plan was an alteration in the appearance of the motions—from their rice-water character to that of a watery bottle-green fluid. An aperient was then given, usually consisting of rhubarb, sulphate of magnesia, and carbonate of soda, with some warm tincture in mint water. This would probably require repetition, and be followed by dark, fetid, and somewhat more consistent motions, with general reaction, from which time might be dated the probable

convalescence of the patient, who was then treated according as symptoms presented themselves; though in several cases this favourable condition was followed by the fatal consecutive fever.

Without giving any opinion as to the different modes of treating this formidable disease, my successful cases have been from amongst those who, upon their admission, seemed in a most hopeless state of collapse. In some instances from 200 to nearly 300 grains of calomel were administered, and in no case has the slightest trace of mercury been left in the system. In certain cases, where the stomach was irritable, I preferred the larger dose of ten grains, with a few drops of laudanum and wine given at longer intervals. In two cases of singultus, capsicum powder in pills, with aromatic confection, appeared beneficial.

One of these cases deserves some special notice, being that of Ann C—, aged twenty-six, in her ninth month of pregnancy, who was admitted on the 18th of September, apparently in the last stage of the disease, and brought from a cholera district. She was put under the system of treatment above described. On the Thursday (two days afterwards) her condition became evidently favourable, and continued as till Saturday, when she had a sudden relapse of all the choleraic symptoms, with extreme irritability of the stomach. Ten grain doses were then given, every four hours, for six successive periods. On the following evening, there was decided improvement in her condition, and the treatment was suspended. On Monday followed all the symptoms of consecutive fever, with the least possible hope of recovery. On the following morning, at four o'clock, my assistant was hastily summoned to attend this woman upon her confinement. She was speedily, but unconsciously, delivered of a living child, which left her at the lowest ebb of life for the succeeding twenty-four hours, when she began by slow degrees to show symptoms of rallying, and she is now progressing towards a perfect state of recovery; but has no recollection of her delivery, or of her child, which only lived a day.

October, 1854.

P.S.—I omitted, in the above article, to state, that my observations and experience in cholera have been by no means confined to these isolated cases, but I have had a large share out of doors, both in the present and former visitations, in this country, and which falls short of what I have met with in the East Indies.

## THE HUMAN MIND UNDER THE INFLUENCE OF CHOLERAIC POISON.

By JOHN CHARLES ATKINSON, M.D.

In the few remarks I have to offer, I have nothing to say about the treatment of cholera—that will yet remain a *questio venata*. I wish simply to bring before the notice of the profession the following fact—viz., that there is in persons who have imbibed the choleraic poison a species of apathy with regard to consequences and measures that truly demands earnest attention, inasmuch as I attribute the high mortality in adults in some measure to this single circumstance—viz., *self-neglect*, arising from the circulation of poisoned blood, and thus affecting in this way the nervous centre.

I have observed, even before well-developed symptoms of cholera are ushered in, in infected individuals, an inexplicable, I may say uncontrollable, feeling of absence of mind—giving no notice of the possible presence of danger. The mind, hitherto active and alive to the law of *self-preservation*, becomes suddenly altered in its normal characteristics; there is complete indifference; you may urge the necessity of remedies when serious diarrhoea has set in; you may talk of collapse, and its danger to life; you cannot alarm your patient: he tells you quietly, he was greatly relieved by the last evacuation, and that another or two will set him all right: the bare fact of going to the closet, and sitting easily, is stated as very satisfactory to the feelings—the tension of the abdomen, with all its accompanying unpleasantness, is thus temporarily got rid of, and he contentedly arranges his dress, declares he feels better, and disdains treatment. This state of things we all know ends in the extinction of the life of the patient.

It is well known that *Hope* and *Fear* are the panniers of life, which, when equally poised, enable us to proceed best on our journey; but, under choleraic poison, although the mind is cloudless, or apparently so, there is no fear of coming peril. The calmness of mind present in extreme collapse is marvellous; but there is no evident sympathy for the alarm of sorrowing friends; no tears, no expressed interest, about

living. All is icy coldness—the mind as well as the body. Even when the true *facies et vox choleraica* are present, the mind is capable of arranging and disposing of effects and property as in a perfect state of health, as far as the deliberate knowledge of the act is concerned. Strange! when we expect *deliquium* and insensibility from the great loss of serum from the blood, we still have the integrity of the mental faculties remaining; no congestion; no delirium!

The anxiety to apply for means of defence is hourly lessened as the disease progresses. You may tender advice and remedies, but neither the one nor the other will be voluntarily carried out without you have a resolute nurse or attendant determined to assist you.

Again, it is difficult to excite emotion in many of these cases. In two cases, I can confidently assert that the determined attitude and firm language I employed, assisted materially to save my patients. The total neglect of therapeutic means recommended excited my ire. I did not hear this *sub silentio*, but quickly adopted the following step. In both cases I shook my patients thoroughly, (of course they were males,) and declared I should be compelled, if they did not immediately take the remedies prescribed, to give them a good \* \* \*. The blood, commencing to get into the stagnant condition, received a befitting impetus; the reaction thus induced soon gave a corresponding effect on the nervous system, the medicines were taken, and the patients recovered.

It is a sad thing, alas! that a professional man should be necessitated to carry out an old medical aphorism, somewhat amended, *fortiter in modo*, in the place of *suaviter in re*. The proceeding clearly “points a moral,” but “un-adorns a tale.”

From my experience, then, of cholera patients generally, I have arrived at the conclusion, that great firmness in carrying out any well-devised scheme of medical treatment is essentially necessary; and, further, that although the cases cited may appear exaggerated in description, yet it will be found that the peculiarity of mind above recorded is almost invariably present in a greater or less degree, and which will, sooner or later, cause the mind of the pathologist and psychologist to be directed to it, as well as that of the physician.

Romney-terrace, Westminster, October, 1854.

## A Mirror OF THE PRACTICE OF MEDICINE AND SURGERY IN THE HOSPITALS OF LONDON.

Nulla est alia pro certo noscendi via, nisi quam plurimas et morborum  
et dissectionum historias, tam aliorum proprias, collectas habere et inter  
se comparare.—MORGAGNI. *De Sed. et Caus. Morb.* lib. 14. Proœmium.

### ST. BARTHOLOMEW'S HOSPITAL.

#### FIBROID RECURRING TUMOUR OVER THE RIGHT PATELLA.

(Removed by Mr. PAGET.)

We referred last week to an important case of recurring tumour of the breast, under the care of Mr. Hawkins, at St. George's Hospital, the nature of the growth being muco-cystic; and we have now to direct attention to another kind of obstinately recurring tumour, known under the name of the fibroid. It will be seen that the tumour recurs, as happened to Mr. Hawkins' patient, about once a year.

The patient is, in this case, about twenty-five years of age, and was brought into the theatre September 23rd, 1854.

Mr. Paget stated, before proceeding with the operation, that the case presented a good example of the fibroid recurring tumour, a pathological change to which we have already had occasion to refer pretty frequently. The tumour, situated over the right patella, had been removed four times before, and had now grown again for the fifth time. In 1850, 1851, and 1852, it had been taken off by Mr. Skey; in November, 1853, a fourth recurring tumour had been removed by Mr. Stanley, and it had, in all these instances, been found to be of a fibrous character. The patient's health had been very good during the four years when the repullulation of the disease had gradually taken place; no cancerous degeneration had occurred, but the remarkable feature of the case was the obstinate recurrence of the growth.

When the patient had been narcotized with chloroform, Mr. Paget removed the tumour, which had this time reached the size of a small orange, and had grown exactly over the cicatrix left after the last operation. The nature of this fibroid tumour, recurring for the fifth time, was, to the naked eye, the same as had been before noticed; and it is not unlikely that, within a twelvemonth, it may again be reproduced.

Perhaps a certain amount of pressure, when the cicatrix is again formed, might blunt the vitality of the tissues, and incapacitate them from displaying their morbid activity. It has also struck many surgeons, that certain substances of a narcotic or highly astringent kind, as belladonna, acetate of lead, &c. &c. either rubbed on the cicatrix or brought in contact with the raw surface, might modify the nervous and vascular ramification, and arrest further recurrence.

Mr. Paget took occasion to mention that Mr. Stanley has removed a tumour of the same kind from a patient as many as five times, and that the excision had at last proved effectual. It is to be hoped that an analogous result may be obtained in the present case, as the same number of recurrences has now been reached.

In referring to Mr. Paget's work “On Tumours,” we find the author making on this subject the following statements:—“I have proposed the name (recurring fibroid tumour) for a group of which the chief characteristics are, that their general aspect very closely resembles that of common fibrous tumours; their microscopic structure consists of corpuscles, caudate and elongated, as if developing into fibres; and the most striking feature in their history is their proneness to return after removal.”

After relating several cases, fully illustrating this recurring tumour, Mr. Paget says:—“How may we interpret this singular proneness to recur,—this tendency which, by its existence, separates these to some distance from all innocent tumours, and by its existing alone, separates as far from malignant tumours? Two views may be taken of the fact. The tumours may from the first, be formed in a cluster or group, and then the removal of one of them only leaves the remainder to continue their growth; or, secondly, the apparent recurrence may be a real one, such as we suppose occurs in the case of cancers, in which we presume that, in a first operation, every morbid structure already formed in a part is removed, and entirely new growths are produced in the same part. Some,” adds the author, “would add a third, by supposing that in all these cases of recurrence portions of the tumour were left behind in these operations. But this is unreasonable. These tumours are not more difficult to remove wholly than many are which never thus recur, such as the fatty, the fibro-cellular, and the like. Besides, in the cases I have cited, the names of the operators are a sufficient guarantee that the whole of the tumour was every time removed.”

Now it certainly is an important inquiry to ascertain whether these tumours, originally quite benign, may not degenerate and become malignant. On this head, if we again consult Mr. Paget's excellent book, we find the following words (the author having first pointed out that, in some cases, these fibroid tumours have assumed malignant characters):—

“Although there be cases in which this evil career has not been run, yet I think we may regard these tumours as approximating to characters of malignancy, not only in their proneness to recur after removal, but in their aptness to assume more malignant features the more often they recur. Whatever be the truth concerning the supposed transformation of an innocent into a malignant morbid growth, I think it can hardly be doubted that, in the cases of some recurring growths, such as these, and certain recurring proliferous cysts,” (see the case at St. George's, last “Mirror,”) “the successively later growths acquire more and more of the characters as thoroughly malignant disease.”

### GUY'S HOSPITAL.

#### PURPURA HÆMORRHAGICA; DEATH; AUTOPSY.

(Under the care of Dr. BARLOW.)

THE case of hæmorrhagic diathesis observed at St. George's, and which was given last week, brings to our recollection one of a kindred kind, but where the debility of the capillaries and deficient state of the blood were caused by insufficient food. It was, in fact, a very aggravated instance of purpura hæmorrhagica, followed, as is very seldom the case, by the death of the patient. The etiology, progress, and symptoms of the disease are well exemplified.

The notes were taken by Mr. E. B. Hammond, the clinical clerk.

Edward McC—, a baker, aged thirty-six years, was admitted under the care of Dr. Barlow, Feb. 18th, 1854. This patient was in this hospital seven months before his present admission, suffering from bronchitis, and is described in the report as a thin, sallow, unhealthy-looking man, with dark hair and eyes. His mother and seven of his brothers and sisters died of phthisis, and his own health has never been very good. He then remained in the hospital three weeks, and went out pretty well, but could not return to his business as a baker, as he could not bear the heat, so he did any portering work that he could meet with.

About three weeks afterwards, he began to feel very unwell again; had a return of the cough, and went into the country for a few weeks. The patient returned to town, feeling quite well. He continued to follow the occupation of porter, and his health remained tolerably good until six weeks before admission, when his cough came on again, and he began to waste away and lose his strength. He says that he has been living very badly, not being able to procure proper nourishment for himself, wife, and child. He only had a small quantity of meat and potatoes twice a week, and was also quite unable to get any beer.

A few days before admission the patient got up from his chair to walk across the room, when he fainted away, and, on recovery, brought up nearly two gallons (?) of dark-coloured coagulated blood. He had felt very sick for some time previously.

The man continued to cough and vomit up blood during the remainder of the day and night, and some purple spots made their appearance on his arms; he also began to pass blood with his urine.

On the next day, the patient continued to bring up much blood, and more purple spots came out on the trunk, arms, and legs. This state of things continued for several days, when he applied to this hospital.

On admission, there were found purple spots and blotches all over the body, especially the arms and legs; the gums were spongy and bleeding, and there was effusion of blood under the conjunctiva of the left eye.—State when examined: He coughs up a quantity of frothy blood mixed with black coagula, and complains of feeling very sick. The urine is loaded with blood, the same fluid is also passed by the bowels; the voice is husky and indistinct; the respiration laborious; skin hot; pulse 112, compressible. The chest is resonant on percussion, the respiratory murmur being muffled by wheezing and crepitation; heart's sounds, healthy.

Dr. Barlow ordered low diet, ice, lemonade, and twenty minims of the tincture of the sesquichloride of iron, to be taken in an ounce of lemon-juice every fourth hour.

On the next day, it was found that the patient had passed a very restless night, being much troubled with cough; but there was less blood in the expectorated matters. Pulse 120; skin hot.

Venesection to three ounces was now ordered, as also twenty minims of dilute sulphuric acid, in infusion of roses, every fourth hour.

On the second day after admission, the poor man continued to get worse until three o'clock A.M., when he died, retaining his consciousness to the last.

*Secio cadaveris, twelve hours after death.*—Body much emaciated, and well formed, covered all over with spots of purpura; effusion of blood under the conjunctiva of the left eye.—Brain: Dura mater healthy; veins filled with blood; slight sub-arachnoid effusion; the whole substance of the brain perfectly healthy.—Cellular tissue of the trachea and œsophagus filled with blood.—Lungs: The organs did not collapse on opening the chest; adhesions on the left side; effusion of blood under the pleura generally, and at the root of the lungs several of the lobules filled with blood; otherwise healthy.—Heart: Flaccid, with points of ecchymosis; pericardium containing half an ounce of serum; left ventricle empty; a little atheromatous deposit on the valves.—Abdomen: The mucous membrane of the stomach entirely covered with spots of ecchymosis; venous congestion in the small intestines; colon containing much green, fluid, fecal matter; extravasated blood under the mucous membrane; effusion of blood into the mesentery, and the glands much injected. Liver, large and pale. Spleen, of normal size. Kidneys, large, with effusion of blood under the mucous membrane of the pelvis and ureter; structure pale and smooth, with points of ecchymosis beneath the tunic. Bladder, healthy, except a few small points of ecchymosis.

It will be observed, that although seven brothers and sisters of this patient died of phthisis, (as he states,) no tubercles were found in his own lungs.

## UNIVERSITY COLLEGE HOSPITAL.

### RETENTION OF URINE; DEATH FROM CHLOROFORM.

(Under the care of Mr. ERICHSEN.)

DEATHS from chloroform are now becoming a kind of unfortunate casualty which, like shipwrecks and railway accidents, may from time to time be expected. It is satisfactory, under such painful circumstances, to know that in all cases every precaution is taken, before the inhalation, to prevent unfavourable results, and the most strenuous efforts used, when life is threatened, to save the patient from his fate. The case which lately occurred in this hospital fully exemplifies this, for the anæsthetic agent was administered by a gentleman appointed for the purpose, and the means of revival were most promptly and vigorously employed. We give a few particulars of the case, as noted down by Mr. Howitt, the dresser of the patient.

George S—, aged 29 years, was admitted October 11th, 1854, suffering from retention of urine. The patient is a fine, well-made man, who says that he experiences great pain; the intellect is quite clear, but there is slight incoherence.

He states that, three months before admission, he had a first attack of retention of urine, from which he was relieved by Mr. Swindle, of Finchley, who drew off the water several times. He remained quite well for two months, up to four days before admission, when, after a short journey, he had slight pain, and had his water drawn off for two consecutive days. As the urine, however, came away very imperfectly afterwards, several attempts were made to pass instruments without effect, and he lost a considerable amount of blood. The patient was then sent up to Mr. Erichsen, who saw him on the day of admission, at a quarter to four, and found the bladder distended to the umbilicus, and the man complaining of severe pain.

No. 4 catheter was now tried, when Mr. Erichsen felt several false passages in the anterior portion of the urethra, and a stricture near the bladder. No. 1 was then tried, but as, with the most careful management, no instrument could be passed, Mr. Erichsen determined to puncture the bladder through the rectum.

Accordingly, at four o'clock, Mr. Cardell, the house-surgeon, made the patient inhale chloroform, commencing with forty drops, poured on lint. In a few minutes forty more were added, when the man became violent, talking loudly and struggling. Forty drops more were given in about two minutes, (whilst Mr. Erichsen was endeavouring to pass a catheter,) when the pulse suddenly stopped, (having up to that moment been regular at 76,) the breathing became stertorous, and the face flushed.

Cold water was immediately dashed into the face, and the lungs inflated by Mr. Erichsen, using the mouth-to-mouth insufflation. As respiration was beginning to fail it was kept up artificially, and the galvanic battery sent for. This arrived in less than two minutes from the stoppage of the pulse, and was set to work directly. At this time the man rallied, and Mr. Erichsen thought that he would come round, but he again declined and breathed irregularly for a few minutes more. Artificial respiration and stimulant frictions to the limbs were then kept up till five o'clock P.M., when the body was quite cold.

*Post-mortem examination, seventy hours after death.*—External appearances: A strong muscular man, with incipient signs of putrefaction about the abdomen, neck, and chest. Lividity about the ears and the posterior and lateral parts of the neck. The face does not present the usual pallid aspect of death, but has a somewhat reddish hue. Rigor mortis present, but not to any great extent. Thoracic and abdominal muscles healthy in appearance. The veins of the upper part of the thorax, accidentally wounded in opening that cavity, poured out a quantity of dark venous blood.

It is rather strange, considering that the deaths from inhalations of chloroform have now, in this metropolis alone, been rather numerous, to find a case of this kind inserted in the *Bulletin de Thérapeutique* of Paris, on the 15th of April, 1854, mentioned as the first which had occurred in the French capital. It is true that two or three cases had been recorded before the above-mentioned date, but our French brethren ascribe them to the severity of the operations, and to the nervous shock experienced by the patients. However this may be, we are desirous to allude to this first case, as it bears analogy, in one respect, with Mr. Erichsen's case.

The patient in Paris, a woman forty years of age, was to be operated upon for a polypus uteri; and as she had had several fits of hæmorrhage, the surgeon, M. Richard, proposed to operate without chloroform, as he considered the vital energy somewhat lessened by the loss of blood; but the patient requested the use of the anæsthetic agent. It should be noticed that the period of excitement was well marked, a circumstance

rarely observed with women; and whilst the operator was introducing the ligature which was to encircle the base of the tumour, the pulse suddenly stopped, and no effort could excite the action of the heart.

Now Mr. Erichsen's patient had lost a good deal of blood by catheterism before he entered the hospital, and was much exhausted by pain. Perhaps it will be worth while for surgeons to carry these circumstances in their memory, the more so as it stands to reason that paralysis of the heart is not unlikely to take place where the vital fluid is deficient in quantity. Indeed, anemia is perhaps as important a counter-indication to the inhalations of chloroform as fatty heart; for in the former case, it seems that the blood is, at a certain moment, not sufficiently stimulating to the central organ of circulation; whilst the heart is, in the latter case, unable, at a certain period of the anesthesia, to go on contracting, for want of healthy muscular substance.

Nor should we omit to allude to the insufflation into the lungs, to which Mr. Erichsen had rapidly recourse in the hope of saving the man's life. It is well known that M. Ricord succeeded, in a case of the same nature, in exciting respiration and the action of the heart. Mouth-to-mouth insufflation requires on the part of the surgeon a certain amount of generous resolution, which the desperate circumstances in which it has been used are well calculated to inspire.

### Medical Societies.

#### MEDICAL SOCIETY OF LONDON.

MR. HEADLAND, PRESIDENT.

SATURDAY, OCTOBER 21st, 1854.

##### INJECTION OF THE CELLULAR TISSUE IN CHOLERA.

DR. RICHARDSON referred to a paper by Dr. Buchanan, in which it was stated that he had injected the cellular tissue with water in cases of cholera. His (Dr. Richardson's) suggestion was made quite independent of these experiments. Dr. Buchanan's treatment had proved unsatisfactory, it not being possible to inject sufficient fluid to be of service into the cellular tissue; the proceeding producing considerable pain, and the fluid not having been absorbed. It would be difficult, if not impossible, to throw sufficient fluid into the cellular tissue to effect a cure: but this was not the case when the peritonæum was injected. During a debate in the Society last session, Dr. Richardson had predicted that, if a case were ever met with in which a dropsical patient should become affected with cholera, the dropsical symptoms would be relieved by the new disease on the one hand, and the patient would be saved from the fatality of the choleraic attack on the other. He referred to a case of cholera, complicated with cardiac disease and dropsy, both which diseases disappeared under treatment.

MR. HENRY SMITH presented to the Society the parts removed after

##### EXCISION OF THE KNEE-JOINT,

which operation he had performed four days previously, upon a little boy who had been under his treatment for nearly a year with disease in the joint. Mr. Smith, in showing the parts, stated that some of the violent opposers of this operation had at first grounded their opposition upon the fact that, in the earlier cases, death had taken place; but now that the operation had been performed by various surgeons, with a success equal, if not greater than that attending amputation through the thigh, the objection thrown out was, that the cases in which the operation had been performed were not sufficiently serious to warrant any such measures, and would have recovered by themselves. He was anxious to show the Fellows of the Society that no such objection held in the present case, for, independent of there being a large amount of disease within the joint itself, which would have precluded recovery, there was an abscess of considerable size in the head of the tibia, which had obliged him to remove more of that bone than he had intended. He had tried to save the patella, but the articulating surface of this bone was so much diseased that he took it away. The patient was at that time doing admirably, and he should inform the Society faithfully as to the future result of the case.

##### CHOLERA BLOOD.

DR. CRISP said that a few weeks since, when examining dry cholera blood under the microscope, (with a one-eighth inch

glass,) about a week after it was taken, he saw a small insect, about the sixth part the size of the human blood-globule, ( $\frac{1}{1000}$  of an inch.) It moved with great rapidity upon the glass, with a swimming-like movement, using the posterior legs chiefly as a means of progression. Its movements were so rapid, that it was difficult to take an accurate sketch of it; but it resembled in form, and in its mode of progression, the *Dytiscidae*. The insect was watched for nearly half-an-hour by Dr. Crisp and his friend, Mr. R. Corner, and an endeavour was made to detach it from the glass by means of turpentine, but the attempt was unsuccessful. The same glass had been used previously for other objects, but the insect was seen soon after the examination of the cholera blood. Dry blood from various animals had been repeatedly examined before, but nothing of this kind had been observed. The sketch of the insect had been shown to Professor Quekett, who said that it was new to him. Dr. Crisp remarked that he should not have mentioned the subject at the Society had he not received that morning the *Gazette Médicale de Montpellier* for October 16th, 1854, in which there was an article on cholera, headed, "Miraculous Discovery: the Cause of Cholera an Insect, and that Insect a Scorpion; the remedy an emeto-cathartic of tartarized antimony and sulphate of soda every quarter of an hour." Dr. Crisp said he attached but little importance to the communication he had made; but he was anxious to know if the insect he had alluded to had been seen by others, and in a disease about which so little was known he thought that some speculation was allowable. The

##### DISCUSSION ON CHOLERA

was resumed by

\* DR. LANKESTER, who opened the debate by making some remarks on the very unsatisfactory results of inquiries with regard to the origin and nature of cholera. With regard to its origin, we could only reason from analogy. Certain diseases, which were ordinarily sporadic or endemic, became contagious. Instances of this were given in the case of erysipelas, gangrene, and dysentery. Gangrenous matter sometimes produced the highly-contagious puerperal fever. Phlegmonous erysipelas had been rendered communicable, and followed by epidemic parotitis. In this way cholera may have been started into existence, as, probably, syphilis, and other contagious diseases, had been before it; and evils yet unknown might occur from this process of transformation in morbid conditions of the system. Whether this process occurred as the result of a changed condition of the cells, or a chemical change of matter produced in the cells, could not yet be determined. It had been a question whether the cholera poison was propagated in the body, or out of it. Facts seemed to indicate that matters not connected with the living body could retain for months, or even years, the poison; and probably, under some circumstances, it might be reproduced even out of the body. Dr. Snow believed it to be reproduced in the mucous membrane of the body, and diffused by the agency of drinking water. The extensive co-existence of the disease with water suspected of contamination did not confirm this theory, and facts occurred inconsistent with it. Thus, in the case of the Broad-street pump, which Dr. Snow had accused of spreading the cholera in that district, he knew that in one family where cholera had been fatal, that although they had drunk water from the Broad-street pump, they had, for above a week before the attack occurred, taken it boiled. The sewer near the well alluded to by Dr. Snow was a new sewer, and not in a condition to allow of a free passage of its contents into the suspected well. He believed that impure water was a predisposing cause; and in the case of the Broad-street pump, he could say, from having examined it, that, like most of the surface well-water of London, it gave indications of the presence of a considerable quantity of organic impurities. The most important element in the cholera problem seemed to be the predisposition to the disease. In what the condition of the system consisted that invited cholera, we were ignorant; but the proximate causes of that condition we knew something about. The exhalations from decomposing animal and vegetable matter was one. In six houses in Marshall-street, in which the sewers were trapped, no cholera occurred; whilst in nearly every other house the inhabitants suffered. Where one house or gully was trapped, and another was not, the untrapped spot exhaled a larger quantity of the gaseous and injurious matters. Putrid food was bad. He had seen cases occurring immediately after the ingestion of decomposing or "high" food. In Dr. Guy's tables, published after the epidemic of 1849, those trades appeared to suffer most who might be supposed to be exposed to the ingestion of, or the exhalations from, decomposing food, as fishmongers, poultryers,

and greengrocers. Drunkenness was undoubtedly a predisposing cause, and many trades suffered from this where no other cause seemed to exist. With regard to the treatment of severe cases, he spoke despondingly. He warned the profession against being ruled by the results of individual experience. It was only by a large collection of cases, well compared, that any true results could be arrived at. He could bear testimony to the value of sulphuric acid in the diarrhoea, but not in the collapse. He thought no case, in the early stages, should be treated without opium, but he could not say so much for any other remedy.

Dr. COGSWELL, with reference to the exciting cause of cholera, remarked that he considered that there were sufficient historical facts to show that cholera was contagious. He then entered at some length into the mode in which the disease entered into America, and spread through that continent, and its appearance in the Bahamas, and other places, to show that the disease had been propagated by contagion. These facts bore much upon the treatment of the disease; for if established, as he thought they were, it would become desirable to prevent the importation of cholera.

Mr. F. F. CLARK, having been in the midst of the cholera in Soho, could speak from some experience of the late epidemic. In the parish in which he resided, nearly three thousand cases of cholera, in its various forms, had come under treatment in the course of a single month. These cases presented themselves in various degrees, from mere pain and uneasiness in the epigastric region, to vomiting and purging; vomiting and purging attended by cramps; and collapse, attended or preceded by one or more of these symptoms, or coming on suddenly, and striking down the patient before premonitory symptoms could be developed. Under whatever name these various forms of the disease might be designated, he felt assured they were all of one type, and dependent upon one cause. He agreed with Dr. Bennett in thinking the first shock was made on the sympathetic. Without entering into the question of contagion, beyond stating his conviction that the disease was occasionally contagious, he might mention that atmospheric change had a great effect on the disease, and alluded to the "dreadful Friday night," when the heat was most oppressive, and the air scarcely respirable, on which about 300 persons died in his own neighbourhood. With respect to treatment, he believed that in the premonitory stage, when this existed, the disease was easily to be remedied by medicine calculated to stop the diarrhoea; but when collapse had set in, he knew of no remedy that could in any way be depended upon. The patients sunk as if from a dose of prussic acid, so to speak. When a less dose of the poison was taken, they recovered. He spoke in severe terms of the purgative and castor oil systems of treatment, which had been productive of most extensive mischief in his own district, every patient placed under it having died, and many cases having been engendered by the resort to purgation by patients themselves. He eulogised the proceedings of the Board of Health with respect to cholera, and urged the necessity of medical men throughout the kingdom acting in unison with them. He could speak from experience of the good effects of this unison in Soho. He concluded with some severe remarks on the unprofessional and dangerous practice of communicating "cures" for cholera to the newspapers.

Dr. WEBSTER observed that it was curious that, though cholera was fatal to so many persons in 1849, that in 1860 the mortality had fallen so much below the average that there was no excess of deaths in the two years. When cholera was epidemic, other diseases were less fatal and less prevalent. At the St. James's Dispensary there had been less general disease during the present year than there was in 1853 by one-half. It was curious that in 1849 the greatest mortality had occurred on a Friday night in the first week of September, on which day the weather was exactly similar to the corresponding day in 1854, except that in the latter the wind was a little more northerly and easterly. He did not regard the state of the water as the only cause; others, as errors of diet, impure air, bad drainage, might be mentioned. With respect to the late outbreak of the disease in St. James's parish, it was somewhat remarkable that the higher parts of the parish were the affected districts, whilst the lower ones, some of which were in every way as bad as Berwick-street in respect to filth, overcrowding, &c., escaped. In his experience, treatment was only effective in the early stages; when in the state of collapse, remedies seemed to exert little or no influence. Stimulants, as camphor and capsicum, external warmth, and frictions, had been the means to which he had resorted in these cases. He condemned the infatuation of the profession and the public respecting the use of castor oil in this disease, and was gratified that the eyes of both were now opened respecting this dangerous "remedy."

Mr. STREETER had studied the disease carefully in its various outbreaks since 1832 to the present time. He thought the opinion which had been stated respecting doing nothing in the collapsed stage of cholera was unworthy of us; and suggested that, to treat the disease successfully, we should study accurately the mode in which death takes place. His own opinion with respect to the poison of cholera was, that one-third of the persons affected would die from the large dose taken, one-third would recover from the power of the constitution, and the remaining third would live or die according to the treatment pursued. There was a peculiarity in the collapse of cholera which distinguished it from syncope or ordinary asphyxia, and seemed to him to be dependent upon coagulation of the blood beginning in the rete of the lungs, and extending from thence gradually to the heart. The poison, whatever it was,—and it seemed to him to belong to the cyanogen class,—was, he believed, eliminated in the chyliferous processes from the last meal. The poison did not exhibit itself immediately the food was taken into the stomach, but some hours after; it was conveyed with the chyle into the thoracic duct, from whence it got into the circulation, and exerted its deadly influence. He spoke of the necessity of carefully watching the symptoms in cholera, and referred to the records of some cases of the disease in the earlier volumes of THE LANCET as good models for our guidance. With regard to treatment, vomiting often was of great benefit in preventing the coagulation of the blood. In the so-called castor oil treatment, the patients were treated by a plentiful allowance of cold water, the application of mustard poultices and dry warmth to the extremities. In one case a mustard emetic roused the patient from lethargy, and in another turpentine was added. These were the remedies which were ordinarily employed.

Dr. HARE, with respect to the statistics of the mortality of cholera, remarked, that when the plague was epidemic in London, the greatest mortality had occurred in the first week in September, or last week in August. This disease had also in another respect followed the same laws as cholera, by attacking most formidably Southwark, Lambeth, and the other low situated places, while those persons who encamped at Hampstead-hill and other high localities escaped. With respect to the spread of cholera, he thought that the atmosphere had much to do with it, and did not believe that contagion alone could explain the sudden outbreak of the disease amongst five or six hundred people. At the same time, facts seemed to show that, under favourable circumstances, the disease was contagious. Notwithstanding what had fallen from Mr. Streeter, he considered the plan pursued in King's College Hospital, was essentially the castor oil treatment, for as much as a pint and a half had been administered in some cases. The castor oil plan of treatment had been most faithfully carried out on eight patients in University College Hospital, and these all died, though one of the cases, at least, as a colleague of his had observed, ought not to have been a fatal one, as it was not severe. He had tried this plan because it had come from a respectable source, and because he considered that with respect to treatment, we could only expect to be successful from experiment, and could anticipate no good results from theory.

Mr. HEADLAND, in reply, remarked that he had brought forward his paper rather in the character of a student than a teacher, and because he thought that cholera should be more carefully investigated. He had not time to enter fully into all that had been urged against his views, but he did not think any arguments had been advanced which militated effectually against them. He still maintained his opinions, and could not regard cholera as simply "an affair of stomach and bowels," though it was upon these that the most prominent symptoms presented themselves. But the remedies which were most effective in common vomiting and diarrhoea were of no use in cases of cholera; and, notwithstanding what had fallen from Mr. Streeter, respecting the effects of treatment in the stage of collapse, he (Mr. Headland) must repeat, that when the patient was pulseless, blue, and cold, with suppression of urine, and other signs of collapse, he had never seen a recovery take place under any kind of treatment. Dr. Bennett had remarked that there was nothing original in his (Mr. Headland's) views, but he was not aware that any one before had referred the first effect of the disease to the blood corpuscles. These he looked upon as the elements of life, and an interference with their integrity as the cause of death. His view explained why those attacked early in the disease died, as their blood was more damaged than those who became affected at a later period, and who were saved by having enough of good blood left in the system.

## WESTERN MEDICAL AND SURGICAL SOCIETY OF LONDON.

THE first meeting of the session was held on Friday, the 20th inst. The chair was taken by the President, Dr. JAMES ARTHUR WILSON, who, in a brief address, congratulated the members upon their meeting again without any loss in their ranks, after the severe ordeal they had passed through. At the annual meeting in May last, we were anticipating the visitation, which had now nearly passed over us, and he was glad to find that this first night of the session was to afford an opportunity of eliciting the results of the experience of those who had had large opportunities of observing the disease in this western district of the metropolis. As his custom is, when the opportunity offers, he made many practical suggestions; and, in conclusion, adverted to albumin as attracting much attention at the present time; and stated that, whilst it was interesting to the chemist, the production of it in large quantities was promising to be remunerative in a high degree; and at the same time a subject coming legitimately within the scope of the objects of this Society.

Dr. C. J. B. ALDIS then read the notes of some cases of cholera that had occurred in "Belgravia," and although the cases themselves presented no marked peculiarities, they served as a text for the discussion that followed. He commenced by describing the district comprised in "Belgravia," and declared it to be, with its fair outside, too like many other parts of London, "but a whited sepulchre," inasmuch as this district, to the 18th of October, furnished 223 deaths from cholera to the Registrar-General's report. He proceeded to point out that very many of these cases, and certainly the earliest ones, occurred on the banks of the Ranelagh sewer, which forms the western boundary of the district; it is uncovered for a great part of its course, and has been a fertile source of disease for many years past. This Society memorialised the Home Secretary on the subject last year, after many representations had been made to the Commissioners of Sewers by medical men and others in the neighbourhood; but to the present time it remains, without any visible step being taken to abate so abominable a nuisance. Dr. Aldis then related in detail several cases of epidemic cholera, interspersing the relation with remarks as he proceeded, to illustrate more fully the character of the locality, or the result of the mode of treatment employed. Thus, in respect to the use of calomel, he is disposed to attribute good results to its administration where it has been absorbed; but he believed that often where calomel was given in substance, it was neither absorbed, nor even swallowed, in consequence of the completeness of the collapse that existed. He agreed, upon the whole, with the majority of the meeting, in discouraging the use of those, so-called, "heroic" plans which many writers had advocated.

Many members took part in the discussion which followed, and the feeling of the meeting was pretty generally expressed in "a careful attention to the wants of the patient, to prevent all unnecessary exhaustion of the vital powers, and to administer the remedy, whatever it may be, in such doses and at such intervals as the symptoms appear to demand: exercising a judicious watchfulness that, in the progress of the case, and in our anxiety to be doing, we forget not the possibility that the agents we employ as remedies may prove to be dangerous poisons."

At 10 o'clock the meeting adjourned to the 3rd of November, when Dr. CASHILL will read some cases of typhoid fever.

## Reviews and Notices of Books.

*Poisoned Wounds: their Distinctive Features and Classification; with Remarks upon the Classes, and a Special Treatise on those resulting from the Bites of Venomous Reptiles, &c. Being a Report of a Committee to the Medical Association of Missouri.* By A. F. JETER, M.D. Quincy, Missouri, U.S. 1854. Pamphlet.

A NEAT little essay, and to the point throughout. We would print a great part of it entire, if our space permitted; but, happily, in this country its contents are of less importance than in that part of the transatlantic continent where the author resides, which is infested with rattlesnakes, copper-heads, and other venomous serpents. Dr. Jeter, however, remarks that the poison of the bee is similar, if not identical, in nature with that of the rattlesnake, and that where a sufficient num-

ber of bees, wasps, or hornets, have united in stinging a person so as to overcome the vital energies, they produce symptoms, both local and general, in all respects similar to those resulting from the bite of poisonous snakes.

According to a series of experiments instituted by Mr. Blake, Professor of Anatomy in the University of St. Louis, it would appear that an interval of not less than nine seconds were essential, in all instances, to their manifestations upon the nervous centres; but our author denies this conclusion, and states that the bites sometimes act sooner by direct nervous implication. He gives cases in proof of his opinion; and he asserts that the virus, though tasteless, is not, as many suppose, harmless, when taken into the stomach.

As to the treatment of venomous snake-wounds, Dr. Jeter says—

"Excision of the part, its destruction by caustic, actual or potential, may all be very efficient measures of relief in such cases, if resorted to in time. Section with the mouth or with cupping-glasses, after free scarification, are also useful means of averting the evils of this poison, when timely used. Ligation of the member on the cardiac side of the wound will at least prevent such rapid introduction of the poison into the circulation as would be likely to prostrate the nervous system, or, at all events, suffice until some remedy for sustaining the vital powers can be obtained. These appliances, however, are only available for a few minutes after the bite, and unfortunately are rarely brought into use, in consequence of the absence of both physician and materials from the scene of accident."

Potent and diffusible stimuli are always indicated immediately after such wounds, and the author states he has administered to a girl between three and four years of age, who had been bitten, a pint and a half of fourth-proof brandy, without any signs of intoxication ensuing. Sinapisms over the whole body are announced to be the next most reliable means of averting collapse; dashes of cold water along the spine; flagellation; or any other method of keeping the function of innervation alive until the force of the virus is in some measure expended.

In cases where the poison has been taken into the circulation, without causing immediate death, diuretics are required, and Dr. Jeter prefers Labarraque's solution of hypochlorite of soda, given in teaspoonful doses, combined with an alcoholic stimulant, or with carbonate of ammonia or camphor. He says, "Quinine and other tonics often subserve useful purposes; but opiates, in our experience, have been uniformly hurtful." For local application, free inunction with olive oil, or constant bathing of the inflamed part with ammonia or Labarraque's solution, is recommended, to which last some creosote or turpentine may be added, if mortification be imminent.

*On the Pathology of Delirium Tremens, and its Treatment without Stimulants or Opiates.* By ALEXANDER PEDDIE, M.D., F.R.C.P., &c. Edinburgh. 1854. pp. 51.

DR. PEDDIE has here reprinted a paper which lately appeared in the *Monthly Journal of Medical Science*, and, in order further to illustrate the opinions therein advanced, additional cases have been detailed, as also the results of some inquiries made of the medical officers of some of the large Scottish prison establishments, in regard to the effect of the withdrawal of wonted stimulants in the case of prisoners of known intemperate habits. We have not space to discuss critically Dr. Peddie's views, nor the value of the data brought forward to support them; but we most strongly recommend his very interesting and thoroughly practical paper to the attention of our readers, being convinced it is one that few can peruse without profit.

ST. BARTHOLOMEW'S HOSPITAL.—The vacancy left in St. Bartholomew's Hospital by the lamented death of Dr. Roupell creates another opportunity for the "average man." Dr. Martin, the lecturer on Natural Philosophy in the School, has announced himself as a candidate.

## THE LANCET.

LONDON: SATURDAY, OCTOBER 28, 1854.

LET those who argue that the medical officer attached to our armies is, in all essential respects, a civil officer; that his duties are of a civil and not of a military nature; that the scene of his labours, in great measure, preserves him from the dangers to which other portions of the army are exposed; and that his position, his honours, and his rewards should be regulated in accordance with this idea;—refer to, and well and carefully read over again, that eloquent passage in the letter of the correspondent of *The Times* at the seat of war in the Crimea, which runs thus:—

“What is that grey mass on the plain, which seems settled down upon it almost without life or motion? Now and then, indeed, an arm may be seen waved aloft, or a man raises himself for a moment, looks around, and then lies down again. Alas! that plain is covered with the wounded Russians still. Seven hundred and fifty wounded men are still upon the ground. \* \* \* We have done all we can for them, and now, unable as we are to take them along with us, or to send them away, we must depart.”

But striking and painful as this picture may be, let them read a little further, and say—In the midst of this mass of 750 wounded men, what further object presents itself to the view? Who is that single individual who, of all the host which is marching away from the scene of its late triumph, is still to be found upon that blood-stained field? and what is the errand in which he can be engaged—there, alone amongst his enemies, watching the retreating forms of his friends, his countrymen, and gathering up his courage as best he may, to undertake those duties which, in obedience to the dictates of humanity, it has become his stern duty to perform?

“In order to look after their wounds, an English surgeon was left behind with these 750 men. This most painful and desolate duty devolved on Dr. Thomson, of the 44th Regiment \* \* \* and then, provided with some rum, biscuit, and salt meat, he was left alone with his charge.”

Well may *The Times'* correspondent describe him as a painful and desolate duty! and well may we ask, if the courage required to sustain him in this most trying emergency was not at the least equal to that demanded of our gallant soldiers when called upon to face such difficulties as those they had so recently, so gloriously overcome?

We desire particularly to direct attention to this incident, as serving to show the nature of the duties our army surgeons are liable to be called upon to undertake. We know that a man, in the ardour of the fight, in the full tide of battle, side by side with his comrades, with the eyes of his fellow-men upon him, will, in the moment of excitement, nerve himself to face the cannon's mouth, and to perform deeds of daring which in his cooler moments he would not venture to contemplate. But what is to be said of the heroism required to face death in the thousand forms in which it must have presented itself to the mind of that lonely man, alone in the midst of hundreds, with nothing to relieve his sense of desolation, and supported only by that moral courage which the consciousness of being engaged in the discharge of the noblest of duties—that of humanity—could confer? We answer that, let the deeds done by others in that gallant army be what they may, none are more worthy of mention, or required more real

courage, more heroic courage and self-devotion, than this of Dr. THOMSON, of the 44th. Melancholy to relate, two days after these noble and charitable exertions, Dr. THOMSON was hurried from the scenes of his benevolence by that fearful scourge, the cholera. He died after twenty-four hours' illness.

But conspicuous as is this instance of heroism on the part of one army surgeon, we know that the duties which the whole body were called upon to perform after the battle of the Alma were such as to demand the exercise of qualities of the very highest order. The soldiers of our army fought for *three hours*, and truly they did their work as English soldiers know how to do it. But we also read of the medical staff, that for *forty-eight hours* after the battle they were incessantly occupied in their dreadful and arduous duties! and we do not hesitate to say that, during these forty-eight hours, every one of these men underwent as much danger of death as any individual amongst the officers or men who so gallantly stormed the heights two days before. Doubtless, the perils of the surgeon are surrounded by no halo of glory; they have no such thrilling accompaniments as belong to those encountered at the cannon's mouth, or when charging upon the sword of the foe. But the dangers are no less real: the enemy is to the full as deadly, and his aim as sure: they occur for the most part silently and insidiously; they were ever present during his labours for the two days and nights upon the field of fight, exposed to the chances of death from fatigue, from cold and dew, and from the tainted atmosphere which the neighbourhood of the wounded and dying inevitably brings; and they are present in a peculiar manner when he is called upon in camp or in hospital to incur the risk of contagion from cholera or other pestilence which accompanies constant intercourse with the sick, in addition to the ordinary liability to the illness which he shares in common with the rest of the army from residence in the infected district.

The dangers being thus at least equally shared by the whole army, we should of course expect that the rewards of successful daring would be equally divided also. Whether this is so our readers are but too well aware.

IN THE LANCET of last week we adverted to the fact that, in the despatches received from Lord RAGLAN, no mention is made of his medical staff, or of the vast services which they must have rendered immediately after the battle; not one word to cheer or inspirit them; they are passed over in silence; their very existence forgotten. The public, indeed, now that the emergency has arrived, and upon the mere suspicion of a deficiency in this particular, has shown, by unmistakable signs, that they feel to the full extent the exact value of the medical staff attached to an army, and are willing to recognise the vital importance of this arm of military science. But the Government of this country (and, consequently, the agents of the Government) evidently look upon them as performing duties of a very secondary nature; and although upon their skill and devotion to their calling the restoration of our soldiers and friends to life and health, and, in many instances, their restoration with a whole body instead of a maimed trunk, entirely depends, any extraordinary encouragement, or any greater stimulus to exertion in their labours, or any other object of honourable ambition for which to strive, than is provided by their own consciences, their sense of duty, the calls of humanity, or the distant prospect of promotion in the ordinary course of things, is systematically denied to them. A man can, without difficulty, be rewarded by knighthood or a baronetcy for a success-

ful speech in parliament, or for a vote which has saved a ministry; but for the man who has saved hundreds or thousands of his fellow-countrymen, by services to the army, any such distinction is considered to be entirely unnecessary.

If the prevention of epidemics be one of the chief cares properly devolving on the Board of Health, it follows that the prophylaxis of small-pox, than which no zymotic disease is more terrible, or requires more constant vigilance, ought, in the nature of things, to be under the charge of that department. No example can more strikingly illustrate the present confusion that prevails throughout our sanitary legislation, than the laws and practices professing to have for their object the prevention of small-pox. We have on former occasions exposed, from the statistics of the Small-pox Hospital, drawn up and analyzed by Mr. MARSON, the not very creditable fact that England, the birth-place of JENNER, the country to which all other countries owe that discovery of all others the most valuable in its results that medicine ever gave to the human race, exhibits not only the most imperfect vaccination, as regards the diffusion of that operation throughout the population, but also the worst in point of individual performance. This fact is incontrovertibly proved by authentic and consistent observations, extending over many years. Vaccination, often bad when performed at all, and the total neglect or refusal of vaccination by a large portion of the population, necessarily left never-failing sources for the maintenance and spread of small-pox. The Compulsory Vaccination Act of Lord LYTTLETON was passed in the hope of making vaccination universal and effective. It cannot be doubted that, could that object be attained, small-pox would be, if not entirely expelled from the land, at least kept within such narrow limits as to cease to be a national infliction and a national reproach. Does the Act hold out any reasonable hopes of attaining this point? The most undeniable evidence proves that the Act has failed. Vaccination has not been extended. Small-pox has not been diminished. It was obvious to those who had studied the subject of sanitary police, that failure would ensue. At the time when the Bill was under discussion, we pointed out the defects in its principle and in its provisions which surely foreboded that result. We have now the means of exhibiting the state of the country, as far as regards small-pox and vaccination, since the attempt has been made to bring the Act into operation. We conceive that we shall discharge an urgent duty, and render a good service to the cause of Sanitary Reform, by showing the manner and the causes of the failure of this Act. The materials from which we draw our conclusions are contained in the "Quarterly Return of the Registrar-General" ending in June last.

If we examine the reports of the local Registrars, we shall find abundant evidence of the extent to which this loathsome, and fatal, and preventible distemper has prevailed; and distinct indications of the causes which entertain it.

The Registrar of St. George's, Hanover-square, says:—"Small-pox has prevailed with fatal effect, principally in unvaccinated persons." In Lambeth, it is reported that "there have been many cases of small-pox. The Registrar has no means of ascertaining how far the Vaccination Act is complied with, there being no appointed public vaccinator in his district." At Kingston, in Hampshire, the Registrar says: "Small-pox is on the increase. Like fever, it has been most fatal in those localities where drainage, sewerage, and

"ventilation are most wanted. I am of opinion the disease is propagated by mothers and nurses, who purposely take the children into infected houses!" In Landport, "the increase in the deaths above the average is attributable to the ravages of small-pox, which has been, and continues to be, epidemic here." In Southampton, "small-pox has continued to be very fatal during the first two months of this quarter." At Leighton-Buzzard, in Bedfordshire, the disease "has been very prevalent." At Luton, "the increase of deaths above the average is mainly caused by small-pox; but I believe that the disease has been fatal only to those who had neglected vaccination." At Norwich, "small-pox continues to be epidemic, but only one death has occurred where vaccination had been previously performed." A Registrar says: "I regret to add, that many of the poor and uneducated parents are extremely averse to having their children vaccinated." At St. Thomas, in Devonshire, "vaccination is still objected to, and duplicate certificates are slowly returned." At Plymouth, "there have been twenty deaths from small-pox." At Stogumber, "small-pox has been raging. Parents pay very little attention to the vaccination of their children, and many refuse, notwithstanding the Vaccination Act, and when the disease is spreading around them." At Taunton, "the Vaccination Act is not carried out." In Droitwich, "small-pox still continues to rage." At Ashbourne, in Derbyshire, "small-pox is still very prevalent." From Stockport we find an almost solitary testimony in favour of the Act, and even that testimony carries an important qualification: "The Compulsory Vaccination Act is working well. There are a few parents that have strongly objected to it, but by reasoning with them they have given way. The chief difficulty arises from apprehension that the vaccine matter may be taken from unhealthy children." In Bolton, "the Act is evaded." In Yorkshire, "small-pox has been prevalent at Topcliffe. Two deaths had been registered, in neither of which had the parties been vaccinated. Vaccination is still much neglected by the labouring classes." In Kendal, "small-pox has been very prevalent."

Such are examples of the evidence supplied by the Registrars. That evidence leaves no doubt as to the prevalence of small-pox. It affords also the most distinct proof that vaccination is still obstinately resisted. It is equally proved that the Compulsory Vaccination Act is unequal to the charge of diffusing vaccination.

In considering the amount of the evils inflicted by small-pox, it must be borne in mind that that amount is not to be measured by the deaths. Many who recover with their lives suffer from a variety of secondary evils; blindness, deformity, debility, scrofula, insanity, impair the enjoyment of life, and predispose to early death.

But why has the Vaccination Act failed? Upon this point we have the most certain information. Our own observation, and the uniform testimony of the medical profession, who, more than any other class of the community, enjoy the opportunity of ascertaining the unbiassed feelings of the poor, concur in demonstrating that the association of the Boards of Guardians with the execution of the Act constitutes the one great and insurmountable obstacle. The special and peculiar duty of Boards of Guardians is to administer the Poor Law. The poorer classes will naturally contract a dislike, that may be a prejudice, against those who are charged with this unpopular office. Vaccination coming from them, and coming

with the additional drawback of compulsion, will necessarily be regarded with suspicion. Whatever is forced upon the labouring classes by the Poor-law officials assumes the odious form of Poor-law relief. The vaccinators are appointed by the Guardians. The poor are told that they *must* carry their children to be vaccinated by medical men who may be strangers to them. They apprehend—and the apprehension is not altogether unfounded, or unshared by the educated classes—that the vaccine matter employed may carry with it the seeds of other diseases not less loathsome than the one it is intended to prevent.

The consequence of this wide-spread discontent is what we have seen: diminution of vaccination, and increase of small-pox. What is the remedy? what is the course to be adopted? Is it not obviously to withdraw the charge of extending vaccination from the inefficient hands of the Boards of Guardians, to entrust it to that department whose special and natural function it is to prevent epidemics, and to watch over the general health of the community?

There is surely no valid reason why small-pox should be made an exceptional case; why one zymotic disease should be picked out from its congeners, and the care of preventing it taken away from that department which is alone able to cope with it in a comprehensive manner; and without wounding the honest pride of large classes of the people.

GREAT as is the cause for animadversion upon the conduct of our medical establishments, we would emphatically express our belief, that, in the preparation of medical and surgical means for the service of our army now in the field, Dr. ANDREW SMITH, the respected head of the medical department of the army, did all that was needful. If necessities were wanting in the field, or in the hospitals at Scutari, we must look to the executive authority on the spot for the explanation. This is a point not understood by the public, and hence the unjust observations of some portion of the daily press.

In a most fair and liberal article on the alleged neglect of our wounded soldiers, the *Examiner*—one of the ablest of the weekly journals—does ample justice to Dr. ANDREW SMITH, and to those acting under his orders. The Editor declares his belief, that every fresh information will increase our satisfaction with the medical arrangements—a belief in which we altogether concur. Referring to the sentiments expressed by the French press on this subject, the Editor of the *Examiner* offers the following important observations, which we commend to the attention of the profession:—

“A word in conclusion on the way in which this alleged failure of our medical arrangements, as to which we have been remarking, has been discussed by our friends the French. It may turn out worth while to have been somewhat misled in the matter for a little useful plain speaking. Reports, with probably little truth in them, elicit remarks that have unquestionably a great deal of truth in them.

“The French say, then, that such a failure would be mainly due to the fact that the medical profession has achieved for itself no adequate honour or reputation in England. In France, during the last half century, there is no council board, no administration, no society, in which the medical profession has not found itself represented, whether at the Court of the Sovereign, amongst the Peerage, or in the Legislature. Physicians of the Institute take their place naturally amongst the first of the land. Their views, their discoveries, their cares, their professional ideas and suggestions, must be listened to, cannot be neglected, and may never be treated as intrusive; nor had Napoleon fewer physicians and surgeons for friends, councillors, and dignitaries of state than

he had of any other profession. But in England all such interests find themselves either unrepresented, or not represented worthily, and the best of her physicians is good only to amass money, or, at the highest, to get a baronetcy. What important or salutary medical influence has made itself felt in the public administration since the wounds of Waterloo were healed? and where, in all those years, except to born lords and baronets, have we had the means of looking for sanitary wisdom or suggestion? For answer, we are referred to the whole history of our sanitary and medical administration. Provided only a man be born baronet or lord, we are ready to accept him for a born scavenger and born physician as well; nor can any amount of science or learning be esteemed paramount to our regard, except the science of addressing and managing constituencies, or the knack of palavering either House. There may be some exaggeration in this, but it will be safe to admit that there is also considerable truth; that though the text is inaccurate enough, there is something in the comment it provokes; that honour and influence in this country tend far too much in one direction; and that, so far from our men of mere learning and science finding easy access to their Sovereign or her councils, they have only too much reason to be thankful when they get the ear or be worthy the attention of an Under-Secretary of State.”

This is excellently well put, and to attain to the status of the general body of the profession in France we must bring about a great reform within ourselves. We believe that the political shyness of the profession ought above all things to be overcome. Where there is now one medical man in Parliament, there ought to be twenty. No man ought, in our opinion, to hold the position occupied by Dr. ANDREW SMITH without a seat in Parliament. His explanations of the medical arrangements for the East ought to be made in Parliament, face to face with those who are really responsible for the errors which have been committed. We wish, too, that Sir WILLIAM BURNETT could be brought to believe that his leisure could be better occupied in serving some parliamentary constituency, and upholding the Medical Department of the Navy in the Legislature, than by bottling and sealing solutions of chloride of zinc.

WHENEVER the important subject of the prevention of unqualified persons from practising medicine has come before the public, unprincipled quacks and ignorant legislators have opposed any scheme for the purpose, on the absurd plea that it would infringe the liberty of the subject. England has been called the “Paradise of Quacks,” and a Minister of the Crown endorsed the axiom by his memorable quotation—

“That the pleasure is as great  
In being cheated as to cheat.”

One of his successors in office, however, not appreciating either the morality or the expediency of such a doctrine, made lately a striking commentary upon it, by ordering the prosecution of a notorious quack for having cheated a patient of his life. It has been too much the fashion to regard the suppression of illegal practice as affecting merely the practitioners of medicine—that their interest only is involved in the matter. There never could possibly be a greater mistake. However much a stringent law to suppress illegal practice might benefit the profession, we unhesitatingly affirm that such a measure would confer a far greater benefit upon the public at large. Those whose daily duties call them to the bedside of the sick and the suffering are constantly in the habit of witnessing the dangerous effects of the practice of medicine by ignorant persons. Cases occasionally come before the public in the report of a police-court, or of a coroner's inquest, of poisoning by some potent drug ignorantly administered, or of death from some serious disease wrongly treated. But cases of this kind that

never meet the public eye are undoubtedly of daily occurrence. It is the practice of those who impose upon the public by false titles or quack nostrums to leave their patient in the time of his greatest danger, and the qualified attendant is merely called in at the closing scene to give his assistance in a hopeless case, and "a certificate of the cause of death." We do not overstate the fact when we assert that thousands of lives are annually sacrificed in England to the ignorance of unqualified practitioners. That the members of our profession are deeply injured by the want of a stringent law to prevent illegal practice, we are willing to admit. That they should be allowed to suffer under such an injury is a disgrace to the Legislature. For thirty years we have fought for that protection in the pages of this journal, and until that act of justice is consummated we shall continue the struggle.

Those who can carry their memory back for the last quarter of a century will see something of hope in the future. Parliament and the public think very differently now to what they did on the subject of protection, and it is certain that no measure of Medical Reform will be carried that does not contain a stringent clause for the prevention of unqualified practice. Persons falsely pretending to be lawyers are punished as criminals. An Act of Parliament has decreed that the forger of the "Hall mark" upon base metal shall be treated as a felon. But the public have no protection against any ignorant knave calling himself a physician or surgeon, and practising as such. Property is held sacred. Life is treated as worthless!

The result of the case of the Apothecaries' Company *versus* BROWNRIDGE, as reported in the present number of THE LANCET, must be highly satisfactory to qualified practitioners. From no class do they suffer so much as from the prescribing druggists. To the injury inflicted by these persons are many of the difficulties which beset the path of the young practitioner to be attributed. There is not a member of our profession who will not readily assent to this. Mr. BROWNRIDGE is only a type of his class. We trust that the just verdict obtained against him will stop the prescribing career of many of his brethren. Notwithstanding legal quibbles and subterfuges, the law has reached the offender. It cannot be long, however, before a more summary mode of proceeding than suing for penalties in the County Court will be instituted to stop the dangerous practice of ignorant and unqualified persons.

THERE is in *The Times* of October 25th, an article so forcibly true, that it must excite the attention of every medical officer who has served in the field. It is a fact, now, in relation to the Crimea, and has always been a fact in every British military expedition, that medical officers and their stores have been the last to be provided for, and hence the prevalence of former and present neglect of our sick and wounded. The very sutlers are provided for before our surgeons and the means of relieving those who fall in battle. This lamentable state of things, as the article referred to truly states, is brought about by the utter want of all independent action in the medical staff of our armies. The military medical officers ought to be masters both of their own men and of their own stores. If this were the case, our superior military surgeons, whether in home or foreign administration, would become justly responsible, both to their commanders and to the Government. The truth has been exactly as now stated in the public press, and it has ever been, and always will be so, with our

medical stores and medical officers, until an independent action is permitted. They ought no longer to be under the entire control of generals-in-chief or generals of division, but they should have everything within themselves. They should then be responsible to their generals and to the authorities in this country for the use made of the means at their disposal. This is what is wanted in our fleets and armies. The commissaries-general and their superior officers enjoy on service a completely independent action, and yet they are as thoroughly responsible as the lieutenant-colonel or the major to the generals and to the Government. It is for this kind of independent action that we contend, as being absolutely necessary alike to the efficiency of the medical department and to the welfare of the soldier. More than enough of medical officers and stores were sent with the army from this country; but the generals left them at Varna, and no doctor had even the privilege to complain. Sir ROBERT PEEL states, on the information of the authorities, that courts-martial are to be held in the East upon the recent blunders. No good can come of this. The inquiry, to be efficient, should be made in this country, and it would have to begin with the highest places and personages concerned in the conduct of the war.

## Correspondence.

"Audi alteram partem."

## THE LATE DR. ROUPELL AND THE "THIRD YEAR'S STUDENT."

To the Editor of THE LANCET.

SIR,—My attention has been directed, through the courtesy of a friend, to a recent number of a medical periodical which I seldom peruse. In its impression of the 7th inst. some observations occur in eulogy of the late Dr. Roupell, propounded in the very feeblest language, that makes reference to a trivial and brief criticism which, under the title of the "Third Year's Student," was published many months since in the columns of THE LANCET. Had not my name of late been so frequently associated, both privately and publicly, with the contributions of the "Third Year's Student," it would misbecome, as well as be unnecessary for, me to notice the remarks to which I refer; but the profession is cognisant that such is not the case, and as I believe it to be a most salutary principle that a wilfully malicious statement published in a journal, of however limited a circulation, should, if the topic is of moment, suffer immediate refutation in the most effectual manner, I scarcely conceive that I make an idle request in asking the attention of your readers to the subject of this letter.

Now permit me to quote the passage in question. It is as follows:—

"In the words he (Dr. Roupell) was always accessible to the students, ready to communicate, and full of practical knowledge. *We would not willingly, on the present occasion, allude to a disagreeable subject, but, in justice to his memory, cannot here omit to state, that no one than he less deserved the impertinent and personal criticisms which recently appeared in the columns of a contemporary as the contribution of the 'Third Year's Student.'*" The italics are my own.

Those whose recollection of the "Letters" is by this time obliterated will naturally ask, What are these "impertinent and personal criticisms?" Sir, they were embodied in a single observation. The nature of this remark (although I should have considered it sufficiently intelligible to have been susceptible of comprehension by the least educated person) was, at the period of its publication, misunderstood by a correspondent, and therefore, in a subsequent number of THE LANCET, this criticism was thoroughly elucidated. With your permission, I will cite the entire passage:—

"The charge of ignorance which I am asserted to have 'lodged' against Dr. Roupell is contained in a single remark. 'Dr. Roupell, indeed, uses it, (the stethoscope) but more, I believe, *pro forma*, than from any confidence he himself puts in it.' How far this is 'lodging a charge,' I leave others to

judge. My expressions and phraseology are, I am aware, crude and imperfect, but the statement I intended to make was, that from a careful contemplation of Dr. Roupell's practice in the wards of the hospital, I found it was his habit, usually, to rely upon the diagnostic acumen an experienced eye furnished him, rather than be influenced materially by the confirmation, or otherwise, which the stethoscope afforded. I have often observed, that unless specially requested by a clerk, or other student, Dr. Roupell is not usually wont to use with any frequency either percussion or auscultation, to assist him in the prognosis or treatment of a case."

This, Sir, is the whole of the "impertinent and personal criticisms." The profession will observe, that throughout the complete correspondence of the "Third Year's Student" but a single reflection is cast upon Dr. Roupell, and this was not uttered in disparagement of his educational powers, but in order to demonstrate at the time, how few opportunities the pupils at St. Bartholomew's possessed to make themselves proficient in the ordinary details of stethoscopic science.

With Dr. Hue—an "antiquated automaton"—with Dr. Roupell careless in regard to this matter, surely the "Third Year's Student" might justly, and without peculiarity, take exception at this deficiency in an otherwise excellent teacher, and declare—as your correspondent did at the time—that upon Dr. Burrows alone rested the responsibility of rendering the pupils of the medical wards sound, enlightened, and useful practitioners; upon him they had indeed to rely "for their treatment of disease and integrity of practice." Where then is the cause, what grounds exist, for that most unworthy and ignoble sneer which, relying upon the carelessness or want of recollection of its readers, the medical journal quoted has had the indiscretion to publish?

In conclusion, allow me to say, that Dr. Roupell's reputation as a physician was far too well established, his character as a man too amiable and exalted, to require that "in justice to his memory" recourse should be had to party devices and inaccurate statements. Generous, considerate, amiable, and kind-hearted, he united in his person the most admirable qualities, while he was accomplished and erudite in many branches of knowledge. The School of St. Bartholomew's owes to its late teacher a deep debt of gratitude, for there is not a single department in it which does not afford some proof of his profuse and high-minded generosity. The walls of our college hall have been adorned by Dr. Roupell with portraits of all the most illustrious of those medical worthies who have achieved for themselves niches in the "Temple of Fame," and our lecture-rooms and library exhibit similar examples of his ubiquitous munificence.

Sir, at a time when, in common with all who knew him, I deeply deplore his premature decease, surely such acts as these should scarcely be forgotten; and Dr. Roupell's friends may solace themselves with the belief, that those who knew him less well than they, can sincerely appreciate his many excellent qualities.

October, 1864.

I am, &c.,  
H. CHALMERS MILES.

## WANT OF SURGEONS IN THE CRIMEA.

To the Editor of THE LANCET.

SIR,—My attention was drawn to your leading article in last week's LANCET, respecting the deficiency of surgeons in the East; and in answer to a correspondent, "A Subscriber," you state, that "the authorities at the Admiralty will only be too happy to find any respectable candidates applying for appointments as assistant-surgeons at any time." I feel surprised that they are so badly in want of surgeons, when I call to mind that, about three or four months ago, I felt desirous of going to the East as an assistant-surgeon. Accordingly I wrote to the Admiralty, to be placed upon the list of candidates for the naval service. To my great astonishment, I received a letter, stating that I was deficient "of six months' lectures on the Practice of Medicine," although I had attended two courses, of six months' duration each, and two six months' courses on Clinical Medicine, and I had attended more lectures on other subjects than what was required by the regulations. The board considered my deficiency a *sine qua non*, and would not place my name on the list until I had attended another course of lectures on that branch of medical science.

Now, Sir, I have been in the profession seven years, and possess the double qualification, besides that of M.D. from the University of Glasgow. At that time I did not think much of my application being refused, but since I have read the remarks

made in your journal, and in *The Times*, of the lamentable deficiency of medical officers in the army and navy, I felt a little surprised at my application having been refused, and at a time when our services were required. No doubt many other applications have been refused on these or similar trivial grounds; and in consequence of such absurd regulations, those brave men who have gone forward to fight in aid of a good cause, and more particularly those who have gloriously fallen in defending their country's honour, are deprived of the services, sympathy, and condolence of the guardians of health. When I call to mind the assertion made in *The Times*, that after the battle of Alma 700 wounded soldiers lay upon the field, wallowing in blood, and only one surgeon to attend to them, while the French army was well supplied with the disciples of *Æsculapius*, surely this is a great stain upon our country and Government, and one that will live to be told "by generations yet unborn." I beg to enclose my card, and am,

Sir, your obedient servant,

October, 1864.

SUCH IS LIFE.

## THE TREATMENT OF CLUB FEET.

[LETTER FROM MR. LONSDALE.]

To the Editor of THE LANCET.

SIR,—Were I inclined to enter into a controversy of a personal nature with Mr. Solly, his letter, published in the last number of your journal, contains elements amply sufficient for the purpose. This, however, is not my wish.

Mr. Solly thinks I ought to have waited till the publication of the details of his case before I presumed to give an opinion on the operation in question. Now, this is not at all requisite; for no details of a case can justify the performance of a dangerous operation, if it be found by experience that a cure can be equally well effected without having recourse to it; and such, I repeat, is the fact with the treatment of club feet; and that the severest forms can be cured (if curable at all) without the necessity of removing the os cuboides, however favourably Mr. Solly's present case may ultimately terminate.

In writing the letter which you did me the favour to publish, I believed I was only doing my duty in protesting against what I knew, from extensive experience, to be the promulgation of false principles in surgery, and especially when coming, *ex cathedra*, from a surgeon to one of the largest hospitals in London, and on the public occasion of the introductory address at the opening of the medical session.

Mr. Solly will forgive me, I hope, when I say there is one paragraph in his letter which caused me to smile—I mean where he refers to "the liberal support" the Orthopædic Hospital has received from the London surgeons. Now, of this I must confess that I am quite ignorant, and am really at a loss to know what he means. If I might venture to give an opinion, after having been connected with it for so many years, I should rather say that the Orthopædic Hospital has become a firmly-established and successful institution, quite independently of, and in many instances in opposition to, the London surgeons; and that the real secret of its success is, that the treatment adopted is founded upon sound principles of surgery, based upon large experience and patient observation.

I have no wish to enter further upon the subject, and should feel obliged by your inserting this letter.

I have the honour to remain, Sir,

Your obedient servant,

EDWARD F. LONSDALE,

Surgeon to the Royal Orthopædic Hospital.

Montague-street, Russell-square, Oct. 1864.

NEGLECT OF ARMY-SURGEONS BY THE  
COMMANDER-IN-CHIEF.

To the Editor of THE LANCET.

SIR,—We may fairly infer that there were very few surgeons in the Crimea at the period of the late engagement, and, consequently, that little service was rendered; for Lord Raglan mentions with honour every class of warrior, from generals and admirals to privates and sailors, but with scarcely an allusion to any medical officers. Had they been present their duties would have been as arduous and distressing, in administering to the dreadful sufferings of 2000 fellow-countrymen, as the generality of those engaged in the action, and surely such services would not have been overlooked. All practical medical men have known throughout the expedition that there should have been at least four times the number of surgeons (and additional assistants in various ways also) to have attended the sick; and when bloody and active warfare was immediately

\* Third Year's Student's Letter, (THE LANCET, February 5th, 1863.)

imminent, a greater increase even was required; and ample assistance might have been procured, if an appeal had been made to the profession and fair consideration shown; many qualified young surgeons would have accepted temporary employment, say for a year or two, and many junior members of the profession would have gladly joined as dressers, but redtapeism and bureaucraticism forbid such irregularities, and the most simple, yet useful, suggestions to the War-office, and officials in general, are utterly unheeded.

Many young men, of good name and character, who had obtained diplomas from the College and Hall, had all kinds of obstacles thrown in their way on applying for an appointment, and were obliged to "read up" to a considerable extent for the sake of getting up some peculiar kind of knowledge, and passing another examination; and after all this, they languished for weeks and months at Woolwich, Chatham, the Isle of Wight, and other *dépôts*, whilst hundreds and thousands were dying untended in the East. The position and objects of army surgeons should be borne in mind; they seek the army for a livelihood, and practise an art and science a knowledge of which has been obtained at a great cost of time and money, and sometimes of health; all other officers are men of means, and seek the army to obtain rank, and a footing in society and in the world of fashion; the prospects, therefore, of the army surgeon do not hold out a sufficient or just reward, and many a young man has borrowed £200 to make a start in the late expedition, and has insured his life at 8 per cent. as a security. The initiatory expense and outfit have scared away many. It is not too late now to procure temporary assistance, (say for a year or two, without granting permanent commissions,) and the excuses in a leader in *The Times* of the 16th are as lame and futile as its unwarrantable and most untruthful attack on the profession in its advocacy of the castor oil bubble.

I am, Sir, your constant reader,  
AN OLD MILITIA SURGEON.

## COMFORT FOR THE SOLDIER.

To the Editor of THE LANCET.

SIR,—A plan has occurred to me which I think will prove highly useful to our gallant soldiers and seamen. It is most simple, and I have no hesitation in stating that much good would ensue from its adoption. The plan recommended (to the soldier particularly) is, that he should wash his feet, either every day, or three times a week. The following results would take place:—The feet would become expanded; corns would be cured; the whole foot and calf would be greatly strengthened; there would be a more equalized circulation; warm feet; no headache; the soldier could march with more ease, and my firm opinion is, that from this suggestion, he would be enabled to add from three to five miles to a march.

Whilst on this subject I would further remark, that importance should be paid to the manner in which the nails are cut. It was my practice in youth, and it is not confined to youth, to perform the operation as thoroughly as possible, by paring them down to the quick. Not a word must be said respecting the consequences. A short time since, I was summoned to a policeman, who informed me that he had been unable to walk for nearly three months. I soon perceived that the nail had penetrated the flesh; the portion was immediately snipped out with scissors. The man walked.

I am, Sir, your obedient servant,  
Newcastle-under-Lyne, WALTER SCOTT, M.R.C.S.E. & L.S.A.  
Sept., 1854.

## THE WAR.

(FROM A CORRESPONDENT.)

CAMP GALATA, Sept. 22nd, 1854.

It is now some time since I last wrote, having postponed this letter until now, as a friend of ours told me he was going to write and give you particulars of all that had taken place. No doubt long before you get this, you will have received some important news from the Crimea. Up to this time we have heard that all the army had disembarked, without the least opposition, and were received by the inhabitants with open arms, since which they have obtained us some thousands of oxen, and other things for provisions, and seemed inclined to assist us all in their power. The Russians did not expect us, as they had heard we were decimated by cholera, so they were not prepared. One of their couriers has been inter-

cepted, begging for 50,000 men as soon as possible, or else they could not hold out. They have suffered very severely also from cholera, and in the Crimea there are not above 40,000 soldiers, 30,000 of whom are at Sebastopol. Lord Cardigan, with the 11th Hussars, another regiment of Dragoons, and some Rifles, had gone to intercept two Russian cavalry regiments who were marching to Sebastopol, and it was thought he would be able to come in contact with them. Our spies have gained information that there is great discontent amongst some of their soldiers, on account of the work they have been subjected to all the summer. News can arrive in England from Varna now in less than three days, as the electric telegraph is open to Bucharest. There is a stoppage at the latter place, and from there to the next station it goes by post.

After the landing in the Crimea they had some awful rain or hail, and in a very short time 1100 reported themselves sick; some say 700, some 1000, were sent immediately to Scutari. I trust that cholera has left us, no case having occurred here now for about a fortnight, neither have I heard of one. Fever seems to be getting less, but dysentery is increasing; some very bad cases have occurred, but very few seem to be fatal. Mercury with chalk, with powdered ipecacuanha; sugar of lead, two grains; opium, half a grain; of calomel, are the medicines that are used, and eventually relieve the patient, though some cases are very protracted. In cases of simple diarrhoea we use sulphuric ether and laudanum with great benefit. Diarrhoea is very prevalent, and soon passes into dysentery, if not checked. Bed-sores and sores of any extent show a great tendency to pass on to gangrene, and a few cases have been lost in consequence. It causes us to be very particular, even in putting blisters on. I think we have suffered much less from intermittent fever than we anticipated, but have had a great many cases of low fever. At first the cases of fever were not severe, and did well; but about the end of August and beginning of September they put on a much lower form, and ran a rapid course—either to convalescence or death, requiring a great amount of stimuli. We are now waiting for ships to take the sick to Scutari, where they are to be placed, I believe, under the care of staff-surgeons, and then the regimental assistant-surgeons proceed to Sebastopol. We are all waiting anxiously for these said ships, as we want to see some other work than we have been lately used to, and I trust that we shall soon be at Sebastopol. The army suffered from cholera on its way up. Some cases were extremely rapid, one case mentioned to me being less than three hours in duration; the man was waiting at dinner at four, and at seven they were sewing him up in his blanket, but no doubt he had suffered from diarrhoea for hours; this, however, I could not ascertain. They took fourteen days before they arrived at their destination and disembarked, as they anchored off various places before they stopped finally.

I suppose the second summer has begun here now. About a fortnight ago there was a break up of the fine weather, and for a few days it was stormy, with cold rain; but now it has changed again, and become fine and very warm; the nights are close, with a great dew. We have given up the General Hospital at Varna to the French, who are going to winter there, while they have given up Scutari. I hope our army may never put foot again in these parts; we shall all have vivid recollections of the past.

September 30th.—I told you, a few days ago, in my letter, that I thought the second summer had begun; indeed, it has been but of a few days' duration; now the wet season seems to have commenced. We were aroused on the morning of the 27th, about four o'clock, having had a sleepless night on account of the rain and wind, by our servants telling us, that nearly every tent and hospital marquee in the encampment was down. We were soon up; and too true was the statement; there we saw our village lowered to the ground, only two hospital marquees out of the whole standing, and those were expected to fall every moment; the poor sick huddled (many helpless) together, while those able to get up were standing under trees, or any place that gave them a little shelter. You may imagine the heart-rending sight to see these poor creatures; and it was about two hours before we were able to pitch some of the marquees and tents afresh, as the merciless storm did not abate in the least until then. I am afraid it will be the death of many. The encampments on the other side of Varna were in the same plight, but being close to the town, their sick were removed into the general hospital, then empty. We were too far off, and had not conveyance for them, otherwise it would have been the wisest plan for us. As soon as it is at all fine we are going to remove all into Varna. Our sick here were about 300 at the time of this unfortunate occurrence.

(FROM ANOTHER CORRESPONDENT.)

The Crimea, Sept. 27th, 1854.

By this time the great victory of the Alma is known to you. I intended writing sooner, but have had so much to do that writing has been out of the question. Since the victory and the march inland, the men have been gorging themselves with fruit, and as a consequence cholera has made its appearance. Several valued officers have been cut off. Thomson, (44th.) Reid, our college friend, and Dr. Mackenzie. How shall I record Dr. Mackenzie's death? Poor fellow! Leaving Edinburgh full of enthusiasm, talent, and with the most rising reputation that any English surgeon could have. To die with cholera, away from friends and relations, is sad; how much sadder must the death of such a man be! He was seized, and died in eight hours. What surprise will be occasioned in Edinburgh when the news of his death reaches there! He left Edinburgh to come out here to improve his knowledge, and by so doing advance the interests of his pupils; he has fallen a victim to his noble devotion to science. In him the profession have lost an ornament, and one who was destined to take high rank as an operator.

A number of the medical officers are laid up. I myself am now acclimatised, and bear all hard work well; and hard work I have, and to spare.

In one of your letters you mention something about the purgative plan of treating cholera. I wish the upholders of this doctrine could only see the cholera we have to deal with here. Cases are brought under our notice—cases in which the man is more dead than alive, with all the well-marked symptoms of cholera; and to throw in purgatives! Preposterous! There are some few cases marked by yellowness of skin; in such cases purgatives are of use, because in these cases the liver is the faulty agent.

The medical arrangements are bad—faulty in the extreme. Every man has his own pet medicine; this of course he administers, and then wonders why his patient dies. When I see a cholera case, I get the man made as warm as the limited means will allow, and stimulate,—coffee, opium, in fact, any stimulus that is at hand,—and let the patient drink water. Fever, too, is beginning to prevail; I intend to try the saline plan.

—, and several other assistant-surgeons, are on the sick-list. Double the number of medical men ought to be out here. If the deaths here were known in England, I am sure the astonishment and feelings of pity would be great. In my next letter I shall, I hope, be enabled to send you something interesting.

The following interesting account is from the correspondent of *The Times*:

## THE BATTLE OF THE ALMA.

"I felt proud of my country when I saw little groups of English soldiers tenderly nursing wounded and dying Russians on the field of Alma the day after the battle, particularly when my indignation was hardly calmed at the well-proved stories of ferocious feeling manifested by these same wounded. In several instances they treacherously fired at or stabbed the doctor who had just dressed their wounds, or the kind Samaritan who had slaked their thirst with a draught of water, thus showing all the inextinguishable hatred of a dying wild beast and none of the noble chivalry of a civilized soldier. Notwithstanding the ingratitude of these poor Russian slaves, an English doctor, to his eternal honour, volunteered to remain behind and endeavour to alleviate the sufferings of 700 wounded Russians, who had been removed from the field of battle on the south bank of the Alma to the deserted village on its north bank.

"Dr. James Thomson, Assistant-surgeon of the 44th Regiment, and his soldier-servant, deserve to be held up as heroes. For four or five days they, and they alone, had to wait upon and support this enormous mass of severely-wounded men. The task was in many respects a most dangerous one. As we have seen, the patients themselves were not to be trusted. The Cossacks might also at any time make prisoners of them on the retreat of the allied armies. The dead were festering in heaps around the sick and dying. These two men frequently had to bury a horrid mass of carcases and fragments before they could get at some poor wounded wretches. In this way they must with their own hands have dragged out and buried some 200. There was no food of any kind for the sick, so the soldier managed to drive in a stray bullock, and with the aid of some Russian convalescents, (their misfortune seem to have humanized them,) he killed it and made some soup for them. At length her Majesty's ships *Albion*, *Vesuvius*, and the screw

transport *Avon*, arrived. The whole crew of the first landed and removed the wounded on board the *Avon*, while the *Vesuvius* guarded the shore. In the midst of this humane occupation a Russian force of some 4000 or 5000 men approached the village, and the sailors were obliged to hasten on board, as it was beyond the range of the ships' guns. However, 340 wounded were put on board the *Avon* under the charge of their heroic preservers, Dr. Thomson and his servant. About forty were left behind, and many of these poor fellows, who had previously seemed unable to walk, endeavoured, with all their might, to hobble after their more fortunate comrades. The next day the *Avon* proceeded with them to Odessa. Now, surely, when the Humane Society rewards a man who saves one single individual, society will not fail to do something for two men who, under such dreadful trials, saved the lives of 340." [Since the above was written, intelligence has been received that Dr. Thomson has died from cholera; also Dr. Reid, assistant staff-surgeon.—Ed. L.]

## THE CHOLERA.

RELATIVE to the progress of cholera in the metropolis, we condense the following from the "Weekly Return" of the Registrar-General for the week ending October 21st:—

Districts.	Elevation above water mark.	Population (1851).	Deaths from Cholera.
Northern (Marylebone, &c.)	135 feet	490,396	17
Central (St. Giles, &c.)	49 "	393,256	7
Western (Kensington, &c.)	28 "	376,427	26
Eastern (Shoreditch, &c.)	26 "	485,522	20
Southern (St. Saviour's, &c.)	6 "	616,635	93
Lambeth, &c.)			163

Of these 56 were below 15 years of age; 89 between 15 and 60; 18 above 60 years old. 78 persons are stated to have died from diarrhoea.

We find from the above that the mortality from the epidemic declines, but not so rapidly as in the same month of 1849. In three weeks of October in that year the deaths were 288, 110, and 41; in the last three weeks of the existing epidemic they have been 411, 249, and 163. The fatal cases of diarrhoea and dysentery were 102 and 106 in the first two weeks of the present month; last week they declined to 83. In comparing the returns from the five metropolitan divisions for the last two weeks, it appears that the improvement which they show is greatest on the north side of the river. Of the five northern districts cholera lingers most in Marylebone, though the mortality in it is not great. In the last two weeks the deaths in that district were 9 and 12; while in St. Pancras, with a larger population, there were only 3 last week, which occurred in Camden-town. Only one death occurred last week in Islington, and one in Hackney. Amongst the sub-districts on the south side of the river still haunted by the disease, are St. James, Bermondsey; the Kent-road sub-district; and St. Peter, Walworth.

In the present Report a table is given, embracing the Returns of an additional week, in which it is shown that 2353 deaths from cholera occurred in seven weeks in the 40,046 houses supplied with water from the Thames at Battersea, and 202 in the 26,107 supplied from the Thames at Thames Ditton.

We have received a copy of the reprint of Mr. Bodington's pamphlet, first published in 1831. From it it is clear that, twenty-three years ago, Mr. Bodington brought before the notice of the profession the utility of nitrous acid in particular, and of the mineral and vegetable acids generally, in the treatment of cholera. "In so far therefore as the author may have stated subsequently that the sulphuric acid was the particular drug used by him, he has been led into an unimportant error through defectiveness of memory. Still the principle remains quite unaffected by this mistake. He is at present engaged in an investigation into the influences of the mineral acid gases on foul and unwholesome atmospheres, which he trusts shortly to lay before the public."

We extract the following from a contemporary journal:—"According to our latest Arctic narratives, the cholera had made, and was making, frightful ravages amongst the Esquimaux. Now the Esquimaux are a wandering race, consequently their sewage cannot be bad; they live in a climate too cold for putrefactive fermentation, so the low-water level

cannot affect them; and the only water they can get must be absolutely and chemically pure, because it is obtained artificially from the fusion of blocks of ice. Then whence comes the cholera amongst the *Equipeaux*? As Brutus says, 'we pause for a reply.'

## HULL COUNTY COURT.

OCTOBER 12TH, 1854.

*(Before W. Raines, Esq., Judge, and a Jury.)*

## IMPORTANT CASE.—APOTHECARIES' COMPANY v. BROWNRIDGE.

MR. DEARLEY (instructed by Mr. J. J. Thorne) appeared for the Company, and Mr. Seymour, M.P., and Mr. Graham (instructed by Mr. Todd) for the defendant. This was an action brought by the Apothecaries' Company against Mr. Brownridge, a druggist in Mill-street, Hull, for having acted as an apothecary without a certificate. The penalty according to the Act was twenty pounds. Mr. Dearley having opened the case, and Mr. Seymour's objection as to twenty-one days' notice being required having been overruled by his Honour,

Mrs. ANN RUTHERFORD, wife of Thomas Rutherford, deposed that she had had a child, named John Rutherford, twelve months old. That on the 13th of February last, as the child was ill, and his complaint was, in her opinion, a cold in his teeth, she took him to the defendant, in Mill-street. When he saw the child, he said nothing as to what the complaint was. He gave her some medicine for him. She took him on several other occasions, but he got worse. The defendant said the child had a complaint that was prevalent, and that he was very ill, and he would look in and see him when he was passing. He called in twice. He saw him on both occasions, but he did not tell her to do anything, with reference to medicine, beyond saying that she was to fetch it. The child died on the 20th of February. A paper, signed by the defendant, was given to one of her neighbours, who was present. Witness paid him for the medicines when she got them.

Cross-examined.—Was only charged for the medicines when she took the child to the defendant. She said he had got a stuffing in the chest, and that he was not sufficiently ill to need a doctor. Asked for something to remove the stuffing, which was not serious enough to make her go to the expense of a doctor. The defendant gave her something, and said he would look in as he was passing by, and see the child, and she thanked him for his promise. Had had to get medicines from other druggists before, and the charges made by them were the same as those of the defendant. Mr. DEARLEY said, that it was admitted there was no consideration for the visits, beyond the sale of the medicines thereby, but the point was, the defendant had acted without a certificate.

Re-examined.—Other druggists did not come to visit her child at her house.

MARY WHARTON deposed that she resided at 15, Temperance-street. Was once present when the defendant visited the child. The certificate produced was the one she received, and which stated the cause of death to be inflammation of the lungs. She took it to the registrar's office, in Parliament-street, and registered the death there; did not get the child registered the same day. Went to the defendant to ask for the certificate.

In answer to his Honour, the clerk stated that the Act of Parliament said nothing about a certificate from a qualified person being required. There was a printed form for qualified practitioners, provided by the Registrar-General.

TAMAR GOULD, of 5, Success-place, Collier-street, deposed that, in August, 1853, she had two children, and one died on the 23rd November. Knew the defendant. One of the children had been ailing for some time, and when too ill to be taken to the defendant, he came to her house once or twice. After her confinement with the other child, in August twelve months, she took it in blankets to the defendant. Had got her medicine from him, and also from Mr. Lambert, another druggist. She produced a bill, but it contained no charge for attendance.

Mr. DEARLEY said he had eight or nine cases precisely the same as the others.

Mr. SEYMOUR said he would admit them, and they were therefore not gone into.

Mr. BIRCH, clerk to Mr. Thorne, produced a bill signed by J. Brownridge, which he got from his shop. Took it from the counter; there were two or three hundred lying there.

Cross-examined.—Went to defendant to serve the notice upon him. Was not asked to take the bill.

Mr. THOMAS HODGSON, printer's clerk, deposed that the bills were printed at their establishment for the defendant by

his order. The bills when printed would go to the defendant. The bills set forth the excellences of a stomach restorative, which he alleged never failed to cure a disordered stomach, and contained these words—"The above question is one which I have put to me by at least two-thirds of the numerous patients applying for advice."

Mr. SEYMOUR contended that there was no case to go to a jury, inasmuch as the defendant had not acted as an apothecary, either according to the Act of Parliament, or to the common acceptance of the term.

His Honour decided that there was a sufficient case to go to the jury, and

Mr. SEYMOUR accordingly proceeded to address the jury, arguing that his client had not violated the Act of Parliament, or done anything but what a chemist was entitled to do. It was said that Mr. Brownridge had visited the witness's children; but if he did not charge for his attendance, and if he did not charge for the making up of prescriptions, as an apothecary was entitled to do, he contended that he had the same right as any other man to visit another's house through kindly motives; and the learned Counsel called

Mr. JOHN GREEN, druggist, of Barton, who deposed that he was in business prior to the passing of the Act in 1815—perhaps for two years. Before that year he used to visit persons when required to do so, and he then acted, in fact, as an apothecary. He had continued so to act up to the present time.

Cross-examined.—There was a surgeon in those days, and two chemists in the town. Could not say that he charged for his attendance, and he thought he had a right to attend patients as well as surgeons had. Did not know whether it was usual to make charges for attendance.

Mr. LUNN, surgeon, was called by Mr. Dearley to state his opinion. He deposed that he had been in practice since 1803. Before 1815 it was not the business of the chemist, so far as he heard or knew, to visit patients. He did not believe it was the chemists' practice before 1815 to visit as apothecaries.

Cross-examined.—Did not recollect sending Mr. Wilkinson, chemist, a notice not to practise as an apothecary. Druggists were not, so far as he knew, in the habit of attending patients.

Mr. SEYMOUR having replied on this evidence—

Mr. DEARLEY replied on the whole case, commenting upon the conduct of the defendant in visiting his customers, which act was unfair, both to the other chemists and the medical profession.

His Honour then summed up, recapitulating the evidence, and telling the jury, that with respect to the printed bills taken by one of the witnesses, they must put them from their consideration, as what occurred with respect to them was after the present action had been commenced. The Legislature had he thought acted wisely in restricting unqualified persons from acting as surgeons or apothecaries; but whether the defendant's conduct exceeded these restrictions it would be for them to determine. If their verdict went against the defendant the penalty inflicted upon him would be £20.

Verdict for the plaintiffs. Penalty, £20.

## NURSES FOR THE LABOURING CLASSES.

THE following queries have been issued by a committee of the Epidemiological Society to the medical officers of the various union workhouses in England. As it is most desirable that the information sought for should be early obtained, we trust that the gentlemen addressed will return immediate answers.

I. Are you in the habit of obtaining nurses from the workhouse for the labouring classes in sickness?

II. If so, to what kind of persons are they sent, and how do they behave?

III. Do you often feel the want of a nurse amongst the labouring classes in times of epidemic and other sickness?

IV. Do you consider that material advantages would be gained (by the community at large as well as by the labouring population) by organizing a system by which nurses could be easily commanded, either gratuitously or at a low charge?

V. Would the labouring classes be likely to avail themselves of nurses, if the opportunity were offered?

VI. If a staff of nurses were provided in every union (either in connexion with, or apart from the workhouse) so as to be easily attainable by the poor, what results should you anticipate with regard to the arrest and prevention of disease; more particularly in regard to contagious and epidemic disorders?

VII. Would any pecuniary saving be likely to accrue to the ratepayers eventually?

VIII. If the able-bodied females residing in workhouses were extensively employed as out-door nurses, in what manner should they be controlled and supervised? How could they be best made to aid and follow the directions of the medical attendant?

IX. Could you find occupation for male nurses, as in cases of insanity and delirium?

X. Be good enough to add any practical suggestions in reference to the special scheme proposed in the statement of the committee; or to favour them with your views generally in regard to the question of providing nurses for the paupers and labouring population.

XI. What was the total number of patients receiving medical relief at their own houses during last year?

### Medical News.

UNIVERSITY OF ST. ANDREW'S.—List of gentlemen who had the degree of Doctor of Medicine conferred upon them October 20th, 1854:—

ANDREWS, JAMES, M.R.C.S. and L.A.C., London.  
 BAXTER, ROBERT WALMSLEY, M.R.C.S. and L.A.C., Kent.  
 BROWNE, JOSEPH, M.R.C.S., Royal Navy.  
 GARDEN, ALEXANDER, M.R.C.S., London.  
 MARCHANT, WILLIAM ROBERT F., M.R.C.S. and L.A.C., North Curry, Somerset.  
 MARSTON, JEFFERY ALLEN, M.R.C.S., Newcastle-on-Tyne.  
 MORGAN, MOSES, M.R.C.S., London.  
 PALMER, CHARLES, M.R.C.S. and L.A.C., Ormskirk, Lancashire.  
 PEARSE, JOHN SAMUEL, M.R.C.S. and L.A.C., Newcastle-on-Tyne.  
 PRATT, HENRY, M.R.C.S. and L.A.C., Montreal, Canada.  
 PURNELL, THOMAS, M.R.C.S. and L.A.C., Wells, Somerset.  
 ROSE, HENRY COOPER, M.R.C.S. and L.A.C., Teignmouth, Devon.  
 STEVENTON, WILLIAM, M.R.C.S. and L.A.C., Middlesex.  
 TREFFRY, RICHARD BARON, M.R.C.S. and L.A.C., Nottingham.  
 WARWICK, WILLIAM ROLLINSON, M.R.C.S. and L.A.C., Southend, Essex.

ROYAL POLYTECHNIC INSTITUTION.—On Thursday, the 19th inst., the Directors of the institution, in the liberal spirit which has always distinguished this peoples' school of instruction, devoted the receipts of the day for the benefit of the widows and orphans of the brave but unfortunate men who fell at the battle of the Alma. The appreciation of the public of this noble intention was shown by the attendance of nearly 1500 persons. The Earl of Shaftesbury made an excellent and appropriate speech on the occasion, after which a lecture "On the Munitions of War," was aptly enough given by J. H. Pepper, Esq. The lecture was intended to give a general idea of the nature of destructive agents, and also to explain why such enormous mechanical force is produced when gunpowder, gun-cotton, fulminating mercury, terchloride of nitrogen, teriodide of nitrogen, are fired, either by percussion or heat. Mr. Pepper first alluded to the discovery of gunpowder by Roger Bacon, about the middle of the thirteenth century; and stated, that although the honour of the discovery had been claimed for others, it certainly did appear that this learned monk and alchemist was original in his ideas and experiments, and therefore entitled to the position of author of one of the most important substances which have ever been discovered in alchemical or chemical laboratories. The lecturer then pointed out the chief characteristics of the three well-known ingredients, nitre, sulphur, and charcoal; and proved, by many brilliant experiments, that a mixture in which one of the ingredients was omitted, would be useless as a means of propelling a ball; and that even the careful mixture, by hand, of the whole number, did not make a gunpowder which could be supplied to a modern army, but that certain mechanical processes of grinding, pressing, granulating, and drying, must be carefully attended to, in order to obtain a mixture which would keep any reasonable time, and be ready to flash off as it were instantaneously into an enormous volume of gas on the application of flame. The consideration of the other explosive bodies was deferred to a future lecture, and Mr. Pepper concluded by classifying explosive bodies under three heads:—1. Explosions produced by the resolution of a compound body into its simple elements; the examples being terchloride and teriodide of nitrogen, peroxide of chlorine, &c.—2. Explosions caused by a fresh arrangement of the

elements of the solid, a species of internal double decomposition, as shown in gunpowder, gun-cotton, the fulminates, where the elements chiefly concerned in the expansive power—viz., nitrogen, carbon, and oxygen—at one moment solid, were changed to nitrogen, carbonic acid, and carbonic oxide.—3. Explosions caused by quick combustion, whereas the slow burning of the material could be made without an explosion. Examples, coal gas and air; sulphuret of carbon, fired *per se*, and then mixed successively with a volume of air, and a volume of deutoxide of nitrogen; and, finally, oxygen afforded a gradation of noises which could be appreciated by the old-fashioned degrees of positive, comparative, and superlative.

THE ARCTIC EXPEDITION: SIR JOHN FRANKLIN.—Dr. Rae, the Arctic traveller, has communicated some intelligence to the Admiralty which leaves no doubt, we fear, of the melancholy fate of Sir John Franklin and his crew, amongst whom were Assistant-surgeons H. D. S. Goodair, A. M'Donald, and J. S. Peddie. Dr. Rae says—"During my journey from Repulse Bay this spring over the ice, with the view of completing the survey of the west coast of Boothia, I then and subsequently obtained information, and purchased articles of the natives, which prove beyond a doubt that a portion (if not all) of the then survivors of Sir John Franklin's long-lost and ill-fated party perished of starvation in the spring of 1850, on the coast of America, a short distance west of a large stream, which, by the description given of it, can be no other than Back's Fish River. Amongst the articles purchased, (all of which are now in my possession,) which the Esquimaux found where the corpses of the 'white men' were discovered, are a small silver plate, with 'Sir John Franklin, K.C.B.' engraved upon it, several silver spoons and forks, with initials of the following officers—viz., Captain Crozier, Lieutenant G. Gore, Assistant-surgeon A. M'Donald, Assistant-surgeon J. S. Peddie, and Second master G. A. M'Bean."

APPOINTMENT.—At a meeting of the governors of the Royal Cornwall Infirmary, held on Monday last, Mr. Bassett was elected resident house-surgeon, vacant by the resignation of Mr. Ball, who has faithfully discharged that office for the long period of fifty-five years; and, at the same time, Mr. Henry Andrews and Mr. S. Michell were elected visiting surgeons, which appointments had become vacant by the resignations of Mr. Ball and Mr. Bassett.

THE METROPOLITAN FREE HOSPITAL.—There is a vacancy for a surgeon at the Metropolitan Free Hospital, Mr. Harvey Ludlow having resigned his office in order to join the army in the East.

FRENCH HONOURS TO MEDICAL MEN.—Our allies continue to heap rewards on all her medical officers who distinguish themselves in the East. From a paragraph in the *Moniteur*, it appears that MM. T. Marriou, head surgeon of the Black Sea squadron, and L. H. Beau, surgeon of the *Montebello*, have been promoted to the rank of officers in the Legion of Honour; and MM. P. A. Gourier, of the *Friedland*, A. Leroy de Méricourt, of the *Alger*; A. A. J. Bourgarel, of the *Valmy*; L. M. D. Pellegrin, of the *Magellan*; and P. M. G. Macé, of the *Ville de Paris*, have been named chevaliers of the same order, for the devotedness they displayed during the time the fleet was attacked by cholera.

KNIGHTHOOD OF DR. COOPER, OF HULL.—We are glad to have it in our power to record even an accidental honour conferred upon a member of our profession. By a fortuitous conjunction of events, a physician happening to be mayor of Hull, and the Queen happening to pass through that city, a physician has been raised to the dignity of knighthood. This may be all very well and proper. All we regret is, that it was the mayor, and not the physician, who was honoured. We nevertheless congratulate Dr. Cooper, being well assured that he is not less worthy of knighthood as physician than as mayor.

SALUBRITY OF BIRMINGHAM.—Allusion being often publicly made to the marked healthiness of this town, when compared with other populous localities in Great Britain, the following instructive letter, addressed by Dr. Evans, one of the physicians to the General Hospital of Birmingham, to Dr. Webster, and appended to his recent "Report on the Sanitary Condition of England during 1853," seems to explain this fact so satisfactorily, that it is now transferred to the pages of THE LANCET, for the information of those who may not have access to the original. In reply to the question, "What are the chief causes of the great salubrity of Birmingham, compared with other towns, especially on the coast?" Dr. Evans wrote to Dr. Webster as follows:—"1. The elevated situation of the town, which varies from 300 to nearly 500 feet

above the sea-level; its undulating surface; and the greater part of the town being built upon the new red sandstone and gravel. 2. The comparative exemption from filth and stagnant water, which are carried off by the porous nature of the soil and an excellent plan of sewerage; and adequate supply of good water. 3. The smaller density of its population, compared with other large towns, almost every family being provided with a separate house, and no instance of a cellar being used as a dwelling; its wide and well-ventilated streets. 4. That, with few exceptions, the processes employed in the manufactures are not injurious to health. 5. The almost invariable prosperity of trade for many years past, the remuneration for labour being adequate to supply the operatives with the necessities of life. 6. The great number and variety of trades and manufactures, affording extensive scope for the exercise of inventive and practical talent, by which the enterprising artisan is elevated *gradually* to advance himself to the state of a master, his success depending more upon industry, ingenuity, and skill, than the amount of capital at his disposal; hence the number of small firms, and the large proportion of inhabitants who are in easy or moderately affluent circumstances. I believe that this facility of self-advancement," adds Dr. Evans, "is one of the most remarkable features of this town; it operates powerfully as a stimulus to the acquirement of industrious, temperate, and provident habits; it accounts for the more equal distribution of wealth in Birmingham than in other large towns, and contributes greatly to the improvement of the sanitary, moral, and physical condition of its inhabitants."

**PUBLIC BATHS AND WASHHOUSES.**—An account showing the number of bathers and washers, and the receipts, at eleven establishments now open in London, and a few out of the many similar establishments in the country, in the quarter ended Michaelmas, 1854:—

Name of the Establishment.	Number of Bathers.	Number of Washers.	Total Receipts.

(Signed) GEORGE WOOLCOTT, Assist.-Sec.  
Secretary's Office, Buckingham-street, Adelphi, London.

**THE MEDICAL SCHOOL OF BORDEAUX.**—By a decree of the Emperor, dated October the 10th, the Preparatory School of Medicine and Pharmacy of Bordeaux has been reorganized. There are to be eight professors in chief, seven assistant professors, a chief of anatomical studies, a prosector, and a pharmaceutical and toxicological assistant. This decree follows upon a similar one, by which the Preparatory School of Lyons has been reorganized. It is in contemplation to extend like measures of reform to all the preparatory medical schools in succession.

**TESTIMONIAL TO DR. ARMSTRONG.**—The ship's company of the *Investigator* subscribed seventy guineas for their surgeon, Dr. Armstrong; and immediately on being paid off a deputation of ten of their number proceeded to the Ship hotel, and pre-

sented to him, in the presence of a number of his brother officers, a gold chronometer and gold chain, valued at seventy guineas, as a testimony of their sincere respect and affection during their five years' arduous service while discovering the North-west Passage. The gift was handed to Dr. Armstrong, with an appropriate address, signed by each man, which was answered by Dr. Armstrong in a neat and effective speech.

**THE CHOLERA AT BIDEFORD.**—The town of Bideford has been severely visited by the cholera, and it appears to have been most virulent in the dirtiest parts of the town. One of the medical men is said to have declared that there was to be found a cause either in choked drains, open sinks, deposits of filth, &c., for every case that has occurred. Disinfectants are freely used, and the streets have been fumigated with burning tar-barrels. In one week there were about forty persons attacked, and nineteen of them died. Houses of reception have been provided for those attacked, and every measure taken to abate the pestilence.

**FEMALE PAUPERS.**—A Parliamentary paper recently printed states that on the last day of the last week in the quarter ending at Lady-day, 1854, there were 21,673 aged and infirm women in the workhouses in England and Wales, and 13,893 able-bodied women. Of these latter, 5855 were of good character, 1904 of dissolute and abandoned character, and 3593 were mothers of illegitimate children, but were not of dissolute or abandoned habits.

**PREVALENCE OF INSANITY.**—It would be interesting to ascertain, even approximately, the amount of mental disease in India amongst Europeans and Eurasians. Although it has been generally believed, and in the main with justice, that southern nations are less subject to insanity than northern ones, it has been nevertheless the popular view that Europeans going to the tropics are especially liable to attacks of the nervous system. Both Copland and Prichard talk of the mania resulting from the effects of warm climates, and these views are embodied in the following extract from Oesterlen's recent "Manual of Hygiene":—"The powerful influence of hot climates on the nervous system is manifested by the production of the most varied nervous affections and mental maladies. In the East Indies, Ceylon, and other tropical countries, (especially amongst new arrivals,) paralysis of the limbs takes place with great rapidity; in others, weakness and even destruction of the memory and the mental powers supervene, reminding us of the fabled Armida's garden in Ariosto; and if, as is often the case in Europeans, there are superadded to this the at once debilitating and exciting influence of hot climates, sleeplessness, disappointed hope, regret at having left home, and nostalgia, the condition of excitable debility proceeds even further, and readily ends in incurable madness or in despair and suicide."—Dr. MACPHERSON'S *Report on Insanity amongst Europeans in Bengal*.

**OBITUARY.**—On the 5th inst., at Balaklava, near Sebastopol, of cholera, Dr. Alex. Rothney Reid, assistant staff-surgeon to the forces, aged 24.—On the 7th inst., Mr. Charles William Henry Howell, surgeon, Stratford, Essex.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, OCT. 21st.**—The deaths declined last week to 1321. In the ten weeks of the years 1844-53, corresponding to last week, the average number was 942, which, being raised in proportion to increase of population, becomes 1036. About 300 persons died last week more than could be estimated from the experience of former years at the middle of October.

To be paid in Advance.

Post-office Orders to be addressed to EDWARD THOMAS, *THE LANCET* Office, 423, Strand, London, and made payable to him at the Strand Post Office.

\* Or the linen of 341,000 persons.

## TO CORRESPONDENTS.

*A Subscriber to the Eastern Dispensary of Bath.*—Disagreements between the medical officers of our public charities are always to be regretted. We have, therefore, perused with much pain the pamphlet published by Dr. Tunstall in defence of his conduct; not that we can come to the conclusion that he has acted in any way that calls for censure, but because it exhibits a state of feeling on the part of the medical officers of the Eastern Dispensary which should not exist amongst colleagues of a learned profession. The simple question appears to be this: Is there any rule of the dispensary on which the case of Henrietta Smith could be refused admittance? If not, and there appears nothing to show that such is the case, it appears that the real offenders against the charity are those gentlemen who refused attendance upon the woman on the receipt of the subscriber's orders. That Mrs. Smith was a "necessitous person," was clearly shown by the letter of Mr. Mason, and, as far as appears in evidence, entitled to receive the aid of the charity. Upon what just ground then is Dr. Tunstall called upon to resign his office? Anxious as we are for the strict observance of professional etiquette, we cannot see that in the present instance Dr. Tunstall has been the offender. It is to be regretted that there is not a Medical-Ethical Association in Bath, to which such cases could be referred. It would be a protection to the accused party, and would, in such an instance as the present, remove his case beyond personal influences, the exertion of which might result in a denial of justice.

*Yema.*—1. A good book.—2. No notice has been given of any such publication.—3. It has not been announced.

*Mr. W. B. Norcott* is thanked. The communication is most interesting and important. It will appear in our next.

*A. B.*—We are not acquainted with the facts. The information would be acceptable.

## TREATMENT OF CHOLERA BY ACIDS.

To the Editor of THE LANCET.

SIR,—Mr. Boddington and others are contending strongly for the honour of priority in the use of sulphuric acid for the cure of cholera. The profession generally must surely be aware that the practice is old. I have before me at this moment two books, one written by a Frenchman, though in Latin, the other by an Englishman, in which sulphuric acid is recommended for the cure of diarrhoea and cholera morbus. The name of the former author is Donatus Fontanous; the book was published so early as the year 1806. The name of the English author I do not know, the title-page being lost. The book is dedicated to Sir Lucas Poynter, Bart., Physician to his Majesty, &c. &c., so that the date of it is easily known; besides there is at the end an advertisement, announcing that Dr. Moore in Anatomy, Mr. Fife in Anatomical Demonstrations, Drs. Black and Hope in Chemistry, &c. &c., are the gentlemen occupying the respective professorships at the moment of its publication in Edinburgh.

In the English book I find the following on the treatment of diarrhoea:—"The first indication is when the disease arises from matter acting on the intestines, performed by—1st, emetics, &c.; 2nd, diluents and demulcents, &c.; 3rd, by absorbents, &c.; 4th, by acids, as ripe fruit, or acid of vitriol in a dilute state."

The same author, in his directions for the cure of cholera morbus, observes that "Elixir of vitriol in a teaspoonful, repeated as indicated, is reckoned by some physicians to be a specific here."

I find also on referring to an old favourite author of mine—Thomas—that he recommends ripe fruit and dilute sulphuric acid in diarrhoea when there is acie fermentation.

Now, I am at a loss to know on what grounds any man can pretend to originality in recommending, in the year 1851 or 1852, the employment of a remedy known in France 85 years ago, and probably in England just as long. But, Sir, this is not the first time I have found very honest men (no doubt) contending in your pages for laurels long ago earned and worn by others. A notable instance occurred lately about the employment of cinchona in certain malarial complaints, when two gentlemen carried on a smart correspondence in your journal, each claiming a superior title to the merit of a discovery which neither of them made.

Caius College, Cambridge, October, 1854.

R. W.

*Mr. Edmonds'* request shall receive attention.

*Questions.*—Though there may be some truth in the remarks sent for publication "verbatim," it would be an injustice to the Fellows of the Medical Society of London to publish criticisms on their proceedings by an anonymous correspondent.

*Mr. Blacklock (Dumfries)* is thanked for his enclosure. The obituary of Mr. Burnsie shall appear next week.

*Mr. James.*—The matter is to be brought before the Court of Queen's Bench. *A Candidate.*—The following are the regulations last issued:—

"No medical candidate who has not passed his examinations at the Royal College of Surgeons of London, Edinburgh, or Dublin, shall be eligible for the commission of assistant-surgeon; and he must have served as such on full pay five years before he shall be eligible for promotion to the rank of staff-surgeon of the second class."

"Staff-surgeons of the second class must have served ten years in the army on full pay before they shall be eligible for the next step of rank."

"A staff-surgeon of the first class must have served three years at home, or two years abroad in this rank, before he shall be eligible for promotion."

"A deputy inspector-general of hospitals must have served five years at home, or three years abroad in this rank, before he shall be eligible for promotion to the highest rank of inspector-general."

*E. F.*—It would appear the deaths were caused through starvation. An account of the melancholy fate of this expedition will be found at page 366.

*A Secretary.*—We could not give our opinion on the subject unless the whole of the particulars were placed before us.

*Junius.*—About thirty.

*Enquirer.*—No such name appears in the BRITISH MEDICAL DIRECTORY for 1854 as "Richard Henley," who stated he was a surgeon, at the Worship-street Police-court.

Dr. Joseph Williams presents his compliments to the Editor of THE LANCET, and informs him that he is not the Dr. Williams referred to in the "Notices to Correspondents" in a certain weekly publication.

*The Fate of Sir John Franklin.*—Just before going to press we have received a copy of Dr. Richard King's correspondence with the Admiralty and Colonial Boards. We have only space on this occasion to call attention to the interesting series of letters written by Dr. King. They show clearly that, had the advice of this experienced and energetic member of our profession been taken, the fate of the Franklin expedition would probably have been different.

*J. B.* (a Subscriber to THE LANCET).—The pay of a surgeon of militia is *Ms.* per day, with an allowance of *2s.* for horse, and *2s.* extra when on duty away from headquarters. There is also an allowance of *9d.* per mile for travelling expenses when engaged in examining volunteers at the appointed towns in the country. The Lord-Lieutenant nominates, and the Queen appoints.

## GUTTA-PERCHA COFFINS.

To the Editor of THE LANCET.

SIR,—It has been my painful duty during the last few days to conduct the obsequies of a near and most dear relative. Following the excellent example set by the Duke of Portland, we dispensed with the attendance of those ghastly undertakers, (the vendors of mourning are as bad,) and no hired mutes, with cloaks, plumes, hat-bands, and trumpery, were present to reveal in our distress; but we found it absolutely necessary to have a leaden coffin, and the noise of the plumbers and the scuffle occasioned by the weight were most harassing to our feelings. It has since occurred to me (and I venture to trouble you on the subject as the most proper medium in such a case) that an envelop of gutta-percha might be made for such purpose, which would answer all the purposes of lead, and would avoid at once the noise, expense, and mechanical difficulties occasioned by the use of it. If by this suggestion I can help to save any afflicted family from any portion of the annoyances and imposition with which they are visited on the occasion of a death, I shall consider that I have done good service. Your obedient servant,

Nottingham, October, 1854.

FRATER.

*"A Clergyman."*—The name of our correspondent was not required for publication, but merely as a guarantee of his good faith. The case to which he alludes we have also had brought under our notice by a member of the medical profession. The most objectionable work, which calls forth the just indignation of "A Clergyman," will shortly be noticed, as it deserves, in the pages of THE LANCET.

To the Editor of THE LANCET.

SIR,—May I beg the favour of your informing me, in your next number of THE LANCET, whether in any work or periodical there is a code of instruction for the guidance of clinical clerks in the drawing up of cases, or whether any of the metropolitan hospitals have printed instructions to that effect.

I have the honour to be, Sir, your obedient servant,

Infirmary, Newcastle-upon-Tyne, October, 1854. ANDREW BOLTON.

\* \* We would advise our correspondent to consult a work published by the Society of Medical Observation for ample suggestions as to the mode of recording cases.

*Mr. Dixon's* case, "On Delirium Tremens treated without Opium," shall be published.

## "CURES" FOR CHOLERA.

To the Editor of THE LANCET.

SIR,—Without comment, I ask you to publish the following "cures" for cholera. There may be many more, which at this hurried moment I do not recollect; but I am sure you will forgive me when I tell you I have suffered from the "sulphur explosion," which ought, by some means, to save Newcastle and Gateshead from cholera for ever.

S. E.

Acetic acid.	Castor oil.	Or gall.
Sulphuric acid.	Croton oil.	Pure gall.
Gallie acid.	Olive oil.	Yeast.
Nitric acid.	Camphor.	Injections into the veins.
Bismuth.	Colchicum.	Injections into the bowels.
Chalk.	Brandy.	Mustard blisters.
Crocote.	Salt.	Turpentine ditto.
Calomel.	Blue pill.	Brandy ditto.
Carbonate of soda.	Iodine.	Sand baths.
Chlorate of potash.	Magnesia.	Hot sheets.
Capicum.	Opium.	Cold ditto.
Cold water.	Sugar.	Tobacco injections.
Chloric ether.	Sulphur.	and
Chloroform.	Lead.	Thunder storms!!
Cajuput oil.	Eggs.	&c. &c.

Th. Banks of the Tyne, October, 1854.

The following articles, already in type, are unavoidably postponed:—*Mr. G. Allen*, (Bath), "On the Treatment of Cholera;" the conclusion of *Mr. Edmonds'* paper, "On the Laws of Mortality and Sickness of the Labouring Classes of England;" *Mr. Langley* "On the Treatment of Disease by Bloodletting;" and *Dr. Willshire's* "Memoranda relative to some Cerebral Affections of Children."

COMMUNICATIONS, LETTERS, &c., have been received from—*Dr. Marshall Hall*; *Dr. Robert Lee*; *Mr. Lonsdale*; *Mr. Erichsen*; *Mr. Edwards*; *Chirurgus*, (Bristol); *J. E.*; *Frater*, (Nottingham); *Mr. E. L. Dixon*, (Preston); *Mr. Sweetman*; *Dr. Tunstall*, (Bath); *W.*; *Abernethian*; *Causticus*; *A. Sander*; *Surgeon*; *R. B.*, (a Subscriber to THE LANCET); *Mr. Blacklock*, (Dumfries); &c. &c.

## Purify Sick Rooms, and give comfort

to Patients and perfect Safety to Attendants.—The most offensive atmosphere is instantaneously purified, and the air impregnated with refreshing fragrance, by SAUNDERS' ANTI-MEPHITIC FLUID, prepared by J. T. Saunders, Perfumer, 315a, Oxford-street, Regent-circus. Sold by all Druggists and Perfumers. Price 1s.

## Drug Price Currents forwarded free

of Postage, on application, by Messrs. HEWLETT and GODDARD, Wholesale Druggists, 6, Arthur-street West, Upper Thames-street, near London Bridge, removed from Hatton-garden; containing the ready Cash Prices for Drugs and Pharmaceutical Preparations of the purest quality. Messrs. H. and G. solicit the attention of the Medical Profession resident in the Provinces, Infirmary Committees, Dispensaries, &c. &c., to the advantages attendant upon the above Price Current.

## W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible; also to his MEDICINAL EXTRACTS, prepared from the fresh plants (*Hyocyanus Niger*, *Conium Maculatum*, *Atrop*, *Belladonna*, *Cystodon Umbellatus*, &c.); also to his Liq. Tamariz, Liq. Gali Aparinis (a valuable alterative), Liq. Parietaris (diuretic), and Liq. Bala (prepared from the Egie Marmelos, or Indian Basil), for Dysentery and Diarrhoea.

W. T. has a large supply of INDIAN BARK on hand.

2, Edward-street, Portman-square.

## Mineral Waters.—W. Best begs to

inform the Nobility, Gentry, and the Faculty, that he has just received a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg, Kissingen, Vichy, Seiditz, Pullna, Ems, Seltzer, Fachingen, &c., at his Ems-Cologne, Arguebuzard, and Foreign Mineral Water Depot, 23a, Henrietta-street, Cavendish-square.—N.B. Balls and evening parties supplied with German and Struve's Artificial Seltzer Water on Advantageous terms.

N.B. Allsopp's and Bass's Pale Ales, and Guinness's Dublin Stout.

## Aërated Waters of sufficient and

uniform strength. BLAKE, SANDFORD, and BLAKE, 47, Piccadilly, having given great attention to the manufacture of Mineral Waters, and feeling it important that medical men should be assured of the quantity of Alkali contained in each kind, beg to submit the following list of their preparations:—

Potash Water, 18 grains of the Bicarbonate in each bottle; Citrate of Potash, (a new and valuable auxiliary in Gout and Rheumatic affections,) 30 grains; Soda, 15 grains; Magnesia, 12 grains, and Ammonia, 10 grains.

B. S. & B. would especially recommend their Seltzer and Vichy Waters; the latter now bottled in half-pints as well as pints.

BLAKE, SANDFORD, and BLAKE, 47, Piccadilly.

## HYGIENIC BATHS.

JENSEN'S TONIC

## DAPHNE MARINA SALT BATHS

When dissolved in a Cold, Tepid, or Warm Bath, imparts so eminently strengthening and beneficial properties to the same, that, when once tried, a Bath will scarcely ever be taken without it. In the buoyancy and freshness it produces in the system, it is far superior to any known Sea Bath.

Sold at 1s. per packet, by the Proprietor, G. MINTO, 103, Leadenhall-street, and 213a, Piccadilly, (near Regent-circus,) and by all Chemists, and Bathing Establishments.

CITY OF LONDON PIANOFORTE MANUFACTORY.

## New Pianofortes for Hire,

with the option of Purchase or Exchange, packed free.

G. PEACHEY (Maker to the Queen), 73, Bishopsgate-street Within, opposite the Marine Society.

PIANOFORTES  
PREPARED  
EXPRESSLY  
FOR  
EXPORTATION.

PIANOFORTES  
REINSTATED  
IN TONE AND  
TOUCH UPON  
IMPROVED  
PRINCIPLES.

ROYAL-VICTORIA PICCOLO PIANOFORTE, AS EXHIBITED AT THE GREAT EXHIBITION.

The most extensive and elegant assortment of Pianofortes in London New and Second-hand, of every description and price, for SALE, HIRE, EXCHANGE, or EXPORTATION, at the lowest prices for Instruments that really can be warranted.

G. PEACHEY, MANUFACTORY and WAREHOUSE, 75, BISHOPSGATE-STREET WITHIN, LONDON.

TO SURGEONS IN THE ARMY AND NAVY, AND OTHERS.

## A Complete Set of Surgical Instru-

ments for SALE, consisting of five Amputating-knives, &c., complete, silver serrules; full Set of Operating, Trephining, &c., Trocars and Canulas, silver and gum-elastic Catheters, four Tourniquets, &c., between 60 and 70 instruments, in handsome mahogany case, brass bound; been one voyage. The whole of the instruments, having been put in thorough repair, are the same as new. Price £15.—Apply to James E. Maddox, 19, University-street, University College Hospital.

## Dr. Lever's Improved Elastic Utero-

ABDOMINAL BELT being constructed by Mr. H. Bigg, 29, Leicester-square, under the immediate suggestion of Dr. Lever, will be found to combine every advantage possible to obtain. It upholds the parietes of the abdomen, secures support to the uterus, and admits of the elastic force immediately above the pubes being increased by the patient after the Belt is applied.

To be had only of Mr. H. BIGG, 29, Leicester-square.

## Spinal Curvature.—Mr. H. Bigg, 29,

Leicester-square, particularly invites the attention of the Faculty to two new and distinct forms of SPINAL APPARATUS he has recently invented. The principle on which they are constructed, thoroughly supplants the "brute force" of the screw, yielding instead an elastic power analogous to muscular motion; it also encourages respiration, admits of the spine being moved in any direction, and possesses a weight so trifling as hardly to be felt by the wearer.—PATENTED.

To be had only of the Patentee, 29, Leicester-square.

## Treatment of Club Feet, Spinal

CURVATURE, &c., WITHOUT THE EMPLOYMENT OF THE SCREW.—MR. HEATHER BIGG, 29, Leicester-square, begs to invite the attention of the Faculty to an entirely new principle he has discovered for constructing the various apparatus for deformities of the feet and spine.

"The living structures do not with impunity tolerate the brute force of the screw." In any case in which the force of the screw is employed, unless for a very brief period, excoriation, sloughing, intolerable pain in the parts compressed will inevitably result. Dr. LITTLE, on "Deformities," pp. 34, 35.

Mr. H. Bigg has recently invented four distinct forms of Orthopaedic Instruments for Talipes Varus, T. Valgus, T. Equinus, Lateral Curvature, &c., in all of which the principle of muscular elasticity is simulated and the "brute force" of the screw ignored.—PATENTED.

29, LEICESTER-SQUARE.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

## Important Saving, by Pre-payment,

in the PURCHASE of

NEW WHITE MOULDED VIALS.

APSLEY PELLATT and CO. submit the following PRICES of VIALS, for PRE-PAYMENT only:—

1/2 oz.	1 oz.	1 1/2 oz.	per Gross, 6s.
2 oz.	"	7s.	
3 oz.	"	8s.	
4 oz.	"	10s.	
6 oz.	"	15s.	
8 oz.	"	18s.	
4 1/2 oz.	graduated in 3 doses	12s. 6d.	

In quantities of not less than Six Gross, assorted to suit the convenience of the purchaser, delivered to carriers in London. No charge for Package. Breakage at risk of Purchaser.

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,

APSLEY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

## Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BEEKLEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1. THE THIGH AND KNEE-PHIOE.—Mr. Bourjeaud begs to state that these are combined to answer certain purposes of compression when cedema or distension of the thigh and knee exist together.

FIG. 2. SPIRAL STOCKING MADE TO FIT FROM THE TOES TO ABOVE THE KNEES.—This appliance is one of the most valuable, and gives such support to the whole limb that the venous blood is returned with great ease. Patients affected with varicose veins should generally resort to this stocking, which, like the other appliances, is made of varying compressing force to suit every shade of difference among patients. All the above spiral appliances may be put on with the greatest ease, as they will stretch to almost double the size, and the force is so managed that support is given without creating the least uneasiness.

**Water Filter for the Pocket, with**  
 DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.  
 J. SOLOMON, Wholesale Optician, and Photographic Depot, 23, Red Lion-square.

**Anatomical and Dental Repository,**  
 45, Museum-street, Bloomsbury, London.—JOHN HARNETT begs most respectfully to call the attention of Lecturers, Students, and Gentlemen connected with the Medical Profession, to his large and select Stock of Anatomical Preparations, consisting of Skeletons, loose and articulated Skulls, Hands and Feet, Vertebra, and Loose Bones, at the lowest possible prices.

**Mr. Edwin Osborne, of 24, Savile-**  
 ROW, LONDON, the Sole Licensee and Maker of PALMER'S PATENT LEG, adapts this beautiful substitute to every form of amputation; and having had great experience in its manufacture, feels confident of giving comfort and satisfaction to those persons who may favour him with their patronage. References given, (if required.)

## Huxley's Fulcrum

ABDOMINAL BELT will be found, from its mechanical arrangement, (acting diagonally,) and producing the required support for the lower part of the Abdomen, to be the most complete and comfortable arrangement ever invented. It is extremely light, weighing only 4oz. Price 18s.

Measures required.—Circumference at A, B, and C; depth from A to C.

A discount of 20 per cent. to the profession.  
 HUXLEY and CO., 8, Old Cavendish-street, late of 5, Vere-street, Oxford-street.

## Walters' India-rubber URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

Made of Solid India-rubber, with Patent Valve, and adapted for Ladies, Gentlemen, and Children.

Manufacturer also of the PATENT HYDRO-STATIC TRUSS. One of the advantages of this Truss is, that the pad, being filled with water, adapts itself with perfect accuracy to the form of the body, thereby keeping up a firm but easy pressure on the internal ring.

F. WALTERS,  
 16, MOORGATE-STREET,  
 LONDON.

## John Harvey, Nephew and Successor

to the late Mr. ANDREW SPRINGWEILER, No. 2, Duke-street, Smithfield, London, Medicine Chest and Dressing Case Maker. Ship Medicine Chests according to Act of Parliament. Emigrant Chests, &c., for all Climates.

Chemical and Plate Chests, Toilette, Jewel, Liqueur, and Sample Cases, Writing Desks, Despatch Boxes, &c., &c.

Wholesale and for Exportation.—Warranted to stand any Climate.

J. H., in soliciting of the medical profession and the trade generally a continuance of the liberal patronage enjoyed for so long a period by his late uncle, begs to inform them that the firm of Springweiler and Thompson (which existed in name only) was dissolved nearly two years prior to Mr. Springweiler's death, and that J. H., as successor and executor of the deceased, continues to carry on the business at the premises occupied for so many years by Mr. Springweiler.

## New Spinal Support.—Fr. G. Ernst,

Lamb's Conduit-street, Foundling Hospital, begs to draw the attention of the Faculty to his recently-invented SPINAL APPARATUS, which, after some months of trial, has proved superior to any of the various kinds hitherto used, and produced the most satisfactory results. This appliance, being self-adjusting, free bodily motion is permitted; thus, while equal and necessary support is given to the wearer, all injurious or painful pressure is avoided, and a great amount of comfort and benefit consequently yielded. It can be modified so as to suit any FORM OF SPINAL DEFLECTION; its weight is comparatively trifling, and from its capacities for nice adaptation elicits no observation when on the body.

To be had only of the Inventor, 43, Lamb's Conduit-street.

TO THE MEDICAL PROFESSION.

## Fr. G. Ernst, Anatomical Machinist

and MANUFACTURER OF SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF OF BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam EXNER (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &c.

## Warming and Ventilating, by Hot

AIR, CHURCHES, HOSPITALS, TOWN HALLS, and other PUBLIC BUILDINGS.—J. BOILESSVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

Eardiston House Worcestershire, March 1st, 1854.

SIR,—I am much pleased in being able to give you a justifying account of your Calorifere. Since I burn nothing but coke in it, the change has been quite surprising. I must say, that now I have a very high opinion of your machine, and find it a great comfort in my house, the cost of warming it was one shilling per day.

To J. Boilessve, Esq.

WM. SMITH. (Sir, Barrow.)

## Purification of Linen.—Prevention of

Disease.—J. BOILESSVE, 55, King William-street, City of London, solicits the attention of the nobility and gentry to his CALORIFERE, for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

From his Grace the DUKE OF BEDFORD, Woburn Abbey, Sept. 24th, 1853.

SIR,—His Grace the Duke of Bedford has desired me to say, his Grace has received your letter inquiring about the Calorifere (drying machine) put up in the Laundry at Woburn Abbey in May, 1852, by Mr. Boilessve. In answer to that inquiry, I have to state, that nothing can exceed it in effect and economy. I sent to the Laundry for the man who has the management of it, and he says, that they can dry off the linen in much less time than they could with the old stove, without dust or dirt of any kind in the Laundry. They can obtain any degree of heat they wish for, and that at a great saving of fuel.

I am, Sir, your obedient servant,

J. Boilessve, Esq.

J. PALFREMAN, House Steward.

## Gold Chains and Jewellery.—

WATHERSTON and BROGDEN'S GOLD CHAINS, by troy weight, at realizable value, and the workmanship at wholesale manufacturers' prices.

EXAMPLE.

Intrinsic value of a chain of 15 carat gold, weighing 1½ oz.	... £3 10 7
Supposing the workmanship to be	... 2 0 0
Total	... 5 10 7

By this arrangement the public will see at a glance the proportion charged for labour compared with the *ballion* in a gold chain, and being always able to realize the one, will have only to decide on the value of the other. An extensive assortment of jewellery, of the first quality, all made at their manufactory, 16, Henrietta-street, Covent-garden, London.

Established A.D. 1793.

## Patent Perambulators.

C. BURTON, Inventor, Patentee, and Sole Manufacturer to Her Majesty by appointment.

The distinguished patronage, the flattering encomiums, and the increasing demand, are sufficient proofs of the utility and excellence of these fashionable, safe, and elegant Carriages for adults, children, and invalids, propelled from behind by the slightest effort. Country and Shipping orders. Illustrated Circulars.

OFFICE, 487, NEW OXFORD-STREET.

Also, C. BURTON'S PATENT PERAMBULATOR FOR THE MILLION. Price Two Guineas.

CAUTION.—To avoid unprincipled and dangerous imitations, look for Burton's Label on each Carriage.

**Allsopp's Pale Ale in Bottle, as**  
supplied to the CRYSTAL PALACE; also in casks of 18 gallons  
Recommended by BARON LIEBIG.

Address, HARRINGTON PARKER and CO., 5½, Pall-Mall, London.

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts. Delivered free within four miles of London, and carriage free to all railway stations in England at 6d. per dozen extra.

WOOD & WATSON, 16, Clement's-lane, City.

**Soyer's Aromatic Mustard. — "M."**

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration. — THE LANCET.

Sole Agents: Messrs. CROSSE and BLACKWELL, 21, Soho-square, London.

**To Invalids and those desirous of**

**PRESERVING HEALTH.**—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO'S HOMEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

**Cocoa of the finest quality, prepared**

in the best possible manner.—Our PURE GRANULATED COCOA was pronounced by the Analytical Chemists employed by THE LANCET, in their memorable researches into the Adulterations of the Food of the People, to be free from any admixture whatever. The Invalid, and Cocoa-drinkers in general, are requested to make trial of it. In pound packets, 1s. each. Arrow-root, genuine as imported, at 4d. per lb., 6d. per lb., 8d. per lb., 1s. per lb., 1s. 4d. per lb., and the very finest Bermuda in the Kingdom, 1s. 8d. per lb.; 7 lbs. of that at 8d. per lb., or any higher quality, packed in tin canisters, without extra charge. Good Ceylon Coffee, 1s. per lb.; Java Coffee, a rich and useful article, 1s. 4d. per lb. Good Congou Tea, 3s. per lb.; very excellent ditto, 3s. 4d. Orders to the amount of 40s. for any of the above articles, covering a remittance for amount of same, forwarded, carriage free, to the nearest railway station.

HANDFORD & DAVIES, 61, High Holborn.

## DOMESTIC ECONOMY

**H. Sparrow and Co. beg to announce**

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.

Fine Souchong, 3s. 4d., 3s. 8d., and 4s.

Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 6d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

**Pure as well as Fine Tea.—**

Tea, when pure, is well-known to produce a most wholesome beverage; the impolicy of allowing it to be coloured by the Chinese is fully set forth by the Analytical Sanitary Commissioners, in THE LANCET, and also in THE TIMES, (October 6th, 1852.) The fact, therefore, is now familiar to most, that artificial colour is used to give the Spring crop and the spent Autumn gathering the same appearance. If this practice were discontinued, a twofold benefit would arise; first, the fine qualities would have all the fragrance and strength unimpaired; and, secondly, the inferior faded leaves could not then be passed off as good, causing the flat, insipid infusion, so frequently the subject of complaint. The uncoloured Tea imported from China, by HORNIMAN and CO., London, is perfectly pure; the Green, from the absence of the usual artificial colouring, is of a natural olive hue. The Black, and also the Green, are exclusively of the Spring product from young and vigorous plants, which yield not only more strength, but the full degree of fragrance which FINE Tea, when purely natural, and seasonably selected, alone possesses; ONE TRIAL induces a continued preference. The prices are REDUCED:—

Finest Congou, 3s. 8d. Finest Lapsang Souchong, 4s. and 4s. 8d.

Fine and Pure Green, 3s. 8d., 4s., and 4s. 8d.

HORNIMAN and CO., Wormwood-street, London, Importers of the most approved Teas in general use, but free from the objectionable artificial colour on the surface.

Agents in London, PURSELL, 80, Cornhill; and ELPHINSTONE, 227, Regent-street, and 366, Oxford-street.

Sold by authorized Firms in all Towns, in 1 lb., ½ lb., and ¼ lb. packages only.

**Cotyledon Umbilicus. — Epilepsy**

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.

Insipiated Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

Taraxacum (Davenport's Liqueur, or Fluid Extract, prepared by Spontaneous Insipiation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 5s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 83, Great Russell-street, Bloomsbury.

**Recherché Wines.—Sherry: A very**

fine Sherry, (Amontillado and Montilla.) Brown and Pale, for Cash, at 42s. per dozen; 421 per quarter-cask; 422 per hogshead; 424 per butt.

Port.—Very fine old dry Wine (Vintages 1827, 1830, 1832, 1834), lately imported: from the Wood at 43s., 64s., 63s., and 68s. per dozen.

First Class Champagne, (Ay, Avize, Pierry, Verzenay, and Sillery.) Sparkling and Still Moselle, Sparkling, Still, and Red Hocks, and Bordeaux Wines, at very moderate prices.

These Wines are patronized and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples and List of Prices forwarded on application.

H. H. HAMMICK, Importer, 11, Pall-mall, London, opposite the "Travellers' Club."

**Gas-heating Apparatus.—H. Mather**

begs to call attention to his GAS-COOKING STOVES, which will cook dinner for Twenty Persons at a cost of Fourpence.—Gas Gridirons Broiling and Boiling in Five minutes.—Small Stoves to Boil and Fry, which can be put anywhere, Eight Shillings each.—Gas Stoves for Operative Chemists, Jewellers, and all purposes where heat is required.—Manufactured on the premises at 76, GRAY'S-INN-LANE, LONDON.

N.B.—Gas-fitting done in all its branches.

**Ten Thousand Stoves.—The Tenth**

Thousand of the PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, and CO., 46, King William-street, London-bridge, and may be obtained of most ironmongers. The Improved Patent Ventilating Stove, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded, post free.

**The 16s. Trousers reduced to 14s.—**

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

**R. T. Pigram, Practical Tailor, and**

Inventor of the Indicator of the Human Figure, whereby a perfect fit is secured, respectfully invites the attention of the public to his mode of art, since none can doubt the importance of an easy and exact adjustment of wearing apparel. Superior Trousers at 17s. 6d. per pair.

R. T. PIGRAM, 51, Lamb's Conduit-street, Foundling Hospital.

**Overcoats, Capes, &c., at W. Berdoo's,**

98, New Bond-street, and 69, Cornhill, one of the largest stocks in London. Superior garments at reduced charges. Shooting Jackets. Berdoo's well-known Light Overcoat, for all seasons, (price 45s.) Ladies' Cloaks, Mantles, Habits, &c., all made thoroughly impervious to rain, without obstructing free ventilation, and without extra charge; or made to order at a day's notice.

TO THE NOBILITY, CLERGY, AND GENTRY.

**Walker Babb's Two-Guinea Coats,**

One-Guinea Trousers, and Half-Guinea Vests, made from Welsh, Scotch, and Irish Wools, in their pure state. Will stand any wear, and can be worn in any climate. For Fishing and Shooting nothing can equal them. The Black Tweed is well adapted for Clergymen's Riding Trousers. Waterproof Pocket Coats and Capes, Box Coats, Liveries, &c. &c.

DOYLEY'S SCOTCH WOOLLEN WAREHOUSE, 348, Strand, opposite Waterloo-bridge.

**Assistant-Surgeons.—Gentlemen**

**Christian Medical Association.—An**

Address is proposed to be delivered, in connexion with this Association, in the Lower Hall, Exeter Hall, Strand, on Friday, November 10th, at Eight p.m., by R. D. GRAINGER, Esq., F.R.S., Lecturer on Anatomy, &c. C. J. B. WILLIAMS, M.D., F.R.S., in the Chair.

The attendance of all Medical Students is specially invited. They will be admitted on exhibiting their entrance card to Hospital Practice, or to any of the Courses of Lectures delivered in the Medical Schools. Practitioners desirous of attending, are requested to present their private cards at the door

S. O. HARRISON, M.D., } Hon. Secs.  
CHARLES H. MOORE. }

EAST INDIA HOUSE, Aug. 9th, 1854, and Oct. 4th, 1854.

**Notice is hereby given, that the**

ANNEXED CODE OF REGULATIONS for the ADMISSION of CANDIDATES at the First Examination, to be held in January next, for the APPOINTMENT of ASSISTANT-SURGEONS in the service of the EAST INDIA COMPANY, has been framed by the Board of Commissioners for the affairs of India, under the provisions of the Act 16 and 17 Vic., cap. 95, sec. 38.

REGULATIONS FOR THE ADMISSION OF CANDIDATES FOR THE APPOINTMENT OF ASSISTANT-SURGEONS IN THE SERVICE OF THE EAST INDIA COMPANY.

All natural-born subjects of her Majesty may be candidates for admission into the service of the East India Company as Assistant-Surgeons. They must, however, be between 22 and 28 years of age, and of sound bodily health.

They must subscribe and send in to Dr. Scott, the Physician to the Hon. East India Company, before the 10th day of December, 1854, a declaration to the following effect:—

"I [Christian and surname at full length], a candidate for employment as an assistant-surgeon in the service of the East India Company, do hereby declare that I was — years of age on the — day of — last, and that I labour under no constitutional disease or physical disability that can interfere with the due discharge of the duties of a medical officer; and I also attest my readiness to proceed on duty to India within three months of receiving my appointment."

This declaration must be accompanied by the following documents:—

1. Proof of age, either by extract from the register of the parish in which the candidate was born, or by his own declaration, pursuant to the Act 5 and 6 Wm. IV., c. 63.

2. A diploma in surgery, or a degree in medicine, provided an examination in surgery be required for such degree, from some body competent by law to grant or confer such diploma or degree.

3. A certificate of having attended two courses of lectures, of six months each, on the practice of physic, and of having attended for six months the practice and clinical instruction of the physicians at some hospital containing at least on an average one hundred in-patients, or of having attended one course of lectures of six months on the practice of physic, and clinical instruction for twelve months.

4. A certificate of having attended for three months the practical instruction given at one of the public asylums for the treatment of the insane.

5. A certificate of having attended for three months one of the institutions, or wards of a hospital especially devoted to the treatment of ophthalmic diseases.

6. A certificate of having attended a course of lectures on midwifery, and of having conducted at least six labours.

7. A certificate of having acquired a practical knowledge of cupping.

Candidates may also, at their option, send in certificates of attendance at any hospitals, or on any courses of lectures, in addition to the above. Attendance on a course of military surgery is recommended.

Candidates producing satisfactory certificates will be admitted to an examination to be held in January, 1855.

The examination will include the following subjects:—

1. Surgery in all its departments.  
2. Medicine, including the Diseases of Women and Children, Therapeutics, Pharmacy, and Hygiene.  
3. Anatomy and Physiology, including Comparative Anatomy.  
4. Natural History, including Botany and Zoology.

The examination will be conducted:—

1. By means of written questions and answers.  
2. By object examinations and experiments, when the subject admits of such tests.  
3. By practical examination at the bedside of the patient, and by dissections and operations on the dead body.  
4. By vivâ voce examination.

The persons who shall be pronounced by the examiners to be the best qualified in all respects, shall be appointed to fill the requisite number of appointments as assistant-surgeons in the East India Company's Service.

All assistant-surgeons are required to subscribe to the Military or Medical, and Medical-retiring Funds at the Presidencies to which they may be respectively appointed, and to the Military Orphan Society also, if appointed to Bengal.

All assistant-surgeons who shall neglect or refuse to proceed to India under the orders of the Court of Directors, within three months from the date of their appointments, will be considered as having forfeited them, unless special circumstances shall justify a departure from this regulation.

Candidates may apply to Dr. Scott, 13, Stratton-street, for further information if needed.

N.B. The certificates and notices as to examination herein contained apply only to the examination to be held in January next.

Regulations regarding the requirements of candidates for future examinations will be issued after the first examination.

JAMES C. MELVILLE, Secretary.

NOTE, Oct. 4th, 1854.—Candidates who may not have been able to attend the practice of an asylum for the insane, or of an ophthalmic hospital for three months previous to offering themselves for examination in January, 1855, will not be excluded from examination, but will, if successful in obtaining recommendation for appointments, be required to produce certificates of having attended such practice during the interval between the examination and the time of proceeding to India.

The Board of Examiners of candidates for the appointments of assistant-surgeons in the East India Company's Service give notice, that on the 9th of January, 1855, they will hold examinations at the East India House for the selection of assistant-surgeons. The selection will be made according to merit, and it is expected that about thirty appointments will be awarded.

J. D. DICKINSON, Deputy-Secretary.

**Harveian Society. — The Annual**

Address, at the opening of the Session, will be delivered at the Society's Rooms, 64, Edgware-road, on THURSDAY, NOVEMBER 2nd, at Eight p.m., by the President, W. COULSON, Esq.

**Mr. G. Hind, F.R.C.S., resumed his**

DEMONSTRATIONS on the morning of the 15th of September, at the usual hour.

Class-room, 29, Newman-street, Oxford-street. Private residence, 9, South-crescent, Bedford-square.

**Classics and Mathematics. — A**

Graduate in Honours of Oxford, who has successfully prepared a great number of Gentlemen for the different Medical Examinations, continues to prepare them, in a short time, for the Hall, Fellowships, Matriculations, &c. References kindly permitted to Dr. Power, and many old Pupils.—Address A. H., Somerset House Chambers, 151, Strand.

**House Apothecary wanted imme-**

diately for the LANCASTER DISPENSARY and HOUSE of RECOVERY. Salary, £90 per annum; with apartments, coals, and gas. Applications, with testimonials of professional and moral character, must be sent in, addressed to the President at the Institution. The Gentleman elected will have to enter on his duties immediately after his election.  
Lancaster, October 26th, 1854.

**School for the Sons of Medical Men,**

CLERGYMEN, OFFICERS OF HER MAJESTY'S ARMY, NAVY, AND CIVIL SERVICE, &c.

ST. JOHN'S FOUNDATION-SCHOOL, Greville-mount House, Kilburn, London.

Head Master.—The Rev. Anthony F. Thomson, B.A. Lincoln College, Oxford, (eldest surviving son of the late Dr. Anthony Todd Thomson, of University College.)

Mathematics.—Gowan Evans, Esq., M.A. Lincoln College, Oxford.

German.—U. Green, Esq., (Nieuwied College, Coblenz.)

French.—Hy. Poitavin, Esq., (Paris.)

Music.—Dr. Charles Steggall, Trinity College, Cambridge; Professor of the Royal Academy of Music, London.

The system of this School is particularly adapted to prepare Boys for the Medical Profession, the Army, whether Line or Artillery, the Navy, and Civil Service.

The Terms are moderate and inclusive. The House is new, and has been built with a special view to its purpose, at a cost of over £2500. It is situated on high ground, in the most healthy and beautiful position in the north of London.

A Prospectus, with full details, may be had on application to the Head Master, at the School.

**Resignation of Mr. Wakley, late**

Official Assignee at Newcastle-upon-Tyne.—The following is a copy of a letter addressed by the Newcastle and Gateshead Law Society to Mr. WAKLEY, late Official Assignee in the District Court of Bankruptcy, and Mr. WAKLEY's acknowledgment of the compliment it conveys:—

Newcastle-upon-Tyne, Sept. 29th, 1854.

DEAR SIR.—It is with extreme concern the undersigned solicitors practising here have learnt that the state of your health has compelled you to resign your appointment as one of the official assignees of the Court of Bankruptcy for this district.

We cannot allow you to retire from the office you have so long and so ably filled without expressing our high sense of your official and private character.

In your public capacity, by the very efficient and courteous manner in which you have performed the arduous duties confided to you, and carried out under a new system the complex operations of an important branch of commercial jurisprudence, you have won golden opinions from all classes of the community, and it may be satisfactory to you in your retirement to be assured that the loss of your services is deeply felt and universally regretted. To those of us who have had the pleasure of your friendship, your withdrawal from our social circle will be more sincerely felt than even the deprivation of your official services, and we beg you to accept this parting expression of our personal regard.

In the hope that your health will be soon restored, and that in your retirement from active life you will enjoy many years of uninterrupted happiness in the bosom of your family, and with our united good wishes,

We beg to subscribe ourselves, yours very sincerely,

Signed by the President and Officers of the Newcastle-upon-Tyne and Gateshead Law Society, and by fifty-six Solicitors practising in these towns.

To James Wakley, Esq., Corrie, Devon.

Corrie, Honiton, Oct. 10th, 1855.

GENTLEMEN.—I have the honour to acknowledge the receipt of your valudictory address from the Solicitors of Newcastle-upon-Tyne and Gateshead, and I beg you will assure them that I feel most deeply sensible of this very flattering testimony of kind approval from so highly important a public body.

Throughout my official career nothing has afforded me more unmingled satisfaction than the unvarying good understanding which I have been enabled, through their great courtesy and kindness, to sustain at all times when called into communication with the members of the legal profession of Newcastle and its district.

In lamenting my removal from Newcastle, I beg to assure you that so long as it may please God to spare my life, it will constitute one of my greatest consolations to cherish the grateful remembrance of the kind acts, the friendship and the worth of the many valued friends I have left behind, and who have now so augmented my already deep obligations by the distinguished honour with which they have been pleased to mark my retirement from the appointment of Official Assignee.

In taking my regretful leave of you collectively and individually, I beg to return you my unbounded and most grateful thanks; and reciprocating to all and each of you every kind expression of goodwill and most cordial wishes for your happiness and welfare.

I beg to subscribe myself, Gentlemen,

Your obliged servant and friend,

JAMES WAKLEY.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS.

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.

Office hours from 12 till 4.

**Medical Patent.—Partnership.—**

To be SOLD, price £500 each, FOUR SIXTEENTHS of a valuable PATENT, in daily use by the Profession. A preference given to Medical Men, to whom the undertaking would be perfectly legitimate. Ten per Cent. per Annum will be guaranteed as a minimum return; but as, during the nine months it has been worked, a profit at the rate of Twenty-four has been realized, most lucrative results may reasonably be anticipated.

Apply to Messrs. LANE and LARA, 14, John-street, Adelphi.

**Any length of Introduction can be**

given by the present Incumbent, who is retiring from General Practice, to an old-established Connexion, situated near St. Bartholomew's Hospital, and yielding through a Retail about £400 per annum. Price, with Stock and Fittings, £300; half payable by instalments.

Apply to Messrs. LANE and LARA, 14, John-street, Adelphi.

TO THE PROFESSION.

ASSISTANT, in a large general Practice where there is every facility for acquiring a thorough practical knowledge of the profession. A qualified gentleman preferred.—Apply to Dr. Mackinder, Gainsborough.

**The moiety (£300 per annum) of a**

highly respectable PRACTICE in the CITY, to be SOLD for one year and a half's purchase, with Succession to the whole after a stated period.—Apply, by letter, to D. G., at Mr. Wyman's, 122, Fore-street, Cripplegate.

**Wanted, by a Medical Man, in a**

General Practice in the Country, a Qualified ASSISTANT, to Dispense, Visit, and attend Midwifery.—Address, M. N., Post-office, Elstree-hill, near London.

MEDICAL.

**An M.R.C.S.L. wishes for an Engage-**

ment as Out-door ASSISTANT in an extensive Practice. The most satisfactory references can be afforded.—Address, Medicus, London Hospital, Mile End-road.

TO STUDENTS IN MEDICINE.

**A Hospital Physician and Lecturer,**

residing at the West-end of London, will receive into his family a PUPIL. Unusual advantages are offered. Terms moderate.—Address, T. Z., THE LANCET Office, 423, Strand.

**To be Disposed of, a most desirable**

and increasing PRACTICE in the City; present receipts, £300 per annum. The terms of purchase may be arranged to suit the convenience of a successor, but the command of £500 will be essential.—Address, M. C., Messrs. Sangster and Roberts, Solicitors, 31, St. Swithin's-lane.

MEDICAL.

**Wanted immediately, by a Practi-**

tioner in the Country, an ASSISTANT, fully qualified.—Apply personally, or by letter addressed T. S., stating age and salary required, to the care of Messrs. Westwoods and Hopkins, Wholesale Druggists, 16, Newgate-street, London.

MEDICAL.

**Wanted to Purchase immediately,**

by a Member of the London College and Hall, (married,) a PRACTICE or PARTNERSHIP in the Country, (a good Town preferred,) the income to be from £400 to £800 per annum.—Address, in the first instance, Medicus, Messrs. Milner and Cowdery, Wholesale Druggists, Paternoster-row.

**Medical Practice to be Disposed of**

in a large provincial town; business doing from £300 to £400 per annum. An appointment worth £80 per annum. As the Proprietor wishes to leave before Christmas, £250 down will be taken, to include horse, chaise, harness, surgery fixtures, and stock.—Address, W. W., THE LANCET Office, 423, Strand.

**Medical Transfer and Partnership.**

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**

and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RESIGN, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

MEDICAL.—TO ASSISTANTS AND PRACTITIONERS.

**A Gentleman, retiring from the**

active duties of his Profession, wishes to meet with a SUCCESSOR. His Practice returned last year upwards of £400. The Premium to be paid by £50 yearly instalments out of the proceeds of the Practice, the first payment being made upon taking possession.—Address, A. B. C., care of Mrs. Wilson, No. 3, Newcastle-place, Mile End-road.

TO CHEMISTS AND DRUGGISTS.

**To be Sold, the Lease and Goodwill**

of an old-established BUSINESS, in a leading thoroughfare at the West-end of town. The House is in excellent order, and the upper part has been occupied by the same gentleman for many years. The sum required will be about £1500. It is requested that principals only, or their solicitors, will reply to this advertisement.—Apply, post-paid, to H. B., Mr. James Boylston, Carey-street, Lincoln's-Inn.

TO PHYSICIANS.

**In consequence of an M.D. being**

under orders to proceed on military service to the East, his PRACTICE as above is for immediate Disposal. To a gentleman of manners and education, with sound bed-side knowledge of Medicine, this opening would prove advantageous in every way.—Address, for negotiation, C. P., Shipton, Marlborough.

MEDICAL.

**To be Disposed of immediately, in**

consequence of the death of the Principal, a MEDICAL PRACTICE, at Wilmalow, near Alderley, in Cheshire, twelve miles from Manchester. A union contract and a Forester's Society connected with it. The above has been carried on successfully for several years.—Application to be made to E. Mayson, Wilmalow, or to Richard Wilkinson, 6, Corporation-street, Manchester.

TO SURGEONS ABOUT TO COMMENCE PRACTICE IN LONDON.

**A Chemist's Business for Disposal in**

the West-end, near Cavendish-square, and consisting of an extensive Prescribing and General Retail trade. Not one open Surgeon's Shop in the neighbourhood, and one is much required. Stock of Drugs large and select. House in thorough repair. Rent moderate. Sum required, £300.—Apply to Mr. N. Jacobson, 37, Walbrook, Mansion-house.

MEDICAL.

**A Gentleman wishes for an Assistant-**

ship, about the 17th of November, in a good part of London or a suburb, in a Practice quite private and select, where his chief duties would be moderate Dispensing and Book-keeping, and where occasional Visiting, or attendance in a Labour, in the absence of the Principal, might be required. The Advertiser was formerly a Student of King's College, London. Since then, he has been an Assistant, and during eight years at one post. He is very desirous of a gentlemanly home, (where he might remain about two years,) rather than of much salary.—Address, A. B., Post-office, Colchester, Essex.

**To be Disposed of, in consequence of**

the continued indisposition of the proprietor, Mr. Elijah Fring, the Good-will, Stock, Fittings, &c., of that well-known establishment, the MEDICAL HALL, No. 30, Westmoreland-street, Dublin, (established in 1821,) now in full working order, and to which a highly respectable and numerous connexion is attached. The business, until disposed of, will be carried on as usual. The fullest information can be had of Messrs. Herring and Co., 40, Aldersgate-street, London; of Mr. Graham, No. 12, Cope-street, Dublin; and of Messrs. Grattan and Co., Belfast; or at the premises.—16th September, 1854.

**Buxton Baths.—St. Ann's Hotel.—**

The Reduced Charges for the Winter will commence on the 1st of November. Conducted by Mrs. HARRISON.

N.B. The New Baths are kept open as usual during the Winter Months.

TO PROFESSORS OF ANATOMY, STUDENTS, &c.

**Dr. Kahn continues to execute every**

description of ANATOMICAL and PATHOLOGICAL WORK MODELY.

For a List of Prices apply at 222, Piccadilly.

DR. KAHN'S ANATOMICAL MUSEUM is open Daily, from Eleven till Five, and from Seven till Ten. Admission, One Shilling. Lectures, as usual, by Dr. SUTTON, F.R.G.S., and F.E.S.

**Matrimonial Institution.—Founded**

1846.—Offices: 12, John-street, Adelphi, London; and 18, Nassau-street, New York.—This Institution has been established many years, (with great success,) as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.

Prospectuses, Application Forms, Rules, and every information sent free to any name, initials, or address, on receipt of 12 postage stamps, by order of the Director, LAURENCE CUTEBURY, 12, John-street, Adelphi, London.

# NEW WORKS AND NEW EDITIONS,

Published since the First of October.

I.  
**A Manual of Pathological Anatomy.** Illustrated with numerous Engravings on Wood. Fcap. 8vo, cloth, 12s. 6d. By C. HANDFIELD JONES, M.B., F.R.S., Assistant-Physician to St. Mary's Hospital; and EDWARD H. SIEVEKING, M.D., Assistant-Physician to St. Mary's Hospital.

\* \* Mr. Churchill is happy to announce this additional volume to his Manuals, and believes it will be found fully to sustain the high reputation which the Series has attained.

## MEDICAL HANDBOOKS

PUBLISHED BY MR. S. HIGHLEY.

### Mr. S. Highley's Publications may

be seen and obtained of his English Agents.—Mr. Graham, Oxford; Messrs. Macmillan and Co., Cambridge; Messrs. Simms and Denham, Manchester; Mr. J. H. Bellby, Birmingham; Deighton and Loughton, Liverpool; Mr. C. Heald Thomas, Gloucester; Fletcher and Alexander, Norwich; Mr. Leng, Hull; Messrs. Sutherland and Knox, Edinburgh; Mr. Hadden, Glasgow; Mr. J. A. Wilson, Aberdeen; Messrs. Hodges and Smith, Dublin; and Gentlemen remote from Towns may procure any work contained in this Catalogue by forwarding a Post-office Order for the Price specified. All works above 5s. in price will be sent *Carriage Free* to any part of Great Britain and Ireland.

**PHARMACOPEIA LONDINENSIS.** Translated by RICHARD PHILLIPS, F.R.S. L. & E. With copious Notes and Illustrations, and a Table of Chemical Equivalents. 8vo, 12s. 6d.

"We consider the new edition of Phillips' Pharmacopoeia very carefully executed, and equal in all respects to the former. We have little doubt but that the work will maintain the well-earned reputation of former editions, and will be considered, as hitherto, the most indispensable companion of those engaged in the practice of pharmacy and the study of materia medica."—ASSOCIATION JOURNAL.

**ODLING'S PRACTICAL CHEMISTRY.** Course of Practical Chemistry for the Use of Medical Students. Arranged with express reference to the Three Months' Summer Course. By WILLIAM ODLING, M.B., F.C.S., Professor of Practical Chemistry and of Natural Philosophy at Guy's Hospital. 8vo, price 4s. 6d. [Just published.]

**A TOXICOLOGICAL CHART:** Exhibiting at One View the Symptoms, Treatment, and Mode of Detecting the various Poisons, Mineral, Vegetable, and Animal; to which are added Concise Directions for the Treatment of Suspended Animation. By W. STOWE, M.R.C.S. Eleventh Edition, varnished and mounted on cloth, with roller, price 6s.; or 2s. the plain sheet.

"Every prudent, not to say humane, druggist should have this chart affixed to that department of his dispensary where poisons are kept."—ANNALS OF CHEMISTRY.

**THE CHEMISTRY OF POISONS.** A Concise Arrangement of the most deadly Mineral, Metallic, and Vegetable Preparations; exhibiting at one view the Appropriate Tests in Qualitative Analysis, with accurately Coloured Tests. Designed for the Use of Medical Men and Chemists. By JOHN HORSLEY. Second Edition, revised and extended. 5s. [Just published.]

**THE ANATOMICAL REMEMBRANCER;** or, Complete Pocket Anatomist: Containing a Concise Description of the Bones, Ligaments, Muscles, and Viscera; the Distribution of the Nerves, Bloodvessels, and Absorbents; the Arrangement of the several Fasciæ, the Organs of Generation in the Male and Female, and the Organs of the Senses. Fourth Edition. Royal 32mo, price 3s. 6d.

London: S. HIGHLEY, 32, Fleet-street.

No. 1627.

Illustrated with 250 Wood Engravings. 8vo, 21 5s.

## Erichsen's Science and Art of

**SURGERY;** being a Treatise on Surgical Injuries, Diseases, and Operations. By JOHN ERICHSEN, Professor of Surgery in University College, and Surgeon to University College Hospital.

"The aim of Mr. Erichsen appears to be, to improve upon the plan of Samuel Cooper, and by connecting in one volume the science and art of Surgery, to supply the student with a text-book and the practitioner with a work of reference, in which scientific principles and practical details are alike included. We can cordially recommend it as a work of reference, both to students and practitioners."—MEDICAL TIMES.

"We do not hesitate to say that the volume before us gives a very admirable practical view of the science and art of Surgery of the present day, and we have no doubt that it will be highly valued as a surgical guide, as well by the surgeon as by the student of surgery."—EDINBURGH MEDICAL AND SURGICAL JOURNAL.

"Regarded as a whole, we recommend it as the best compendium of surgery in our language. The clear and easy style of composition, and the excellent illustrations, in number more than 260, independently of its other merits, will tend to make the work a favourite both with students and practitioners."—THE LANCET.

**KIRKES' HANDBOOK OF PHYSIOLOGY.** By W. S. KIRKES, M.D., Demonstrator of Morbid Anatomy at St. Bartholomew's Hospital, assisted by JAMES PAGET, Lecturer on General Anatomy and Physiology at St. Bartholomew's Hospital. Second Edition. One Vol. 12mo, with Illustrations on Steel and Wood, 12s. 6d. cloth, lettered.

"We predict that this will take its place as a standard work on physiology in all our medical schools and colleges."—MEDICAL GAZETTE.

"The authors have succeeded in producing a work well adapted for students. The copious references made, both to elementary works and to original papers, are most valuable; more especially as this species of research is of great importance to students, and is apt to be neglected by the authors of manuals."—EDINBURGH MONTHLY JOURNAL.

**MURPHY'S LECTURES ON THE PRINCIPLES AND PRACTICE OF MIDWIFERY.** By EDWARD MURPHY, A.M., M.D., Professor of Midwifery in University College. 8vo, with many illustrations, 16s.

"By this work Dr. Murphy has placed his reputation and his fame on a solid and durable foundation."—DUBLIN MEDICAL PRESS.

"In all that is anatomical, physiological, descriptive, and theoretic, relating to obstetrics, it cannot be surpassed, and gives the most recent information in a well-arranged manner and agreeable style."—DUBLIN JOURNAL OF MEDICINE.

"Uterine Hæmorrhage." This part of his subject is treated with great ability by Dr. Murphy. He prefaces its consideration by a description, illustrated by some good lithographs, of the modern researches into the uterine and placental circulation; and, indeed, the present is the only work on Midwifery in which they are completely set forth."—BRITISH AND FOREIGN MEDICO-CHIRURGICAL REVIEW.

London: WATSON and MABERLY, Upper Gower-street, and Ivy-lane, Paternoster-row.

In fcap. 8vo. cloth, price 5s.  
**The Diseases of the Fœtus in Utero;**  
 with an Outline of Fœtal Development. By HENRY MADGE, M.D.,  
 M.R.C.S., &c.  
 London: Henry Renshaw, 356, Strand.

Just published, in fcap. 8vo. cloth, price 7s.  
**A Treatise on Hooping-Cough: its**  
 Complications, Pathology, and Terminations; with its Successful  
 Treatment by a New Remedy. By GEORGE D. GIBB, M.D.  
 London: Henry Renshaw, 356, Strand.

In two thick vols. 8vo. cloth, price £3,  
**Chelius' System of Surgery.** Trans-  
 lated from the German, with considerable additional Notes and  
 Observations, by JOHN T. SOUTH, Surgeon to St. Thomas's Hospital.  
 "The most complete systematic treatise now extant."—EDINBURGH MEDICAL  
 REVIEW.  
 "It is alike essential to the student and the practitioner."—MONTHLY  
 MEDICAL JOURNAL.  
 London: Henry Renshaw, 356, Strand.

Octavo, price Two Shillings,  
**Essays on the Ligature of Arteries,**  
 SECONDARY HÆMORRHAGE, and AMPUTATION at the HIP-  
 JOINT. By JAMES VEITCH, M.D., a Retired Hospital Surgeon, of the  
 Navy, D.I.H.  
 London: Samuel Highley, 32, Fleet-street.

A SURGICAL HANDBOOK FOR THE CRIMEA.  
**Military Surgery; or, Experience of**  
 Field Practice in India during the Years 1843 and 1846. By J. J. COLE,  
 M.R.C.S.E., H.E.I.C.E., late Surgeon to the Auxiliary Forces during the War  
 in the Punjab. 8vo. 8s.  
 "Mr. Cole found himself, seven months after his arrival in India,  
 (November, 1847,) in charge of Lieutenant Edwards' Army, (18,000 strong,)  
 then encamped before Moultan. The work shows talent, and is both truthful  
 and original. Mr. Cole evidently had the welfare of the soldier at heart. The  
 reader will find in it much that is interesting and useful."—MEDICO-  
 CHIRURGICAL REVIEW.  
 London: Samuel Highley, 32, Fleet-street.

Just Published,  
**How to Use Midwifery Instruments;**  
 written in the form of Dialogue. By JOHN ROBERTSON, formerly  
 Senior Surgeon in Ordinary to the Manchester and Salford Lying-in Hospital.  
 Printed for John and Wm. Wood, Surgical Instrument Makers, 74, King-  
 street, Manchester; and sent by them free on receipt of eighteen stamps.

Now ready, price 1s., pp. 108,  
**Sanitary Report on the Copper-**  
 SMOKE, &c. By Dr. WILLIAMS, of Swansea.  
 Published by Herbert Jones, Swansea; and by Simpkin and Marshall,  
 London.

Now Ready, Part IV. of  
**The Ferns of Great Britain.**  
 Illustrated by JOHN E. SOWERBY.  
 Descriptions by C. JOHNSON, Esq.  
 To contain about Forty-Six Plates, and to be completed in Eight Monthly  
 Parts, full coloured, at 3s.; partly coloured, at 1s. 6d. per Part.  
 To be had through all Booksellers, and of the Proprietor, JOHN E. SOWERBY,  
 3, Mead-place, Lambeth.

Just published, 8vo. cloth,  
**Practical Observations on Conical**  
 CORNEA. By J. NOTTINGHAM, M.D., F.R.C.S., Surgeon to the  
 St. Anne's Eye and Ear Institution, Liverpool.  
 London: John Churchill, New Burlington-street.  
 Liverpool: Deighton and Laughton.

On the 1st of November, 1854, was published, price One Shilling, No. 161, of  
**The Pharmaceutical Journal,**  
 Containing the  
 TRANSACTIONS OF THE PHARMACEUTICAL SOCIETY.  
 CONTENTS:—The Library of the Pharmaceutical Society—The Pharmaceu-  
 tical Meetings—The Medical Protection Society—Distribution of Prizes—  
 Gubela Cuski, Black Pepper of West Africa—Examination of the Alkaloids in  
 Poppy Capsules—Zinc Ointment, with Benzoin—Prepared Lamb-skins—Salts  
 of the Organic Radicals, Amyl, Ethyl, and Methyl—The Action of Iodic Acid  
 on the Vegeto-Alkalies—The Leaves of the Coca of Peru (continued)—Ozone—  
 Manufacture of Carbonate of Magnesia—Perechloride of Iron—Apparatus for  
 the Analysis of Coal—British Association: Meeting at Liverpool—American  
 Pharmaceutical Association: Annual Meeting—The Early Closing Move-  
 ment, &c. &c.

VOLUME XIII. may be had in boards, as well as the preceding volumes,  
 price 12s. 6d. each.  
 London: John Churchill, New Burlington-street; MacLachlan and Stewart  
 Edinburgh; and Fannin and Co., Dublin.

**Allen's Illustrated Catalogue,** con-  
 taining size, price, and description of upwards of 100 articles, consisting  
 of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes,  
 Writing-desks, Dressing-cases, and other travelling requisites, forwarded on  
 receipt of two stamps.

ALLEN'S TRAVELLING-BAG (patented) has the opening as large as the  
 bag itself, and therefore possesses an immense advantage over all others.  
 ALLEN'S REGISTERED DESPATCH-BOX and WRITING-DESK, and  
 their New Quadruple Portmanteau (containing four compartments), are the  
 best articles of the kind ever produced.  
 J. W. and T. ALLEN, Manufacturers of Portable Barrack-rooms, Furniture,  
 and Military Outfitters, (see separate Catalogue,)  
 18 & 22, WEST STRAND.

**The Pen Superseded.**  
 The most elegant, easy, economical,  
 and best method of MARKING LINEN,  
 Silk, Books, &c., without the ink spreading  
 or fading, is with the INCORODIBLE  
 ARGENTINE PLATES. No Preparation  
 required. Any person can use them with the  
 greatest facility. Name-plate, any style, 2s. 6d.;  
 Initials, ditto, 1s. 6d.; Numbers, per set, 2s. 6d.;  
 Crest, 5s. Sent, post free, with directions, on  
 receipt of stamps or post order.

FREDK. WHITEMAN, Inventor and Sole Maker, 19, Little Queen-street,  
 Holborn.

**A New Discovery.—Mr. Howard,**  
 Surgeon-Dentist, 52, Fleet-street, has introduced an entirely NEW  
 DESCRIPTION OF ARTIFICIAL TEETH, fixed without springs, wires,  
 or ligatures. They so perfectly resemble the natural teeth as not to be  
 distinguished from the original by the closest observer; they will never  
 CHANGE COLOUR OR DECAY, and will be found very superior to any teeth ever  
 before used. This method does not require the extraction of roots, or any  
 painful operation, and will give support and preserve teeth that are loose, and  
 is guaranteed to restore articulation and mastication; and that Mr. Howard's  
 improvements may be within the reach of the most economical, he has fixed  
 his charges at the lowest scale possible. Decayed teeth rendered sound and  
 useful in mastication.  
 52, Fleet-street. At home from Ten till Five.

**Teeth.—Mr. Alfred Jones, of Gros-**  
 venor-street, has recently completed a new and important improvement  
 in the construction of ARTIFICIAL TEETH. The superiority of their  
 appearance, and the unerring accuracy with which they are fitted to the  
 mouth, without wires, springs, or ligatures, and the lightness of their con-  
 struction, gives greater facility in mastication and freedom to the speech, and  
 imparts a more youthful appearance to the countenance than has hitherto  
 been attained; they support any teeth that may be loose, and have been tested  
 by many of the first medical men, the nobility, and gentry, from whom he has  
 received the most flattering acknowledgments of success. Supplied only by  
 Mr. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of  
 Gloucester, her late Royal Highness the Princess Augusta, and his late  
 Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street,  
 Grosvenor-square.—At home from Eleven until Five.

**The Eye Douche, for applying Lotion**  
 to or bathing the Eye, is self-acting, simple, and portable. The im-  
 mediate relief obtained from its use particularly recommends it to the notice of  
 all who are much engaged in reading, writing, or designing; it has been  
 employed with the most favourable results by patients under the care of  
 Haynes Walton, Esq., Surgeon to the Central London Ophthalmic Hospital.  
 Price 20s.; carriage paid to any railway station.  
 Manufactured by WILLIAM T. COOPER, 26, Oxford-street, London.

**COOPER'S LAVEMENT APPARATUS** is the most  
 perfect ever invented; the possibility of air entering the bowels is prevented,  
 and the labour of pumping is avoided; being constructed entirely of metal,  
 without valves, it cannot become out of order, which renders it particularly  
 suitable for use in the country or in foreign climates. Price 35s. Each  
 Apparatus from 10s.; Superior Reservoir Apparatus from 27s.—Each instru-  
 ment in mahogany box with lock and key.  
 Manufactured by WILLIAM T. COOPER, 26, Oxford-street, London.

**THE CORK RESPIRATOR** is the lightest cheapest, and  
 most efficacious ever produced; allows free respiration, and from being easily  
 applied and removed, is specially adapted for the use of Invalids, or Ladies  
 attending evening meetings or places of amusement. Price 3s., free by post.  
 Wholesale only of WILLIAM T. COOPER, 26, Oxford-street, London.  
 Illustrated Catalogues free by post.

**Surgical Instruments, and every**  
 Implement necessary for Surgeons and Druggists, can be had (war-  
 ranted best quality and moderate prices). Retail as well as Wholesale, from  
 the Manufacturer, JAMES ARNOLD, 36, WEST SMITHFIELD, S.  
 Bartholomew's Hospital, London.

# THE BRITISH MEDICAL DIRECTORY

## FOR 1855.

The Editors respectfully and gratefully acknowledge the receipt of a large number of "Returns" for this Directory.

The Editors have stated on previous occasions, that when the entries in the Directory for the current year (1854) are found to be correct, a mere intimation of that fact will be sufficient; but when *alterations* are required, they should be distinctly specified, and in all cases the Names should be written *clearly*, and at *full length*.

Lists of the Names of duly-qualified Practitioners resident in the several Cities, Towns, and Villages of the United Kingdom, will be thankfully received, as also information of the Death, Removal, or Appointment to a Public Office, of any duly-qualified Practitioner. In the Metropolis, and other Cities and large Towns, the *streets and numbers* of the Houses should be given.

Duly-qualified Practitioners who have already responded to these appeals would confer a favour on the Editors by inducing Professional friends and neighbours to make their "Returns" as quickly as possible, as delays might evidently cause some names to be omitted.

"The BRITISH MEDICAL DIRECTORY, for ENGLAND, WALES and SCOTLAND," to be published on the 1st of January, 1855, may be obtained of all Booksellers and Newsmen, price Six Shillings, (including One Shilling postage.)

OFFICE, 423, STRAND.

### Henry Bigg, 9, St. Thomas's-street,

Borough, Surgical Instrument-maker to Guy's and St. Thomas's Hospitals, begs to call the attention of the Medical Profession to the following valuable Instruments, made from designs and suggestions kindly given by the Gentlemen whose names are attached—viz., Mr. Le Gros Clark's Talipes Instrument; Mr. Bransby Cooper's Ovarian Trocar; Mr. Cook's Recto-Vesical Trocar; Mr. Cooper Forster's Ear Speculum; Mr. Hilton's Speculum Ani; Dr. Lever's Midwifery Instruments; Mr. Solly's Elastic Catheter, with Catgut Director. These Instruments being constructed on the premises secure their excellence and perfect finish.

9, St. Thomas's-street, Borough, London.

### Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1. KNEE-PIECE AND ANKLE-PIECE.—Mr. Bourjeaud begs to state that these may be worn together or separately. The former is especially useful in chronic enlargement of the knee-joint, weakness in the articulation, &c. &c.; and the latter should always be used after the subsidence of the inflammatory stage in sprains, dislocations, &c. &c.

FIG. 2. MR. BOURJEAUD'S REGISTERED ELASTIC STOCKINGS, acting Spirally, free from Seams, requiring no Laces, and put on with the greatest ease.—

These stockings constitute one of the greatest improvements of modern times in appliances for compression, and Mr. Bourjeaud is happy to say, that the Medical Profession in London and the Provinces have pronounced them the most efficient that have ever been produced. They are made of most carefully-prepared webbing of varying elasticity, and disposed in strips running spirally round the leg, and the amount of pressure may thus be regulated to a nicety. The elastic force is accurately calculated, and adapted, upon the directions of the medical attendant, to the different pathological states of the ankle, leg, knee, or thigh, requiring gentle and equable pressure. The stockings are put on without the slightest effort, from below upwards, and thus possess the advantage of driving the blood from the vessels before the pressure is exerted; no tedious lacing is required, and hence there is no risk of congestion of the head and unpleasant swelling of the legs consequent upon stooping. Patients afflicted with oedema of the lower extremities, varicose veins, enlargement or weakness of the knee or ankle, should wear none but these stockings; they are invaluable in all cases requiring compression, which latter may be made more or less powerful through the whole length, or only on a given spot, to answer the various indications which the surgeon wishes to fulfil.

The Stockings are to be obtained only at 11, Davies-street, Berkeley-square, opposite Mivart's Hotel.

### Dissecting and Post-Mortem Instru-

MENTS, New and Second-hand. Surgical Instruments of the best description; A. URE'S New Urethrotome for Stricture; New Uterine Compress; Newly Improved Passary; Instruments for Army and Navy Surgeons; DARTNELL'S Patent Truss; Trusses for Union Surgeons; Enema Syringes; New Syphon Enema, as supplied to the Army; New Spinal Machine, pronounced the best ever invented—at

PRATT'S, Surgical Instrument Maker, 430, Oxford-street.

### New Spinal Support.—Fr. G. Ernst,

Lamb's Conduit-street, Foundling Hospital, begs to draw the attention of the Faculty to his recently-invented SPINAL APPARATUS, which, after some months of trial, has proved superior to any of the various kinds hitherto used, and produced the most satisfactory results. This appliance, being self-adjusting, free bodily motion is permitted; thus, while equal and necessary support is given to the wearer, all injurious or painful pressure is avoided, and a great amount of comfort and benefit consequently yielded. It can be modified so as to suit any FORM OF SPINAL DEFLECTION; its weight is comparatively trifling, and from its capacities for nice adaptation elicits no observation when on the body.

To be had only of the Inventor, 43, Lamb's Conduit-street.

TO THE MEDICAL PROFESSION.

### Fr. G. Ernst, Anatomical Machinist

and MANUFACTURER OF SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF of BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam ERNST (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &c.

### ELECTRICITY

FOR NERVOUS, FUNCTIONAL, AND RHEUMATIC DISEASES.

MEINIG'S New and Greatly Improved GALVANIC ELECTRO-GENERATOR, for supplying vito-functional energy to any organ in want of the same, and to the system generally, may now be had at the Establishments, 103, Leadenhall-street, and at 213A, Piccadilly. All wet and metallic contact with the Body is entirely obviated; it acts with water alone, without acid, the action lasts more than twenty-four hours after each damping, and can be renewed and regulated without undressing, the Generator, enclosed in an envelope, being carried in the pocket or suspended from the neck.

THE EXTRAORDINARY CURATIVE VIRTUES OF THESE MILD CURRENTS OF ELECTRICITY ARE NOW FULLY ESTABLISHED BY EXPERIENCE. The Prospectus (to be had gratis, or by post for two stamps) contains the names of more than 600 persons cured within the last eighteen months, and this remedy is now adopted in nearly all the Hospitals, and by the most eminent practitioners. Sold at 6s. and upwards, according to power, at C. MEINIG'S, 103, Leadenhall-street, and 213A, Piccadilly.

N.B.—In the first stages of COLIC, the continuous current from the colon to the abdomen has been found eminently successful in checking the further progress of the disease.

POCKET-BATTERIES for Medical Practice on the same principle. (Intensity of 120 cells within the space of a small pocket-book.) 103, LEADENHALL-STREET and 213A, PICCADILLY (near Regent-circus.) Prospectus gratis, or by post for two stamps.

## Family Endowment Life Assurance AND ANNUITY SOCIETY.

12, CHATHAM PLACE, BLACKFRIARS, LONDON.  
ESTABLISHED 1835.  
CAPITAL, £500,000.

### DIRECTORS.

William Butterworth Bayley, Esq., Chairman.  
John Fuller, Esq., Deputy-Chairman.

Lewis Burroughs, Esq. Edward Lee, Esq.  
Robert Bruce Chichester, Esq. Colonel Ouseley.  
Major Henderson. Major Turner.  
Charles Henry Latouche, Esq. Joshua Walker, Esq.

An Annual Bonus is allowed to parties who have made Five Annual Payments on Policies taken out on the Profit Scale. That for the current year is 20 per cent. in reduction of the Premium.

ENDOWMENTS AND ANNUITIES GRANTED AS USUAL.

### INDIA BRANCH.

The extensive Assurance Business of the Agra and United Service Bank has been transferred to this Office, and the Society has Branch Establishments or Agencies at Calcutta, Madras, Bombay, Agra, and Hong Kong.

JOHN CAZENOVE, Secretary.

## Water Filter for the Pocket, with

DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.

J. SOLOMON, Wholesale Optician, and Photographic Depot, 22, Red Lion-square.

## Purify Sick Rooms, and give comfort

to Patients and perfect Safety to Attendants.—The most offensive atmosphere is instantaneously purified, and the air impregnated with refreshing fragrance, by SAUNDERS' ANTI-MEPHITIC FLUID, prepared by J. T. Saunders, Perfumer, 315s, Oxford-street, Regent-circus. Sold by all Druggists and Perfumers. Price 1s.

## W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opistors are inadmissible; also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atropo, Belladonna, Cytiledon Umbilicus, &c.) also to his Liq. Taraxici, Liq. Galli Aparinis (a valuable alternative), Liq. Parietarin (diuretic), and Liq. Belce (prepared from the Egle Marmelos, or Indian Bael), for Dysentery and Diarrhoea.

W. T. has a large supply of INDIAN BARK on hand.

2, Edward's-street, Portman-square.

## Dinneford's Pure Fluid Magnesia,

now greatly improved in purity and condensation.

"Mr. Dinneford's Solution may fairly be taken as a type of what the preparation ought to be."—PHARMACEUTICAL JOURNAL, May, 1846.

This excellent remedy, in addition to its extensive and increasing sale amongst the public, is now very largely employed in DISPENSING: for which the cheapest and most convenient form is in the STONE JARS; half-gallon, 5s. 6d.; gallon, 9s. 6d.; specially adapted for the use of Surgeons and Chemists. To be had from the manufacturers, DINNEFORD & CO., Chemists, 172, Bond-street, London; and all respectable Wholesale Druggists and Patent Medicine Houses.

## Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 26th, 1854.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.

Insipiated Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

Taraxacum (Davenport's) Liqueur, or Fluid Extract, prepared by Spontaneous Insipiation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

## Hooper's Juice of Taraxacum,

Insipiated by dry air, can be obtained in the following forms:—

The EXTRACT; dose, a tea-spoonful.

The FLUID EXTRACT; dose, a dessert-spoonful.

The LIQUOR, with CORTICAL ESSENCE of SARSAPARILLA; dose, a dessert-spoonful.

With Seltzer Water, either of these preparations forms a pleasant draught, and with which their effects are greatly augmented.

"For emaciated constitutions, I know of no medicine equal to Hooper's Taraxacum and Sarsaparilla."—Dr. JOHNSON.

For Affections of the Liver, Kidneys, Jaundice, Indigestion, Cutaneous Affections, and Constipation, these preparations have long been prescribed by the most eminent of the Faculty with the best results. The above Extracts of Taraxacum, when mixed with water, produce a milky appearance, similar to the juice in its fresh state.

"So valuable a preparation as your Taraxacum can need no recommendation from me; still I feel bound to say its beneficial effects have surpassed my most sanguine expectations. My mother, who is in her 78th year, and who through the greater part of her life has been a martyr to liver complaint, appears to have had ten years added to her life by a three months' use of it."

"I remain, yours truly,"

ASTLEY LEPINGWELL.

"To Mr. Hooper, 7, Pall-mall East."

BRIGHTON SELTZER WATER, 4s. per doz. Other fictitious Mineral Waters, at a reduction of 25 per cent.

HOOPER, Operative Chemist, 55, Grosvenor-street, and 7, Pall Mall East, London. Laboratory, Great Scotland-yard.

## The Conservative Land Society.

### SUCCESS OF THE SOCIETY.

Total number of Shares issued up to the 29th of September, 1854	10,312
Total Cash Receipts up to the same date	£139,303
Amount of Land Sold to the same period	498,515
Amount of Reserve Fund to the same date	28,095
Shares on the Order of Rights by completion, by Public Drawings, and by Seniority, to the same date	3,529
Last Share Number on the Order of Rights by Seniority	1,228
Bonus realized on Shares during the First Year	6 per cent.
Interest now allowed on Completed Shares, and on payments of a Year's Subscription in advance, and upwards, such interest being payable Half-yearly, one month after Lady-day and Michaelmas	5 per cent.
Estates purchased in various counties	Nineteen.
" allotted, or partly distributed amongst the Members	Twelve.
" to be allotted	Seven.

CHARLES LEWIS GRUNNISEN, Secretary.

The Twenty-third Public Drawing will take place at the Office, 33, Norfolk-street, Strand, on Saturday, the 11th inst., at noon.

## Hare-Lip.—Extraordinary Application and CURE.

Communication from Mr. BROADBENT, Surgeon, Ferry Hill, Durham.

Mr. BENJAMIN NICKELS.

SIR.—I wish to state concerning your Plaster to the following effect. About ten days after an operation for Hare-lip, the boy fell against a stone step and ruptured the lip. The day previously I had received your Elastic Plaster, and on being summoned to the boy, (without much hope of success,) I applied three strips of the Plaster, extending from ear to ear, bringing the ruptured edges into apposition. Seven days after, the Plaster retained the cheeks in the position I had left them on the day of application. Fresh strips were then applied, and the edges ultimately united. In my opinion, no other plaster could have answered the intention, and I think it specially adapted to wounds on the face.

I remain yours obediently.

(Signed) G. W. BROADBENT.

NICKELS'S PATENT ELASTIC ADHESIVE PLASTER, and ELASTIC ADHESIVE BANDAGES, which are made on quite a new principle, rendering them a cheap, efficient, unvarying support as a spiral covering, or stocking (without the trouble of lacing), for varicose veins, sprains, weak joints, and all rheumatic affections. These Bandages may also be cut and applied as ordinary strapping.

The Patentee has had the honour of receiving the highest testimonials in approbation of his ELASTIC PLASTERS from the following most eminent Members of the Profession, and many other Gentlemen, by whom they are patronized and used in their hospital and private practice:—J. C. W. LEVER, M.D., Physician Accoucheur, Guy's Hospital. Mr. FERGUSON, Surgeon to his Royal Highness Prince Albert, Prof. Surgeon, King's College, London; Surgeon King's College Hospital. Mr. HILTON, Surgeon, Guy's Hospital, Surgeon to the City of London Hospital for Diseases of the Chest.

THE PATENT ELASTIC COURT PLASTERS are found most superior both in appearance and quality.

Sold by all principal Chemists in the United Kingdom, and by Mr. BENJAMIN NICKELS, Surgical Plaster Manufacturer, 9, Camberwell-green, London.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lyttæ P.L., easily applied and removed, and will not produce stranguary or troublesome after-sores. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing twelve square feet, 6s. 6d.; and small Cases of six square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing twelve square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1853.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

JOHN GAY, F.R.C.S.

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown."

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction.

"80, Grosvenor-street, London."

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. BROWN'S BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicator, when carefully applied, and has not been productive of any degree of Stranguary.

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. Brown, Druggist, Handsworth, Birmingham."

Prepared by Thomas B. Brown, Pharmaceutical Chemist, 43, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignee, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

## LETTSONIAN LECTURES

## On Surgery.

DELIVERED BEFORE THE FELLOWS OF THE  
MEDICAL SOCIETY OF LONDON,

DURING THE SESSION 1853-54.

By JOHN BISHOP, Esq., F.R.S.

## LECTURE I.

DISEASES OF THE BONES.

(Concluded from p. 328.)

WE now come to the consideration of those forms of softening of the bones which are attended with organic changes in their structure, and accompanied with great constitutional derangements. There are two forms of disease attended with softening of the bones—namely, rachitis and mollities ossium. Rickets is a disease affecting children at an early age, most commonly occurring between the first, or second and sixth years. It interferes with the development of the osseous fabric, and generally occasions a disproportion in the relative dimensions of the several bones of the skeleton. According to Guérin, this disease is more common in the female than in the male sex. Out of 346 cases, 198 were females, and 148 males; of these, 176 were attacked in the second year of their age. The actual degrees of retardation in the dimensions of most of the segments of the skeleton have been measured by both Guérin and Mr. Alexander Shaw, and they both agree that the retardation is greatest in the lower extremities.

In most cases the bones of the lower extremities are first attacked, the disease then extends to the pelvis, from thence to the rest of the trunk, and, finally, pervades the whole of the skeleton. More frequently, however, the disease is confined to certain bones, and the rest of the skeleton remains comparatively free. When the disease is of a mild description, the lower extremities and the metacarpal bones are those chiefly affected; the texture of the bones affected becomes sensibly changed, the Haversian canals and cells are enlarged, the cells of the spongy bone and the medullary canals become distended, and their walls are broken down and contribute to the formation of larger cavities. In process of time, the medullary cavities are expanded to enlarged areas, and the bones become soft and easily broken. According to Rokitsansky, a pale yellowish-red jelly is effused into the canals, cells, and medullary cavities, and also penetrates beneath the periosteum. The inorganic constituents of the bones partially disappear, and the bone is reduced almost to its organic elements. The bone corpuscles are found empty, and their canaliculi disappear. In the lamellar structure, the lamellæ become partially obliterated, and between the remaining layers their vacant places may be easily seen under the microscope, the cavities being occupied only with occasional corpuscles which have fallen asunder. The bones in rickets become highly vascular, and the vessels gorged with blood, which is of a darker colour than natural. The periosteum also is more vascular than natural, and turbid; and it adheres to the bone so firmly that it cannot be torn from its surface without bringing away with it also a layer of the expanded spongy tissue. There is always found a considerable reduction of the inorganic constituents of the bones, as may be seen in the chemical relations in the table\*, so that the bones are become soft and pliable, and have not sufficient strength to resist the action of the muscles. The tibia and fibula give way under the weight of the body, and curve in different planes; this is commonly the mechanical effect even in the milder cases of this disease; but in the more aggravated forms the pelvis is contracted, the vertebral column and ribs are distorted, and the figure of the thorax is what is called pigeon-breasted. The disorganization of the bones most affected is so great that they never entirely recover their normal texture; but they may, however, in some degree recover their texture and form by the reabsorption of matter

diffused into their cavities, and by the subsidence of the swelling of the bone; or the cure may be otherwise effected by the matter in the bones becoming firm, increasing in hardness, and at last ossifying. In the latter case, the bones remain hypertrophied, and become exceedingly dense and hard; the Haversian canals are contracted chiefly on the concave side of the curves, and the bones at these parts become not only hard, but elastic. It is at this juncture that the bones should be brought into their normal position—that is, before they become hard and elastic; otherwise they remain distorted through life, for the reasons that have been already explained. It might be easily supposed that a disease which produces such destructive changes in the osseous system cannot exist without great constitutional derangement. The pain, however, is not so great as might be expected from the degree of mischief inflicted.

According to Guérin, the time occupied in the incubation of rickets is about six months, during which a marked train of deranged action manifests itself. Many of these actions are common to other diseases; but some are peculiar, and determine the specific character of the complaint. The most ordinary symptoms are—gastro-intestinal irritation, accompanied with diarrhoea, enlarged abdomen, nocturnal sweats, mental depression, irritability of temper, weakness and emaciation of the muscular system, low febrile irritation, swellings of the bones of the extremities; the urine is loaded with the earthy phosphates; the countenance is pale; the face is attenuated, giving the appearance of increased age; the eyelids are usually wide open, the eyes brilliant, and with a lively expression; the nostrils are dilated; the lips kept apart; the skin is generally pale, and in some parts of a violet hue; the respiratory and circulating movements are accelerated; the appetite is feeble, and the digestion difficult. Such is the catalogue of constitutional derangements which accompany the organic changes in the bones already described.

The medical treatment of rickets is a subject of great interest, and it requires all the talents of the pathologist, and great tact in therapeutics, to arrest the progress of the disease, and bring the case to a successful issue; but with judicious treatment this complaint does not usually terminate fatally.

The other form of softening of the bones—namely, osteomalacia, or mollities ossium—occurs at an adult period of life, and frequently at very advanced age. This disease differs from rickets with respect to the effects produced on the bones, and also (according to the present state of our knowledge) with regard to the susceptibility of cure. It is also, fortunately, compared with the frequency of rickets, a very rare disease. It attacks chiefly the bones of the trunk, leaving the rest of the skeleton comparatively free, and happens to invalids already bed-ridden, which circumstance tends to give rise to the distortions peculiar to this complaint. When the bones of the extremities or of the skull are affected, they do not suffer so much as the trunk. It occurs more frequently in the female than in the male sex, and is often associated with cancer.

The effect of this disease on the bones is of the most fatal character, and, besides being malignant, it is very painful. The change in the bones first commences in the laminae, which increase in size; and the bones around them become more transparent, and finally, several laminae unite and form one cavity. However, this cavity does not long remain empty, but (according to Professor Quekett) becomes filled up with a kind of soft adipose tissue, so that the bones are found attenuated, and full of fat. From this latter ultimate condition, the disease has been classed with those of fatty degenerations. In other cases, the absorption of the earthy matter is so great that the bones are reduced almost to their cartilaginous state; they become flexible and often brittle, and may be easily cut with a knife.

Independently of the substitution of fat for osseous tissue, in mollities ossium, there are sometimes found imbedded in the deposit peculiar nucleated cells, which are probably malignant. The distortion of the skeleton in these cases often becomes of the most irremediable and frightful description. The pathological state of the body that produces these effects on the bones does not appear to have been very accurately described, or even investigated; but the case detailed by Dr. Benoe Jones shows that the kidneys secreted a large amount of the earthy phosphates, together with 66·97 in 1000 parts of a peculiar substance, which was found by ultimate analysis to consist of a hydrated deuteroxide of albumen; and hence Dr. Jones concludes that, as far as the albumen is concerned, each ounce of urine was equivalent to an ounce of blood lost. On examination after death, the kidneys were found healthy, nor could any structural derangement be discovered by the microscope. Dr. Jones recommends that this substance should be again sought for in acute cases of mollities ossium; and also if chlorine be present in the urine, of which there was a suspicion in this case, as he thinks that it might lead not only to the explanation of the formation of the albuminous substance, but also to the comprehension of the nature of the disease by which the bones are thus affected. Lehmann imagines that the deposition of fat in the bones is an effort of the *vis medicatrix nature* to impart some matter to supply the place of that which has been removed by the disease.

In the case examined by Dalrymple, he states that the quantity of matter deposited in the lumbar vertebrae was not equal to that removed by absorption, and that the thickness of the bodies scarcely exceeded that of the inter-vertebral substance; and these vertebrae had lost nearly one-third of their normal bulk. It would appear from the morbid anatomy of the specimens of the bones affected with this disease preserved in this country, and from the researches of Rokitsansky, that the deposition of fat in the bones is most common in England, and the degeneration of the bones to a cartilaginous state in France and Germany; and that, while the disease in the former country affects chiefly the extremities, in the latter it may affect the whole or any part of the skeleton.

The next subject to which I propose to engage your attention, is that of ulceration of bone. We find that the substance of bones, like that of the soft parts, is liable to ulcerate, and this, indeed, is a very common form of disease to which the osseous system is liable. The most familiar example of ulceration of bone is that of caries. This may follow from a simple inflammatory state of the osseous tissues, arising from blows or shocks of the system, but it is more frequently the result of some taint of the constitution, such as scrofula, or syphilis. Sometimes caries is associated with morbid growths of a malignant character, such as tubercle or cancer. Caries is most commonly situated at the surface of bones, and attacks the compact tissue; but at other times it commences in the interior of the bone, and in the medullary portion. It may affect only a small portion of a bone, or the whole extent, such as the bodies of one or several of the vertebrae, or the tarsal or carpal bones, or that of a whole finger or toe. It sometimes presents a circumscribed spot on the shaft of a long bone, or on the superficies of the bones of the head; in fact, there are no bones in the skeleton exempt from liability to the attacks of caries. The bones, in a state of ulceration, present many different aspects, depending on the cause and the state of the constitution under which it is produced; and the treatment must be governed in a great measure by the constitutional affection which gives origin to the disease, as it is apparent that in syphilis and in scrofulous affections the treatment will correspond accordingly. When the caries is seated in the compact tissue, the bone is found covered with an ichor, and presents a rough and irregular surface; this aspect is produced by the unequal action of the disease on the parts affected; the Haversian canals become enlarged, and the surrounding parts disorganized and infiltrated with ichor; granulations of a spongy texture, which easily bleed, are generated from them; these granulations advance outwards on the rough surface of the bone, and internally they, in a greater or less extent, fill up the expanded Haversian canals. The bone in these cases becomes porous and discoloured, presenting various tints of red, from the colour of the granulations. When the cancellous tissue is the seat of the affection, the bone becomes of a red colour, soft, and brittle, or it may be easily cut with a knife, or yield to the pressure of the finger, and finally the bone becomes swollen, especially when the spongy bone is implicated, in consequence of the walls giving way to the pressure within. In the carious state of the internal portion of the bone, during the inflammation of the Haversian canals, a sanious product is effused, which causes a partial solution and loss of the osseous

tissue; the canals are enlarged in every direction, and become filled with secreted matter, which, according to Delpsch and several others, is composed of a peculiar fatty matter; but, according to Mouret, the gelatinous portion does not disappear, and this seems to be confirmed by chemical analysis.

*Proportions of Inorganic and Organic Constituents in Caries.*

In this analysis of the bones in caries, it will be seen that there is an absorption, principally of inorganic matter, and that in some bones it is even less than that of the organic, so that they become compressible and inelastic; and hence the distortions which this disease may occasion. The acrid fatty matter is variously tinted, and will, as we know, blacken both silver probes and linen. It also contains small particles of bone, which are doubtless minute portions of the bone in a necrosed state, for in all forms of caries very minute particles of bone successively die, and are thrown off. Hence, by examining the pus, we can always form a diagnosis as to whether the bone is or is not in a state of ulceration by the presence or absence of bony particles. When macerated and dried, the carious bone is rough, and appears as if corroded and worm-eaten, the cells of the cancellous structure are enlarged, or its walls demolished, and the bone becomes lighter than natural, discoloured, expanded, and brittle. In some cases, the neighbouring bones are porous and hypertrophied, but terminating in atrophy of the bone. After the destructive process in caries has proceeded to a greater or less extent, the diseased state is changed into a healthy, suppurating, and granulating process. The deposition of new bone, however, is very limited, and, in the vertebrae, the loss of almost the entire bodies may result; and, indeed, when they are once destroyed they appear to be never entirely reproduced, as some orthopaedic authors have asserted, and great and incurable deformities of the body succeed. While the disease is going on, the surrounding soft parts are more or less inflamed, and the periosteum and ligamentous tissues adjoining are necessarily involved in the affection. The mode by which the ulcer of bone finds an opening externally is sometimes by a large abscess in the vicinity of the ulcer, sometimes by a tortuous fistulous opening at a considerable distance from the seat of the disease. When the pus is thrown off from the lumbar vertebrae in caries, it very frequently gravitates down into the thigh, below Poupart's ligament, where it forms a sac, which is well known under the term "psoas abscess;" sometimes the matter collects immediately under the femoral artery, and pushes the artery outwards, so that in placing the finger on the tumour, it is found to pulsate, and may be mistaken for aneurism. A correct diagnosis, however, may be obtained by ascertaining that the pulsation is not diffused over the surface of the tumour, but remains restricted to the line of the artery. There are always more or less constitutional derangements associated with caries. When the latter is occasioned by blows, or other extraneous causes, the constitutional disturbance will be sympathetic; on the contrary, when the disease in the bones is the result (instead of cause) of a pathological state of the system, the constitutional derangements are not only sympathetic, but primary. The predisposing conditions of the system such as those infected with scrofulous and syphilitic taints, which result in caries, are the most common, and are generally the most tractable when taken in time, and if appropriate treatment be applied; but why the bones should be selected to suffer in the manner they do, is not at present intelligible. But when the constitution is delicate, and the patient has not the means of obtaining those changes of air, diet, and medicine required, they frequently sink from the profuse discharge and exhaustion of the vital powers of the system. However, the constitutional derangements in caries are very different in various individuals, and the degree of irritation seems not always to depend on the amount of the loss of osseous tissue by the disease, inasmuch as in some

persons a very small speck on a bone will give rise to great constitutional irritation and death, while in others, nearly the whole of the body of one or more vertebrae may be sloughed away without endangering the life of the individual.

It would be superfluous in these lectures to enter minutely into the details of the constitutional treatment of caries, when the nature of the taint in the constitution has been thoroughly understood, as that would lead to all that belongs to the pathology and treatment of syphilis, scrofula, and other predisposing affections; and it is necessary only to mention the great value of the mercurial and iodine salts in the constitutional taints to which I have just referred. Since the promulgation of the views of Lugol, on the influence of iodine in scrofula, I can bear testimony, from many years' experience, of the special value of combinations of iodine and iron in diseases of the bones when associated with a scrofulous constitution.

With regard to the surgical treatment of caries, it must be borne in mind, that the disease in the bones always begins in an inflammatory condition of its texture, and it may be either acute or chronic, but it is very frequently of a chronic character, of such a low type that the disease often runs into a state of ulceration before much attention is given to it by the patient; and in this case there is frequently so much delicacy of constitution as to forbid any depletory measures, and the issues, setons, moxas, cauteries, and blisters applied as counter-irritants over the parts affected, in many of these cases fail to produce the great relief expected from them. Still, in some cases they are said to be instrumental to the cure. In caries, (especially of the vertebral column,) rest is absolutely requisite, and pressure on the bones affected should, as much as possible, be removed; for this purpose, triple, inclined and prone planes, water and spring beds, and other mechanical apparatus, have been provided. Having already published my views of the comparative merits of these contrivances, it will be unnecessary at present to call your attention to that subject.

With regard to the treatment of abscesses which are formed in cases of caries of the bones, much difference of opinion has prevailed. The question is, after the disease has been cured, whether an abscess, such as a psoas abscess, should be left to the efforts of nature, or be made the subject of surgical treatment. Sometimes the pus disappears spontaneously by absorption; at other times it will remain for several years without giving rise to any mischief. Occasionally the walls of the abscess give way, and the contents are discharged, and do not again accumulate; in other cases, the pus becomes, after a time, converted into fat. Dupuytren and many other surgeons maintain that it is highly dangerous to open abscesses resulting from caries, and that "it is preferable to leave them to nature, whether the caries yield to treatment or not." Mr. Abernethy and others, again, have recommended opening the abscess by a lancet, and healing the wound by the first intention immediately after having discharged the matter. It is always important to ascertain whether the disease in the vertebrae is still making progress or not, (which may be done in the manner already explained,) as it is obvious that the abscess would require being repeatedly opened as long as the ulceration of the bone continues; but as long as the presence of the matter is productive of no constitutional irritation, it may perhaps be much better to let it alone, from the consideration that it has frequently happened that the health of patients has rapidly changed for the worse immediately after the operation.

## OBSERVATIONS ON THE TREATMENT OF CHOLERA.

By GEORGE ALLEN, Esq., L.S.A.

DISTRICT SURGEON OF ST. ANN'S, SOHO.

IN bringing before the profession the result of my experience in the treatment of the present epidemic, as district surgeon of St. Ann's parish, where the plague seemed for a season to have concentrated its most deadly virus, I feel I am merely performing a public duty, the omission of which would be highly censurable. In the present paper I make no pretence to originality whatever. The treatment of cholera by mercury was, I believe, that which in 1832 obtained the greatest confidence of the profession, and has since been ably and successfully practised by Dr. Ayre and others. If I am not mistaken, it is that which every day's experience will prove to be alone worthy of that confidence, and to be the sole remedy upon which, when properly and regularly administered, we can depend for the salvation of our patients. Upon my appointment as one of the district surgeons of St. Ann's, I had no

prejudice in favour of any one line of treatment, and in my first two cases employed the sulphuric acid, both of which terminated fatally. I then vigorously adopted the calomel treatment, the result of which the statistical table on the two next pages will prove, the details being faithfully copied from my case-book, and the greater number of the cases having been visited with me by my friend, Dr. John James M'Gregor, a gentleman who has had great opportunities of seeing the disease both at home and in India.

Having now given the profession a faithful report of my treatment of cholera, with the result, I shall add a few practical observations which occur to my mind, one or two of which I have not seen in authors on the subject. Out of thirty cases of cholera, I had twelve deaths, two of which were treated by the sulphuric acid, which leave but ten treated by mercury. One aborted, and sunk immediately after delivery. One was convalescent, but was destroyed by repeated doses of brandy, administered by a drunken father. Another sunk from having no attendant but a drunken nurse. One was exposed, during collapse, to the draught caused by an open window and door, and another was drenched with chilled water by a hydropathist. I found in one of the fatal cases, that the medicine was improperly mixed with water, the calomel adhering to the sides of the vessel; so that, fairly speaking, I could trace six of the ten deaths to incidental circumstances. I remarked those cases made the best recoveries where no stimulants were given; and during convalescence, when the cholera had disappeared, there was in almost every case sub-acute gastritis, whether arising from the mercury, stimulants given, or the disease itself, I cannot pretend to say, but this complication readily yielded to blisters and iced water. In conclusion, I can say with truth, that from the result of my experience I consider collapsed cholera, if seen by the medical man in time, and if his instructions are rigorously carried out, a very manageable, and by no means fatal, disease. In few instances did the calomel fail, when administered in two grain doses at short intervals, to produce reaction, by diminishing the evacuations, promoting perspiration, causing the kidneys to resume their functions, and, in fact, restore the general harmony of the system. The greatest caution should be observed in permitting the patient to return to solid food, one of my patients having nearly fallen a victim to his imprudence in this respect.

Soho, October, 1854.

## ON THE

## TREATMENT OF DISEASE BY BLOODLETTING.

By JOHN LANGLEY, Esq.

(Concluded from page 208.)

THE following case, in reference to diagnostic symptoms, bears a strong analogy to Case No. 1, and in order to abridge the narrative, I shall give a brief but faithful summary of the treatment I adopted for six weeks prior to his having been unceremoniously, and without the usual gentlemanly etiquette, taken out of my hands, and placed under the care of Dr. Watson; and, forsooth, because his friends thought that my having taken from my patient 160 ounces of blood in three weeks, I must, with *malice prepense*, have a design upon his life, which they were determined to frustrate by removing him from me who, by the by, had implicit confidence in me himself, I having been his family medical attendant for nearly twenty years:—

CASE 2.—Mr. W. B—, of Holles-street, Cavendish-square, suffering from a distressing sensation in the head, which he very emphatically called a "boaty feel," applied to me for advice. Upon examining the case, and from his general plethoric appearance, I bled him largely from day to day, generally with some relief, but not such as to give him any comfortable freedom from his "old-boaty feel," as he invariably called it. These bleedings I repeated more or less until the aggregate amount reached the extent of 160 ounces, which so alarmed his friends that they insisted upon his consulting Dr. Watson, to whom he and his friends, in a truly lachrymose manner, described how I had starved and bled him; in fact, that I had quite "out-Sangradoed Sangrado," describing, at the same time, the "old-boaty feel," and other symptoms of so-called nervous irritation, which condition, although having existed previously to his having lost one ounce of blood, Dr. Watson attributed to my treatment, and resulting from the debility caused by the great loss of blood, and advised the patient to live generously, and take some wine, at the same time prescribing quinine in combination with steel. This confirmed the opinion his friends had formed of my violent proceedings, and condemned me in

TABLE OF CHOLERA CASES.

No.	NAME, &c.	AGE.	STAGES OF DISEASE.	WHEN FIRST SEEN.	RECOVERY.	DEATH.	TREATMENT AND REMARKS.
1	H. B., Wardour-street	23	Coll., Cholera	Sept. 1, 5 P.M.	...	Sept. 2	Dilute sulphuric acid, 1 drachm doses every half-hour for 8 hours; chloride of mercury, 5 gr., every half-hour afterwards for 6 hours.
2	S. I., St Ann's-ct.	20	Cholera ..... Collapse ...	Sept. 2, 9 P.M. ,, 3, 6 A.M.	...	Sept. 2	Dilute sulphuric acid, 1 drachm every half-hour.
3	B., Mrs., Poland-st.	55	Cholera ..... Collapse ... Fever and } Gastritis }	Sept. 1, 6 P.M. ,, 1, 11 P.M. ,, 3, 9 A.M.	Sept. 21	...	Chloride of mercury, 2 gr., every 10 minutes for 4 hours, every half-hour for 12 hours, every hour for 12 hours; salines, blisters, ice, and tonics. Brandy and water was given to this patient whilst in a collapsed stage, contrary to orders, consequently the gastritis was very severe.
4	P. M., Gt. Chapel-street	9	Coll., Cholera Fever and } Gastritis }	Sept. 2, 2 A.M. ,, 3, 10 A.M.	Sept. 12	...	Chloride of mercury, 1 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; salines, castor oil, and tonics.
5	G., Mrs., Berwick-street	72	Cholera ..... Collapse ... Fever and } Gastritis }	Sept. 2, 1 P.M. ,, 2, 3 P.M. ,, 3, 9 P.M.	Sept. 15	...	Chloride of mercury, 2 gr., every ten minutes for 3 hours, every half-hour for 12 hours; salines, blisters, ice, tonics, and castor oil.
6	P., Miss, Gt. Chapel-street	19	Coll., Cholera Fever and } Gastritis }	Sept. 3, 5 A.M. ,, 4, 11 A.M.	Sept. 20	...	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; salines, blisters to the epigastrium, ice, and tonics. This patient had mercurial erythema very strongly marked, which a few doses of castor oil removed.
7	K., Miss, Wardour-street	55	Coll., Cholera Fever .....	Sept. 3, 5 A.M. ,, 4, 8 P.M.	...	Sept. 11, 10 A.M.	Chloride of mercury, 2 gr., every 10 minutes for 4 hours, every half-hour for 12 hours, every hour for 12 hours; salines, with stimulants, blisters to the epigastrium, and ice. This patient appeared to sink from the fever (being of a most typhoid character) and a determination not to take any nourishment.
8	S. R., Dean-st.	15	Cholera ..... Collapse ... Fever .....	Sept. 3, 10 P.M. ,, 4, 6 A.M. ,, 5, 8 A.M.	Sept. 14	...	Chloride of mercury, 1 gr., every ten minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; salines, ice, castor oil, and tonics.
9	A., Mrs., St. Ann's-court	49	Cholera ..... Collapse ... Fever and } Gastritis }	Sept. 4, 6 P.M. ,, 4, 10 P.M. ,, 5, 8 P.M.	Sept. 24	...	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; salines, blisters to the epigastrium, and tonics. This patient, having naturally a debilitated constitution, has made a slow recovery.
10	B. H., Little Chapel-st.	38	Coll., Cholera Fever and } Gastritis }	Sept. 4, 6 P.M. ,, 5, 10 P.M.	Sept. 14	...	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; salines, blisters to the epigastrium, ice, and tonics.
11	P. G., Hollen-st.	35	Cholera ..... Fever .....	Sept. 4, 10 P.M. ,, 6, 8 A.M.	Sept. 9	...	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; salines, castor oil, and tonics. This patient made a rapid recovery, consequent upon his taking no stimulants during cholera.
12	C. E., St. Ann's-court	13	Coll., Cholera Fever .....	Sept. 4, 11 A.M. ,, 5, 10 P.M.	Sept. 10	...	Chloride of mercury, 1 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; effervescent salines, castor oil, tonics during convalescence.
13	E. G., L. Chapel-st.	24	Coll., Cholera	Sept. 5, 1 A.M.	...	Sept. 5, 10 A.M.	Chloride of mercury, 1 gr., every 10 minutes for 3 hours, and every half-hour till death.
14	H. E., Wardour-street	2	Coll., Cholera Fever .....	Sept. 5, 11 A.M. ,, 6, 5 P.M.	...	Sept. 8, 3 P.M.	Chloride of mercury, 1 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; salines on Sept. 7th. This child was exposed in a state of nudity to the draught of an open window and door.
15	W. M., Gt. Chapel-street	3	Coll., Cholera Fever .....	Sept. 6, 10 A.M. ,, 7, 8 P.M.	...	Sept. 11	Chloride of mercury, 1 gr., every 10 minutes for 3 hours, every half-hour for 6 hours, every hour for 6 hours; salines. This patient was apparently dead when first seen, and had recovered, when her father gave her a teaspoonful of brandy every half-hour, which brought about the fatal result.

TABLE—(Continued.)

No.	NAME, &c.	AGE.	STAGES OF DISEASE.	WHEN FIRST SEEN.	RECOVERY.	DEATH.	TREATMENT AND REMARKS.
16	B. Mr., Dean-st.	49	Cholera ..... Fever and } Gastritis }	Sept. 6, 9 P.M. " 8, 8 A.M.	Sept. 23	...	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; salines, blisters to the epigastrium, ice, and tonics. This patient was near sinking from fever of a typhoid character, and a determination not to take proper nourishment.
17	G. S. I., St. Ann's- court	49	Coll., Cholera Fever and } Gastritis } Comatose ...	Sept. 7 " 9 " 11	...	Sept. 13	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; blisters to the epigastrium, effervescing salines, ice, tonics, and stimulants. This patient had been living a very irregular life for 3 months previously.
18	D. J., Little Chapel-st.	5	Cholera ..... Fever (slight)	Sept. 7 " 8	Sept. 9	...	Chloride of mercury, 1 gr., every 10 minutes for 3 hours, every half-hour for 6 hours, every hour for 12 hours; salines. This child was running about on the following day.
19	J. E., St. Ann's-ct.	5	Coll., Cholera Fever (slight)	Sept. 7 " 8	Sept. 10	...	Chloride of mercury, 1 gr., every 10 minutes for 3 hours, every half-hour for 6 hours, every hour for 12 hours; salines.
20	S. H., Hollen-st.	28	Cholera ..... Fever and } Gastritis }	Sept. 7 " 8	Sept. 18	...	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; salines, ice. On the 10th, sitting up, and imprudently partook of about 3 oz. of mutton. A relapse of all the cholera symptoms by ten o'clock in the evening,—rice-water evacuations, cramps, &c. Returned to mercurial treatment as before for 24 hours, when gastritis supervened of a more serious character; blisters to the epigastrium on Sept. 12th; ice, salines, and tonics.
21	H. R., Little Chapel-st.	50	Cholera ..... Fever and } Gastritis }	Sept. 7, 9 P.M. " 9, 7 A.M.	Sept. 20	...	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; salines, blisters to the epigastrium, ice, and tonics. This patient had afterwards a very severe attack of gout.
22	H. R., St. Ann's- court	66	Coll., Cholera	Sept. 8, 9 P.M.	...	Sept. 9, 9 A.M.	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 8 hours. This patient lived in a back cellar, 8 feet square, and was attended by a drunken nurse.
23	A. W., St. Ann's- court	40	Coll., Cholera	Sept. 9, 3 A.M.	...	Sept. 9	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 9 hours. Reaction had just commenced, when some interfering friend brought in a hydro-homœopathic doctor, who had him stripped in the draught of an open window and door, and washed with chilled water. He died shortly afterwards.
24	F. J., St. Ann's- court	35	Cholera ..... Fever (slight)	Sept. 9, 9 P.M. " 11, 11 A.M.	Sept. 17	...	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; salines, ice, castor oil, and tonics.
25	C. E., St. Ann's- court	45	Cholera ..... Collapse ... Fever .....	Sept. 9, 11 P.M. " 9, 12 P.M. " 11, 11 A.M.	...	Sept. 15	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; salines, ice, castor oil, and stimulants. She aborted on Sept. 14th, 7 P.M. The fever of this patient was of a most typhoid character.
26	L. T., St. Ann's- court	45	Coll., Cholera	Sept. 10, 10 A.M.	...	Sept. 10, 4 P.M.	Chloride of mercury, 2 gr., every 10 minutes for 4 hours, every half-hour till death. This patient was only attended by his wife, who had two children at the same time lying down in cholera, and one in diarrhoea.
27	R. E., Gt. Chapel- street	4½	Cholera .....	Sept. 11, 1 A.M.	Sept. 13	...	Chloride of mercury, 1 gr., every 10 minutes for 3 hours, every half-hour for 6 hours, every hour for 6 hours; salines.
28	M. M., St. Ann's- court	57	Coll., Cholera	Sept. 11, 3 A.M.	...	Sept. 11, 10 A.M.	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 5 hours. But, on visiting this patient at 9 o'clock A.M., I found nearly all the mercury in a wine-glass, the powders having been mixed with water; consequently she took nothing up to an hour of her death.
29	H. J., Little Chapel-st.	44	Coll., Cholera Fever and } Gastritis }	Sept. 18, 2 A.M. " 20, 11 A.M.	Sept. 25	...	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for 12 hours, every hour for 12 hours; salines, no stimulants, castor oil. This patient had very slight fever and gastritis.
30	G. M., St. Ann's- court	20	Cholera .....	Sept. 18, 10 A.M.	Sept. 23	...	Chloride of mercury, 2 gr., every 10 minutes for 3 hours, every half-hour for six hours, every hour for six hours. No stimulants of any kind were given to this patient; she recovered with scarcely any fever or gastritis.

their estimation and that of my patient, who went on "his way rejoicing" in the change. But, alas! his serenity was not of long duration. In three or four days he became much worse, his "boaty feeling" so far increased as to prostrate him on the ground. He again visited Dr. Watson, who not quite persisting in his former opinion, thought some advantage might be obtained by taking away some blood locally, and ordered him to lose fourteen ounces by cupping, which Mr. Betts soon abstracted from the nucha, Dr. Watson at the same time substituting saline febrifuge medicines for the ferrous sulphate of quinine, with active aperients. But neither the cupping nor medicine warded off the crisis the generous diet and steel had promoted, for a few nights afterwards he had an apoplectic fit in his bed, to which I was summoned; and to which, after the treatment I had experienced, I reluctantly went, and saved his life, by bleeding to the extent of fifty ounces, when the stertor ceased, the convulsive restlessness was subdued, and perfect consciousness succeeded the usual semi-sensitive state attending such attacks. With very little medical treatment and careful diet he soon recovered, and resumed his usual active pursuits in business; and, I am happy to have lately heard, has continued in good health ever since.

I feel much gratification in giving this case thus fully to the professional world, as it so strongly and irrefutably shows how unjustly a *valuable measure* is condemned from lack of experience in its importance; when I think every candid and impartial reader, not pinning his faith upon a Dickson, or any such doctrinarian, but thinks for himself, reads over and over again this case, and asks himself the two following questions:—What harm did the abstraction of 224\* ounces inflict upon the future state of this gentleman? also, What treatment saved his life?—will have no doubt upon this question.

The two following cases of inflammatory neuralgia, if I may be allowed the expression, I think clearly prove the truth of my theory in reference to the cause of pain generally, viz., that it depends upon an irritable and painful condition of the nerves, never existing *per se*, but caused by the pressure of contiguous over-distended bloodvessels from repletion or hypertrophied tissues or membranes adjacent to such nerves or nervous filaments, and which (inverting the order of one of Cullen's signs of inflammation) accounts for the *dolor cum tumore* in inflammatory congested conditions of any external or internal organ or parts of organs, or of any of the constituents of the body into which bloodvessels enter. We all know from experience the acute torture from the slightest pressure of any substance, even æriform, as when we gently inhale a breath of air, over a denuded dental nerve. I believe the vague terms of muscular, nervous, rheumatic, &c. &c., are all involved in this one condition of nervous oppression.

CASE 3.—Mr. S—, of Upper Charlotte-street, Portland-place, having been long, unavailing, under several medical gentlemen, applied to me early in 1853, in consequence of severe pain in the lumbar region, extending into the glutei muscles and the hips, involving a most painful condition of the sciatic nerves; in the inguinal fossæ, also, down the thighs into the knees, a rigid, painful state of the gastronomic muscles and ligaments of the ankles, giving him in walking excessive pain, and depriving him of the power of raising himself from his seat without much difficulty and excessive pain: his nights were also generally painful and sleepless, unless under the influence of morphia. Having relieved minor affections of this kind, commonly called rheumatic, by modified bloodlettings, I proposed to bleed him, and abstracted from him fifty ounces of blood, he sitting erect the whole time, *not the slightest tendency to syncope* supervened, and he declared, "He should not have known he had been bled if he had not witnessed the operation;" he gradually recovered in a short time, is perfectly free from any kind of lameness, has thrown off his hobbling, crippled gait, and moves now in his active avocations, freely and painlessly. I only gave him, in addition, a little purgative medicine, and enjoined abstemious diet. He is at the present time in excellent health, and would be happy to confirm this statement to any sceptic.†

\* This amount includes the fourteen ounces ordered by Dr. Watson.

† The sarcasm and professional persecution I experience on account of my honest and unflinching avowal of my practice, little inferior to the persecution of the great man who discovered the circulating course of the important fluid, the foundation and preservation of life in normal action and quantity, cannot be better elucidated than by the following:—The gentleman the subject of this paper was met some time back by a surgeon whose patient he had formerly been, who expressed himself astonished at the miraculous change wrought in his condition, and inquired,—"How came it about?"—when Mr. S— told him a friend recommended him to a gentleman of the name of Langley. "I know Mr. Langley well, what did he do for you? did he bleed, for that?"—"Yes, he did; he took fifty ounces of blood from me at one time."—"Good God! were you not faint? very ill and weak after it?"

CASE 4.—Mr. S—, a livery stable-keeper in Albany-street, applied to me about four months since, under the following condition of suffering:—He had been afflicted for some months previously, with varying intensity, in the following manner—a most painful sciatic affection, the pain extending all around the hip into the upper part of the thigh, with deep-seated pain in the iliac fossæ, greatly impeding the separation of his thighs, the act being also accompanied with excruciating pain. He was for the last month unable to lie down or arise without suffering torture, and when having sat down, compelled to remain *statu quo* until assisted, when he suffered equal agony. I considered it a case of sciatica, with some painful condition of the obturator nerve, and extensive rheumatic inflammation. Previous to my seeing him, colchicum, carbonate of iron, morphia, cajuput oil, and all the usual remedies, were adopted, but without success. I advised bleeding, and took fifty ounces. *Not the least tendency to syncope*. In less than half-an-hour he could move his limbs with much less pain. As he was not in the least prostrated, I renewed the fillet, and abstracted twenty-five ounces more. Both quantities being weighed netted seventy-five ounces. *Still no syncope*. Could get in and out of bed this night without pain. Could sit down and raise himself without pain, which he did in the presence of a friend of mine the same night. Walked to Piccadilly and back the following day, and is now in better health than he has been for years. What is *tic douloureux* but the same affection *alteri loco*?

The following cases show the unequivocal value of bloodletting in gouty diathesis—a condition in which it is pertinaciously repudiated:—

CASE 5.—George E—, Buckingham-street, Fitzroy-square, had been occasionally subject to gout for a long period, and, after some recent annoying attacks, was seized with intense pain of the great toe, with considerable swelling and fiery redness, extending over the instep, with the usual podagral, shiny surface. He had considerable fever. I bled him to fifty ounces. He fainted. On recovery from the syncope, the pain had subsided; he could bear considerable pressure without pain; the redness disappeared, and the swelling gradually subsided in the course of twelve hours, since which period, now upwards of six years, he has not experienced the slightest tendency to relapse.

CASE 6.—Mr. H—, Southampton-street, Fitzroy-square, had a severe attack of gout in September, 1850. Every symptom yielded to one bleeding of forty ounces in twenty-four hours.

These are not isolated cases, and I think it worthy of remark and consideration that in these cases the treatment is so simple and uncomplicated with drug remedy, that it is impossible to ascribe the benefit to any other cause than the depletion, giving the sceptic no room to quibble as to which cause to attribute the favourable result. I have some most important cases, showing how the fatal progress in advanced stages of phthisis pulmonalis, recognised by the first medical talent in London, have been arrested, and are still kept in abeyance, by frequent bleedings, resorted to whenever a certain boundary of healthy vascular action or repletion is exceeded,—when a recurrence of hæmoptysis and purulent expectoration supervenes, but is immediately arrested by timely depletion; and one case in particular, where an accidental pleurisy, occurring from cold taken from a tedious stethoscopic examination, when the pain became so dreadful upon inspiration, that I bled on three successive days, and had the happiness to witness not only a remission of the pleuritic inflammation, but also of the physical signs of consumption, and this after the prognosis of Dr. Theophilus Thompson, Dr. Walshe, and Dr. Thomas Davies, that her pulmonary disease was so far advanced she would not live a week. This lady is now alive, enjoying tolerable health, perhaps as delicate in appearance as any in London; yet such is the congested condition of her lungs, and

"Not in the least," was the reply. "Well, bleeding is now quite out of fashion." "I am sorry it should be, and hope it will be soon revived; it is the only thing that did me the best good, and no doubt would have the same effect upon all similar cases." "But, did he do nothing else but bleed you?" "Only gave me a few doses of aperient medicines." "Did he not diet you?" "He desired me to eat animal food only three or four days a week." "What did he let you drink?" "I here digressed a little from Mr. Langley's injunction to refrain from fermented or spirituous liquors, and took a weak glass of grog sometimes at bedtime." "You did, did you? Ay, that did it! it was that cured you, not the bleeding. I thought there was something." "But how came it I did not find benefit from this, my usual habit, before I was bled?" "Good morning, I am glad to see you well, good bye," ended this colloquy.

Another professional gentleman in my own immediate neighbourhood, meeting a friend of mine, who told him he was on his way to consult me, said, "Take care! He will be sure to bleed you," making use of what appeared to his little mind a splendid *bon mot*,—"He'll bleed a candlestick." I only say to him, and to other equally liberal minded men, *caveat, nemo me impune lacessit*.

predisposition to inflammatory action, I am compelled, at least four times a year, to take from her at each bleeding an average quantity of twenty ounces. It would afford me the greatest pleasure to present this lady to any gentleman in the profession who may marvel at this extraordinary treatment. I am certain, as are also the lady herself and her husband, that her life has frequently been saved in pulmonary inflammation by these means. This lady kindly saw Dr. Routh, the secretary of the London Medical Society, not one hour after I had taken eighteen ounces of blood from her. Dr. Routh's seeing her was the result of accident, having met him *en passant*; and I wished him particularly to see the case, having been present upon my reading a paper at the London Medical Society upon this important subject.

**CASE 7.**—Captain M——, Great Portland-street, aged sixty-one years. Frequently subject to very severe attacks of gout. For several years previously had a very painful affection of the intercostal muscles, with crampy sensations of the stomach, which Dr. Chambers considered to be a gouty metastasis,\* and prescribed warm aromatic medicine, with opiates and carminative aperients, during which course of treatment he (Captain M——) became so much worse, that during an exacerbation he called me to his assistance. Upon examination of the case, which presented but one leading feature—high inflammatory fever, with severe local pain—I could suggest no other *rational* curative measure than bleeding, the effect of which as a sedative (and the only valuable and permanent one in such cases) seems quite to be overlooked by the profession, or, from want of experience, misunderstood. He was most boisterous in his opposition to bleeding, adding that Dr. Chambers told him never to be bled. His pain, however, became so intense, that he said, "You may cut my head off, if you like." I took away between forty and fifty ounces of blood, and applied a mustard cataplasm, and gave twenty minims of Battley's sedative solution. His pain was greatly diminished in a short time, before the opiate could possibly have taken effect. He slept four consecutive hours. I remained with him, his friends fearing some serious event from the bleeding, which they had been so strongly forewarned against. On the following day he experienced some relapse of pain and stomach spasms. I bled him again from the same orifice to twenty ounces, and gave him one ounce of castor oil. No return of pain; no other medicine than magnesia as an aperient; quite convalescent in ten days, and able to attend his club daily, as his wonted custom. He had not had one single attack of gout more than four or five years after this period, when he called upon me.

Albany-street, January, 1844.

## MEMORANDA RELATIVE TO SOME CEREBRAL AFFECTIONS OF CHILDREN.

By W. HUGHES WILLSHIRE, M.D. Edin.,

FELLOW OF THE ROYAL INFIRMARY FOR CHILDREN, &c.

(Continued from p. 170.)

### No. VII.

*Meningitis occurring in the course of Abdominal and Thoracic Tuberculosis.*—F. C——, a little boy, one year and eleven months old, had suffered from diarrhoea (with occasional intermissions) for several weeks. He was reduced to a state of much exhaustion, the marasmus was great, and he appeared to be labouring under the symptoms of general tuberculosis, or entero-colitis, or of both. Suddenly an attack of convulsions appeared, from which he rallied, passing into a condition of semi-stupor, and continuing in this state for nearly a week, when another attack of convulsions ensued, and death immediately followed. Dr. Westley and myself examined the body, which was extremely emaciated, the integuments, of a dirty-brown colour, hanging in folds and wrinkles about the thighs. The meningeal vessels were much congested, and whitish, alba-

\* I never could reconcile myself to this term, as applied to the migratory character of disease from one locality to another. I think the attack of the same character, in any distant part of the system, far more rationally and consistently referrible to the same cause which produced it in its original situation, than to suppose the consequence of the same disease leaving one part must be its attack of another, or the diminishing its intensity in one point should increase it in another. I have relieved violent podagra inflammations and pain by cold evaporating lotions, always deprecated from fear of producing metastasis—a false induction. I think it might as well be inferred that a poker heated to redness at one pole might have its increased temperature transmitted to the other by plunging the heated extremity into cold water. It is really time these absurd notions should be abrogated. Why should medical science be so far in the background?

minous-like effusion accompanied the course of the larger veins on the convexities; here and there a small quantity of semi-concrete yellowish exudation was observed. There was considerable effusion into the ventricles, (four to five ounces,) and great softening of the central parts of the brain. Much congestion of the vessels at the base existed, and abundance of semi-concrete yellow matter was also present there. In only one or two spots could we find a granular development of the exudation. On opening the abdomen, ample evidence was found of the severity of the general tuberculosis, and also of the entero-colitis. The intestines, as well as the mesenteric glands, were in a state of tuberculosis. The spleen was loaded with yellow matter, which was also deposited in its peritoneal investment. In both the lungs grey granulations existed generally, whilst in the left were some large softening yellow nodules. The bronchial glands were tuberculous. The absence everywhere of adipose tissue was very striking.

E. J——, a girl, two years and three months old, was brought to the Infirmary in June of the present year. "She is of Jewish extraction on the father's side, who lives in a low, damp place near the Waterloo-road. Her sister was a patient at the Infirmary for two years, and died about a month ago of general tuberculosis, enlargement of the liver, and ascites." The mother states that the patient was "well and hearty" until about five weeks back, when "she began to fever," to get thin and weak, and unable to stand. The child now exhibits the symptoms of typhoid remittent, which, considering the external appearance of the patient, (marasmus, long eyelashes, hair on arms, &c.) and the history of her sister, is regarded as dependent on the process of tuberculosis. Under the treatment put in force the child seemed to rally somewhat, and was occasionally carried out and about by her mother, but was usually, as the mother said, "All for laying and sleeping." A fortnight after she brought her to the Infirmary, she took her out with her (Thursday) for the benefit of the air, and, according to the mother's account, was going down the Marsh, when she felt the child hang heavy on her arm. She told her to "hold up," and, turning round to look at her, saw froth and blood coming from her mouth, and her child in convulsions. The latter continued off and on until night, the child then lying quiet and not to be roused; "indeed, there was no moving in her until the Monday after," when she appeared a little better, but it was found she had lost power over her right side; in fact, there was hemiplegia. Under the influence of a blister to the nape of the neck, a purgative, and ammonia, the patient became conscious, putting out her tongue when told. She continued much in the same way, but every now and then shaking or trembling, until Thursday, when another attack of convulsions supervened, and continued for more than an hour. The child again lay quiet and motionless until the next day, when, "after a twist in the mouth," she died quite quietly early in the morning. Mr. Bealey and myself examined the body the next day. The child had been tall for its age, the body was much emaciated, and the capillary development of that character so frequent in tuberculous children. The skull was thin, and not adherent to the dura mater, the meningeal vessels gorged, and much white semi-opaline effusion existed beneath the arachnoid, over the whole of the hemispheric convexities. At the margin of the posterior part of the right hemispheric surface was a slight patch of granular exudation. The brain matter was soft generally, but especially the central portion; there was rather free effusion into the ventricles, the latter were dilated, and the choroid plexus was highly coloured. At the base of the brain but very slight effusion or exudation was present. The cerebellum was rather softer than usual. On opening the chest, the lungs were found loaded with much grey, and a slight amount of yellow, tubercular matter, and the bronchial glands were enlarged by the presence of the latter. No further examination was prosecuted.

Three important stages in the history of "acute hydrocephalus"—as the tuberculous or granular meningitis of modern pathology is still frequently called in this country—may be thus pointed out. First, that stage which extends from, and includes the time of, the actual recognition of the ventricular effusion, and the belief of its constituting the essence of the disorder, or of its being the sole malady; secondly, the period when this doctrine was denied, when the effusion was regarded as of secondary occurrence, or only a consequence of the real disorder, which was believed to be congestion or inflammation of the meninges; thirdly, that stage when the connexion of the cerebral disease with the tuberculous diathesis was pointed out, and in which the opinion was generally entertained that "acute hydrocephalus" was in most instances *meningitis of a tubercular character*. But another step in the

history of this too well-known and lethal malady deserves attention. It dates no further back than 1846 or 1847, and has had perhaps as yet no very great influence on practice, although it may be said that Guersant, several years before, had prepared the way by his so strongly insisting upon the *irregularities* of the disease under consideration. We refer to the time when M. Rilliet, completing his account of the disease, pointed out how it may arise—1st, in connexion with pro-droma of greater or less duration; 2ndly, during the course of confirmed thoracic, abdominal, or general phthisis; and 3rdly, during apparently perfect health, and how such circumstances modify its commencement and progress. This portion of the history of the disease has also been enlarged upon by M. Legendre, and very lately by M. Hahn; and the two cases now recorded are brought forward as illustrative of how different the outbreak and progress of granular meningitis are when occurring during the course of confirmed abdominal or thoracic tuberculosis, to what is witnessed when the cerebral affection occurs under other circumstances. The cases in question aptly illustrate the remarks both of M. Rilliet and M. Hahn. "When," says the former, (*Traité Clin. et Prat.* 2nd ed., tome iii. p. 484.) "the meningitis is developed during the progress of a confirmed chronic or even an acute phthisis, it is only exceptionally that the meningeal symptoms follow the regular course we have described. . . . Most frequently the first period is very short, sometimes even completely wanting, and delirium, coma, some convulsive movements and contracture, open and terminate the scene." "It ordinarily commences," writes M. Hahn, (*De la Meningite Tuberculeuse étudiée au point de Vue Clinique*, p. 35, Paris, 1853,) with headache, vomiting, delirium, and sometimes by an attack of epileptiform convulsions. . . . This first period of the disease scarcely lasts longer than three or four days. . . . The second period continues only a day or two, and passes rapidly into the third, which is announced by convulsions, contracture, and often by the paralysis of one or other member, and is necessarily followed by death." As has been remarked, however, there is nothing very astonishing in the fact, that almost all the cases of meningitis developed during a confirmed phthisis should present an irregular course. It is scarcely difficult to comprehend how the severe derangements of the system accompanying chronic tubercularization should give rise to great disturbances of the characteristic manifestations, sequence, and connexion of the symptoms of meningitis. It is probable also that M. Legendre's views will be more fully admitted than at present, according to whom the variety of meningitis now under consideration should be subdivided according to whether it appears during the course of general chronic tubercularization, of acute tuberculosis of the typhoid form, or in children arrived at the last stage of pulmonary phthisis.

The cases now recorded might (did opportunity permit) open the question as to the *constant* value of typhoid symptoms in children not more than two years of age, and upon which M. Hervieux has expressed some very decided opinions. The subject more particularly belongs, however, to the general history of tuberculosis than to that of cerebral disease.

## A Mirror

### OF THE PRACTICE OF MEDICINE AND SURGERY IN THE HOSPITALS OF LONDON.

Nulla est alia pro certo noscendi via, nisi quam plurimas et morborum et dissectionum historias, tam aliorum proprias, collectas habere et inter se comparare.—MORGAGNI. *De Sed. et Caus. Morb.* lib. 14. Proœmium.

#### ST. THOMAS'S HOSPITAL.

MYELOID TUMOUR DEVELOPED WITHIN THE RAMUS OF THE LEFT LOWER JAW; REMOVAL OF THE WHOLE HALF OF THE INFERIOR MAXILLA; DEATH FROM Erysipelas.

(Under the care of Mr. MACKMURDO.)

OUR object in calling attention to this case is to put upon record one of the exceptional instances, in which the removal of half the lower jaw, for non-malignant disease, was followed by the death of the patient, in spite of the best directed surgical efforts; and also to give publicity to an example of one of

those tumours to which Mr. Paget has given the name of myeloid.

We may well say that death after the above-mentioned operation is exceptional. Let us hear what Mr. Stanley says on the subject in his work "*On the Diseases of the Bones*:"—"Morbid growths from the lower jaw, even when of large size, are usually more favourable for removal than those originating in the upper jaw, their outline and connexions being, in general, better defined; they do not extend indefinitely into the surrounding osseous and soft structures, as the tumours of the upper jaw are apt to do. Accordingly, provided the tumour of the lower jaw does not present features of malignancy, although it may be of great size, and implicates a large portion of the jaw, the removal of the tumour, and of the portion of the bone from which it has arisen, can be effected with the prospect of a satisfactory result. For it is true that operations upon the lower jaw are, in general, followed by a less amount of constitutional disturbance than ordinarily ensues from operations of the same magnitude in other situations. The results of operations of this kind, which have been performed at St. Bartholomew's Hospital, fully agree with this statement; and in seven cases of ablation of half the lower jaw, performed by Mr. Cusack, the patients, with one exception, had in a few weeks completely recovered from the operation. In the unfavourable case, erysipelas ensued, terminating in sero-purulent effusion into the cellular tissue around the larynx and within the glottis.

"It is recorded that Dupuytren removed portions of the lower jaw in eighteen or twenty cases; that in one of these the result was fatal from inflammation extending to the larynx; and that in two others the disease, which was stated to be cancer, recurred at distant periods; but that, with these exceptions, the operations were successful. In one of the cases where I removed the portion of the jaw between its symphysis and ramus, no constitutional disturbance ensued; the whole tract of the wound united by adhesion, and on the eighth day the patient left her bed, and moved about in good health."

As to the importance of the operation and its history, Mr. Stanley says:—"The operation of removing portions of the lower jaw constitutes one of the most remarkable of the achievements of modern surgery. It appears that the first of these operations was performed by Mr. White, at the Westminster Hospital, in the year 1804; but it does not seem that the operation was repeated until the year 1821, when it was performed by Dr. Valentine Mott, of New York."

Let us now turn to Mr. Mackmurdo's case, the notes of which were kindly furnished by Mr. Spencer Edmonds, the dresser of the patient.

John H—, aged twenty-six years, was admitted on the 6th of June, 1854, under the care of Mr. Mackmurdo. The patient is a sofa manufacturer, and first noticed a swelling about the lower part of the left side of the face about nine months before admission, and ascribes it to a carious left lower molar tooth, which for a long time troubled him greatly. After suffering for some time from this tooth, he had it extracted, but the swelling and pain continued, and ever since the former has gradually, but slowly, increased. During its progress, the patient has at times experienced severe gnawing pain in connexion with it, but the pain of late has been but slight. He states that during the last fortnight the swelling has increased with great rapidity. The man is of a nervous temperament; he has previously been once in this hospital, viz., for the fortnight ending May 10th, 1854, when he left in a fright at the idea of an operation.

*Present condition.*—The tumour extends externally from just below the zygomatic arch to near the symphysis of the inferior maxilla; it projects considerably into the cavity of the mouth, where it presents an uneven surface; while externally it is for the most part smooth, and has a firm feel. There is some swelling and tumefaction of the soft parts over the jaw, arising from inflammatory action, and the skin is freely movable over the tumour. To the touch externally, as has been already said, the tumour presents chiefly a firm feel; but in parts distinctly circumscribed fluctuation is detectable. The part which projects internally into the mouth presents several small, irregular cysts, evidently filled with fluid. When first he was admitted, on April 25th, a cyst on the outer, and another on the inner, aspect of the tumour were punctured; fluid escaped, and the probe, passed through either of the apertures, touched bone. The lungs are in good condition; heart, healthy, though excitable.

After consultation with his colleagues, Mr. Mackmurdo determined on excising the left half of the lower jaw, as the non-malignant character of the tumour had previously been determined (as far as possible) by microscopic examination of the

contents of two of the cysts by Mr. Simon. It was argued, that if the tumour was not removed, it would, if it continued to increase as rapidly as it had done during the last fortnight, shortly terminate the man's life, whereas its removal would give him a chance.

On the 10th of June, the operation was performed. Chloroform was administered to the patient while in the ward, and he was conveyed in a state of insensibility into the operating-theatre, where the head was kept elevated. The lower incisor teeth to the left of the mesial line having been removed, an incision was made through the middle of the lower lip to the incurvation of the chin, exposing the inferior maxilla, which was then sawn through at the symphysis. A second large semilunar incision was then made from the termination of the former ones to the front and lower part of the ear. The flap thus made was dissected upwards from the tumour, which was thus completely exposed. The jaw was then seized at the symphysis, and drawn outwards, the textures connected with it being successively divided from the mesial line outwards. Having arrived near the articular extremity, the jaw was disarticulated, and after a few more touches with the knife, entirely separated, leaving, however, a small portion of the coronoid process (which, being weakened from having its osseous tissue diminished and expanded, broke under the influence of the force used) in connexion with the insertion of the temporal muscle, and which subsequently was easily removed in fragments.

During the operation, the patient lost less blood than is usual at such a time. The wound was lightly sponged, and then filled with dry lint, upon which the flap rested, and the man was then carried to bed.

No vessels at this time appeared to require deligation. After the operation, some wine was administered through a tube, in small quantities, and at short intervals. About three hours afterwards, when the patient had rallied, the flap was raised, the lint removed, and five vessels, which now began to bleed freely, were ligatured. The edges of the wound were then retained in apposition, below the lip, by two hare-lip pins, and elsewhere by three sutures. Lastly, several strips of adhesive plaster were used. In the course of the evening, strong beef-tea was carefully administered, but the patient experienced some difficulty in swallowing.—Ten P.M.: He is sleeping soundly.

*Examination of the removed moiety of the jaw.*—The mass of the disease involving the left half of the lower jaw was cystic; though the bulk of the jaw was considerable, there was not much true osseous structure; it was expansion, not super-addition; this expansion was so great about the coronoid process, that the latter broke on removing. There was found much earthy matter, in the form of small, modulated masses, this matter containing many specimens of the cells called myeloid—or marrow-like, and presenting, with some granular matter, many nuclei, varying from two to twenty; these were found in the walls of the cysts.

First day after the operation.—Nine A.M.: Feels tolerably comfortable; no particular pain. To have strong beef-tea frequently.—Three P.M.: The portion of the wound below the lip is uniting nicely by the first intention; the saliva flows from the posterior part; the patient feels comfortable; appetite good; pulse 120. Ordered, strong beef-tea; wine, ten ounces.

Fifth day after the operation.—The part of the lower maxilla which is left keeps in very good apposition with the upper jaw. There is a considerable discharge from the posterior part of the wound; the anterior part has united by the first intention; appetite good; the man takes nourishment through a tube; sleeps well; pulse 100; bowels costive; there is some erysipelatous redness and swelling, extending from the wound upwards to the eye.

Seventh day.—The erysipelatous blush has quite disappeared; discharge considerable; bowels well relieved by an enema administered this morning.

Tenth day.—The redness appeared again yesterday, and to-day has much increased, it runs from the line of incision to the cheek and opposite side of the face; restless last night; pulse 120, feeble; takes the wine and beef-tea. A good deal of discharge from the wound; to-day a large slough was removed from the hinder part; edges look foul; odour very fetid; has been using chloride of soda for some days; with it the mouth is well syringed out; the last ligature was removed yesterday, viz., the ninth day.

Eleventh day.—Erysipelas has not extended, though there is rather more cedema of the structures which it involves; the patient seems lower, and articulates with great difficulty.

Twelfth day.—Passed a better night; pulse 130; not so irritable; erysipelas decreasing; considerable offensive dis-

charge from the wound, both externally and internally. Nine P.M.: Is very delirious at times, frequently attempting to get out of bed; pulse 140, weaker; more irritable. Urine passed involuntarily.

Thirteenth day.—Evidently sinking; head symptoms more prominent; cannot articulate, but utters confused sounds; very restless all last night; pulse tremulous, too rapid to be counted. The man died at eight in the morning on the fourteenth day.

The foregoing details are sufficient to show that the unfavourable results of the case were mainly owing to erysipelas, and to a want of power in the patient for resisting the onset of this formidable complication.

As to the operation itself, we would just mention that in this case was exemplified the well known fact, that the hemorrhage during the removal of half of the lower jaw is in general trifling, with exception of the blood which may come from the facial artery. In the present instance, no vessels whatever, after the bone had been removed, seemed to require ligature, though several bled a good deal when reaction had taken place; this circumstance proving how closely patients who have undergone this operation should be watched.

Still, the more we see operative proceedings of this kind, the more we become convinced of the inutility of tying either the internal or external carotid previous to the incisions, as a matter of precaution. Nor should the following very correct observation of Mr. Stanley be forgotten, viz., that, "Whilst the disease is in progress, the adjacent arteries, even when of large size, often become obliterated, so that, when divided, no bleeding ensues."

As to the steps of the operation, it will be perceived that Mr. Mackmurdo was careful to have the patient's head held erect, so as to favour the escape of the blood outwardly, and prevent the fluid from penetrating into the larynx, rendered insensible by chloroform. The general rule is, to divide the soft parts (after the removal of one or more teeth) from the ear to the chin, and, if necessary, through the lip, detach the bone from the fleshy tissues, and then use the saw. But Mr. Mackmurdo first made a vertical incision through the lip to the chin, then divided the body of the jaw close to the symphysis, and subsequently made his incision from the ear downwards along the border of the maxilla. Thus, after the connexions of the bone with the parts within the mouth were divided, the moiety of the jaw (the symphysis being sawn through) had no longer any attachment but towards the temporo-maxillary articulation, which attachment speedily gave way, especially as the coronoid process broke off. We observed that the morbid mass yielded very easily at a certain state of the operation, as the symphysis was divided; but this advantage cannot, of course, be obtained by those surgeons who are anxious, for fear of the retraction of the tongue, to cut the genio-glossi muscles before they apply the saw. We did not perceive that any alarming retraction of the tongue took place, and no surprise need, perhaps, be felt at this circumstance, since the organ, though it loses support on the affected side, is still sufficiently retained in its normal position, by its connexion with the sound portions of the jaw.

The examination of the tumour presented some interest, as the morbid growth had been pronounced non-malignant; the microscope confirmed the diagnosis, and its nature was found to be myeloid, or marrow-like. This name is founded on the minute structure, and was formerly confounded with fibrous tumours, and included in the class of osteo-sarcoma. Such is the onward march of pathology and chemistry: the more we unravel, the more minutely we analyze, the more we want new names; and, indeed, when a student opens a book on organic chemistry or modern pathology, he may well be frightened at the unharmonious and endless nomenclature which meets his eye. Nor can his mind (like that of his forefathers) rest on great and sufficiently palpable divisions, leaving the sub-divisions and minutiae for a time when he is less startled; for the multiplication of classes, species, and varieties, has been so great, that the main divisions become uncertain. Thus it was somewhat satisfactory, at no distant period back, to make a clear and quiet distinction between malignant and non-malignant tumours; but the latter are now found to encroach upon the former, and hardly have we mastered the names, structure, and pathology, of benign tumours, than we are told that they may sometimes be malignant; and such a good authority as Mr. Paget suggests the terms "semi-malignant," "locally malignant," "less malignant than cancer," for certain myeloid tumours. Here is the passage alluded to:—

"Now, in both these cases," (examples of myeloid tumours,) "and especially in the last, the whole history of which seems full of anomalies, there were certainly such features of dia-

similarity from the usual general characters of the myeloid tumours that, although the microscopic characters appeared identical, yet they are not enough so to prove even the occasional malignancy of the disease; they are enough to make us cautious; enough to induce us to study the disease very carefully, as one of those that may, in different conditions, or in different persons, pursue very different courses; appearing in some as an *innocent*, in others as a *malignant* disease. The use of such terms as 'semi-malignant,' 'locally malignant,' 'less malignant than cancer,' and the like, in relation to growths of this kind, involves subjects of singular interest in pathology, as well as in practical surgery."—Paget "On Tumours," p. 227.

But to return to myeloid or marrow-like tumours, of which we have an example in Mr. Mackmurdo's patient. They were formerly called by Lebert, fibro-plastic, because they contained corpuscles like the elongated cells, or fibro-cells, which he has called by the same name. But Mr. Paget has found more characteristic constituents in these tumours—namely, the peculiar, many-nucleated corpuscles which have been recognised by Kölliker and Robin as the elements of the marrow and diploe of bones, especially in the fetus and in early life; and he thinks it best to name the tumours myeloid, or marrow-like, after their nearest affinity.

As to the development and history of this kind of tumour in bone, Mr. Paget says, p. 218, "The most general facts I can collect are—that the myeloid tumours usually occur singly; that they are most frequent in youth, and very rare after middle age; that they generally grow slowly and without pain, and generally commence without any known cause, such as injury or hereditary predisposition." (In Mr. Mackmurdo's patient the first symptom was toothache, the disease having probably begun in the cancellated texture of the jaw, and irritated the root of the teeth.) "They rarely, except in portions, become osseous; they have no proneness to ulcerate or protrude; they seem to bear even considerable injury without becoming exuberant; they may (but I suppose they very rarely do) shrink, or cease to grow; they are not apt to recur after complete removal; nor have they, in general, any features of malignant disease."

It will thus be seen that the above-mentioned operation was undertaken under very favourable auspices, and that the case included the usual elements of success. And here we would beg our readers to refer back to an instance of tumour of the lower jaw, treated by Mr. Fergusson at King's College Hospital, which bears much analogy to the present case, (*THE LANCET*, vol. i. 1851, page 545.)

Lastly, we have some apology to offer for an incorrect statement respecting a tumour which grew on the scalp of a boy, under the care of Mr. Stanley at St. Bartholomew's Hospital, about two years ago, (*THE LANCET*, vol. i. 1852, p. 233.) The poor little patient died, and the case created very great interest, as the growth seemed to have been caused by blows struck upon the boy's head by a cruel and brutal relation. The tumour was, at the time we reported the case, considered as cancerous; but Mr. Paget, having submitted it to a careful microscopic examination, found in it the characters of the myeloid tumour; and in extenuation of the error into which we fell in calling it cancerous, we would quote the following passage:—"It would be difficult to find a tumour more imitative of cancer than this was in its mode of growth, its infiltration of various tissues, its involving of important parts, its apparent dissimilarity from any natural structures. And yet it certainly was not cancer; the microscopic elements were like those of natural parts; not a lymphatic or any other organ was affected by similar disease, and death seemed to be due solely to the local effects of the growth."—Paget on Tumours, p. 225.

Now, as a contrast to the benign tumours which were observed both in Mr. Mackmurdo's and Mr. Stanley's patients, we would call attention to an instance of malignant disease, developed in the head of the tibia of a man upon whom Mr. Erichsen has lately performed amputation of the thigh at University College Hospital. The history of the case is replete with interest, and we beg to subjoin the following details, obtained from the notes of Mr. Howitt, the dresser of the patient.

#### UNIVERSITY COLLEGE HOSPITAL.

ENCEPHALOID CANCER DEVELOPED IN THE HEAD OF THE TIBIA;  
AMPUTATION ABOVE THE KNEE.

(By Mr. ERICHSEN.)

JAMES R—, aged twenty-eight years, was admitted on October 1st, 1854. For the last eight years he had been a

gunner and driver in the Artillery; his father had died when between fifty and sixty years of age, after the operation of lithotomy, the stone not having been entirely removed, but having broken during extraction. His mother is sixty, is still living, and in very good health. In fact, the patient's parents never had tumours of any kind, nor were they subject to cough; he has a brother and sister living, and they and their children are all healthy. One brother died in infancy, and two, who had arrived at manhood, of typhus and scarlet fever respectively. None of the man's relations were ever subject to any swellings or tumours.

The patient is a widower, and has two healthy children. In his youth he suffered from scarlatina and measles, but recovered perfectly. Six years before admission he had gonorrhoea, which was cured in four days, but he never had syphilis or rheumatism. The patient has always had good and sufficient food, is steady and temperate, and always enjoyed good health until about four years previous to the present examination.

At that time pain was produced by pressure on the patella, but the man could walk well, and there was neither heat nor swelling about the joint. For two years and a half he was then employed in recruiting in the north of Scotland, during which time he had to walk sometimes fifteen miles a day, but felt no inconvenience from this exertion. The pain above-mentioned was of a gnawing description, and only occurred on pressure. The patient continued in this state till the end of 1851, when he first noticed a swelling on the inner side of the head of the tibia; the swelling was as hard as bone, and painful on pressure, but there was no heat in it. He could walk easily and without pain on level ground, but on a rough road he experienced much uneasiness in the joint. The general health was all this while excellent.

From this time till April, 1852, the swelling and tenderness increased, as also the weakness of the limb; but, even then, no pain was felt in the part except it was roughly handled. At this time, the patient was admitted into the Woolwich Hospital, where the affection was locally treated by cupping, leeches, blisters, warm fomentations, and, lastly, the moxa, but none of these means had any salutary effect.

He left the hospital rather worse, after a stay of six weeks, went on duty again, and left in September for the West Indies. There he was actively engaged for a year, and was then admitted into hospital, the tumour having increased, the tenderness being greater, and constant pain being felt for the first time in the joint.

He was not benefited by the treatment, and was sent out in six weeks to convalescent duty. The tumour and pain increased, however, until July, 1854, when the man was obliged to use sticks, and return to the hospital.

The appetite now began to fail, he lost flesh, especially about the thigh, and was obliged to leave the service. On his voyage home, in August, he had bilious vomiting, and was attacked by a cough, which has gradually become worse. Soon afterwards night perspirations commenced; and he noticed that on standing up, the veins of the limb became much distended, but the glands in the groin remained unaffected. On the 25th of September the foot swelled, but since the patient's arrival in England his health has been improving, though no favourable change occurred in the knee.

*State on admission.*—The right knee is flexed at right angles, and elevated in bed. In the situation of the head of the tibia is observed a swelling, extending four inches from the lower edge of the patella, and, laterally, for about five inches. The colour of the skin is not changed, but it is traversed towards the lower part by enlarged veins. The head of the fibula is to be distinguished on the outer side. The circumference of the tumour, round its centre, measures sixteen inches, and the other leg, at the same spot, eleven inches and a half. The tumour is confined to the head of the tibia, the outline of the condyles of the femur and the patella being easily made out. In the interval between the bones the cavity of the joint can be recognised in a normal condition. The greatest tenderness is in the centre of the tumour, and on pressing it with both hands, a slight crackling can be felt as of slight shell of bone; superficial to the tumour some enlarged arteries are observed to pulsate. The joint is fixed and immovable, but there is no pain except on pressure.

The general aspect is anæmic, the patient is emaciated, and has a hacking cough with profuse spits, and sweating at night; examination of the chest reveals no actual signs of phthisis.

On October 11th the thigh was amputated by slide flaps, and the patient has done very well since.

*Examination of the head of the tibia, made by Mr. KIALDMARK, house-surgeon to the hospital.*—On dividing this process longitudinally, the tumour was found to consist of yellowish,

cartilaginous, encephaloid substance, softening towards the circumference into a discoloured matter, bounded by a thin shell of bone, and having masses of fresh osseous deposit in its centre. The yellowish matter contrasts with the bluish appearance of the cartilage; a little fluid exudes from it, but it does not break down under the fingers. The osseous deposit is rather considerable, particularly where it is not so firm as in the centre. Exterior to the bone, posteriorly, are masses of fatty-looking substance, they are firm, and appear like true encephaloid; in front are some osteoid portions, and nodules of bony matter encased in fibrous tissue. The joint is healthy, but the head of the fibula is a little injected. The disease extends down to the medullary canal, and between it and the marrow a gelatinous substance is observed, with mixed spiculae of bone, this is also infiltrated into the cancellous structure of the shaft. Under the microscope, the firm substance shows characteristic cancer cells, with fatty degeneration. In the masses at the back of the joint the cells are larger; and in the bony deposit they were fusiform and caudate.

Here we have a *bond fide* cancerous growth, taking its development in the head of the tibia, a portion of bone especially obnoxious to transformations of this kind. A feature worthy of note, is the absence of pain in the four years during which the disease invaded the process which it eventually destroyed; and we may also mention the immunity enjoyed by the cavity of the articulation while these serious changes were going on.

This tumour must be placed amongst the variety called *firm medullary cancer*, and belongs to those which form distinct masses in the articular ends of bone, round which the walls are expanded into a shell. The patient is doing well, and is likely to recover from the effects of the operation; but as to recurrence, it is but too probable that it will take place, the average life after removal of limbs affected with medullary cancer being, according to Mr. Paget, about thirty months. This author says:—"If the operation be recovered from, the regular course of events brings about the renewal of cancerous growth, either near the seat of the former growth, or in the lymphatics connected therewith, or, more rarely, in some distant part.....Recurrence and death occur, on the whole, more tardily after amputations for medullary cancers of the bones and soft parts of the limbs than after extirpation of the eye or testicle.....Now, respecting the propriety of removing a medullary cancer in any single case, it may be said that the hope of finally curing the disease should not be entertained. Such an event may happen, but the chance of it is not greater than that of the disease being spontaneously cured or arrested; and the chance of any of these things is too slight to be weighed in the decision of any single case. The question in each case is, whether life may be so prolonged, or its sufferings so diminished, as to justify the risk of the operation. In general, I think, the answer must be affirmative wherever the disease can be wholly removed, and the cachexia is not so manifest as to make it probable that the operation will of itself prove fatal."

We now would for a few moments direct the attention of our readers to a case of medullary cancer of bone, the situation of which precluded any surgical interference; we shall thus be enabled to study the rise, progress, and issue of the disease when art is powerless in arresting its fatal tendencies.

#### KING'S COLLEGE HOSPITAL.

MEDULLARY CANCER OF THE ILLIUM, PRESENTING VERY STRONG PULSATIOMS.

(Under the care of Mr. FERGUSON.)

JAMES B—, aged fifty-six years, was admitted May 4th, 1854, with a pulsating tumour, situated on the posterior part of the left ischium.

The patient states, that about four months before admission he began to feel some pain in the above-named region, which was at first trifling, but increased on the slightest exertion, and was always relieved by rest. This pain became gradually more severe until six weeks before his application here, when it came on rather more abruptly than usual, and it was then that he first perceived a swelling at the spot where the pain was experienced. The tumour was then about the size of the last phalanx of an adult thumb, there being distinct pulsations in it.

(To be continued.)

EPIDEMIOLOGICAL SOCIETY.—The first meeting of the present session of this Society will be held on Monday, the 6th of November, at half-past eight P.M., at 37, Soho-square. An introductory address will be delivered by the president, Dr. Babington. Afterwards a discussion will take place relative to the late visitation of cholera.

## Reviews and Notices of Books.

*Transactions of the Pathological Society of London. Vol. V. Including the Report of the Proceedings for the Session 1853-54. pp. 371.*

IN calling the attention of the profession to this interesting volume, we would preface our observations by expressing the high sense which we entertain of the respectability and utility of the Society from which it has emanated. The Society is, in our judgment, second to none in practical value and in the active support which it receives from the most distinguished members of our profession. It is also a pattern to other similar institutions in the economy with which its general affairs are managed, as evinced by the publication of so handsome a volume out of the yearly subscription of one guinea paid by its members.

The "getting up" of this work is highly creditable to the hon. secretaries, and the literary character of the articles does honour to the contributors; whilst no fewer than seventeen large plates, containing a multitude of drawings, and several woodcuts, illustrate and decorate its pages. There is also a good general index of the contents, but we think the work lacking in a separate catalogue of the subjects of the illustrations. There is also an indefiniteness about the expression, "List of Specimens exhibited at the Meetings of the Society during the Session 1853-54;" for since that list is, in fact, a catalogue of the contents of the volume, it would appear that all communications made to the Society were admitted into the "Transactions"—a statement which cannot be correct.

We must also offer our approval of the microscopic character with which the plates have been invested, and of the artistic and faithful mode, as we believe, in which they have been executed. Such drawings are peculiarly fitted for the "Transactions" of our learned societies, since matters of great interest and novelty may thus be rapidly and simultaneously brought under notice in a department which has been, and still promises to be, the most fruitful in results.

The contents of the volume consist of 135 communications, and are arranged under nine heads—viz., Diseases of the Nervous System, Organs of Respiration, Heart, Organs of Digestion, Urinary and Generative Organs, Osseous System, and Ear; with papers on various miscellaneous subjects, and on Diseases of the Lower Animals. Our space will not permit us to notice every article, but we shall give an analysis of the most interesting cases.

#### *Diseases of the Nervous System*

are illustrated by twelve communications. Thus, Dr. Ogle exhibited a cyst from the meshes of the pia mater of the brain, which produced absorption of the convolutions of the surface; also a cyst at the base of the brain, formed by the softening of scrofulous deposit, and clearly indicated during life as to its position by certain well-marked symptoms; and a specimen, showing extensive softening of the entire spinal cord, without discoloration thereof. Dr. Bristowe exhibited a tumour, probably epithelial cancer of the dura mater. Mr. John Wood exhibited a brain and dura mater taken from a man after a blow on the head. Mr. Toyne exhibited a diseased brain arising from caries of the temporal bone after scarlet fever. Dr. Septimus Gibbon exhibited the left middle cerebral artery, plugged with a fibrinous clot, the result of phlebitis. Dr. Markham showed a cancerous tumour in the posterior lobe of the right hemisphere of the brain. Dr. Hall related a case of chronic abscess of the brain, giving rise to symptoms resembling chorea. Mr. Shaw exhibited a fibrous tumour on the left ventricle of the brain; and a bony deposit in the arachnoid membrane of the right hemisphere. Dr. Peacock and Dr. Thurnam presented a cholestea-tomatous tumour of the brain; and Dr. Sankey described a mode of taking the specific gravity of healthy and diseased brain. Of these, Dr. Bristowe's and Dr. Peacock's tumours are illustrated by twelve figures.

Dr. OGLE's first case occurred in a woman, aged thirty-four, who had been subject to fits for several months, and at length died in an attack of epilepsy. The catamenia had not appeared until aged twenty-four years, and subsequently were irregular. The cavity of the cysts was more than an inch in diameter, and a quarter of an inch in depth, and was lined by a tough membrane, the result of inflammation. The cystic fluid was limpid, and contained bloodvessels, granular matter, and fibrillated structure; whilst the softened brain at its base consisted of granular matter, with oval and irregularly shaped nucleus-like bodies, globules like pus-globules, wasted nerve-tubes, with star-shaped and caudate bodies, having dark margins and a calcareous appearance. The arachnoid was much thickened, the brain vascular, and the whole viscera congested.

His second case is one of much interest, and occurred in a girl, aged eighteen, who had not menstruated. She had been ill but about four months, and died after a so-called fainting fit. Her first symptoms were pain in the forehead and giddiness, followed by tottering and numbness of the whole of the *left* side up to the middle of the neck and the *right* side of the face, with failure of sight in the *right* eye, and of hearing in the *right* ear. There was also double vision for a short period; there was lachrymation and vascularity of the conjunctiva, and incomplete closure of the eyelids of the *right* eye. There was loss of the power of abduction of that eye, and the pupil was contracted, but tolerably active. Towards the close of the case the bowels were excessively constipated. Vomiting occurred, the mouth was drawn to the *left* side, and the pupil contracted and inactive. The cyst, as large as a pigeon's egg, was situate in the pons Varolii in the *right* side, and implicated the fourth, fifth, sixth, and seventh pairs of *right* cranial nerves.

The third case was non-inflammatory, and accompanied by remittent colic-like pains, and pains in the head and limbs, with much loss of muscular power. She ultimately died in convulsions.

Dr. BRISTOWE's case was that of a man, aged seventy, who died perfectly paralyzed. A small tumour (quarter of an inch by one third of an inch) was found growing from the dura mater, which presented small ulcerated cells of a non-squamous epithelial character, together with the involucria, ovoid cells, and other forms of cells which Dr. Bristowe states to be characteristic of epithelial cancer. There were also globular and ovoid bodies, with fibres of various sizes, chiefly without nuclei. The author did not connect the existence of the tumour with the cause of death, but believed it to be of the nature of epithelial cancer.

Mr. TOYNBEE was of opinion that in his case (a patient, aged twelve, in whom there had been a discharge from the ear during two years after an attack of scarlet fever,) the caries of the bones was due to the impediment offered by the membrana tympani to the egress of the secreted matter.

Dr. GIBSON attached importance to his case, on account of the coincidence of a clot in the middle cerebral artery, and vegetations on the cardiac valves in a case of puerperal phlebitis. He attributed the immediate production of this clot to a diseased state of the veins, but could not account for its passage through the pulmonary capillaries.

The case related by Mr. SHAW had been under the care of Dr. Watson. Twenty-seven years before, the patient had had a temporary loss of feeling, with contraction of, and pain in both legs. In 1853, pain occurred over the right brow, with retchings before breakfast. In some months the pain settled in the parietal bone, and at the end of the year he was suddenly seized with transitory paralysis of the left arm, and with difficulty of speech. Paralysis then attacked the right side, and he was nearly choked on attempting to swallow. Everything seemed turned "upside down" to him. He died in four days. Two pieces of bone were found in the arachnoid, over

the right hemisphere, without evidence of inflammation, and an irregularly-globular fibrous tumour, of the size of a molar tooth, projecting far into the cavity of the left ventricle, between the corpus striatum and the septum lucidum. The ventricle contained four ounces of clear serum.

Dr. PEACOCK's case was an ordinary one of insanity in a female, aged sixty, consequent upon domestic inquietude, who ultimately died of apoplexy, with convulsions. The tumour (as large as a walnut) was developed in the convolutions, and under the edge of the right lobe of the cerebellum, and, pushing aside the vermiform process, extended nearly to the left side of that organ. It consisted, according to the report of Dr. Bristowe, of irregularly-polyhedral cells, with numerous crystals of cholesterine in the softer substance, with nucleated, granular, polygonal scales on its nacreous portion, and was of the nature of a cyst.

Dr. SANKEY's method of taking the specific gravity of the brain, was that adopted for the like purpose in the lungs, but, in addition, he measured its exact specific gravity, by immersing it in fluids of various known degrees of density, (rendered so by the addition of sulphate of magnesia,) and taking the mean between two, in one of which it sinks, and in another swims. Thus, if the two fluids have densities of 1.030 and 1.032 respectively, the brain will have a specific gravity of 1.031.

There are four papers on

#### *Diseases, &c., of the Organs of Respiration.*

Mr. HUTCHINSON described the lungs and heart of a child, aged six years, who had died from dyspnoea, the result of the pressure of a tuberculous gland, the size of a pigeon's egg, on the right bronchus, immediately at the division of the trachea. The left lung had been previously destroyed by pleuritic effusion, which had been absorbed.

Dr. HYDE SALTER exhibited, with microscopical illustrations, a bony mass, about two and a half inches long, by two inches broad, and one inch thick, which he had found embedded in the sub-pleural areolar tissue covering the diaphragm, and which appears to be the counterpart of a deposit described by Dr. E. Smith, in *THE LANCET*, 1853. It was not true bone, but, with a distinctly fibrous matrix, there were numerous tubes running in a wavy parallelism, which resembled imperfectly-formed dentine. A similar structure had also been discovered by the author in an ossification of the aorta, possessed by Professor Quekett.

Dr. BRISTOWE has figured a fungus, with a distinct mycelium and perfect fructification, which he had found in a tubercular cavity, without tubercle, at the apex of the lung of a woman, aged forty-nine. He was of opinion that the sporules had been introduced during life, and consequently that the development of the fungus was a vital process.

Dr. FULLER has described, and figured some branching casts moulded in bronchial tubes of the third or fourth diameter, and their branches. They were about one and a half inch in length, and of the diameter of a crowquill. The patient, aged twenty-five, had lost three sisters of phthisis, and from the age of fourteen years had been afflicted with cough and dyspnoea, and had expectorated small pieces of plastic material, and also casts which at one period were four inches in length. Dr. Peacock, in his remarks on this case, has entered at length into the etiology of the affection, and has collected a long series of instructive cases. The communications on

#### *Diseases, &c., of the Heart*

are numerous, and some of them have peculiar interest.

Dr. PEACOCK has made four contributions. The two first are instances of malformation of the heart, and are illustrative of the cause of cyanosis. One case was that of a child, aged six and a half years, in which there was contraction of the pulmonary artery, a considerable deficiency in the septum

of the ventricles, and an open state of the foramen ovale, so that venous blood readily passed to the right side; whilst the other case was that of an infant with contraction of the right auriculo-ventricular orifice, with two small apertures in the septum ventriculorum, so arranged that if any admixture of blood took place, it could only be from the left to the right side. In both cases there was cyanosis, and in both congestion; and the author inferred that the former condition depends rather upon the latter, than upon admixture of blood in the heart. The latter case was also of interest, as showing intra-uterine disease of the tricuspid valve. His other cases were,—one of lateral, or partial aneurism, at the apex of the left ventricle; and another of rupture of the septum cordis, sufficiently large to admit the forefinger, accompanied by diseased valves, and the earlier stages of fatty degeneration.

Dr. BRISTOWE is the author of four communications, also, of which the one on three cases of fatty degeneration is the most interesting. In the first case, the patient, aged thirty-five, died of pericarditis, implicating the structure of the heart, so that the degeneration was considerable at the seat of inflammation, less so on its borders, and not evident elsewhere. The diseased tissue was not brittle. In the second, there was degeneration and brittleness of tissue, inducing rupture of the posterior part of the left ventricle and the opposed pericardium. The third case was one of blood-disease in an ill nourished boy, and was accompanied by hæmorrhage from the nose, great anæmia and loss of vision, and gave evidence of extreme degeneration, without brittleness. Of the other cases, one was old-standing disease of the aortic and mitral valves, with hypertrophy and dilatation of the heart, which appeared to have produced no inconvenience till a short time before death. Another was extreme hypertrophy of the heart, without apparent cause, and which, in the author's opinion, was the primary and most important of all the concomitant deviations from a healthy condition. The last was the formation of an aneurismal sac opposite to the junction of the four cavities of the heart, and projecting posteriorly.

Dr. OGLE exhibited an intra-uterine malformation of the pulmonary valves, in which there was a plain diaphragm, instead of three segments, pierced by a foramen about the size of a pea. The aortic valves were also malformed, and the author regarded the hypertrophy of the walls of the heart as a conservative process, preventing cyanosis.

Dr. Brinton has described and illustrated two cases of lesion of the aortic valves, which presented symptoms of considerable contrast; and Mr. Obré a case of malformed and diseased aortic valves; and another of bony deposit in those structures. Mr. Haynes Walton also presented the heart of a case of aneurism of the posterior tibial artery, which so far resembled Mr. Obré's cases, that there was a fusion of two segments of the aortic valves into one, and a laceration of one of them causing sudden death after the ligature of the femoral artery. Mr. Walton also gives the details of a case in which there was aneurism of the popliteal, (which ultimately gave way,) aneurism of both femorals and of the subclavian, involving all its branches, and also disease of the heart.

Mr. Harvey Ludlow has described a case of aneurism of the arch of the aorta; and Mr. N. Ward, one of the aorta opening into the œsophagus. Mr. Hutchinson has contributed a case of false aneurism of the arch of the aorta in a child, aged four, which, in his opinion, began as an abscess, probably tubercular, external to the artery. The same gentleman had also examined the heart of a girl, aged eleven, who had from birth suffered from aggravated cyanosis, and had found a fleshy septum dividing a rudimentary right ventricle into two chambers, and the opening of the pulmonary artery reduced so as only to admit a probe. The septum of the ventricles was most imperfect, whilst that of the auricles was complete, and the foramen ovale closed. He regarded the false septum as the cause of the non-development of the true septum. Dr. Sieve-

king has given the case of an infant, aged six weeks, of congenital malformation of the heart, in which there was an absence of the right auriculo-ventricular orifice, with defective inter-ventricular septum and open foramen ovale, without the presence of cyanosis or any symptoms of heart disease. Mr. S. Wells exhibited drawings of the appearance of the surface of the heart in two cases of purpura.

## Foreign Department.

### MAN AND MONKEY.

ARE we truly promoted monkeys? If there is truth in testimony, the confession, however humiliating to human vanity, must be made. What if Lord Monbodo, the much ridiculed, should have the laugh on his side? Our contemporary, the *Gazette-Hebdomadaire*, publishes a circumstantial summary of what he believes to be authentic intelligence. In 1677, it is said, a Dutch traveller, John Struys, was the first to make the interesting discovery that we are entitled to a caudal appendage. He saw, or at least says he saw, in Africa, a man with a tail *more than a foot long*. But this may be a mere traveller's tale. M. du Courret, who has written a book upon the tail question, says that a marabout of Kuchenhah, a town of central Nigritia, affirms that there exists, between the gulf of Benin and Abyssinia, tailed anthropophagi, called Niam-Niams. M. du Courret says he has himself seen at Mecca, in 1842, a negro from Central Africa, who carried a true tail; and further, that he has it from several djelabs, or slave-merchants, Arabian and Nubian, that there is in this part of Africa a spot where all the indigeni have the same conformation as this negro. M. du Courret gave a minute description of this race to the Paris Academy of Sciences, in 1849. He reports that both males and females have tails *from two to three inches long*. The tail of the individual he examined was very movable. Similar communications were made to the Academy by MM. Arnault and Vayssière, and by M. Roches d'Héricourt to the Oriental Society. More recently, M. Francis de Castelnau relates that, travelling some years ago, he was at Bahía, and bethought him that it was a convenient opportunity of studying the question. He interrogated a slave named Mahammah, remarkable for his intelligence and the extent of his travels. This man says that, by order of the sultan of Kano, he once joined an expedition against the Niam-Niams. They came by surprise upon a band of these tail-gifted people, and massacred the whole. They all had tails of about forty centimetres long, and two or three in diameter. The tails were flexible. They afterwards took other parties prisoners. The chief of the Niam-Niams begged for mercy, but the sultan of Kano had them all killed, *because they had tails*, and no one would buy them for slaves. In 1852, M. d'Abbadie, the well-known traveller, related to the Geographical Society that an Abyssinian priest had given him very circumstantial details concerning this race of men. According to this priest, the tail is twenty-nine millimetres long, and covered with hair; but the women do not possess it. M. Hübsch, physician to the hospitals at Constantinople, has just addressed an interesting communication to the editor of our French contemporary. He says that in 1852 he saw a negress with a tail. Her master, a slave-merchant, told him that there exists in Central Africa a tribe called Niam-Niams; that all the members of this tribe have tails, which sometimes reached the length of two feet, but this, M. Hübsch says, may be an Oriental exaggeration. The tail M. Hübsch examined was two inches long, supple, without hair, and ended in a point. Her master could not sell her. The objection did not reside in her tail, but in her avowed taste for human flesh. In 1853, M. Hübsch saw a man of the same race, who had a tail an inch and a half long. He is also acquainted with the son of an apothecary at Constantinople who was born with a tail an inch long: he belongs to the white Caucasian race. M. Hübsch adds that the Turks have long been acquainted with this race of men, and are very much surprised that scientific Europe should appear to have been ignorant of their existence. Such is the evidence in favour of our affinity to the monkey tribe. Whether the Niam-Niams be a creation of Oriental fancy, like the Yahoos of Captain Gulliver, or a race actually existing, it is at any rate an object of interest to extend our ethnographical inquiries in Central Africa. Should any enthusiastic traveller determine to solve the question, we counsel him to bring home the finest-tailed specimen that can be found.

# THE LANCET.

LONDON: SATURDAY, NOVEMBER 4, 1854.

If any doubt remained as to the absolute necessity of a thorough public inquiry into the conduct of the Medical Department of the Army, it must surely be dispelled by the following extraordinary, and we hope mistaken, censure officially uttered by Lord RAGLAN:—

"Camp before Sebastopol, October 11th, 1854.

"The Commander of the Forces is sorry to have to animadvert strongly upon the conduct of the medical department, in an instance which came under his observation yesterday. The sick were sent down from the camp to Balaklava, under charge of a medical officer of the division to which they respectively belonged; but on their arrival there, it was found that no preparations had been made for their reception. The Commander of the Forces is aware that Deputy Inspector-General of Hospitals, Dr. Dumbreck, gave the necessary order verbally to the staff medical officer of Balaklava; but that officer neglected to inform his superior, and the consequence was that the sick, many of them in a very suffering state, remained in the streets for several hours exposed to very inclement weather. The name of the officer who was guilty of this gross neglect is known to the Commander of the Forces. He will not now publish it, but he warns him to be careful in future, and to be cautious how he again exposes himself to censure. Dr. Dumbreck will, on future occasions of importance, give his orders in writing addressed to the responsible officer. When a convoy of sick is sent from the camp, either to the hospital, or to be placed on board ship, it is henceforward to be accompanied not only by a medical officer, but likewise by the Deputy-Assistant Quartermaster-General of the Division, who will precede it to the place of deposit, and take such steps as may ensure the due reception and care of the men confided to his charge.

(Signed)

"RAGLAN."

The first thing that strikes the reader in perusing this document is the inquiry, What was the motive that induced the Commander of the Forces to notice what we will assume to have been a particular instance of neglect of duty by a medical officer in a General Order? Was that course pursued in order to reprove "the staff medical officer of Balaklava?" If such were the object of the Commander, why not mention the name of the officer whose sense of duty it was intended to quicken? If the "staff medical officer" thus threatened in this undignified General Order has indeed neglected his duty in the manner pointed out, it is clear that he ought to have been tried by a court-martial. Had this course been adopted, it is possible that the medical officer might have been able to show that he was not deserving of censure. It is also possible that the charge of culpable remissness in his duty might have been brought home to him. In either case justice would have been done, and injustice avoided. As Lord RAGLAN states the case, it is obvious that the whole charge consists in the neglect of the "staff medical officer of Balaklava" to inform his superior of the verbal order given by Dr. DUMBRECK. We have not the smallest desire to extenuate the gravity of this offence: we wish to point out that, grave as it is, it is the fault of one man, and that, in common justice, upon that one man should

censure or punishment fall. But what is the conduct of Lord RAGLAN? It is impossible to read his General Order without being painfully impressed by the tone of irritation that pervades it. It is difficult to account for that irritation on the supposition that it is entirely caused by the conduct of the medical officer censured. The concluding part of the General Order clearly enough betrays the existence of a feeling in the breast of the Commander not raised by the single lapse of a single medical officer, but we fear of an unfriendly and mistrustful feeling against the entire medical department. What is there in the circumstances of the case so severely commented on by the Commander to call for this deliberate reflection upon the capacity of the medical staff?—"When a convoy of sick is sent from the camp, either to the hospital or to be placed on board a ship, it is henceforward to be accompanied, not only by a medical officer, but likewise by the Deputy-Assistant Quartermaster-General of the Division, who will precede it to the place of deposit, and take such steps as may ensure the due reception and care of the men confided to his charge."

We will assume that the medical officer at Balaklava neglected his duty: does that justify a studied censure and official degradation of the whole medical staff of the army? And yet this is the course that Lord RAGLAN has thought it necessary to adopt. Now we, in the name of our brethren in the East, and not less in the interest of the public service, unhesitatingly declare that this censure and this degradation must be justified before the public eye. Our army surgeons, who in the present campaign have evinced professional skill and public zeal at least equal to the skill and zeal of any other department of the service, and who have already on many trying occasions displayed the twofold courage of the soldier-surgeon, must not be allowed to remain under the stigma of incapacity, in order, as we strongly suspect, to screen other departments from the censure which is their due.

We conceive that we are justified in this suspicion—one we utter without any intention to reflect upon Lord RAGLAN, whose mind is in all probability under the spell of old War-Office traditions—by the simple fact that the medical department of the army enjoys no distinct and separate authority of any kind, even in matters directly pertaining to professional duties. In everything our medical officers are subordinate to others; for every want, for themselves or for the care and treatment of the sick and wounded, they are at the mercy of other departments; at every turn they are harassed and distracted in the performance of their duties by conflicting anxieties; they have no independence of action even for the most necessary purposes. Where, then, is the consistency in blaming the medical department if the general arrangements for the care of the sick and wounded are defective? Those arrangements, we broadly state, do not depend upon the medical department. All that the medical staff can do consists in personal devotion to their individual duties: and can the Commander of the Forces declare that they have been wanting in this? He cannot require to be reminded, that where there is no authority there can be no responsibility; and that it is monstrous to blame a man for the non-performance of a duty with which he was not entrusted.

If, then, it be true that our sick and wounded have suffered and perished, as but too many authentic accounts concur in stating that they have suffered and perished, from the want of surgeons, from the want of proper means and proper arrangements for removing them from the field of battle, from the

want of hospital ships and hospital accommodation on shore, from the want of medicines and surgical appliances, from the want of medical comforts, and even of food, all these and other shortcomings must be visited on the heads of those who have authority in these matters, and who, having authority, must be content to bear the responsibility.

Although we may regret the injustice committed against the medical officers of the army by the Commander-in-Chief, in the General Order we have quoted; although we may regret the not less remarkable indignity cast upon the medical staff by the omission of all testimony to their services, of even the most passing recognition of their devotion on the field of battle, and during the exhausting labours that followed the fight, in a despatch lavish of praise of every other department; we find comfort in the assurance that the medical history of this campaign, the unnecessary sufferings of our brave soldiers, and this last indignity to the medical staff by the Commander of the Forces, will lead to a rigid and impartial inquiry into the conduct of the medical department during the present war, with the stern determination to trace back all errors to their true source. Nor can it fail to bring about a thorough revision of the whole organization and arrangements of the medical department, and, as a necessary consequence, a radical reform.

Should the public fail to demand, or Parliament fail to initiate, this inquiry, we hope it will not have to be recorded that the medical officers of the army hesitated to challenge the justice of the censure passed upon them in the face of the world by the Commander of the Forces.

It has often been our task to expose the defects of the Lunacy Laws, and to dwell upon the enormities which may be, and as we believe have been, perpetrated under their authority. A case has recently come to light which, although not free from exaggerations, nor perhaps from substantial error, still affords conclusive evidence of the truth of many of the objections we have felt it our duty to urge against the principles, and some of the provisions, of those laws. In laying the leading facts of this case before our readers, it is our desire to abstain for the present from individual censure, and to consider it mainly in its general relations to the Laws of Lunacy: further inquiry is necessary, and will probably be instituted, in order to arrive at an accurate judgment as to the culpability of the parties principally concerned: the illustrations revealed of the imperfect state of the Lunacy Laws, and of the abuses which may be perpetrated under their authority, are clear and unmistakable enough.

The facts of the case, as condensed from the report in the *Daily News*, are briefly as follows:—In June, 1852, the Rev. Mr. HOLMES was brought before Mr. CANN, a magistrate at Wymondham, in Norfolk, charged by a woman residing at Hethersett with attempting to commit a rape on her child. Her deposition was taken and sworn, and a warrant was prepared. Mr. CANN, the clerk to the magistrates, stated:—“I felt, with my father, the magistrate, that Mr. HOLMES was labouring under some complaint, and communicated with the Rev. Mr. ANDREWS; and from inquiries I made, I felt he was labouring under insanity. It was therefore hinted to Mr. ANDREWS, that if something was done within a certain time, the warrants would not issue to be executed.” In answer to questions by Mr. SULTZER, (one of the visitors,) Mr. CANN

replied, that “the magistrate withheld the warrant in consequence of the station in life of Mr. HOLMES. *Probably, had he been a poor man*, the case would have been different. The usual course would be, to prove the offence first, and afterwards to consider the plea of insanity.” It would appear, that in consequence of the view taken by the magistrate, Mr. NICHOLS, a leading surgeon in the city of Norwich, and one of the proprietors of the Heigham Hall Asylum, saw the defendant, and afterwards applied to several medical men, in order to fill up the necessary certificates to authorize his detention as a lunatic. Mr. MILLS, of Norwich, after seeing him, declined to certify that he was insane. Dr. HULL did not see him, and consequently could not offer an opinion upon the case. Mr. DASHWOOD was ill in bed, and could not see him. The two certificates were ultimately signed by Mr. WILLIAM HENRY TAYLOR, of Norwich, and Mr. GEORGE GILLET, of Brooke; and the order for the detention of the certified lunatic being signed by the Rev. J. HOLMES, his brother, he was consigned, in strict conformity with the law, to the asylum. He remained in the asylum as a patient until the 4th of September, 1852, when he was discharged, and appointed chaplain to the asylum. He officiated in this capacity for two years; his name was publicly announced in the prospectuses or circulars of the establishment; his appointment was recognised by the Commissioners in Lunacy and the visiting magistrates. But it must be borne in mind that the Lunacy Acts expressly and carefully provide that no patient shall be retained as a boarder in a private asylum after his formal discharge. It is obvious that, but for such a provision, persons of sound mind might be detained in asylums, secreted from the eye of the Commissioners, and withdrawn altogether from the cognizance and protection of the law. It is only fair to say, that no secrecy of this kind was practised, or could have been contemplated, in the present case. If it was improper that the Rev. Mr. HOLMES should be allowed to remain in the asylum as chaplain, the blame must be borne by the visiting magistrates and the Commissioners in Lunacy, who, being officially informed of all the circumstances, permitted, if they did not directly sanction, the appointment.

But, nevertheless, there was enough in the matter to give rise to honest animadversion; and we fear it is not altogether unfounded to conjecture that local jealousies and personal feelings prompted to a certain extent animadversions of a less disinterested character. Dr. RANKING, who had recently become a partner in the asylum, called upon the visiting magistrates to institute an inquiry into the whole matter. The inquiry took place, when the facts we have related were established. But Dr. HULL, on being examined, affirmed that Mr. NICHOLS, when he called upon him on the occasion referred to, said, “That a country gentleman of a high county family had committed a rape; that the family wished to make him out mad; that the person himself wished to be made out mad; that he (Mr. NICHOLS) had rescued him from custody, and brought him to Norwich; that he (Mr. NICHOLS) wanted a second medical certificate to get him into his asylum; when once secured, he should defy magistrates or anybody else to get him..... That if he (Dr. HALL) would grant a certificate, it would be hundreds a year in his (Mr. NICHOLS) pocket.....” Dr. HALL stated, that he declined to comply with the request. This statement of Dr. HALL’s, it appears, had become the topic of common conversation in the town. The visiting magistrates having considered

the statements and documents submitted to them, agreed to the following resolutions:—

“First.—That the Rev. Mr. Holmes, by being placed in the asylum under the circumstances appearing on this inquiry, was rescued from the gripe of the law on a criminal charge.

“Secondly.—That the order and medical certificates upon which he was admitted into the asylum were regular, and in the form prescribed by Act of Parliament in that behalf.

“Thirdly.—That in the opinion of the visitors, Mr. Holmes is not a proper person to have been appointed, or to continue to officiate, as chaplain to the asylum.”

This was the position of the case when the Norwich City Magistrates recently met at the usual quarterly gaol session. On the motion, that the present justices of the Lunatic Asylums should be re-appointed, Mr. PALMER, a magistrate, after much opposition, elicited the report of the visitors relating to their inquiry into this case. The publicity thus given to the matter has naturally called forth the animadversions of the press. Some of our contemporaries have, as it seems to us, directed their censures too strongly, because somewhat prematurely, and too exclusively, against the proprietors of the asylum. It appears to us obvious that further inquiries are wanting, in order to determine correctly the extent to which they are deserving of reprobation. It is clear that the question as to the good or bad faith of the proprietors turns greatly upon the fundamental question as to the sanity or insanity of the alleged lunatic. Upon this point we think it only just to observe that, with our present information, the presumption is that the Rev. Mr. HOLMES was insane at the time of his admission at Heigham Hall. But further, in order to substantiate the imputation of corruptly employing the machinery of the Lunacy Laws to rescue a person charged with a criminal offence from the law, it is necessary to show that the Rev. J. HOLMES, the brother of the alleged lunatic, who signed the order for his admission; that Messrs. TAYLOR and GILLET, who signed the medical certificates; and that Messrs. NICHOLS and WATSON, who received Mr. HOLMES into their asylum, did what they did respectively, *not believing him insane*. It is true that sufficient grounds may not exist to satisfy the public mind as to the insanity of the alleged lunatic. We cordially agree with Mr. PALMER in not “pinning our faith upon the report of any Commissioner in Lunacy whatever.” But still we discover nothing in what has transpired to show that Messrs. NICHOLS and WATSON did not believe Mr. HOLMES to be insane. We find that they possessed, at least, the legal evidence that the patient they were called upon to admit was a proper person to be confined. We are not entitled to assume out of what has transpired that the proprietors acted corruptly in receiving into their asylum a person duly certified as insane.

With reference to the second charge, that they have been guilty of a breach of the Lunacy Act, in retaining a person discharged as a patient as a private boarder, we think there is even less evidence in substantiation. Viewing all the circumstances of the case, it cannot be denied that the sudden transition of the alleged lunatic from patient to chaplain, was calculated to give rise to suspicion and remark. But we have already seen that there was no concealment in the matter. The Rev. Mr. HOLMES was publicly announced as the chaplain; his appointment was known to, and at last tacitly sanctioned by, the Commissioners in Lunacy; and in a minute, made by the visitors in September, 1852, that is, immediately after the appointment, and signed, “P. MONEY, and E. COPEMAN,

M.D.” it is said “divine service is performed on Sundays, by “a clergyman of the Church of England, recently discharged “from the asylum, but now resident there.” The appointment may not have been the most eligible or the most unobjectionable, but it is clear that neither the Commissioners nor the visitors saw in it a breach of the Lunacy Laws.

But, although we cannot in justice to the proprietors of the asylum withhold our opinion that they have been prematurely, and perhaps unjustly, assailed, we still think that further inquiry is essential. It is due to the proprietors themselves. In a letter, addressed to the *Daily News*, they challenge investigation; and they state, as an example of the prejudice and exaggeration surrounding the case, that the culprit or lunatic “never committed a rape at all.”

Should it be proved, after full, impartial, and *public* inquiry, that the charges adduced against the proprietors are well-founded, we shall not be slow to express our abhorrence of their conduct. But in the meantime we shall not allow ourselves to be diverted from the plainer and more profitable course of illustrating by this case the monstrous defects of the Lunacy Laws; of showing, by the history of this case, whether the alleged lunatic were insane or not, the fatal facility with which those laws may be made subservient to the foulest of purposes; how easy it is to pervert those laws into engines of oppression, to deprive the innocent and the sane of liberty, and to subtract the guilty from merited punishment.

These are the points which it most deeply concerns the public to discuss. The paramount duty is to examine and to remedy the defects of laws based upon a principle of injustice, and so constructed as to afford scope and facility for the most nefarious deeds. But for the iniquitous basis and construction of our Lunacy Laws, the offence charged against the magistrates of Wymondham, the brother of the alleged lunatic, the medical practitioners who signed the certificates, and the proprietors of the Heigham Hall Asylum, would have been impossible. When the inducement to prove insanity is strong, and the process easy and secret, bad deeds will surely be done. The end to be steadily borne in view is to remove the inducement, and to render the process difficult and public.

EVERY account from the seat of war adds fresh proof of the sad insufficiency of the medical department of the Army and Navy. It is in vain that we are told by the Medical Director-General at home that surgeons are attached to the forces in the proportion of one to ninety-seven men. It is in vain that the too true and circumstantial relations of the want of medical and surgical appliances for the wounded and sick in the Crimea are met by columns in the newspapers, setting forth the number of yards of bandage, adhesive plaster, the number of splints, the quantity of lint, &c., which have been sent out. It still remains a lamentable and disgraceful fact, that hundreds and thousands of the flower of our army have suffered and perished without the succour or the consolation that medical skill could have supplied. The special correspondents of the press have rendered an invaluable service to our soldiers and to the country by their methodical observation and regular reports of the condition of the troops. It is through their agency that we who are at a distance from the scene of action are enabled to judge of the wants of the army, of the shortcomings of the authorities, of the faults of system, and of the means by which effectual aid can be given. That the sanitary condition of the

forces is most deplorable cannot now be doubted. Every letter confirms the terrible fact, that pestilence marches with the army, destroying more than the foe. It is impossible to drive away the apprehension that, should the contest be protracted in the Crimea for two or three months, our forces will be fearfully reduced in numbers, and that the survivors will be so broken down in health and spirit, that, even if we escape a reverse, victory will only be achieved at a terrible cost. It will then perhaps too late be a matter of regret that the first great principle in strategy, the duty of preserving those who are to fight in vigorous health, has been neglected. In reviewing the events of the campaign even down to the latest accounts, while many, too many, victims are still doomed to fall, it is even now ascertained that the greatest losses the army has sustained are from sickness. If we may judge from the comparatively feeble efforts made to improve the medical arrangements of the expedition, we must conclude that the consequences of sickness are very imperfectly understood. It seems not to be considered that health is synonymous with strength and efficiency in an army. The loss of an able, disciplined soldier cannot easily be replaced. The loss of many able soldiers may break up or destroy the efficiency of a regiment. Of what avail is military science, if the materials for its exercise are wanting? It may be urged that disasters are inseparable from warfare; that sickness is one of the difficulties to be encountered; that the enemy is equally exposed to it. All this may be admitted. But we do not admit that those who have the conduct of war do their duty, or show the highest skill and foresight in their vocation, unless they bring into operation all the aid that science can afford in obviating the known causes of sickness. In what does the superiority of one army over another consist? Is not one element at least superior physical prowess and endurance? Is it not, then, a paramount and obvious duty to secure to our army this source of superiority? Can it be said that this has been accomplished to the utmost of our power?

We feel that we are insisting upon truths so palpable and familiar that we can hardly persuade ourselves that it can be necessary at the present day to revert to them. But truths are long familiar to science and the world before they become practically recognised by governments and take the name of action. The force that the science of Medicine can bring to the art of war is not yet understood. Until the art of preserving the health of individuals and masses of men under varying conditions of climate, of exposure, of food, and of epidemic influences be estimated as it ought to be, our battles will be fought at a needless cost of treasure and of life.

AMONGST other serious evils which result from the present unsatisfactory state of the laws which regulate the medical profession, is the disgrace brought upon the respectable members of that body by the false assumption of medical titles by rogues and impostors. The records of our Police Offices and Criminal Courts have afforded abundant evidence of the truth of this remark. How frequently has it occurred that an offender against the law has described himself as a "physician" or "surgeon," when, on inquiry, it has turned out that he has not the slightest pretension to such titles, and that he is repudiated by that profession? The public, however, generally altogether unacquainted with the anomalous state of the laws relating to the practice of medicine, regard the criminal as a

legitimate practitioner. Many of the public receive with incredulity the denial of the claims of such a person, and can scarcely believe it possible, in a country where property is protected so stringently and with so much jealousy, that a vagabond should be allowed by the law to assume a title by which he can plunder, without fear of punishment, the pocket of his victim, and destroy his health, without infringing the law. Yet such is the fact—a fact which cannot be too often repeated. The opponents of any change in the laws which relate to the medical profession will scarcely vindicate such a condition of things as this. If they are prepared, however, to justify the practice of fraud and imposture, they must be equally prepared to do away entirely with all medical instruction, and all examinations to test the qualifications of a practitioner of medicine. If there is to be free-trade because it is good, then surely the more unrestricted it be the better. What right has the Legislature to demand that a class of men, such as the qualified practitioners of this country, should undergo a long and expensive course of instruction, and be subject to severe penalties for malpraxis, and afford them no protection afterwards?

This is a question which must be answered, and that it will be so in a satisfactory manner in the next Medical Reform Bill, we feel assured.

### Medical Societies.

#### MEDICAL SOCIETY OF LONDON.

MR. HEADLAND, PRESIDENT.

SATURDAY, OCTOBER 28TH, 1854.

DR. ROGERS exhibited to the Society

#### THE UTERUS OF A FEMALE,

who died between three and four weeks after her delivery. It contained a nodule of flesh about the size and shape of a nut, firmly adherent to the posterior wall of the uterus. The female from whom it was taken had had nine children, the three last prematurely born about the sixth and a half month, and were accompanied with great hæmorrhage. Before her last accouchement, which appears to have been brought on by bodily fatigue, she caught a violent cold, which assumed the form of a severe attack of bronchitis subsequent to her delivery, which took place on the 21st of August. The labour was natural and favourable, the placenta being discharged of itself half an hour after. On examination, it was found very small sized, perfectly rounded, a fissure through its centre, but without any apparent loss of substance. The uterus contracted well, and for eight days Mrs. G— appeared progressing favourably, excepting the danger she was in from the bronchitis. On the 8th of September, while sitting up reading the newspaper, and listening to alarming accounts of cholera, violent hæmorrhage came on, which was subdued by tincture of the ergot. This again recurred on the 14th, and was arrested by matico and gallic acid. The cough was most incessant and violent, and to it was attributed the hæmorrhage, especially as on examination no cause was discovered, excepting a small coagula in the neck, which was then removed. On the 22nd it suddenly returned with great violence, producing extreme prostration, from the combined effects of which, and effusion into both lungs, she gradually sank three days after. On the third and last return of hæmorrhage, the uterus seemed forced down very low, and on examination a small fleshy nodule, high up towards the fundus, could be felt. During all this period no fetid or disagreeable discharges ever took place. Having been the only case of its kind that ever fell under Dr. Rogers' notice, he thought it not undeserving the attention of the Society, and desired their opinion of the fleshy nodule in the interior.

In answer to questions, Dr. ROGERS stated that the discharge from the uterus had not been fetid. The pulse became very rapid after the last attack of hæmorrhage, and continued so until death.

Mr. HEADLAND, Mr. W. ADAMS, and Dr. CHOWNE, ex-

pressed an opinion that the tumour was not placental, from the fact of there not having been discharge to indicate it, from the slender attachment of the tumour to the uterus, and its having no resemblance to the structure of the placenta. It was regarded as a fleshy or fibrous tumour of the uterus.

#### EXCISION OF THE ANKLE-JOINT.

Mr. HANCOCK exhibited a boy to the Society, ten years of age, in whom he had, three years previously, removed the lower ends of the tibia and fibula, and the upper part of the astragalus, for disease of the joint. The boy walks remarkably well, with scarcely any halting. There is considerable motion in the joint, and altogether the case was a most satisfactory instance of conservative surgery.

Mr. MILTON, in the absence of the author of a paper announced for the evening, at the request of the PRESIDENT read a paper on

#### THE TREATMENT OF INVETERATE GONORRHOEA AND GLEET.

He remarked that cases of this kind were far from being rare; every surgeon might meet with them occasionally, while statistics showing the number of cases cured, and of those not cured by medicines, were still wanting. Neither were there any means of arriving at a conclusion as to which remedies had proved most successful in curing cases which had resisted ordinary treatment. Authors had mentioned an immense variety of remedies, but they did not give exact rules for ascertaining to which particular class of cases they were applicable, or specific, clear, directions for making use of them. He thought all cases would become inveterate, if treated by specific remedies, when they had been thirty days under treatment without giving any signs of improvement; or when, after getting somewhat better in that time, they relapse without any manifest cause; still more probable was it that they would become inveterate, when worse at the end than at the beginning of thirty days of judicious treatment. His experience of these cases was, that not one in fifty would be cured by ordinary remedies. Ordinary remedies he called those usually recommended; extraordinary, those called for solely in inveterate cases, such as blisters, quinine, veratrine, bougies, and caustic. It might be objected that thirty days was a very short time, but in almost every case of cure, he had found that a sensible improvement was effected within this period. Stricture, too, might spring up while we were trying to arrest the discharge, and he did not think we were justified in giving such large and long-continued doses of powerful medicines. Copiba might bring on a most irritable state of the skin, kidneys, stomach, bladder, or bowels; alkalis might in time seriously damage the processes of nutrition. The materials for forming really useful and trustworthy rules of treatment were to be drawn from three sources:—1. The nature of the discharge. 2. The history of the previous treatment. 3. The absence or presence of complications. The history of the previous treatment required to be carefully gone into, for many cases lasted so long, solely from the patients' disinclination to conform to restrictions. Inveterate, purulent, or muco-purulent discharge, of whatever kind, was a difficult case to manage. He should, therefore, for the sake of explaining his views, divide the disease into four classes. 1. Neglected gonorrhoea, in which a cure is brought about by mild aperients and injections. 2. Inveterate gonorrhoea, in which there are severe symptoms, such as great pain on passing urine, and chordee; a free, purulent, discharge, &c. In long-standing cases of this kind, stricture, if not known to exist, was not necessarily to be suspected; for, when it complicated these severe cases, it usually became so bad at the end of a few months, as to declare its character quite clearly. It (inveterate gonorrhoea) was occasionally cured when treated like acute gonorrhoea in its early stage; most cases, however, only yielded to strong purgatives and blisters. Blistering has here the advantage, when the patient will not allow a bougie to be passed, that, if it fails, it convinces him that an instrument should be used. The author could not acquiesce in the opinion commonly taught, that a tendency in gleet to break out afresh, on indulgence, should make us suspect stricture; nor the view held by Jesse Foot and others, that gonorrhoea could not exist long without inducing structural change. 3. Muco-purulent gleet, with narrowing of the orifice, generally indicative of stricture. Indeed, this complication was found in every case except one, where the persistence of the disease was traced to fistula. The gleet, after stricture was cured, generally yielded to the use of a moderate-sized bougie, well warmed, with quinine and an aperient, the health of many of these patients being disordered, probably from so much medicine. Tender spots in the urethra were to be relieved by caustic and the use of Morson's veratrine.

4. Mild chronic gonorrhoea, owing to some peculiar disposition in the urethra, not curable either by ordinary treatment or blisters. Only three of these cases were met with; one was cured by caustic. 5. Pure mucous gleet—a, from the urethra, was rather rare. It was unaffected by any remedies the author had seen tried; various astringent injections had been employed without success, green tea amongst the number. β, Prostatic and vesical gleet were passed over. He (Mr. Milton) totally disbelieved in the influence of diathesis, and could not trace the peculiarity of the discharge remaining uncurable to the habits of the patients; he thought it resulted from an in-born infirmity in the secreting apparatus of the urethra, where alone inflammation could go on for years without producing structural change, from an imperfect evolution of call and fibre. Every case of purulent discharge was essentially curable, and, if uncomplicated, curable by blistering. In twenty-one cases this remedy effected a radical and permanent cure, in nineteen of which all other treatment had failed. One relapsed from fresh infection; one lived at a distance, and when last seen was cured, but could not be traced. In seven of these the disease had lasted from one to six years and a half. Mr. Hall, of Leeds, and Mr. Acton, had tried the plan with success. There were ten cases in which blistering had failed; in seven of these (further examination by the bougie being only submitted to in some instances, after failure with blisters) stricture or abscess in the perineum was actually present, or ensued shortly after. One of the remaining three was cured by caustic; one left uncured, but relieved; one was pure mucous gleet, which, like all such cases, seemed not to be affected by any remedies. As a complication, abscess of the perineum offered the most unsatisfactory results, only one case out of five being completely cured. The treatment of these cases in which stricture was detected before resorting to blisters, was omitted; as was also that of pure mucous gleet, except in the one case alluded to, it being a mild, harmless form, which would die away if left to itself. The author concluded by saying that his aim was to bring the subject before the fellows, and leave it to them to say which was best, the old treatment, or the new.

The PRESIDENT made some remarks on the poisonous effects which occasionally followed the use of copiba, particularly the eruption of the skin, &c. He alluded to a mucous discharge from the urethra occasionally occurring at stool, which appeared to be dependent upon the state of the bowels, and removable by purgatives.

Mr. HANCOCK could see no utility in such a minute division of cases of gonorrhoea. Neglected cases occasionally presented themselves, and were obstinate; but he had not found so much difficulty in effecting a cure as the author appeared to have done. The mucous discharge mentioned by the President he believed to be the result, in many cases, of subacute inflammation of the prostate from masturbation. Many cases of gonorrhoea were made obstinate by an early resort to copiba and inattention to the state of the bowels. He alluded to a discharge connected with or preceding gout, which was most controllable by doses of colchicum.

Dr. CHOWN made some remarks on gonorrhoea and purulent discharge from the urethra occurring without any previous impure connexion. Married men occasionally consulted us respecting such a disease, and great caution should be exercised by the medical attendant in expressing an opinion upon its nature. Such discharges often arose from constitutional and other causes independent of infection, and much domestic misery might arise in such cases by giving a hasty and erroneous opinion respecting them.

Mr. WREEDON COOKE had seen much of gonorrhoea, and regarded, in obstinate cases, the constitutional treatment of the disease as the most effective. Change of air, particularly to the sea-side, would often effect a cure when all other remedies failed. Blistering was a severe remedy, and should not be resorted to hastily; as a local application, he had found an injection of half an ounce of liquor plumbi to three ounces of water a very effectual application. Discharges from the male might result from a woman having leucorrhoea or the catamenia upon her at the time of coition.

Mr. HUNT had found cases of gonorrhoea more readily controllable by salines and gum arabic than by copiba or canbala. He mentioned that he had seen two or three cases of ardor urinae, accompanied by purulent discharge, follow the use of arsenic in small doses.

Dr. TYLER SMITH had found that when purulent discharge in the male was produced by leucorrhoea, the latter discharge contained a considerable quantity of epithelial scales.

After a few remarks from other members, the Society adjourned.

## NORTH LONDON MEDICAL SOCIETY.

MR. NORMAN IN THE CHAIR.

WEDNESDAY, OCTOBER 25TH, 1854.

MR. QUAIN placed before the Society a piece, about three inches long, of a gum elastic bougie, which he had removed from the urinary bladder of a young man. The patient had suffered about three years from a narrowing of the urethra, which originated in gonorrhoea, and for a good part of that time he himself had been in the habit of passing a bougie. At length the instrument broke in the canal, and he felt the fragment slip into the bladder. The journey to London was a long one. Three days had elapsed from the occurrence when he came to Mr. Quain. At first, an effort was made to withdraw the foreign body with slender forceps, but though grasped, yet apparently from being taken hold of in the transverse direction, it slipped away when drawn to the urethra. The idea of removing it in this way was soon abandoned, the more so on account of severe pain, complained of in the left side of the loins, affording evidence of an inflammatory state of the left kidney. The operation as for the removal of a calculus was decided on, but delayed because of this pain. Leeches and hip-baths being used, and relief obtained by these means in a couple of days, the operation was performed on the sixth day after the accident. The incision through the integument was a short one; the prostate was left untouched. The bougie was found lying transversely above the orifice of the urethra towards the pubis. From this position it was hooked down with the finger, so as to be seized with a pair of straight forceps which had been used in lithotomy upon children. The patient got well rapidly. The urethra too was so completely restored to a healthy condition, that a bougie (No. 11) passed easily in a short time. Mr. Quain added, that as from the nature of the foreign body there is a want, in such a case as this, of any assistance which the clear click gives when a stone is struck with a metallic instrument, as well as of the aid afforded by the feel of a firm body under a sound, the removal of the piece of bougie per urethram, softened as it is by residence in the bladder, must be a matter of chance, depending upon the mode in which it is seized. He thought it of importance, in assuring the safety of the patient, that the prostate should not be incised in any degree.

Mr. S. ALFORD read a case of

## PERITONITIS CAUSED BY IMPACTION OF HARDENED SCYBALA IN THE VERMIFORM APPENDAGE.

A little boy, aged three years and a half, when first seen by Mr. Alford had been ill four days, complaining of pain in his bowels, and vomiting frequently; he was cold and pulseless, his breathing hurried, his manner wild and restless, but he was quite sensible; he vomited, sank back, and died twenty minutes from his being seen. On the post-mortem examination, the omentum, stomach, large intestines, and margin of the liver, were found covered with recently-deposited lymph. The vermiform appendage seemed the source of this peritonitis, for here an ulceration and perforation was found communicating with the peritoneal cavity; between the perforation and the cæcum were three small, hard, dry portions of feces, of the colour and consistence of half-dried clay.

## A CALCULUS EXTRACTED FROM THE SCROTUM

was presented by Mr. WARD, of Bodmin, removed from Patrick M—, a seaman, aged sixty-four. About three years before he came under Mr. Ward's care, lithotomy had been performed, and a large calculus removed from his bladder. It would appear, from the man's account, that the incision healed without observed complication or unusual symptom of any kind. Six months subsequent to this operation he began to suffer occasional pains in the scrotum; these recurred with varying frequency, but not at first with much severity, and upwards of two years elapsed before he applied for relief. On examining the seat of pain, Mr. Ward found a hard, roundish tumour simulating, both in size and appearance, a third testicle; closer examination led to the detection of a body of stony hardness impacted in the scrotal cellular tissue. The pain and inconvenience having become severe, an incision was made, and the calculus extracted with forceps. The stone has been accidentally broken into three fragments; when extracted, it was ovoid in shape, its dimensions one inch and a half by one inch; it presents no very distinctive character, and had evidently been formed in the urinary bladder. Nothing could be elicited from the patient which could assist conjecture as to

either the date or mode of its transit from that viscous to the situation in which it was ultimately discovered. The case went on favourably to recovery; the incision soon healed, and there had been no return of calculous disease.

Mr. COUSINS suggested that this might be a case of phleboliti. An animated discussion ensued, when a committee, consisting of Messrs. Adams and Erichsen, were requested to examine the specimen, and report upon it.

Mr. COUSINS related a case of

## PAINLESS LABOUR.

He was called, on October 18th, to a lady, aged twenty-six, eight months gone in her first pregnancy, who had been exerting herself during the day preparing for a dinner-party. At half-past five P.M., a sudden gush of liquor amnii took place, carrying down the funis of a child, this was replaced, but again descended in ten minutes; it ceased to beat, and the os uteri being readily dilatable, Mr. Cousins turned the child. No sensation of pain had occurred until this operation, which gave rise to some slight suffering: the child, a small one, was easily expelled by the expulsive efforts of the uterus; throughout this there was no pain besides that described above. When asked during the uterine contractions, she averred, without any falter of voice, that she felt no pain whatever. She gave directions which were required, and sustained an easy flow of conversation. Mr. Cousins watched the descent of a second child, a healthy, strong boy, the passage of whose shoulders alone caused pain: during the uterine contractions, she, now that her attention was aroused, "felt, as it were, a band pressing about her," but nothing more; and she recollected that, for twelve hours before she sent for him, she had more than once remarked to a servant, "how tight she felt all at once." Throughout the day the characteristic mucus had been abundant.

Mr. COUSINS read a case of

## RENAL DISEASE, CAUSING PROLAPSUS ANI, AND SIMULATING CALCULUS IN THE BLADDER.

J. H—, aged eight months and a half, was moribund when first seen, and soon expired: it had suffered eight days from dysentery. The child had been born in India, whence it arrived two months previously; had been brought up on artificial food; had had no ailment from his birth until the present illness; had never had diarrhoea, or other faulty condition of the stools; had never had any medicines; but, from the age of one month, he strained when at stool or urinating, and latterly the bowel came down during micturition, the prolapsus first becoming permanent during this illness. It appeared thus that the usual course of this by no means rare occurrence was absent, and the history suggested, as a cause, irritation of the neighbouring organs, presumably of the bladder. Blood had not been ascertained to have passed in the urine. At the post-mortem examination, the bowel was found much prolapsed, and extensively ulcerated; the mucous membrane throughout the colon and rectum softened to a greyish pulp, with numerous abraded patches, and general vascular redness. The prepuce was very long, and abraded at its extremity; the testicles were in the inguinal canals. The bladder was empty, its parietes peculiarly muscular and thickened. The right kidney contained a large quantity of sabulous matter; the left a yet larger quantity, together with some small calculi of urate of ammonia. Its texture was peculiarly firm; the capsule adherent; and at one extremity the incision laid open a small cavity containing pus.

Mr. BALY read a communication upon the

## TREATMENT OF CERTAIN FORMS OF CONSTIPATION.

A young lady came under his care in the autumn of 1853, anæmic, and of feeble constitution; had been troubled with habitual constipation from childhood; from the age of fifteen had constantly had recourse to large doses of aloetic aperients, and for many years had not had an action of the bowels without their aid. Latterly she had frequently used injections, but these now fail frequently, and at the present time she generally obtains relief, every three or four days, by a dose of blue-pill and colocynth at night, followed by an enema in the morning: the latter frequently requires to be repeated. She complains of great debility; inability to make exertion, mental or bodily; temper irritable; spirits depressed; pulse feeble; catamenia regular, but pale; frequently suffers from cold extremities; appetite small. When the bowels have not acted for three or four days, she suffers from a sense of fullness and distention of the abdomen; she frequently, after an evacuation, suffers for some hours from severe prostration. In this case, Mr. Baly revived the treatment proposed by Dr. Strong in 1842, it being evident that the continued employment of any form of aperient would be hurtful. Having, as a preliminary measure,

cleared out the bowels with a dose of blue-pill and colocynth, followed by an enema, he ordered sulphate of zinc, five grains; bread-crumbs, sufficient for a pill, to be taken three times a day, immediately after each meal. This was continued for ten days, without causing sickness, and with decided relief to the abdominal distention; the appetite improved; the listlessness decreased. No evacuation of the bowels occurred from the second day till the tenth, when the following was administered: calomel, four grains; compound colocynth pill, six grains: make a pill, to be taken at bed-time, followed by a black draught in the morning. On the day following this, the bowels acted spontaneously; and from that time until now, nearly twelve months, have been relieved daily without aperients or enemata. The use of the sulphate of zinc was continued for three weeks, and then gradually exchanged for sulphate of quinine. A curious fact deserved notice in this case. For some time after the discontinuance of enemata, the patient was not sensible of the action of the rectum during the passage of *fecæ*. Other cases were cited in support of this treatment, the use of which Mr. Baly limited to cases dependent upon want of tone.

Mr. HAINWORTH exhibited a canula, which he had first used sixteen years ago, for the removal of fragments from the bladder after lithotomy.

## Correspondence.

"Audi alteram partem."

### THE LATE DR. ROUPELL AND THE THIRD YEAR'S STUDENT.

To the Editor of THE LANCET.

SIR,—An unfortunate mistake, which is susceptible of very considerable misconstruction, occurs in my letter which you were so courteous as to publish in the last number of your periodical. It is an error which no doubt, in the haste with which I was forced to write, crept through inadvertence into my own MS. The blunder to which I refer is as follows:—"Had not my name of late been so frequently associated, both privately and publicly, with the contributions of the 'Third Year's Student,' it would misbecome as well as be unnecessary for me to notice the remarks to which I refer; but the profession is cognisant that such is not the case," &c.

I had intended to write—"but the profession is cognisant that such is the case." You will pardon my importunity if I request you to insert this explanation in the current number of THE LANCET, as the unfortunate insertion of "the particle of negation" changes the entire significance of the sentence, and renders me liable to much misconception.

I have the honour to be, &c.,

H. CHALMERS MILES, M.R.C.S. Eng.

Dowlais, Glamorgan, October, 1854.

### THE LATE PESTILENCE.

To the Editor of THE LANCET.

SIR,—Having for some weeks past had many cases of diarrhoea and cholera under my care, and in all of them found that a particular state of the digestive organs preceded the diarrhoea and cholera, I wish, through your columns, to draw the attention of the profession to this state, that other observers may be able to verify its presence in other quarters where cholera has prevailed, should such have occurred in their experience. It has been so universal in this district, so uniformly present in every case of diarrhoea and cholera, that I look upon it as something more than an accidental circumstance, or a mere state of borborygmus from error in diet. It may be a state of the system which predisposes to the cholera poison, or it may be the first effect of that poison on the system—the stage of invasion; I do not pretend to determine which; but I look upon it, and treat it, as the great appreciable symptom of an impending attack of cholera. The following is the state to which I allude:—A person, apparently in a state of robust health, feels suddenly a rumbling sensation at the stomach, with sickness or faintness, followed by a rushing through the bowels, as of air and fluid, all the while apprehensive that he is about to have a copious liquid stool; at once the rumbling ceases entirely, and he finds that his fears have been groundless; there are no eructations; there may not even be any escape of flatus, or if there is, it is frequently free from fœtor. Again and again the same rumbling is repeated, it may be at

long intervals, but sooner or later it is followed by diarrhoea, frequently terminating in cholera.

I dare say that many of the profession may be disposed to look upon this state as a trifling matter, and consider it nothing more than simple flatulence, easily removed by any of the cordial tinctures. Some may think that I am endeavouring to give it undue prominence as a premonitory symptom of cholera, which I firmly, however mistakenly, believe it to be. I do not know whether others may have remarked this state to exist previous to the appearance of cholera. I write for the purpose of drawing attention to it, of inviting communications on the subject, and of eliciting from other observers whether they have witnessed it in other localities where cholera has appeared; and, if so, may I not with confidence inquire,—are we not in a condition, have we not sufficient indications, to enable us to avert an attack of cholera altogether, and thus remove one of the reproaches of our profession? Apologising for the length of my communication, I have the pleasure to be,

Yours sincerely,

M.D.

Oct. 1854.

P.S.—I enclose my card and address.

### UNQUALIFIED PRACTITIONERS.

To the Editor of THE LANCET.

SIR,—An idea I have long entertained is confirmed by the case of Brownridge, in THE LANCET of October 28th, and with your permission I will submit it to your consideration. It is this, whether it would be advisable that every medical man who loves his profession should be requested to send you the names of all those unqualified individuals practising in his locality, thereby furnishing you with valuable statistics in case they should be required at the next reading of the "Medical Reform Bill," and also forming for ourselves a data of the loss we (as a profession) sustain from these encroachments by uneducated and unqualified persons.

May I ask you to place this suggestion before the profession through the medium of your widely-circulated journal; and if adopted by my medical brethren generally, I shall be happy to transmit to your office a list of names from my own immediate neighbourhood.

I am, Sir, yours very truly,

MEDICUS.

October, 1854.

### THE EASTERN WAR.

A PROPOSITION TO SUPPLY OUR ARMY WITH AN EFFICIENT STAFF OF SURGEONS.

To the Editor of THE LANCET.

SIR,—Would it not increase the country's confidence in the young surgeons volunteering for the East, and pave the way for rescinding the foolish regulations of the unprofessional medical boards, viz., that of the Admiralty, &c., if they each took out a certificate of competence, granted after a careful examination by that eminent authority in military surgery, Mr. Guthrie, in the presence of either his colleagues or a few distinguished men of the nation? Mr. Guthrie would, perhaps, feel himself not authorized to do so. But who could censure him? not the profession, for they would be only too glad of his services, and would appreciate his painstaking as they already do his comments on military surgery, and I am sure it would go to the very heart of the young men themselves, feeling that that eminent man was satisfied of their ability before despatching them to the East.

I remain, Sir, yours most obediently,

A PATRIOT.

### THE WAR.

(FROM OUR OWN CORRESPONDENT.)

H.M.S. "NIGRA," BALAKLAVA, OCT. 7TH, 1854.

THE morning after the battle I landed at half-past six o'clock; and such a scene! it is impossible to describe it—the groans of the wounded, the ghastly stillness of the dead, was something horrible to witness. Seeing that our own wounded were being attended to by their own medical officers, I went to the Russian side of the field, and worked hard for some hours, cutting out balls, putting on splints, and, what was a greater boon to them, giving a little brandy and water (which I carried with me for the purpose) "to slake their dying thirst." When I had expended all my supply, and quite exhausted from stooping so much over

the wounded men, I was passing on, trying to avoid the anxious looks of the poor fellows, as I had nothing more to give them, when I heard a mournful voice cry, "Monsieur! monsieur!" I turned, thinking a Frenchman had fallen there, when I saw a young Russian soldier, quite a boy, lying on his face, evidently badly wounded. He spoke French and German fluently, and, from his beseeching look and interesting face, I could not find it in my heart to leave him. I cut his clothes off, and examined his wounds, and the poor little fellow was so anxious to know if I could save his leg, which had been broken by a ball, (the left thigh was broken, and the ball lodged; another passed over the right knee-cap, and a third went through his right arm,) that I was obliged to say "yes," and from that moment determined to do everything I possibly could for him. After some trouble I managed to get a stretcher for him, and had him carried down to the village, and from there to the beach. I knew if I left him for a moment that he would be bundled anywhere, as they were carrying all the wounded on board the ships, and such a scene as the beach presented that evening. Men actually dying and left dead upon the sands; hundreds of wounded lying on the shore, where they had been brought from the field for embarkation; crowds of boats taking them on board, and the noise and bustle of their crews engaged in the operation presented a scene of confusion not to be described. With a good deal of difficulty I succeeded in getting my poor little wounded Russian on board the *Colombo*, one of the ships appointed to receive the wounded. The next thing was to get him a cabin, and by telling the chief officer of the ship that he was a young Russian officer, and that Lord Raglan wished them all attended to, he said that I might have everything for him that I wished. After getting him into a comfortable cabin, and dressing his wounds, I returned on board the *Niger*, having been thirteen hours on the field without eating or drinking, for I started in the morning before breakfast. The next morning I returned to the *Colombo* with some linen for my protégé, and while there our Medical Inspector of the Fleet came on board, and said, as they could not get army medical officers, he had orders from the Commander-in-Chief to send naval medical men with the wounded to Scutari, and that as I was there he would send me; so that, as luck would have it, I was still to remain with "Nicolas Klousheu," for that was the name of my young Russian. He is a cadet in the Russian army, and had not served his full time for a commission. His father, he told me, is secretary to the Military College at Moscow. I forwarded a letter to him from his son, written in French, in which no military news was mentioned more than that they had had a battle, the Russians retreated, and he was left wounded in the hands of the enemy. Fancy about 650 wounded officers and men, including the Russians, on board our ship, and only three doctors to attend them, myself and two others! I assure you we were working day and night, not even time to sit down to dinner. Nothing but cutting off arms and legs all day long. I had more operations during that time than any London surgeon in a twelvemonth. We could not operate fast enough to save all the wounded on board. I had one amputation of the shoulder-joint, and as for thighs and legs I left off counting them. I had one most extraordinary case. A man named Hackett, I think belonging to the 33rd Regiment, was struck with a ball on the anterior edge of the tibia, in an oblique direction from above downwards. Strange to say, the ball was cut in two by the bone; one half lodged on the inner side of the tibia, and was cut out on the field by the surgeon of the regiment, who must have fancied that no more entered; the other half I found on the outer side of the leg, and, on cutting it out, was struck with its appearance, as if freshly cut, and evidently by its own velocity, from the edge of the cut which struck first being indented, and the opposite edge prolonged out. If you can understand my explanation, to prove the case, there was only one opening in the first instance, so that only one body could have entered; that opening was round, and corresponding to all wounds made by round bullets. It was also situated over the sharp anterior edge of the tibia, and the two halves of the same ball were cut out from exactly opposite points of the leg. Guthrie mentions (if I remember right) a similar case, but occurring on the nose. I have preserved the half that I cut out. The men who I cut bullets out of generally wished to keep them, and I of course always gave them to them; but I have managed to keep some, and will send you one as a relic of the battle of Alma. I also took a ball out of Colonel Webber Smith's leg, of the 95th Regiment, but he retained his as a trophy. Having seen all my patients safely lodged in the barracks at Scutari, not forgetting poor little Klousheu, I tried to get leave for him to be attended to privately, but the commandant could not grant it. Dr. Glascott, of Constantinople, kindly told me he would take

charge of him, but the application failed; however, he gets everything he requires at Scutari. I returned by the *Beagle* gun-boat to Sebastopol, and joined the fleet; but my ship was round in Balaklava, and I got a passage to her that night in the *Sans Pariel*. Since my arrival I have been twice up to the camp, and had a splendid view of Sebastopol. The day before yesterday, when I was up, a shell burst in the camp of the 68th. I was standing a little distance off with the 44th, and crossing to see what damage the shell had done, I had to cross a slope that was exposed to the Russian battery, when—whiz—went a shot, and struck within five yards of me. I immediately altered my course, not knowing but it was a shell. However it did not burst. On getting up to the 68th camp I found two men had been killed and two wounded by the explosion of the shell, the occasion of my visit. I was very much pleased yesterday to get a letter from our Medical Inspector of the Fleet, returning me thanks for my services to the wounded.

**SURGEON FOR THE EAST.**—C. R. Nicholl, Esq., surgeon in the Grenadier Guards, has taken his departure, with a detachment of his regiment, for the East. Previous to his departure, the soldiers who have been placed under his charge presented him with a suitable testimonial in appreciation of his kindness and attention to them whilst in England, and they feared that the chances of war might deprive them of another opportunity of evincing their respect and esteem for their medical officer.

## THE CHOLERA.

RELATIVE to the progress of cholera in the metropolis, we condense the following from the "Weekly Return" of the Registrar-General for the week ending October 28th:—

Districts.	Elevation above water mark.	Population (1851).	Deaths from Cholera.
Northern (Marylebone, &c.)	135 feet	490,396	3
Central (St. Giles, &c.)	49 "	393,256	11
Western (Kensington, &c.)	28 "	376,427	10
Eastern (Shoreditch, &c.)	26 "	485,522	12
Southern (St. Saviour's, Lambeth, &c.)	6 "	616,635	30
			66

Of these 25 were below 15 years of age; 32 between 15 and 60; 9 above 60 years old. 46 persons are stated to have died from diarrhoea.

From the present Returns it will be seen that the cholera epidemic in London is, for this season, quickly passing away, and that the total mortality has nearly resumed its former position.

The deaths by cholera in the three months of July, August, and September, throughout England and Wales, have been 15,687; by diarrhoea, 11,135; or 26,722 by the two forms of disease. The epidemic has exhibited less intensity than it did in 1849; and although diarrhoea has been apparently as prevalent, or at least as fatal, the deaths by cholera have been less by 28,234 than the deaths by the same disease in the three summer months of that year. The mortality from cholera and diarrhoea is less by one-half than it was in 1849.

The districts in what was called the London Cholera Field have suffered most severely; and there it is known that, though some sanitary improvements have been projected, they have only in a few instances been carried out.

Liverpool has been attacked by the epidemic, but the deaths by cholera in that town and its suburbs (the districts of Liverpool and West Derby) have hitherto been 953; whereas the deaths by cholera in the corresponding period of 1849 were 4545. Liverpool has a Health Officer; and certain sanitary measures have been carried into effect. The authorities of the town deserve credit for their successful efforts in the improvement of the health of Liverpool.

Deaths by the epidemic cholera have, during the three months, occurred in every county except Herefordshire, Rutlandshire, and Westmoreland; but many districts have escaped hitherto, and a few, such as Merthyr Tydfil, have suffered or are still suffering severely.

The diarrhoea, which was so fatal in Birmingham, Manchester, and other districts, where few deaths are referred to cholera, requires investigation; it is undoubtedly, in the majority of instances, a modification of choleraic disease.

## Medical News.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

*Thursday, October 26th, 1854.*

BENNETT, EDWIN, Dorchester.  
HALSE, CHARLES SMITH, London.  
MARSTON, JEFFERY ALLEN, Newcastle-on-Tyne.  
SHARPLEY, THOMAS, Louth, Lincolnshire.  
SMITH, MATTHEW BASS, Louth, Lincolnshire.

*October 20th.*

HOFFMAN, OCTAVIUS WILLIAM, Queen-street, Ipswich.

**ROYAL COLLEGE OF SURGEONS.**—From the annual account of the receipts and disbursements of the College, just published, it appears that the former amounted to £13,692 6s. 6d., and the latter to £18,992 10s. 7d., being an excess of £5300 4s. 1d. over the receipts. The principal sources of revenue arises as heretofore from the Courts of Examiners for the diploma of Member and License of Midwifery, amounting collectively to £9619 16s. Not the least important item is that arising from the sale of the Fellowships, which, during the past collegiate year amounted to no less a sum than £998 10s. From a summary of the account now presented to the members, it appears that the incidental income is £12,627 1s., and the incidental expenditure £14,685 15s. 3d.; whereas the permanent income is only £1065 5s. 6d., arising from dividends on investments in Government securities; and the permanent expenditure is £4306 15s. 4d., being an excess over the income of £3241 9s. 10d.

**THE FELLOWSHIP.**—From an analysis of the last published list of Fellows of the Royal College of Surgeons, it appears that there are only 192 who have undergone the examination for this honour, whereas the number who have gratified their ambition for this distinction by the payment of ten guineas, amounts to 757, increasing the exchequer of the College by nearly £1000. The total number of Fellows by examination and election therefore appears to be 949. The Licentiates in Midwifery, all of whom are also Members of the College, amount to 184.

**NORFOLK AND NORWICH HOSPITAL.**—At a meeting of the governors, held on Saturday last, Mr. W. Cadge was unanimously elected assistant-surgeon to the institution. Mr. Cadge, the personal friend and professional assistant of Mr. Liston at the time of the great surgeon's death, formerly held a similar office at University College, but resigned it in consequence of the state of his health. We congratulate the governors of the Norwich Hospital on this appointment, which is eminently calculated to support the established surgical fame of their institution. Mr. Frith was unanimously elected to the office of surgeon.

**THE MYSTERIOUS POISONING CASE AT COULSDON.**—PRESENTATION OF A TESTIMONIAL TO MR. BOTTOMLEY BY THE INHABITANTS. —In December last, it must be in the recollection of the reader, much sensation and horror were produced in the neighbourhood of Coulsdon and Croydon through the death of a whole family, named Atlee, consisting of a man, his wife, and three children, under very sudden and mysterious circumstances. The bodies had been all interred, an inquest having taken place on one of them without the usual post-mortem examination having been made, the cause of death being attributed to natural causes; but Mr. Bottomley, an experienced medical man, of Croydon, was of a very far different opinion; and, notwithstanding that several of his professional brethren had stated that the family died from natural disease, he very properly communicated with Lord Palmerston, informing the noble Home Secretary of his strong conviction that the deaths arose from some irritant poison. The result of that communication was his Lordship directing the exhumation of one of the bodies, and a proper analysis to be made, the consequence of which was that poison—arsenic—was discovered in the stomach, and which accounted for death. It could not be elucidated how the poison got into the stomach, whether by mistake or intentionally; although there was a strong suspicion that the unfortunate father, driven by poverty, first poisoned his family, and then terminated his existence by the same means. After the investigation, which eased the public mind of so much doubt and uncertainty, the inhabitants determined upon presenting the originator, Mr. Bottomley, with a suitable mark of their respect, for the active part he had taken in bringing to

light the truth. Accordingly, last Saturday, the day fixed upon for the presentation of the testimonial, in the shape of a beautifully-chased teapot and salver, the friends and admirers of Mr. Bottomley assembled at the "King's Arms," Coulsdon, where they sat down to dinner; and after the cloth had been removed, the testimonial was presented, with the usual complimentary remarks from the chair. Upon the salver was inscribed—

"Presented to GEORGE BOTTOMLEY, Esq., F.R.C.S.E., in testimony of his great professional skill and zealous conduct in detecting the real cause of the mysterious deaths of John Atlee, his wife, and three children, at Coulsdon, by arsenic poison, in December, 1853."

Mr. BOTTOMLEY, in returning thanks, observed that the whole of the expenses attending the last investigation, the exhumation, &c., were paid out of the private purse of Lord Palmerston. Mr. Robinson proposed the health of the noble Home Secretary, who was ever ready to come forward to do justice, and whose conduct in that particular case was deserving of the highest praise.

The toast was drunk amidst cheers, after which other toasts were given, and the interesting proceedings terminated with a warm vote of thanks to the chairman, Mr. ROWLAND, of Coulsdon.

**NAVAL AND MILITARY INTELLIGENCE.**—A court-martial was held last week on board the *Victory*, in Portsmouth Harbour, to try Mr. David Ormond West, assistant-surgeon of H.M.S. *Victory*, on charges of *drunkenness and disobedience of orders*, which charges were duly proved, and the prisoner was sentenced to receive *three months' imprisonment in the county gaol*, and to be dismissed H.M. service.—*The Times*.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, OCTOBER 28TH.**—In the week that ended on Saturday, the number of deaths registered from all causes was 1228. In the ten corresponding weeks of the years 1844-53 the average number of deaths was 952, and, with a correction for increase of population, 1047. The excess of last week is 181. The deaths from cholera have fallen to 66; those from diarrhoea are 46.

## Obituary.

**DEATH OF DR. GOLDING BIRD.**—On the evening of Friday, the 27th ultimo, this excellent and accomplished physician breathed his last. For some months past his failing health had obliged him to relinquish all professional exertion; and in June last he finally left London to seek repose, though not health, in retirement at Tunbridge Wells. Although he had long suffered from affection of the heart, the immediate cause of death was connected with kidney disease, and thus he fell a victim to a malady, to the elucidation of which the greater portion of his professional life had been devoted, and in the diagnosis and treatment of which he had been one of the greatest authorities. We shall give a brief memoir in our next.

We have to record the death of Mr. BURNSIDE, the able and well-known surgeon of Dumfries. After a professional visit on Saturday, the 14th of October, he was seized with paralysis, under which he rapidly sank, and breathed his last on the following Wednesday. Mr. Burnside studied at the University of Edinburgh, commenced as a practitioner in Maxwelltown, and subsequently settled in Dumfries. Besides his private practice in this town and vicinity, he acted as medical officer under the parochial boards of Troqueer, Terregles, and Irongray, and his time and energies were thus mainly absorbed by the laborious duties of his profession. Though this was the case, he found occasional leisure to devote to the recreations of art and literature. The kindly qualities, combined with his skill and experience, rendered him a most acceptable visitor of the sick, to whom soothing words and gentleness of demeanour are sometimes of more use than medicine, and can rarely be well spared from a doctor's recipe. Mr. Burnside has descended to the grave deeply deplored and lamented by the wide circle of friends and acquaintances amongst whom he lived so usefully and honourably.

On the 30th ult., on board H.M.S. *Apollo*, on his passage from Balbek to Balaklava, of cholera, brought on by the excessive fatigue in the discharge of his arduous duties after the battle of the Alma, FRANCIS C. HUTHWAITE, Esq., surgeon of the 3rd battalion of the Grenadier Guards. The deceased gentleman was appointed to the above regiment in 1845, and ranked as a full surgeon in the army.

On the 28th ult., THOMAS COLBORNE, Esq., surgeon, at his residence, Brentwood, aged sixty-seven.

On the 6th ult., after a few hours' illness, JOHN MACKAY, M.D., of 17, Nelson-street, Edinburgh. The deceased gentleman was parochial surgeon of the North-Western District of Edinburgh City; Ext. Mem. Roy. Med. Soc.; Mem. Edin. Med. Chir. Soc.; Mem. Edin. Obstet. Soc.; and Mem. Med. Soc. Paris.

On the 27th ult., at his residence, Islington, aged thirty-nine years, GEORGE GOULD, Esq., surgeon, formerly of No. 1, Lansdowne-terrace, New Brompton, London.

At his residence, 10, Laura-place, Bath, after a protracted illness, borne with great resignation and patience, ALFRED AUGUSTUS HARVEY, Esq., M.D., aged seventy-one.

## TO CORRESPONDENTS.

IN consequence of the early hour at which *THE LANCET* is necessarily sent to press every Thursday, there is not any certainty for the insertion of communications, not being advertisements, which are received subsequently to Wednesday morning's post.

### CHOLERA FLIES.

*Mr. G. Selwyn Morris.*—The observations which have appeared from time to time on cholera flies afford a striking illustration of the slender evidence which is by many deemed sufficient upon which to build up theories of the highest importance. What are the facts and what the theory in the present case? Certain observers, at different times and places, having, we presume, at the moment but little to engage their attention, and happening to gaze out of the window, have seen, either resting upon the glass or adhering to the bars of the window, stumpy dead flies. Cholera being rife at the time, and the minds of medical men being full of the notion that the cause of cholera was to be found in some fungus, animalcule, insect, or else poisoned state of the atmosphere, they have deduced, from noticing these flies, two important theories. Some believed them to be the cause of cholera, and others considered that the death of the flies was to be attributed to a poisoned condition of the air. Both of these are perfectly gratuitous assumptions, as is evident on bestowing a little consideration upon the matter. The flies in question are the common house-fly. They are to be found in the autumn of every year, in a dying state and dead, in great numbers; some adhering to the walls and windows, and others scattered about loose and unattached. The term of existence of house-flies is but short, and they nearly all perish in the autumn, the cause of death being apparently attributable to a fungus, the sporules and threads of which form the powdery-looking substance often seen lying around them, and by means of which they are attached to the walls or window-frames. The dead flies in question, then, are usually the common house-fly, and their death has no relation to cholera, except that of the mere coincidence, that cholera is generally most prevalent at the period at which the death of these flies ordinarily takes place—viz., in the autumn. Occasionally other species of flies may also be found lying dead, their death taking place from the same law and the same cause which determines the death of the house-fly.

*Mr. Carpenter's* communication did not arrive at *THE LANCET* Office until Thursday afternoon.

### COMFORTS FOR THE SOLDIER.

To the Editor of *THE LANCET*.

SIR,—In reply to the suggestion of your correspondent, "Walter Scott, M.R.C.S.E. & L.S.A.," will you allow me to refer him to Mrs. Glaeser's well-known and excellent directions as to the cooking of a hare? That practical lady says, "First catch the animal, then cook it;" and I also say,—first get your soldiers a supply of water, then wash their feet. In elucidation of my meaning, I would direct your correspondent's attention to an article in the *Illustrated News* of Oct. 28th, headed, "The Troops in the Crimea," page 408. I have the honour to be, Sir, your obedient servant,

DANDIE DINMONT.

*Medicus*, (Guy's Hospital).—The following extract is from Wilson's work on "Diseases of the Skin," and may supply the information required:—

"Depilatories are merely temporary removes of the hair; for it is clear that their agency can extend no deeper than the epidermis; the hair-pulp consequently remains, and the hair is not long in being reproduced. The following depilatory powder is the safest and best with which I am acquainted:—

℞ Soda hypophosphitis, 3iii.  
Calcis vivi, ʒi.  
Amyli, ʒviii.  
M. ft.

The powder, when required for use, should be mixed with water to the consistency of a paste, and, after being applied to the skin for one or two minutes, should be removed with a spatula or paper knife. I have seen deep and troublesome ulcerations produced by the incautious use of depilatories."—*M. Boudet, Journal de Pharmacie*, vol. xviii. p. 119.

*A Foreigner.*—The first meeting of the Royal Medical and Chirurgical Society will be held at 63, Berners-street, on Tuesday evening, November 14th, at eight o'clock precisely.

*Mr. Edward Cousins* is thanked for his polite communication.

*A Member of the Association, and Subscriber to THE LANCET.*—No notice can be taken of such a production.

*Pater.*—There is no cause for alarm. Such cases are common, and easy of cure. Apply to a respectable surgeon.

*M.D.*—The results of the treatment in the cases would be acceptable.

*Dr. G. Greville.*—We have received the extract from the *Bath Journal*, consisting of "Some Remarks on Diarrhoea and Malignant Cholera," and may take this opportunity of stating that we regard the publication of popular theories of, and remedies for, cholera as most objectionable and dangerous. From facts which have reached us, we have good reason to believe that the most disastrous consequences have resulted in very many instances from persons resorting to newspaper "remedies" in cases of bowel complaints, and postponing medical assistance until it is too late to be of service. In addition to the danger of public prescribing, it must also be regarded as most derogatory and unprofessional, and singularly open to the suspicion of having resulted from interested motives. It is only due, however, to Dr. Greville to state, that he has, in this matter, followed in the wake of others, some of whom, at least, ought to have set a better example.

*Mr. W. Miller's* valuable paper shall be published in an early number.

*Bath.*—Dr. Tunstall, we are informed, has given in his resignation. It is therefore unnecessary to pursue the subject further. A Medico-Ethical Association is the proper tribunal for such cases. There is no such society in the west of England.

*Dr. Bone* is thanked. We shall be happy to receive the reports of the cases. *THE LANCET* has been sent to Dr. Rutherford, in the Crimea.

A CORRESPONDENT informs us that a practitioner in Croydon, who has hitherto held a very respectable position in the profession, openly commends the homeopathic system, and treats those patients in conformity with it who prefer that fraudulent scheme.

*W.*—The article was good in every respect, but unsuited for a medical journal.

*A. B.*—The person does not belong to the profession.

*Medicus*—Indentures of apprenticeship are not absolutely necessary in all cases. A certificate of having served five years in the manner of an apprentice is, in some instances, received as sufficient.

*A. B.*—Dr. Richard King has offered, or intends to offer, his services to the Colonial Board, to descend the Great Fish River in search of the remains of the Franklin expedition; and if that Board declines the offer, then to the Admiralty Board.

*Mr. Wilkinson* should forward the paper.

*A Candidate, East India Service.*—Candidates are admitted to examination, although they may not have attended a Lunatic Asylum or an Ophthalmic Hospital. This alteration was made, we believe, to meet the cases of several gentlemen who have already commenced practice, and who cannot, without great sacrifices, obtain certificates of attendance. It will thus be seen that gentlemen in practice need not leave their vocations for three months to obtain the certificates in question on the bare chance of being amongst the successful candidates. If successful, however, they will be required to study Lunacy and Diseases of the Eye, and to give proof of their having done so before proceeding to India. The following notice has also been issued:—

"The Board of Examiners of candidates for the appointments of assistant-surgeon in the East India Company's Service give notice, that on the 6th of January, 1856, they will hold examinations at the East India House, for the selection of assistant-surgeons. The selection will be made according to merit, and it is expected that about thirty appointments will be awarded."

*Mr. Blacklock.*—Advantage has been taken of the notice forwarded. Our correspondent is thanked for the trouble.

*A Non-Medical Man*, (Dublin).—Such a course of proceeding would be highly objectionable, and would subject the party adopting it to a penalty of £20. There are many ways of bringing the matter before the public in a legitimate manner, provided the proposition is worth anything. We cannot advise further.

*THE* interesting memoir, by Dr. Knox, "On the Life and Labours of Bichat," shall be published in our next.

*Dr. Crooke's* (Chorley) paper, "On the Removal of a Fibrous Tumour from the Left Neck," has been received, and shall be inserted.

*The Smoke Nuisance.*—We are glad to observe that Lord Palmerston has given a very intelligible hint that he has resolved that the Smoke Nuisance Abatement Act shall not be a dead letter. With his accustomed energy, he has taken the matter in his own hands, and has directed the issue of a summons against Mr. Jonathan Keen, the owner of the saw-mills on the west side of Waterloo Bridge. The usual defence was, of course, put forward—namely, that in this particular case it was impossible to consume the smoke. The argument of impossibility, Mr. Elliott meets with the invincible reply—You must. So we suppose the impossible will be discovered to be possible. Let others take warning.

COMMUNICATIONS, LETTERS, &c., have been received from—Dr. Marshall Hall; Mr. Coulson; Mr. John Langley; Another Sufferer; Dr. Eade, (Bosfield, Norfolk); The Council of the Ethnological Society; Dr. W. H. Bone; The Secretary of the Whittington Club; A. B.; The Honorary Secretary of the Epidemiological Society; Mr. Chalmers Miles, (Dowdals, Glamorganshire); W.; Mr. Henry Wilkinson, (Rotherham); Mr. J. F. Tucker; Mr. Robert Birch; Dr. Fraser, (Chatham, with enclosure); Mr. B. Webster, (with enclosure); Mr. B. Wilkinson, (Wilmsholme, with enclosure); Dr. Bond, (Lut-teworth, with enclosure); Mr. W. W. Stabb, (Torbay, with enclosure); Mr. A. Wall, (with enclosure); *Medicus*, (Guy's Hospital); J. W.; Dr. Woodman; Dr. King; Dr. Henry MacNab, (Inverness); Dr. G. Greville, (Bath); Mr. W. Luxton; M.D.; Eastern Dispensary, Bath; Dr. Holmes, (Dispensary, Leeds); Dr. Scott, (East India House); Dr. M. Collett; Dr. E. G. Crooke, (Chorley); Mr. Blacklock, (Dumfries); Mr. J. C. Barry; M. S. (Reigate); Mr. William Miller; Mr. Garret Butler; *Medicus*; Dandie Dinmont; A Foreigner; Mr. Edward Cousins; A Member of the Association, and Subscriber to *THE LANCET*; *Pater*; A Candidate, East India Service; A Non-Medical Man, (Dublin); Mr. G. Selwyn Morris; Mr. Carpenter; &c. &c.

**GOLD CHAINS AND JEWELLERY.**

**Watherston and Brogden, Wholesale Manufacturing Goldsmiths and JEWELLERS,** beg to announce to the Nobility, Gentry, and Public in general, that in obedience to the numerous calls made upon them since the Great Exhibition, where they were awarded a Prize Medal, they have resolved to throw open their Manufactory to the Public at Manufacturers' prices, a closer connexion than has hitherto existed between the real worker in the precious metals and the Public being obviously an advantage to both parties. Gold is capable of being alloyed to any extent, and therefore, in order to protect the Public in the article of Chains, Watherston and Brogden will make the Mint price of 77s. 10<sup>4</sup>d. per oz. for British standard the basis of all their operations, and, making their profit on the workmanship alone, will charge the bullion in their Chains at its intrinsic value, undertaking to re-purchase it at any time at the same price: thus—15 carat gold will be charged and will realize 53s. 1<sup>4</sup>d. per oz.; 18 carat gold will be charged and will realize 63s. 8<sup>4</sup>d. per oz.; 22 carat gold will be charged the Mint price of 77s. 10<sup>4</sup>d. The price for workmanship will be charged according to the intricacy or simplicity of the pattern: for example—a Chain weighing 2 oz. of 15 carat gold is worth, at 53s. 1<sup>4</sup>d. per oz., £5 6s. 2d. intrinsic value; supposing the workmanship to be £2, total £7 6s. 2d. By this arrangement the purchaser will see at a glance the proportion charged for labour compared with the bullion in a Gold Chain, and, being always able to realize the one, will have only to decide on the value of the other. An extensive assortment of Jewellery, all made at their Manufactory, 16, HENRIETTA STREET, COVENT GARDEN. (Established 1798.)

**The Arctic Expeditions.—The whole**

of the Ships of the various expeditions which have wintered in the Ice, including those of Sir John Franklin and Captain Collinson, have been Warned by SYLVESTER'S HOT AIR APPARATUS.—For prospectus and prices, apply to SYLVESTER and CO., Engineers and Manufacturers of Heating Apparatus, 86, Great Russell-street, Bloomsbury, London.

AT THE CRYSTAL PALACE.

**"The Duobus," a cheap close Carriage**

for a "Country Practice," having all the comfort and convenience of a Brougham, with the weight of an ordinary Gig. Price £48. This Carriage can be seen at the new Crystal Palace, and sketch and particulars obtained on application to T. R. Starey, Coachmaker, Nottingham.

**Improved Invalid Cot Carriages—**

the greatest luxury and comfort ever introduced for removing invalids, being fitted up with the patent noiseless wheels. These carriages may be engaged, on moderate terms, for any journey, upon application to H. and J. READING, coachbuilders, 14, Riding House-lane, Cavendish-square.—N.B. A good assortment of new and second-hand carriages for sale or hire.

**The 16s. Trousers reduced to 14s.—**

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

**To Professional Men and others.—**

The Oxford Mixed Doeskin Trousers, price 21s. The Striatum Cloth Vest, price 10s. 6d. Stock for choice, or to measure.

S. BATTAM, Coat and Trousers Maker, 160, Tottenham-court-road, four doors south of Schoolbred and Co's.

Patterns of the material and Directions for Measuring sent free per post.

**R. T. Pigram, Practical Tailor, and**

Inventor of the Indicator of the Human Figure, whereby a perfect fit is secured, respectfully invites the attention of the public to his mode of art, since none can doubt the importance of an easy and exact adjustment of wearing apparel. Superior Trousers at 17s. 6d. per pair.

R. T. PIGRAM, 51, Lamb's Conduit-street, Foundling Hospital.

**Assistant-Surgeons.—Gentlemen**

receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at

L. PHILLIPS', 28, WEST STRAND, LONDON,

the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, and every necessary information, may be obtained on application.

THE SYDENHAM TROUSERS.  
17/6

**Samuel Brothers,**

29, LUDGATE-HILL,

Inventors and Sole Manufacturers of the

SYDENHAM TROUSERS, at 17s. 6d.,

Unequalled for superior style, fit, quality, perfect ease, and gracefulness, so requisite for gentlemanly appearance, and so rarely obtained.

Patterns sent free on application.

SAMUEL BROTHERS' Stock of OVERCOATS

for the present Season is worthy of your inspection.

**Cholera Prevented! Rettie's Patents.**

SELF-ACTING SEWER AND SINK TRAPS, for Streets and Kitchen Sinks, to prevent all effluvia from Drains, Cesspools, and Urinals. Damp Houses cured at Fourpence per day, giving a dry, warm temperature, for sick or invalids.

PORTABLE CHAMBER CLOSETS, free from all effluvia.

Orders to E. M. and M. Rettie, 7, Brompton-road. (Enclose Stamp.)  
N.B.—Beware of imitations on the above Patents.

**Ten Thousand Stoves.—The Tenth**

Thousand of the PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, and CO., 48, King William-street, London-bridge, and may be obtained of most ironmongers. The Improved Patent Ventilating Stove, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded, post free.

**Metcalfe and Co.'s New Pattern**

TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfume for the toilet.—At METCALFE, BINGLEY, and CO.'S only establishment, 130 and 131, Oxford-street, second and third doors west from Holles-street. Metcalfe's Alkaline Tooth Powder, 2s. per box.

**Funeral Extortion avoided, by Exe-**

cutors and bereaved Relatives of deceased Noblemen, Gentlemen, Tradesmen, and others, sending in the first instance to SHILLIBEER'S OFFICE, CITY ROAD, near Finsbury-square, or to 12, NORTH STREET, QUADRANT, BRIGHTON, instead of employing their Upholsterer, or the nearest Undertaker, who, not possessing the needful requirements, resort to the Funeral Furnishers, to hire them, and consequently inflict twofold profits.

Shillibeer's Establishment combines under one charge, to any scale of pomp and humility desired.

Funerals of every class, and the most varied description of conveyances, old and new styles, and first-rate equipments, at charges so moderate as to defy competition. Catholic Fittings from Paris. No extra charge within ten miles. A Nobleman's Funeral, Thirty Guinea; Gentleman's, from Ten Guinea; Tradesman's, 28; Artisan's, 24 and upwards.

Originated in 1842.

**Patent Perambulators.**

C. BURTON, Inventor, Patentee, and Sole Manufacturer to Her Majesty by appointment.

The distinguished patronage, the flattering encomiums, and the increasing demand, are sufficient proofs of the utility and excellence of these fashionable, safe, and elegant Carriages for adults, children, and invalids, propelled from behind by the slightest effort. Country and Shipping orders. Illustrated Circulars.

OFFICE, 487, NEW OXFORD-STREET.

Also, C. BURTON'S PATENT PERAMBULATOR FOR THE MILLION. Price Two Guinea.

CAUTION.—To avoid unprincipled and dangerous imitations, look for Burton's Label on each Carriage.

**Allsopp's Pale Ale in Bottle, as**  
supplied to the CRYSTAL PALACE; also in casks of 18 gallons  
Recommended by BARON LIEBIG.

Address, HARRINGTON PARKER and CO., 54, Pall-Mall, London.

**Pale India Ale and Stout, 4s. 6d.**

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts. Delivered free within four miles of London, and carriage free to all railway stations in England at 6d. per dozen extra.

WOOD & WATSON, 16, Clement's-lane, City.

**Allsopp's Pale Ale.—Medical gentle-**

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1852, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTTY, 132, Upper Thames-street, London.

**Soyer's Aromatic Mustard.—"M."**

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration.—THE LANCET.

Sole Agents: Messrs. CROSSE and BLACKWELL, 21, Soho-square, London.

**To Invalids and those desirous of**

PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO'S HOMOEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

**Robinson's Patent Barley, for making**

superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than thirty years, have been held in constant and increasing public estimation as the purest farinæ of the oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.

The proprietors of ROBINSON'S PATENT BARLEY and PATENT GROATS, desirous that the public shall at all times purchase these preparations in a perfectly sweet and fresh condition, respectfully inform them that every packet is now completely enveloped in the purest Tin-foil, over which is the usual and well-known paper wrapper.

Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets at 6d. and 1s., and in Family Cansisters at 2s., 5s., and 10s. each.

**Pure Country Bread, supplied every**

Day by Train by G. BILLINGS, of Sawbridgeworth, Herts.

Sawbridgeworth, Herts, 1852.

George Billings begs respectfully to call the attention of the Public to the subjoined Testimonial (vide THE LANCET, March 28th, 1852) as to the pure and unadulterated nature of Bread made by him.

Having been earnestly solicited by numerous parties in London to introduce it to the public, he has appointed as his agents:—MR. DAVID BILLINGS, 7, Ivy-place, Hoxton; MR. HOLLOWAY, 18, Liverpool-street, Bishopsgate.

N.B.—All Bread supplied to the London public is stamped,—"G. BILLINGS, Sawbridgeworth."

London Hospital, March 17th, 1852.

I have made a careful analysis of the Bread manufactured by Mr. George Billings, Sawbridgeworth, Herts, and I find that it is perfectly free from everything of a deleterious nature: besides which it is of good colour and light texture, is pleasant to the taste, entirely free from acidity, easy of digestion, and apparently well suited to the wants of the dyspeptic.

HENRY LETHEBY, M.B.,

Professor of Chemistry, &c., in the London Hospital.

18, Upper Seymour-street, Portman-square,

November 4th, 1853.

Having submitted to careful analysis a loaf of bread, manufactured by Mr. George Billings, of Sawbridgeworth, Herts, and placed in my hands for that purpose by Mr. D. Billings, of Ivy-place, Hoxton, I find the bread to be well made, free from acidity and all deleterious matter, and accordingly well adapted for the sustenance both of invalids and of persons in health.

ANDREW URM, M.D., F.R.S., Analytical Chemist.

\*.\* Orders by post punctually attended to.

**Infants' New Feeding Bottles.—These**

celebrated Nursing Bottles, the best Artificial Mother ever invented, enabling the most delicate Infant to feed from its birth with the greatest comfort and ease, are adapted to milk, biscuits, and all kinds of food. The Nipple, of novel material, is elastic, soft, durable, very cleanly, and so beautiful an imitation of nature, that no Infant ever refuses it.—BENJAMIN ELAM, 9 & Oxford-street,—7s. 6d.—Each is stamped with my name and address.

**Recherché Wines.—Sherry: A very**

fine Sherry, (Amontillado and Montilla.) Brown and Pale, for Cash, at 42s. per dozen; £21 per quarter-cask; £42 per hogshead; £24 per butt.

Port.—Very fine old dry Wine (Vintages 1827, 1830, 1832, 1834), lately imported: from the Wood at 48s., 54s., 63s., and 68s. per dozen.

First Class Champagne, (Ay, Avize, Pierry, Verzenay, and Sillery,) Sparkling and Still Moselle, Sparkling, Still, and Red Hocks, and Bordeaux Wines, at very moderate prices.

These Wines are patronized and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples and List of Prices forwarded on application.

H. H. HAMMICK, Importer, 11, Pall-mall, London, opposite the "Travellers' Club."

**Mineral Waters.—W. Best begs to**

inform the Nobility, Gentry, and the Faculty, that he has just received a FRESH IMPORTATION of the under-mentioned MINERAL SPRINGS of Europe, comprising—Friedrich's Hall, Carlsbad, Marienbad, Homburg, Kissingen, Vichy, Seidlitz, Pullna, Ems, Seltzer, Fachingen, &c., at his Eau-de-Cologne, Arquebuzard, and Foreign Mineral Water Depot, 22a, Henrietta-street, Cavendish-square.—N.B. Balls and evening parties supplied with German and Struve's Artificial Seltzer Water on Advantageous terms.

N.B. Allsopp's and Bass's Pale Ale, and Guinness's Dublin Stout.

**Aërated Waters of sufficient and**

uniform strength. BLAKE, SANDFORD, and BLAKE, 47, Piccadilly, having given great attention to the manufacture of Mineral Waters, and feeling it important that medical men should be assured of the quantity of Alkali contained in each kind, beg to submit the following list of their preparations:—

Potash Water, 18 grains of the Bicarbonate in each bottle; Citrate of Potash, (a new and valuable auxiliary in Gout and Rheumatic affections,) 30 grains; Soda, 15 grains; Magnesia, 12 grains, and Ammonia, 10 grains.

B. S. & B. would especially recommend their Seltzer and Vichy Waters; the latter now bottled in half-pints as well as pints.

BLAKE, SANDFORD, and BLAKE, 47, Piccadilly.

**The Respirator.—The assumption of**

the name of Respirator for various discreditable and defective imitations of MR. JEFFREYS' Instruments, the value of which in medical practice has given a false reputation to the name, can only mislead unwary persons not acting under professional advice.

City Office for the Respirator, 25, Bucklersbury; West-end Depot, 25, Holles-street, Oxford-street, London. In London and all Towns, the principal Chemists and Surgical Instrument Makers are Agents for Mr. Jeffreys' Respirators.

TO THE SURGICAL AND MEDICAL PROFESSION.

**W. F. Durroch, late Smith, begs to**

inform the Profession, that he continues to MANUFACTURE SURGICAL INSTRUMENTS of every description, and that he has attained the highest reputation by the approval and patronage of the most eminent practitioners and lecturers for the improvements made in various articles. Gentlemen favouring him with their orders may rely on having their instruments finished in the best and most modern style. Surgical and Medical Instruments made to drawings, and kept in repair. Established 1798. No. 2, New-street, St. Thomas-street, (near the Hospital), in Southwark.

Superior dissecting instruments and equally moderate in price, well worth the inspection of the student.

SPECULUM ANI, made by W. Durroch, for John Hilton, Esq., may be had at a moderate price.

**Mr. Edwin Osborne, of 24, Savile-**

ROW, LONDON, the Sole Licencee and Maker of PALMER'S PATENT LEG, adapts this beautiful substitute to every form of amputation; and having had great experience in its manufacture, feels confident of giving comfort and satisfaction to those persons who may favour him with their patronage. References given, (if required.)

**Dr. Lever's Improved Elastic Utero-**

ABDOMINAL BELT being constructed by Mr. H. Bigg, 29, Leicester-square, under the immediate suggestion of Dr. Lever, will be found to combine every advantage possible to obtain. It upholds the parietes of the abdomen, secures support to the uterus, and admits of the elastic force immediately above the pubes being increased by the patient after the Belt is applied.

To be had only of Mr. H. BIGG, 29, Leicester-square.

**Spinal Curvature.—Mr. H. Bigg, 29,**

Leicester-square, particularly invites the attention of the Faculty to two new and distinct forms of SPINAL APPARATUS he has recently invented. The principle on which they are constructed, thoroughly supplants the "brute force" of the screw, yielding instead an elastic power analogous to muscular motion; it also encourages respiration, admits of the spine being moved in any direction, and possesses a weight so trifling as hardly to be felt by the wearer.—PATENTED.

To be had only of the Patentee, 29, Leicester-square.

**Treatment of Club Feet, Spinal**

CURVATURE, &c., WITHOUT THE EMPLOYMENT OF THE SCREW.—MR. HEATHER BIGG, 29, Leicester-square, begs to invite the attention of the Faculty to an entirely new principle he has discovered for constructing the various apparatus for deformities of the feet and spine.

"\* \* \* The living structures do not with impunity tolerate the brute force of the screw.\* \* \* In any case in which the force of the screw is employed, unless for a very brief period, excoriation, sloughing, intolerable pain in the parts compressed will inevitably result.\* \* \* Dr. LITTLE, on "Deformities," pp. 34, 35.

Mr. H. Bigg has recently invented four distinct forms of Orthopaedic Instruments for Talipes Varus, T. Valgus, T. Equinus, Lateral Curvature, &c., in all of which the principle of muscular elasticity is simulated and the "brute force" of the screw ignored.—PATENTED.

29, LEICESTER-SQUARE.

**Mr. G. Hind, F.R.C.S., resumed his**  
DEMONSTRATIONS on the morning of the 15th of September, at the usual hour.  
Class-room, 29, Newman-street, Oxford-street. Private residence, 9, South-crescent, Bedford-square.

## Epidemiological Society.—The First

Meeting of the present Session of this Society will be held on Monday, the 6th of November, at Half-past Eight p.m., at 37, Soho-square; entrance, Carlisle-street. An Introductory Address will be delivered by the President, Dr. BARNSTON. Members of the Profession will be admitted to the Meeting on presenting their cards.

J. O. McWILLIAM, M.D., F.R.S., } Hon. Secs.  
J. H. TUCKER, }

TO PROFESSORS OF ANATOMY, STUDENTS, &c.

**Dr. Kahn continues to execute every**  
description of ANATOMICAL and PATHOLOGICAL WAX MODELS.  
For a List of Prices apply at 232, Piccadilly.  
DR. KAHN'S ANATOMICAL MUSEUM is open Daily, from Eleven till Five, and from Seven till Ten. Admission, One Shilling. Lectures, as usual, by Dr. SEXTON, F.R.G.S., and F.E.S.

## Buxton Baths.—St. Ann's Hotel.—

The Reduced Charges for the Winter will commence on the 1st of November. Conducted by Mrs. HARRISON.  
N.B. The New Baths are kept open as usual during the Winter Months.

## Matrimonial Institution.—Founded

1846.—Offices: 12, John-street, Adelphi, London; and 18, Nassau-street, New York.—This Institution has been established many years, (with great success,) as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.

Prospectuses, Application Forms, Bales, and every information sent free to any name, initials, or address, on receipt of 12 postage stamps, by order of the Director, LAURENCE CURENBER, 12, John-street, Adelphi, London.

**Mr. T. H. Wakley's Stricture Instru-**  
MENTS. Complete Sets of these Instruments may now be had of  
WEISS & SON, 62, Strand, London.

## Anatomical and Dental Repository,

45, Museum-street, Bloomsbury, London.—JOHN HARNETT begs most respectfully to call the attention of Lecturers, Students, and Gentlemen connected with the Medical Profession, to his large and select Stock of Anatomical Preparations, consisting of Skeletons, loose and articulated Skulls, Hands and Feet, Vertebrae, and Loose Bones, at the lowest possible prices.

## M. Pillischer's Newly-Constructed

STUDENT'S MICROSCOPE, which, for solidity, portability, and reasonable price, surpasses any Microscope hitherto made by any English or Continental maker. The Student's Microscope, with coarse and fine adjustments, single mirror, one eye-piece, a one-inch and one-quarter-inch French achromatic object-glasses of best quality, the whole packed in mahogany case, 7in. by 6in., 25 10s.; or with M. Pillischer's own-made, 1in. of 16 degs. angular aperture, and 2in. of 60 degs., 27.

The above stand with lever stage, extra eye-piece, double mirrors, animalcule cage, &c., 28; or with Pillischer's glasses, 29 10s.

A list of prices will be sent free on application to M. Pillischer, 88, New Bond-street.

## Every excellence which the

Surgeon can require—viz., Lightness, Durability, Strength, and Economy—is realized by HUXLEY'S SURGICAL STOCKINGS, KNEE-CAPS, ANKLETS, &c.

H. and Co. have much pleasure in informing the Profession that they have perfected an ABDOMINAL BELT of new construction, which, acting diagonally, is not liable to displacement; its weight is only four ounces. Price 18s. Diagrams and particulars forwarded by post. Every kind of Surgical Stocking made. Spiral Stockings at a great reduction. Measure required for Stocking: Circumference at A, B, C, D, and E; length from A to D, and D to E.

HUXLEY and CO., 8, Old Cavendish-street,  
late 5, Vere-street, Oxford-street.

## Mathey Caylus' Gluten Capsules

contain the purest Copal, either simple or combined with Citrate of Iron, Ratanh, Cubebs, &c.; acknowledged by the London and Paris Hospitals; also by the Lock Hospital; M. Lesueur, chef de Travaux Chimiques à l'Académie de Médecine; Drs. Ricord, Cullerier, &c., who have granted written attestations, to be the best prepared Medicine for the cure of certain diseases.

Extract of a Letter from Dr. Cullerier:—

"I cannot induce you too much to extend the use of your preparations; by so doing you will render a valuable service to the therapeutic of blennorrhagic affections."  
"I am, &c.,  
"CULLERIER,  
"Chirurgien de l'Hôpital de Lourdes."

Sold in Bottles, at 2s. 6d. and 4s. 6d., sealed and stamped with the Government stamp, bearing the name of the Patentee. To be had wholesale and retail of Robert King, French and English Pharmaceutical Chemist, 21, Princes-street, Hanover-square; and all respectable Chemists in the United Kingdom.—Country agents required.

## Christian Medical Association.—An

Address is proposed to be delivered, in connection with this Association, in the Lower Hall, Exeter Hall, Strand, on Friday, November 10th, at Eight p.m., by R. D. GRAINGER, Esq., F.R.S., Lecturer on Anatomy, &c. C. J. B. WILLIAMS, M.D., F.R.S., in the Chair.

The attendance of all Medical Students is specially invited. They will be admitted on exhibiting their entrance card to Hospital Practice, or to any of the Courses of Lectures delivered in the Medical Schools. Practitioners desirous of attending, are requested to present their private cards at the door.

S. O. HARRISON, M.D., } Hon. Secs.  
CHARLES H. MOORE, }

EAST INDIA HOUSE, Aug. 9th, 1854, and Oct. 4th, 1854.

## Notice is hereby given, that the

annexed CODE OF REGULATIONS for the ADMISSION of CANDIDATES at the First Examination, to be held in January next, for the APPOINTMENT of ASSISTANT-SURGEONS in the service of the EAST INDIA COMPANY, has been framed by the Board of Commissioners for the affairs of India, under the provisions of the Act 16 and 17 Vic., cap. 85, sec. 32.

REGULATIONS FOR THE ADMISSION OF CANDIDATES FOR THE APPOINTMENT OF ASSISTANT-SURGEON IN THE SERVICE OF THE EAST INDIA COMPANY.

All natural-born subjects of her Majesty may be candidates for admission into the service of the East India Company as Assistant-Surgeons. They must, however, be between 22 and 28 years of age, and of sound bodily health. They must subscribe and send in to Dr. Scott, the Physician to the Hon. East India Company, before the 10th day of December, 1854, a declaration to the following effect:—

"I [Christian and surname at full length], a candidate for employment as an assistant-surgeon in the service of the East India Company, do hereby declare that I was — years of age on the — day of — last, and that I labour under no constitutional disease or physical disability that can interfere with the due discharge of the duties of a medical officer; and I also attest my readiness to proceed on duty to India within three months of receiving my appointment."

This declaration must be accompanied by the following documents:—

1. Proof of age, either by extract from the register of the parish in which the candidate was born, or by his own declaration, pursuant to the Act 5 and 6 Wm. IV., c. 62.
2. A diploma in surgery, or a degree in medicine, provided an examination in surgery be required for such degree, from some body competent by law to grant or confer such diploma or degree.
3. A certificate of having attended two courses of lectures, of six months each, on the practice of physic, and of having attended for six months the practice and clinical instruction of the physicians at some hospital containing at least on an average one hundred in-patients, or of having attended one course of lectures of six months on the practice of physic, and clinical instruction for twelve months.
4. A certificate of having attended for three months the practical instruction given at one of the public asylums for the treatment of the insane.
5. A certificate of having attended for three months one of the institutions, or wards of a hospital especially devoted to the treatment of ophthalmic diseases.
6. A certificate of having attended a course of lectures on midwifery, and of having conducted at least six labours.
7. A certificate of having acquired a practical knowledge of cupping.

Candidates may also, at their option, send in certificates of attendance at any hospitals, or on any courses of lectures, in addition to the above. Attendance on a course of military surgery is recommended.

Candidates producing satisfactory certificates will be admitted to an examination to be held in January, 1855.

The examination will include the following subjects:—

1. Surgery in all its departments.
2. Medicine, including the Diseases of Women and Children, Therapeutics, Pharmacy, and Hygiene.
3. Anatomy and Physiology, including Comparative Anatomy.
4. Natural History, including Botany and Zoology.

The examination will be conducted:—

1. By means of written questions and answers.
2. By object examinations and experiments, when the subject admits of such tests.
3. By practical examination at the bedside of the patient, and by dissections and operations on the dead body.
4. By viva voce examination.

The persons who shall be pronounced by the examiners to be the best qualified in all respects, shall be appointed to fill the requisite number of appointments as assistant-surgeons in the East India Company's Service.

All assistant-surgeons are required to subscribe to the Military or Medical, and Medical-retiring Funds at the Presidencies to which they may be respectively appointed, and to the Military Orphan Society also, if appointed to Bengal.

All assistant-surgeons who shall neglect or refuse to proceed to India under the orders of the Court of Directors, within three months from the date of their appointments, will be considered as having forfeited them, unless special circumstances shall justify a departure from this regulation.

Candidates may apply to Dr. Scott, 13, Stratton-street, for further information if needed.

N.B. The certificates and notices as to examination herein contained apply only to the examination to be held in January next.

Regulations regarding the requirements of candidates for future examinations will be issued after the first examination.

JAMES C. MELVILLE, Secretary.

NOTE, Oct. 4th, 1854.—Candidates who may not have been able to attend the practice of an asylum for the insane, or of an ophthalmic hospital for three months previous to offering themselves for examination in January, 1855, will not be excluded from examination, but will, if successful in obtaining recommendation for appointments, be required to produce certificates of having attended such practice during the interval between the examination and the time of proceeding to India.

The Board of Examiners of candidates for the appointments of assistant-surgeons in the East India Company's Service give notice, that on the 8th of January, 1855, they will hold examinations at the East India House for the selection of assistant-surgeons. The selection will be made according to merit, and it is expected that about thirty appointments will be awarded.

J. D. DICKINSON, Deputy-Secretary.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS.

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.

Office hours from 12 till 4.

TO THE PROFESSION.

**Mr. Bowmer, M.R.C.S. Eng., 50,**  
LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, *free of expense.*

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

**To be Disposed of.—A Practice in a**  
village in the county of Essex, with immediate possession. Terms moderate.—Apply to Messrs. Corbyn and Co., Chemists and Druggists, 300, Holborn.

MEDICAL.

**A Member of the College and Hall,**  
of mature age, and experienced in town and country practice, is desirous of a Re-engagement. Satisfactory references and testimonials.—Address, paid, Mr. Croft, Mr. Knight's, 5, Queen-street, Golden-square.

**An M.R.C.S., L.M., and L.A.C.,**  
London, aged twenty-five, wishes to meet with a PARTNERSHIP with a gentleman in good practice, where, after a term of years, he could succeed to the whole.—Address, stating terms and full particulars, to George B. Mead, Bury St. Edmunds, Suffolk.

**An M.R.C.S.E. and L.S.A., aged 25,**  
desires an Engagement as Out-door ASSISTANT, or to take the charge of a Branch Practice. A liberal salary required. A permanent Situation, or one likely to lead to a Partnership, preferred.—Address X., Post-office, Bromley, Kent.

**Wanted, by a Practitioner in the**  
Country, a Visiting and Dispensing ASSISTANT. He must be accustomed to Country Practice, and able to give satisfactory references, especially as regards moral character.—Address, stating age and references, C. B. A., THE LANCET Office, 422, Strand.

TO MEDICAL MEN.

**A Surgeon, whose chief objects are**  
to see practice and to be treated in every respect as a gentleman, is anxious to Assist a General Practitioner in any of the provinces. The highest references offered.—Address, F. P., 19, Albert-street, Mornington-crescent, Regent's-park.

**An M.R.C.S.E. and L.A.C., aged 25,**  
who for two years held the appointment of House-surgeon to a large Hospital, and has for the last six months conducted a large Union and private Practice, is desirous of obtaining an engagement as ASSISTANT to an elderly practitioner. A country village objected to.—Address, Alpha, Mr. Watson's, Long Buckby, Northamptonshire.

**A Gentleman wishes to obtain a**  
Situation for his Coachman as Out-door SERVANT. The man can be recommended in the strongest possible terms for sobriety, honesty, and courtesy, and the care he takes of his horses. He is about twenty-five years of age, married, and would be glad to live in rooms over his stable: knows London thoroughly well.—Address, post-paid, A. Z., 423, Strand.

**A Young Gentleman, aged 22, who**  
has served one year and a half of his indentures in the country, being about to walk the Hospitals, wishes to transfer himself to a medical gentleman in or near to London, who would take him into his house to reside, to whom his services would be a matter of consideration. Terms to be sent to Mr. Arundel Rogers, Solicitor, 33, Old Jewry.

MEDICAL.

**Wanted immediately, by a General**  
Practitioner in the country, an In-door Visiting and Dispensing ASSISTANT, not under twenty-five years of age, possessing the double qualification, and experienced in Midwifery. One wishing for a permanent situation will be preferred. Salary, £50 per annum. Applications to be accompanied with a reference.—Address, W. A. E., Post-office, Lumberhurst, Kent.

MEDICAL.

**A Partnership required in a good**  
General Practice, where the receipts are not less than £1200 per annum, by a Gentleman, aged Twenty-six, M.D., M.R.C.S., late House-surgeon to a Provincial Hospital, and of considerable experience in both town and country practice. The suburbs of London, or within twenty miles, will be preferred.—Address to A. J., Messrs. Westwoods and Hopkins, Wholesale Druggists, 10, Newgate-street.

Medical Transfer and Partnership.

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**  
and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RESIGN, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. *He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.*

**Open Surgery.—The Lease of**  
PREMISES and well-fitted OPEN SURGERY, at the corner of Church-street, Grove-road, Lisson-grove, (formerly Messrs. Ansell and Fagg's Surgery), is for Disposal, at a fair valuation, in consequence of the Proprietor having received an appointment in the Public Service.—Apply to Mr. ORRIDGE, 30, Bucklersbury, Mansion-house.

**General Practice.—An old-esta-**  
blished PRACTICE in a pleasant town, about forty miles from London, where there is little competition, is now transferable. The returns are about £700 yearly. There are excellent premises. The command of £800 essential to the succession.—Apply to Mr. ORRIDGE, 30, Bucklersbury, Mansion-house.

**Partnership required.—A Gentle-**  
man, Thirty-two years of age, (who will be happy to exchange references, and possesses the full English qualifications,) wishes to Purchase a SHARE in a PRACTICE of repute, to yield not less than £800 yearly.—Apply to Delta, care of Mr. ORRIDGE, 30, Bucklersbury.

MEDICAL.

**A First Year's Student at Guy's, aged**  
Twenty-three, who has been Assistant for two years in a large provincial town, is desirous to obtain a similar situation in London, with opportunity to attend Lectures and Hospital, board and lodging being the remuneration.—Apply to N. R., care of Mr. ORRIDGE, 30, Bucklersbury.

MEDICAL.

**A General Practice in a town (in a**  
midland county) containing 1200 inhabitants, is for Disposal. It has been many years established, and yields about £350 per annum, including appointments. An efficient introduction can be given. Premium, £300.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

**Wanted, in a General Practice near**  
London, an ASSISTANT, to Visit and Dispense. One qualification indispensable.—Address, B. E., Messrs. Hewlett and Goddards, 6, Arthur-street West, City.

**A Medical Man's Son, in his twenty-**  
second year, would be happy to meet with a situation to Dispense, Visit, and attend Midwifery. The country preferred. Has been accustomed to Union and Club Practice. State salary and duties required.—Address, A. B. C., Post-office, Holbeach, Lincolnshire.

**Midwifery.—Farringdon Dispensary**  
and LYING-IN CHARITY.—Gentlemen wishing CASES are requested to apply to Dr. Griffith, at the Dispensary, or at 8, Wellington-street, London-bridge.

**Metropolitan Free Hospital,**  
DEVONSHIRE-SQUARE, BISHOPSGATE.—The Committee hereby announce a Vacancy in the SURGICAL STAFF. Candidates for the Office must be Fellows or Members of the Royal College of Surgeons of England, not practising Pharmacy, and are required to send in their Diplomas and Testimonials on or before Thursday, the 9th of November, under cover, to the Secretary, 8, Devonshire-square.

JOHN GURNEY FRY, Chairman.  
CHARLES NASH, Secretary.

**Dover Hospital and Dispensary.—**

Wanted, a RESIDENT MEDICAL OFFICER to this Institution. He must be a Member of the Royal College of Surgeons of London, Edinburgh, or Dublin, and a Licentiate of the Apothecaries' Company. He will be restricted from private practice, and expected to enter upon his duties on the 30th of November next. His salary will be £30 a year, with furnished apartments, coals, and candles. Duties and further particulars may be known on application to the Secretary, Mr. ELWIN, No. 35, Castle-street, Dover, to whom Testimonials may be sent on or before Monday, the 20th of November, at 11 A.M. The Hospital contains at present twelve beds for in-patients.

Dover Hospital, 30th October, 1854.

EDWARD ELWIN, Secretary.

**Droitwich Asylum.—Established in**

1791.—This Establishment having undergone extensive improvements and alterations, is now licensed to Sir CHARLES HASTINGS, M.D., D.C.L., and Mr. MARTIN RICHARDS, F.R.C.S., and is open for the reception of PRIVATE PATIENTS ONLY. The grounds are well arranged and extensive, and the charge for Board and Medical Attendance is moderate. The proportion of cures, with the small mortality, have long classed it in a very favourable position as an establishment for the recovery of the Insane. The terms and forms of certificates may be obtained on application to Mr. CHARLES R. SUFFIELD, Medical Superintendent, the Asylum, Droitwich.

November, 1854.

# DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY,  
AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM,  
AND ALL SCROFULOUS DISEASES.

**A**pproved of and recommended by **BERZELIUS, LIEBIG, WOEHLER,**  
**JONATHAN PEREIRA, FOUQUIER,** and numerous other distinguished scientific Chemists.

Prescribed by the most eminent Physicians, and supplied to the leading Hospitals of Europe.  
Specially rewarded with Medals by the Governments of Belgium and the Netherlands.

Has almost entirely superseded all other kinds on the Continent, in consequence of its proved superior power and efficacy—  
effecting a cure or alleviating symptoms much more rapidly.

Contains iodine, phosphate of lime, volatile acid, and the elements of the bile—in short, all its most active and essential  
principles—in larger quantities than the Pale Oils made in England and Newfoundland, deprived mainly of these by their  
mode of preparation.

*The following Extracts are selected from some of the leading Medical and Scientific Testimonials in favour of*  
**DR. DE JONGH'S COD-LIVER OIL:—**

**BARON LIEBIG,**

Professor of Chemistry at the University of Giessen, &c. &c.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this Medicine in its purest and most genuine state must ensure you the gratitude of every one who stands in need of its use."

The late

**Dr. JONATHAN PEREIRA,**

Professor at the University of London, Author of the "Elements of Materia Medica and Therapeutics," &c. &c.

"I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject. The Oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

**Dr. FOUQUIER,**

Professor at the University of Paris, Physician to his late Majesty Louis Philippe, &c. &c.

"You have preserved to science the use of a medicine that might have fallen into utter discredit, in consequence of its unaccountable inaction in some cases."

**Dr. E. RIEGEL,**

Of Carlsruhe, Grand Duchy of Baden.

"This analysis has convinced me that Dr. de Jongh's Oil is not only prepared with greater care than the ordinary Cod-liver Oil, but that it contains in larger quantities those principles which are generally admitted to be most active and essential, so that it ought to be considered the most efficacious kind."

**Dr. SEGWITZ,**

Of Gelnhausen, Duchy of Hesse.

"I am bound to state that this Oil is greatly superior to all other kinds previously used by me, and that, therefore, the object aimed at by the use of this remedy is more surely attained by this Oil than by any other kind."

The

**INTENDANT OF THE CIVIL LIST OF BELGIUM.**

"The King has charged me to return you his very particular thanks for the homage done to him, by the presentation of your most valuable researches concerning the Cod-liver Oil: as an expression of his utmost satisfaction, he has given me the order of presenting you with the accompanying large Gold Medal."

**Dr. VAN DEN HUYDEN,**

Emmerich.

"I CAN conscientiously recommend it to my colleagues as being superior to all other kinds."

The

**MINISTER OF THE INTERIOR OF HOLLAND.**

"I HAVE the honour of bringing to your knowledge, that it has pleased the King to grant you, by his Decree of the 20th January, 1864, No. 101, a Silver Medal with an appropriate honorary inscription, as a testimony of his Majesty's high approbation for your efforts in securing to this country a supply of the most efficacious Cod-liver Oil from Norway. I have given the necessary orders for the execution of this Medal."

**THE ROYAL POLICE OF PRUSSIA.**

"THE Royal Police of Prussia (Königliches-Polizei-Præsidium) has the honour of informing you that it has caused the sample which you have forwarded to be submitted to an official investigation, and that the result of such investigation has proved it to be not only the genuine Cod-liver Oil, but still further, that it is of a kind which distinguishes itself from the Cod-liver Oil in ordinary use, alike by its taste and chemical composition."

**"THE LANCET,"**

(July 20th, 1864.)

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de Jongh gives the preference to the Light-brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. IN THE PREFERENCE OF THE LIGHT-BROWN OIL WE FULLY CONCUR."

"WE HAVE CAREFULLY TESTED A SPECIMEN OF THE LIGHT-BROWN COD-LIVER OIL, PREPARED FOR MEDICAL USE UNDER THE DIRECTION OF DR. DE JONGH, AND OBTAINED FROM THE WHOLESALE AGENTS, MESSRS. ANSAR, HARFORD, AND CO., 77, STRAND. WE FIND IT TO BE GENUINE, AND RICH IN IODINE AND THE ELEMENTS OF BILE."

**"THE MEDICAL TIMES,"**

(August 6th, 1864.)

"We believe that the profession are much indebted to Dr. de Jongh for his laborious researches into the composition and properties of this Oil; and we have the high authority of Baron Liebig and the late Dr. Pereira, in testimony of the value of these labours. In his zeal for investigating the properties of the Oil, Dr. de Jongh made a journey to Norway, and carefully examined its varieties, its mode of preparation, and its adulterations."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S Stamp and Signature, by

**ANSAR, HARFORD, & CO., 77, STRAND, LONDON,**

Sole Consignees and Agents for the United Kingdom and British Possessions, and may be obtained from respectable Chemists and Druggists in Town and Country, at the following prices:—

HALF-PINTS ... 2s. 6d. | PINTS ... 4s. 9d. | QUARTS ... 9s.

**IMPERIAL MEASURE.**

\* Hospitals and other Charitable Institutions requiring large quantities may be supplied on considerably reduced terms.

PRINTED BY THOMAS CHOWAT SAVILL, at his Printing Office, No. 4, Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the county of Middlesex; and published for the Editor by GEORGE CRUICKSHANK, of No. 423, Strand, in the parish of St. Martin-in-the-Fields, Westminster, in the said county, at No. 423, Strand, aforesaid; and sold by all Booksellers and News-vendors in Great Britain and Ireland and the Colonies.—

**Surgical and Pathological Observations.** By EDWIN CANTON, F.R.C.S., Assistant-Surgeon to the Charing-cross Hospital.

S. Highley, Fleet-street.

**Gregory's Handbook of Chemistry.**

For the Use of Students. By WILLIAM GREGORY, M.D., Professor of Chemistry in the University of Edinburgh. With numerous Illustrations. Third Edition, Revised and Enlarged. 2 vols. 12mo, 15s. (Sold separately.)

INORGANIC CHEMISTRY, 5s. 6d.  
ORGANIC CHEMISTRY, 9s. 6d.

"A young man who has mastered these few and by no means closely printed pages, may venture to face any board of Examiners on Chemistry, without fear of being posed by any fair question."—ASSOCIATION JOURNAL, Notice of Vol. I.

"This Handbook of Chemistry deserves the highest praise, as a suitable work for Students. The Author, though never deficient in supplying all necessary details, keeps steadily before the mind of the reader the great general doctrines of his rapidly advancing and therefore changing department of science. We regard this as the chief excellency of Dr. Gregory's volume, that he has not overloaded his pages with all the minutiae of modern discovery, but has rather striven to show its scope and tendency, as illustrated by abundance of well-chosen facts."—LONDON JOURNAL OF MEDICINE, Notice of Vol. II.

**WHEELER'S HANDBOOK OF INORGANIC ANALYSIS.**

By FRIEDRICH WHEELER, M.D., Professor of Chemistry in the University of Göttingen. Translated and Edited by Dr. HOFMANN, Professor in the Royal College of Chemistry, London. Large 12mo, 6s. 6d., cloth.

"Next to Rose of Berlin in the ranks of living analytic chemists, particularly in the inorganic department of the art, stands FRIEDRICH WHEELER, who has in this book given us a compendium of inorganic analysis, illustrated by examples of the methods to be pursued in the examination of minerals, both of a simple and complex constitution, which, if followed out by the student, with ordinary care and patience, and with some little practical instruction, will not fail to render him a thorough master of this division of chemical knowledge."—ASSOCIATION JOURNAL.

**LIEBIG'S HANDBOOK OF ORGANIC ANALYSIS.** By

JUSTUS LIEBIG. Edited by Dr. HOFMANN, Professor in the Royal College of Chemistry, London. Large 12mo. Illustrated by 85 Wood Engravings. 5s. cloth.

"The work now before us is a most valuable contribution to our knowledge on this most important subject. The style is lucid, and the processes are not only explained to the mind, but are made manifest to the eye by a profusion of beautiful illustrations."—MEDICAL TIMES.

London: WALTON & MABERLY, Upper Gower-street, and Ivy-lane, Paternoster-row.

Just published, 2vo, price One Shilling,  
**Painless Tooth-Extraction, without**  
 CHLOROFORM; with Observations on Local Anæsthesia by Congela-  
 tion in General Surgery. By WALTER-BLUNDELL, Surgeon-Dentist.  
 London: John Churchill, New Burlington-street.

On Thursday, the 23rd inst. will be published, in 8vo, with many Woodcuts,  
**Pereira's Elements of Materia Medica**  
 AND THERAPEUTICS. A New Edition of the First Volume, com-  
 prising Psychological or Mental Remedies, and Physical but Imponderable  
 Remedies. Edited by A. S. TAYLOR, M.D., &c., and G. O. REES, M.D., &c.  
 London: Longman, Brown, Green, and Longmans.

NEW EDITION OF NEVIN'S PHARMACOPEIA.  
 The Second Edition, carefully revised throughout, in post 8vo, with many  
 Woodcuts, price 18s.

**Dr. Nevins's Translation of the New**  
 LONDON PHARMACOPEIA, including also the NEW DUBLIN  
 AND EDINBURGH PHARMACOPEIAS; with a full Account of the Chemical  
 and Medicinal Properties of their Contents: forming a complete Materia  
 Medica.  
 London: Longman, Brown, Green, and Longmans.

The Third Edition, in One Volume, 8vo, price 14s.  
**Lectures on the Diseases of Infancy**  
 AND CHILDHOOD. By CHARLES WEST, M.D., Physician to the  
 Hospital for Sick Children, and Physician-Accoucheur to St. Bartholemew's  
 Hospital. The Third Edition, revised throughout and enlarged.

By the same Author, in 8vo, price 5s.  
**AN INQUIRY INTO THE PATHOLOGICAL IMPORT-  
 ANCE OF ULCERATION OF THE OS UTERI.**  
 London: Longman, Brown, Green, and Longmans.

Just published, price 5s., illustrated with numerous Engravings  
 on Wood,  
**The Eye in Health and Disease.**

With a description of the Ophthalmometer, for the adaptation of Spectacles,  
 for Impaired, Defective, or Aged Sight. Being the substance of Lectures  
 delivered at the Central London Ophthalmic Hospital. By ALFRED SMEE,  
 F.R.S., Surgeon to the Bank of England, Surgeon to the Central London  
 Ophthalmic Hospital, &c. Second Edition; to which is added a Paper on  
 the Stereoscope and Binocular Perspective.

 London.

A SURGICAL HANDBOOK FOR THE CRIMINAL.  
**Military Surgery; or, Experience of**  
 Field Practice in India during the Years 1849 and 1840. By J. J. COLE,  
 M.R.C.S.E., H.E.I.C.E., late Surgeon to the Auxiliary Forces during the War  
 in the Punjab. 8vo, 2s.

"Mr. Cole found himself, seven months after his arrival in India,  
 (November, 1847,) in charge of Lieutenant Edwards' Army, (18,000 strong,)  
 then encamped before Moultan. The work shows talent, and is both truthful  
 and original. Mr. Cole evidently had the welfare of the soldier at heart. The  
 reader will find in it much that is interesting and useful."—MEDICAL  
 CHIRURGICAL REVIEW.

London: Samuel Highley, 32, Fleet-street.

PETER PARLEY'S TALES ABOUT EUROPE, ASIA, &c.  
 In one large Pocket Volume, embellished with numerous Illustrations and  
 Maps, engraved on steel, a new Edition, with great Additions, price 5s.  
 in cloth, and gilt edges.

**Peter Parley's Tales about Europe,**  
 ASIA, AFRICA, AMERICA, AND OCEANIA.  
 "The design of this work is to convey, by conversational remarks, a  
 knowledge of Geography and History; it is interspersed with personal  
 adventures, and adapted to the taste and knowledge of children. The author  
 never fails to win attention and raise curiosity; he then uses such familiar  
 terms in gratifying it that the rudiments of Geography are inensibly  
 impressed on the mind, and science is rendered a pleasing study."

Also, a New Edition of  
**PARLEY'S TALES ABOUT THE SEA AND THE  
 PACIFIC-OCEAN.** Cloth, gilt-edges, price 3s. 6d.  
 London: William Tegg and Co., 85, Queen-street, Cheap-side.

PARLEY'S GEOGRAPHY.  
 In one volume, illustrated with numerous Engravings, and 13 Maps,  
 engraved on steel, price, bound in cloth, 5s. 6d.

**A Grammar of Modern Geography.**  
 By PETER PARLEY, Author of "Tales about Europe, Asia, &c."

Also, a new edition of  
**PARLEY'S TALES ABOUT THE SEA AND THE  
 PACIFIC-OCEAN.** Cloth, gilt-edges, price 3s. 6d.  
 London: William Tegg and Co., 85, Queen-street, Cheap-side.

**Miss Lindsay's Excelsior. Song.**  
 Words by LONGFELLOW. (Illustrated with "The Banner with the  
 Strange Device.") 2s. 6d.

To prevent the disappointment which has arisen from the substitution of  
 other songs with the same title for the popular one by Miss Lindsay, pur-  
 chasers are requested to be particular in ordering "Miss Lindsay's Excelsior,"  
 as above.

"This famous poem has been set to music scores of times, but never more  
 successfully than in the present instance."—WHOLEY TIMES.  
 "The theme is tenderly and powerfully conceived. It is an exquisite lyric."  
 —ELIZA COOK'S JOURNAL.

**MISS LINDSAY'S EXCELSIOR,** the Words by LONG-  
 FELLOW. 2s. 6d.

"Without wishing to depreciate any of the numerous compositions to which  
 the 'Excelsior' has given rise, we must testify to the charm of the present  
 effusion, as one that must ensure for it a long and extensive popularity."—  
 VIDE OBSERVER, Aug. 27.

**THE OLD HUNDRETH PSALM,** transcribed for the  
 Pianoforte. By W. VINCENT WALLACE. 4s.

**THE VESPER HYMN,** transcribed for the Pianoforte.  
 By W. VINCENT WALLACE. 3s.

**HAYDN'S SURPRISE,** (Andante from the 3rd Symphony,)   
 transcribed for the Pianoforte. By W. VINCENT WALLACE. 3s.

**IL SOSTENUTO,** (Etude de Salon.) By W. VINCENT  
 WALLACE. 3s. And FADING AWAY. 4s.

These are the most recent of Mr. Wallace's Pianoforte Works.

**SPEAK GENTLY!** Song by Miss M. LINDSAY, the  
 Composer of the popular song, "Excelsior!" Second Edition, 2s. 6d. "The  
 beautiful sentiment embodied in the words and music of this song has made  
 it an especial favourite."

London: Robert Cocks and Co., New Burlington-street, Music Publishers  
 to the Queen.

**H. Silverlock's Medical Label Ware-**  
 house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING  
 OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.

The members of the medical profession are respectfully informed that at  
 H. Silverlock's establishment they will find every kind of Label they  
 can possibly require; and also that every description of Engraving, Letter-  
 press, Copper-plate, and Lithographic Printing is executed by competent  
 workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent  
 per post on application.

**Allen's Illustrated Catalogue, con-**  
 taining size, price, and description of upwards of 100 articles, consisting  
 of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes,  
 Writing-desks, Dressing-cases, and other travelling requisites, forwarded on  
 receipt of two stamps.

**ALLEN'S TRAVELLING-BAG** (patented) has the opening as large as the  
 bag itself, and therefore possesses an immense advantage over all others.

**ALLEN'S REGISTERED DESPATCH-BOX and WRITING-DESK,** and  
 their New Quadruple Portmanteau (containing four compartments), are the  
 best articles of the kind ever produced.

J. W. and T. ALLEN, Manufacturers of Portable Barrack-room Furniture,  
 and Military Outfitters, (see separate Catalogue,)

18 & 22, WEST-STRAND.

## New Equitable Assurance Company,

(Incorporated by Act of Parliament, 7 and 8 Vict. cap. 110.)

CHIEF OFFICES—449, STRAND, LONDON.

BRANCH OFFICES.—SAVINGS BANK, WORCESTER.

CAPITAL, £100,000.

### TRUSTEES.

SIR JAMES DUKE, Bart., M.P.

WILLIAM FERGUSSON, Esq., F.R.S.

SIR CHARLES HASTINGS, M.D., D.C.L.

GEORGE JAMES GUTHRIE, Esq., F.R.S.

### DIRECTORS.

SIR CHARLES HASTINGS, M.D., D.C.L., Chairman of the Board.  
GEORGE BEAMAN, Esq., M.D., F.R.C.S., Deputy Chairman.

### MEDICAL PRACTITIONERS.

THE DIRECTORS ACKNOWLEDGE AND CONSULT ALL DULY-QUALIFIED MEDICAL PRACTITIONERS AS THE MEDICAL ADVISERS OF THE COMPANY, AND UNIFORMLY PAY A FEE OF TWO GUINEAS FOR EVERY MEDICAL REPORT, WHEN THE PROPOSAL FOR ASSURANCE IS FOR £200 AND UPWARDS, AND A PROPORTIONATE FEE FOR A SMALLER AMOUNT.

MEDICAL PRACTITIONERS ARE ALSO ENTITLED TO TEN PER CENT. COMMISSION ON FIRST-YEAR'S PREMIUMS, AND FIVE PER CENT. ON ALL SUBSEQUENT PAYMENTS, FOR ASSURANCES EFFECTED THROUGH THEIR INTERMEDIATION.

### EVERY DESCRIPTION OF LIFE ASSURANCE BUSINESS TRANSACTED.

Prospectuses, Forms for Proposals, and any further information, may be had on applying to the Resident Director, or Secretary, at either Office, or of the Company's Agents.

N.B.—Active and influential AGENTS wanted.

## The London and Provincial Medical

PROTECTION and BENEVOLENT SOCIETY, 43, Lincoln's-inn-fields, London. Conducted by a responsible Committee of Medical Practitioners.

### PRESIDENT.

JOHN PROPERT, Esq.

### TRUSTEES.

John Bowling, Esq., Hammersmith. | Horatio Day, Esq., Isleworth.  
James Clayton, Esq., Percy-street. | J. Propert, Esq., New Cavendish-st.  
Nathaniel Clifton, Esq., Islington. | G. Webster, Esq., M.D., Dulwich.

The objects of this Society are—  
1st. To secure the more regular payment for professional services, and to adopt measures for the benefit and advancement of the general interests of medical men.

2nd. To negotiate the Transfer of Practices, Partnerships, and the providing of Assistants and Pupils.

3rd. To establish a fund for benevolent purposes.

Annual Subscription, One Guinea; a firm, consisting of two partners, a Guinea and a Half; a firm of three partners, Two Guineas. No unqualified person can be admitted a Member of the Society.

The Trustees and Committee are responsible for all moneys paid to the Society, and also for the integrity of their agents.

JOHN CAPES, Esq., Secretary-Superintendent.

## London Necropolis Company.—It is

intended to OPEN the CEMETERY on the 13th November, and this Company will undertake Funerals on and after that date.

A train, conveying Funerals and Mourners will start from the Westminster-road Station daily at 11:20 A.M.

Forty-eight hours' notice of any intended Funeral must be given at the office of the Company, 2, Lancaster-place, Waterloo-bridge, where full particulars of the general arrangements may be obtained.

### The Charges are:—

First Class Single Grave in perpetuity, including conveyance of	£2 10 0
Coffin to Woking, Funeral Service, and Interment	...
Second Class, ditto ditto	1 0 0

This Company has also contracted with eminent and responsible Undertakers and Statuaries, so that the Public may either employ their own Undertaker or Statuary, or by one payment obtain all the requirements of a Funeral.

A detailed Tariff may be obtained on application, either in person or by letter.

By Order,

RICHARD CHURCHILL, Sec.

## Medical Galvanic Coil, complete, at

27s. 6d. Powerful ELECTRO-GALVANIC MACHINES for Medical purposes, of very superior finish, with Battery and Conductor, complete, at 27s. 6d., at C. BAKER'S Surgical, Optical, and Philosophical Instrument Warehouse, 244, High Holborn.

## Army and Navy Surgeons can be

supplied with the best SURGICAL INSTRUMENTS cheaper than any other house in the trade, at PRATT'S, 420, Oxford-street. Travelling Urinals, from 12s.; Brass Enema Syringe in Case, 7s. 6d.; Elastic Stockings, 5s.; Case of Amputating Instruments, £3 15s.; Pocket Case, 30s.; Tooth Instruments, from 25s.

PRATT, Surgical Instrument Maker, 420, Oxford-street.

## Elastic Supporting Belts, of the same

beautiful fabric as Pope and Plante's Elastic Stockings for Varicose Veins. Those for ladies' use, before and after accouchement, are admirably ADAPTED FOR GIVING ADEQUATE SUPPORT WITH EXTREME LIGHTNESS—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed.

Instructions for measurement and prices on application, and the articles sent by post from the manufacturers, POPE and PLANTE, 4, Waterloo-place, Pall Mall, London.

## Bank of Deposit, National Assurance,

and INVESTMENT ASSOCIATION, No. 3, PALL-MALL EAST, LONDON.

Established A.D. 1844.

Empowered by Special Act of Parliament.

Parties desirous of investing Money are requested to examine the Plan of this Institution, by which a high rate of Interest may be obtained with perfect security.

The Interest is payable in January and July, at the Head Office in London; and may also be received at the various Branches, or through Country Bankers, without delay or expense.

PETER MORRISON, Managing Director.

Prospectuses and Forms for opening Accounts sent free on application.

## Family Endowment Life Assurance

AND ANNUITY SOCIETY.

12, CHATHAM PLACE, BLACKFRIARS, LONDON.

ESTABLISHED 1835.

CAPITAL, £500,000.

### DIRECTORS.

William Butterworth Bayley, Esq., Chairman.

John Fuller, Esq., Deputy-Chairman.

Lewis Burroughs, Esq.

Robert Bruce Chichester, Esq.

Major Henderson.

Charles Henry Latouche, Esq.

Edward Lee, Esq.

Colonel Onseley.

Major Turner.

Joshua Walker, Esq.

An Annual Bonus is allowed to parties who have made Five Annual Payments on Policies taken out on the Profit Scale. That for the current year is 20 per cent. in reduction of the Premium.

ENDOWMENTS AND ANNUITIES GRANTED AS USUAL.

### INDIA BRANCH.

The extensive Assurance Business of the Agra and United Service Bank has been transferred to this Office, and the Society has Branch Establishments or Agencies at Calcutta, Madras, Bombay, Agra, and Hong Kong.

JOHN CAZENOVE, Secretary.

## The Respirator.—The assumption of

the name of Respirator for various discreditable and defective imitations of MR. JEFFREYS' Instruments, the value of which in medical practice has given a wide reputation to the name, can only mislead unwary persons not acting under professional advice.

City Office for the Respirator, 25, Bucklersbury: West-end Depot, 25, Holles-street, Oxford-street, London. In London and all Towns, the principal Chemists and Surgical Instrument Makers are Agents for Mr. Jeffreys' Respirators.

## The Pure Warm-Air Charcoal

RESPIRATOR, invented by Dr. STENHOUSE, of St. Bartholomew's Hospital, for preventing and alleviating Diseases of the Throat and Lungs, and also as a safeguard against Fevers, and other infections, which no other respirator will do, is in appearance like the ordinary Respirator, but half its weight. When the breath is fetid, which is the case under many forms of dyspnea, &c., the disagreeable effluvia are absorbed by the charcoal, and pure air alone is inspired. There are three kinds:—One Oral, price 6s., 6d. extra post free; and two Ori-nasal, one for infected atmospheres, the other for chemical and manufacturing establishments.

W. ROOPE, Manufacturer, 8, Willow-walk, Kentish-town.

## Mr. Hooper's Water Mattresses or

BEDS, and CUSHIONS for AIR or WATER, for placing on an ordinary Bedstead. Being made of India-rubber, without the admixture of cloth materials, leakage is avoided. (Extract from THE LANCET, Jan. 25, 1851.)

CUSHIONS FOR BED-SORES.—Whether threatened with Sloughing, or in which Sloughing has taken place, Fractures, Diseased Joints, Spasms, Lassitude, Typhoid and other Fevers, Rheumatic Affections, Dropsy, Coldness of the Stomach and Feet, Consumptive and all Bed-ridden Patients. They are simply to be placed on an ordinary bedstead. These Cushions and Beds are not affected by Heat or Cold, and will bear water at any temperature.

Finsbury-square, February 27, 1852.

I have in several instances employed Mr. Hooper's Water Cushions and Mattresses; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water Bed.

JON. PEREIRA, M.D., Physician to the London Hospital.

Infirmary, Chichester, March 21, 1852.

Sir,—We are all much pleased with your Cushions, and still more so with the Mattresses.

Yours truly,

THOS. NEWHAM, House-Surgeon.

HOOPER, 7, PALL MALL EAST, and 55, GROSVENOR-STREET.

# DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY, AND  
PUT TO THE TEST OF CHEMICAL ANALYSIS.

PRESCRIBED BY EMINENT MEDICAL MEN AS THE MOST EFFECTUAL REMEDY FOR  
CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, RHEUMATISM, SOME DISEASES OF THE SKIN, RICKETS,  
INFANTINE WASTING, GENERAL DEBILITY, AND ALL SCROFULOUS AFFECTIONS.

## PURE AND UNADULTERATED.

THE great difficulty of obtaining genuine and good Cod-liver Oil has long prevented a just appreciation of its acknowledged remedial virtues, and precluded many suffering invalids from realizing the beneficial effects of this truly valuable Medicine.

Dr. de Jongh's Light-brown Cod-liver Oil is of the best kind and finest quality, being extracted from the liver of the Dorse—*Gadus Callarias*—by a process yielding a much larger proportion of iodine, phosphate of lime, volatile acid, the elements of the bile, and other essential principles, than the Pale Oils manufactured in England and Newfoundland, which, by their mode of preparation, are deprived in a great measure of their active elements.

The well-merited celebrity of Dr. de Jongh's Oil is attested by its extensive use in France, Germany, Holland, Belgium, and Italy, by numerous spontaneous testimonials from eminent members of the Faculty and scientific Chemists of European reputation, and since its recent introduction into this country, by the marked confidence, as well as great success, with which it has been prescribed by Medical Practitioners.

*Testimonial from the late Dr. JONATHAN PEREIRA, Professor at the University of London,  
Author of "The Elements of Materia Medica and Therapeutics," &c. &c.*

"MY DEAR SIR,—I was very glad to find from you, when I had the pleasure of seeing you in London, that you were interested commercially in Cod-liver Oil. It was fitting that the Author of the best analysis and investigations into the properties of this Oil should himself be the Purveyor of this important Medicine.

"I feel, however, some diffidence in venturing to fulfil your request by giving you my opinion of the quality of the Oil of which you gave me a sample, because I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this Medicine as yourself, whom I regard as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of responding to your application. The Oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer Oil can be procured.

"With my best wishes for your success, believe me, my dear Sir, to be very faithfully yours,

"Finsbury-square, London, April 16th, 1851.

(Signed)

"JONATHAN PEREIRA.

"To Dr. de Jongh."

*Extract from "THE LANCET," July 29th, 1854.*

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de Jongh gives the preference to the light-brown Oil over the pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. In the preference of the light-brown over the pale Oil we fully concur.

"We have carefully tested a specimen of the Light-brown Cod-liver Oil, prepared for medical use under the direction of Dr. de Jongh, and obtained from the wholesale agents, Messrs. Ansar, Harford, and Co., 77, Strand. We find it to be genuine, and rich in iodine and the elements of bile."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S Stamp and Signature, by

**ANSAR, HARFORD, & CO., 77, STRAND, LONDON,**

Sole Consignees and Agents for the United Kingdom and British Possessions, and may be obtained from respectable Chemists and Druggists in Town and Country, at the following prices:—

HALF-PINTS . 2s. 6d. | PINTS . 4s. 9d. | QUARTS . 9s.

**IMPERIAL MEASURE.**

\* \* Hospitals and other Charitable Institutions requiring large quantities  
may be supplied on considerably reduced terms.

# Three Lectures ON THE SPINAL SYSTEM AND ITS DISEASES.

Delivered at the Chatham-street School of Medicine,  
Manchester.

By MARSHALL HALL, M.D., F.R.S. L. & E.,  
FOREIGN ASSOCIATE OF THE IMPERIAL ACADEMY OF MEDICINE OF PARIS, &c.

## LECTURE I.

### THE ANATOMY, PRINCIPLE OF ACTION, AND PATHOLOGY, OF THE SPINAL SYSTEM.

[THESE lectures were delivered by invitation of the lecturers, and were attended by a large body of students, and most of the leading members of the profession resident in Manchester and the surrounding towns, including Dr. Lyon; Sir James Bardsley, M.D.; Mr. Wilson, President of the Provincial Medical Association; Dr. Radford, Dr. Eason Wilkinson, Dr. Watts, Dr. Noble, Mr. Southam, Mr. Dumville, Mr. Somers, Mr. S. S. Fletcher, Mr. Braid, Mr. Hatton, Dr. Stone, Dr. Clay, Dr. Merei, Mr. Golland, Mr. Murphy, Mr. Windsor, Dr. Whitehead, Mr. J. O. Fletcher, Mr. Morley Harrison, Mr. Manley, Mr. McKeand, Mr. Walsh, and Mr. Manley, of Manchester; Mr. Flint, of Stockport; Mr. Brigham, of Lynn; Mr. Lallemand, of Macclesfield; Dr. Black, Dr. Chadwick, and Mr. Wolstenholme, of Bolton; Mr. Anderson, and Mr. Clark, of Farnworth; Mr. Lumb, and Mr. Lawton, of Rochdale; Dr. Woollam, and Mr. Galt, of Ashton, &c.]

Mr. Southam, in prefacing the proceedings, stated, that he had great pleasure in introducing to the gentlemen assembled Dr. Marshall Hall, who, by invitation of the lecturers of the School, had kindly consented to deliver three lectures on the Physiology and Pathology of the Spinal System. To the members of the profession present it was unnecessary for him to say anything in support of Dr. Hall's views, they being sufficiently well-known and appreciated by all who sought to practise medicine on correct and scientific principles. To the students present he would just remark, that they would have the privilege of hearing explained, by its discoverer, the spinal system, comprising a series of facts which he believed had the same relative importance to medical science, as the atomic theory of their late illustrious townsman, Dalton, had to the science of chemistry.]

Dr. Marshall Hall then addressed the crowded audience as follows:—

GENTLEMEN, — I have accepted, with much satisfaction, the invitation of your able teachers, to expound to you the Anatomy, Physiology, and Pathology of the Spinal System. In doing this, I shall avail myself of experiment and of reference to clinical observation. I wish to demonstrate to you the immediate and intimate connexion between physiology and practice. You may indeed regard these lectures as a specimen of a work which I am preparing for the press, designed specially for the medical student, to be entitled "*PHYSIOLOGY in the Laboratory and the Clinical Ward.*"

I propose, in that work, to effect the separation of mere empiricism from medicine for ever.

Physiology was divided, by the illustrious Bichat, into two systems, or sub-systems,—*the animal, and the vegetative.*

The nervous system has, in a correlative manner, been divided into *the cerebro-spinal, and the ganglionic.*

Both these divisions are defective. There is a *third* sub-division of the nervous system, hitherto undetected, which forms an essential link with the other two, and which I have designated *the Spinal.*

Observe this frog. You are all familiar with its natural movements. I divide what was termed the cerebro-spinal system just below the occiput.

I stop for a moment to call your attention to a most interesting phenomenon. I seize one of the toes of a posterior extremity between my thumb and finger, making a little gentle pressure and movement. No effect is produced. In a minute, or less, you will see how different the result will be. The animal is in the state of *shock*; just such a shock as we observe in practice, as the effect of a violent fall from scaffold.

No. 1628.

ing, or a crushing accident from machinery. I repeat the experiment. You now see the manifestation of returning power in energetic movements.

This experiment, repeated with care, would afford the means of investigating the phenomena of shock, and of a principle of practice. For example: after a violent comminuted fracture, is it better to amputate immediately or after the lapse of a certain interval of time?

I again call your attention to my experiment. Observe how energetic the movements of the frog now are on exciting the skin of the foot; how similar, too, to ordinary voluntary motions! Who would not be beguiled into the conclusion that in this animal sensation and volition still exist?

Nevertheless, if my experiment has accurately divided the cerebrum and cerebellum from the medulla oblongata, and if I induce quiet in the animal by gently controlling its movements, as you see, it will never move spontaneously more! Nay, though I place it in a position which, if sensibility remained, *would be* the most painful, yet, quiet once induced, and *all* external excitation avoided, it will never move again. It might be left in such a position, and if so protected from excitement, it would be found the next day in the same position still.

But again I rub the toe between my thumb and finger, and again it moves; it jumps, and it crawls; the latter movement consisting, in fact, in a series of movements induced by the renewed contact of points of the cutaneous surface with the surface of the table.

What is the *rationale*, what the relations, of these singular phenomena?

Gentlemen, nearly a quarter of a century ago I was engaged in the investigation of the circulation of the blood in the batrachian reptiles; I had been examining the pneumonic circulation in the *triton*; the animal lay on the table; I removed the head and the tail. On touching the latter by the point of a probe, it coiled up! I asked myself the questions which I have just proposed to you. From this simple fact and observation have resulted the discovery, the elaboration, and the application of the SPINAL SYSTEM—that system which, as I have said, I am about to expound to you in these lectures.

I again recur to my question—What is the *rationale*, what the relation to *life*, to anatomy, and to physiology, of this phenomenon? I have removed the cerebrum and cerebellum; it does not therefore depend upon these. But I proceed further: I now remove the whole of the internal viscera, and, with them, the whole of the ganglionic system. Still the movements continue as lively as ever!

Observe this physiological preparation well. There is not in the Hunterian Museum a preparation more replete with the deepest interest. It is the demonstration that when the centre of the cerebral system and when the entire ganglionic system are removed, there still remains a *third* system, independent of each and of both, *sui generis*, autocratic!

Place this specimen of the decapitated, eviscerated frog in your museum—the demonstration of the distinct and independent spinal system—in memory of this day!

Do not be disconcerted that I show you these things in so humble a creature. *All* physiology exists in the caterpillar or the butterfly, if we could only detect it. The least of God's works is infinite.

I began by stating to you that hitherto anatomists and physiologists had divided the nervous system into the cerebro-spinal and the ganglionic. I have analyzed these, and I have demonstrated to you, that in the midst of these two there is a *third* system. As the chemist detects, in a mineral hitherto regarded as consisting of certain elements—say silver and gold—a new element, platinum, so I, in the midst of the cerebro-spinal and ganglionic nervous systems, have detected a new element—the *spinal*; and of how great moment this is I must proceed, without further delay, to unfold to you.

I revert once more to this interesting preparation: the cerebral centres and the ganglionic system are removed; what remains? what is its anatomy, its principle of action, its physiology, its pathology, its therapeutics? what its relation to *life* and *death*?—questions of the deepest interest.

In the first place, observe me now destroy, in this decapitated, eviscerated frog, by means of this needle, the spinal marrow. Now all is still! I irritate the toe in vain. I wait in vain for recovery from shock. All the interesting phenomena formerly manifested are extinct! They depend, then, on the spinal marrow, *their* spinal centre!

In the next place, I take this preparation, which is similar to the former one—viz., without cerebral, without ganglionic systems, and I denude the lumbar nerves. The excited move-

ments in both lower extremities are, as you see, perfect. I divide this *right* lumbar nerve; the excited movements in the *right* leg, and in that leg only, are extinct!

The excited reflex movements depend, then, not only on the spinal centre, but on the nerves connected with that centre.

You observe the phenomena still perfect in the *left* leg: I remove the skin from the foot; the excited movements are again extinct. They depend, then, in this instance, on the integrity of the integuments of the part to which the excitation is applied. In these integuments, in fact, reside the *origin* of those nerves on which these excited reflex actions depend.

But now, gentlemen, I must beg your best attention whilst I explain more particularly the nature and forms of that nervous structure which constitutes the spinal system.

If I either strip off the skin, or destroy the spinal marrow, or divide the lumbar nerve, the phenomena cease. They depend, then, on the *origin* and on the *course* of certain nerves, and on their spinal centre.

But a little more minutely: If I remove the origin of this structure, by removing the integument; or if, within the spinal canal, I divide the *posterior* root of the spinal nerves; or if I destroy the spinal marrow itself; or, if I divide the *anterior* roots of the spinal nerves; or, if I divide the nerves in any part of their course to or from the spinal marrow, I annihilate all reflex phenomena.

Here then is a new *Demonstration*: all reflex actions depend on an *in-going* nerve, with its *origin* in the tissue excited; on the spinal centre; and on an *out-going* nerve, with its *termination* in the muscles. These constitute a *nervous Arc*, consisting of parts *essentially* linked together; a new kind of *Anatomy*, established and demonstrated for the first time.

Each *special* excited, reflex, or diastaltic action, (so I have designated it, because it is excited *through* the spinal centre,) has its *special* diastaltic nervous Arc. Of these *Arches* there is an extensive *series* in the animal economy. Together with their continuous centres, they constitute the spinal system of connected eisodic (or in-going) and exodic (or out-going) nerves.

Gentlemen, no facts in chemistry or physics are more demonstrable than these; none more valuable in their relations respectively; whether we contemplate life, disease, or death, the spinal system becomes now our constant guide.

Let us now, gentlemen, consider what we have within the spinal theca. The sensations of the hands, feet, &c., imply an uninterrupted connexion between those parts and the cerebrum, upwards. The acts of volition of the hands, feet, &c., imply a similar uninterrupted connexion downwards. There are, then, *two* nervous conductors, whether distinct fibres, or whatever they may be, along the spinal marrow, which, in this sense only, may be viewed as a *spinal Chord of nerves*, of sensation, and of volition.

But when the cerebrum is removed, when all sensation and volition are extinct, if we excite the skin of the lower extremity in the frog, the anterior extremity is moved, and *vice versa*; phenomena which cease either on removing the spinal marrow, or dividing the lumbar nerves. How then are we to view these structures?

The lumbar nerves convey sensation and the mandates of volition to and from the cerebral centre, when that remains; they convey the eisodic excitator influence, and the exodic excitator influence, when that centre is removed. The spinal centre is the general key-stone to the diastaltic arcs.

As certainly as the lumbar nerves in the frog convey sensation and volition, so certainly do they convey these other two influences. If Sir Charles Bell has proved that such nerves are *double*, I have proved them to be *quadruple*.

The posterior roots of the intra-spinal nerves are not only sentient, but eisodic excitomotor; their anterior roots are not only conveyers of the influence of volition, but of exodic excitomotor. There is precisely the *same* kind of proof of one of these functions, as of the other. The spinal marrow; the lumbar nerve in the frog; the sciatic in the human subject; are each and all *quadruple* in their mode of action; I do not say in their structure.

There is an additional fact or series of facts: the spinal marrow is the conductor of the influence of emotion, and of that of undue acidity in the stomach, when these affect, the first directly, the second in a reflected manner, the action of the heart—a subject requiring new and careful investigation.

Enough has been said, then, gentlemen, to convince you that the spinal marrow is no mere chord of nerves. Enough has been said to show you that it is intimately connected with the ganglionic system. And especially, enough has been shown to prove to you that it is the great centre of a series of actions in the animal economy.

You will be still more impressed with the importance of the

spinal system, when I tell you that, besides the phenomena which I have brought before you, it is the nervous centre and agent in *All the Functions of Ingestion and of Egestion* in the animal economy, in the *entire Class of Convulsive Diseases* in pathology, in the action of a certain *Class of Remedies*, and in the whole of that department of medicine denominated *Obstetrics*!

Having made these observations, which relate principally to the *Anatomy* of the spinal system, I must now call your attention to its *Principle of Action*. This I have proved, by a series of the clearest experiments, to be the *vis nervosa* of Haller. But this celebrated physiologist, Bichat, and Professor J. Müller, all laid it down as a *Law*, that this power acts in the *direction downwards* only. As long as this idea prevailed, it is obvious that it *could* have no application to *physiology*. For how could the spinal marrow or an exodic nerve be irritated physiologically? Its application was accordingly limited to pathology.

But by a series of experiments on the turtle, I proved that the *vis nervosa* may act *upwards* and *towards* as well as *outwards* and *downwards*, and then its application to physiology became evident.

If you remove the head and viscera in the turtle, and excite an eisodic nerve between the upper and lower part of the animal, *all* the extremities are moved. The influence of the *vis nervosa* has been *inwards*, and *upwards*, and in all other directions, and not *downwards* only.

It now became easy to explain the various acts of ingestion, retention, egestion, and exclusion, depending, as they all do, on an eisodic excitement.

I may now, before entering on this topic, give you a general idea of the Nervous System as we now view it.

The cerebrum, the cerebellum, and, in a certain sense, the medulla oblongata, may be regarded as the Centre of the Cerebral System, of the nerves of special sense, and of volition, of intellect, and of the passions, of pleasure and of pain. By its means we are placed in relation to all that is *external*, *psychically*. By its means we perceive, by its means we seize and use, external objects.

There is good reason to believe that intellect is seated high, the emotions lower, and the faculty of pleasure and of pain lower still, in their general cerebral centre.

Below the centre of the cerebral system is that of the spinal system, and its analogue in the articulate; &c. The spinal centre includes the medulla oblongata and medulla spinalis. It may be divided into—

1. The Medulla Oblongata, the spinal centre principally of the acts of ingestion and of egestion, by which the preservation of the individual is effected, and especially those of deglutition, respiration; &c. With this centre, the pneumogastric, the diaphragmatic, &c., of such momentous importance in these acts, are essentially linked;
2. The Brachial Enlargement;
3. The Femoral Enlargement; and
4. What, I think, may be designated the *Lower Medulla Oblongata*, the analogue with its nerves of the organs of generation, of the upper with its pneumogastric; and the spinal centre in the acts for the perpetuation of the species.

In each of the acts of ingestion and egestion to which I have alluded, there is the essential agency of a diastaltic spinal arc. The pharynx and larynx are excited by eisodic and exodic branches of the pneumogastric; the pneumogastric is the internal excitator of inspiration, acting through the spinal centre and the diaphragmatic and intercostals.

Similar diastaltic nervous arcs constitute the nervous media through which emission, conception, parturition; &c., are effected. In all these are nervous *origins* in exciting surfaces, an eisodic nerve, the spinal centre, an exodic nerve, and muscular terminations. The *law of action*, the mode of action, the channel of action, are in all identical or similar. All have the same object or objects—ingestion, retention, egestion, exclusion.

Can anything be more simple and scientifically beautiful?

All these acts are *physical*. As the cerebral acts depend on the immortal  $\psi\upsilon\chi\eta$ , these depend on the *vis nervosa*; as those relate to external objects psychically—viz., to objects *without*, these relate to them physically, acting *from without* to *within*, and *from within* to *without*.

The spinal centre, with its nervous arcs, and the muscles in which these terminate, are the dynamic agents which accomplish that "*tourbillon*" so eloquently described by Cuvier.

The ganglionic system relates to all that is *within*, governing the peristaltic actions, assimilation, the secretions, the excretions, &c.

But of these functions I must treat as cursorily as I have done of the cerebral system.

They are greatly under the influence of emotion, and of sympathetic or synergic action through the spinal centre. We have only to observe the effect of derangement of the stomach, or of eroded viscera, on the action of the heart, the skin, &c., in connexion with experiment, to arrive at this conclusion.

The experiments to which I allude are the following:—Let the head be removed in a frog, the spinal marrow remaining, and the circulation be ready to fail: if we now crush the stomach or a limb with a hammer, the action of the heart ceases. Let the conditions be the same in another frog, with the addition that the spinal marrow is also removed: in this case, no influence is perceived, on crushing a limb or the stomach, on the action of the heart. Now, the difference is the presence or absence of the spinal centre. This experiment, however, requires careful repetition.

Now, gentlemen, I think I may hope that you have a sound knowledge of the spinal system, as far as it extends; for it is founded on experiments which your own eyes have seen, and which I think you will not forget.

As in the present lecture I have brought before you the Anatomy and Physiology of that system, I propose, to-morrow, to treat of its Pathology.

You will, if I am not mistaken, find your knowledge of the spinal system the key to the diagnosis of the diseases of the nervous system. It is to these, in some degree, what the *Stethoscope* is to diseases of the heart and lung, the administration of a new kind of knowledge being as that of a new mode of observation; and if to know the disease is *not* half the cure, it is the whole of the treatment.

To-morrow evening, then, I propose to discuss the subject of the *Diseases of the Spinal System*.

## XAVIER BICHAT:

HIS LIFE AND LABOURS.

A Biographical and Philosophical Study.

By R. KNOX, M.D.

My professional studies and pursuits, and especially my avocation as a lecturer on anatomy, brought at least annually before me the consideration of the "true relation of anatomy to medicine and surgery." On the other hand, the study of comparative anatomy, embryology, and the transcendental, was from my earliest years the favourite and engrossing object of all my private studies, and led me necessarily to deeply consider, and if possible to discover, the relation of anatomy to philosophy and to science. Latterly, the exterior of man seemed to me worthy of a separate and distinct study. Its delineation forms the grand object of the divine arts of painting and sculpture; its study must have a basis in the anatomy of that form, the exterior of which art alone delineates. This led me to pursue earnestly the study of the relations of the interior to the exterior of living beings, and more especially of man himself. As my inquiries proceeded, I found that artists themselves, and especially the divine Leonardo, had instinctively, and by force of genius, solved the problem by their works; but they had explained nothing in writing; and this consideration, together with others more fully set forth in my work entitled "*Great Artists and Great Anatomists*,"\* led me to review in that work the true relations of anatomy to philosophy, science, and art. A part of my task remained, which I now endeavour to complete: it is, to establish the true relation of anatomy to the practical arts of medicine and surgery—arts which, though moving in a humble sphere, and in no way entitled to the name of sciences, are yet eminently useful to mankind, whatever statisticians and geometers may affirm to the contrary. To establish the true relation, then, of descriptive anatomy to medicine and surgery, is the object of the following Memoir.

The history of anatomy, as applied to medicine and surgery, is wrapt up in the life and labours of one man. That man was Xavier Bichat. Preceded by the laborious and truth-seeking Haller; by Winslow, Du Verney, Morgagni, and Santorini; Malpighi, Fabrinii, the teacher of Harvey; by Harvey himself; Albinus, Ruysch, Vieussens, Vesalius; the contemporary of a greater than all; it was yet left for one man of later times to place human anatomy on its true basis—to discover the descriptive, the general, the surgical; to bestow an intelligible, systematic form on that knowledge which, ere he

wrote and laboured, was disjointed, fragmentary, and all but worthless.

To appreciate justly the vast merits of this profound genius, we must consider first—What is anatomy and what its object? How it stood before the times of Bichat, and how since? What were and what are the views which the public, as well as the professional mind, had adopted in respect of it? Let us carefully distinguish the philosophical from the practical, the theoretical from the empirical, true generalization from mere truism. But first, of the man himself.

Marie François Xavier Bichat was born in 1771, at Thoirette, in Bresse, now called the department of the Jura. His father was a physician and mayor of Poncin, in Bugez; but he had property at Thoirette, where Bichat happened to be born.\* He was the eldest son of Jean Baptiste Bichat and of Marie Rose Bichat. Intended for the practice of medicine, his education was, according to the method usually followed in England, the reverse of what usually prevails in France. He acquired that first which most think should come last—practice before what is usually called theory, but what in reality merely means a scientific education; for practical medicine is not, nor ever was, based on theory. Be it so; but on this point, as on most others, two views are maintained, each having reasons in its favour. To be taught the application of drugs and instruments for the relief of medical and surgical disease before being taught the anatomy of the frame and its physiology, such as it is; its chemistry, its pathology, that mortifying record of well-intended efforts, seems at first sight empiricism to the last degree. And so it is, in a sense. It might be said of the medical man taught after this fashion, that he remains, and must remain, empirical for life. Were such education as universal as it was a few years ago throughout England, medicine must have remained stationary for ages. Many people think that this is exactly what has happened; but, though admitting that centuries pass on, and medicine makes no clear and undoubted progress—that medicine, in fact, has scarcely a literature deserving the name—still let us hope that it is not absolutely stationary. But be this as it may, with the purely practical man, the man who knows nothing of science, nothing of the frame, it becomes self-evident that the trade he exercises is not a profession. Reduced to a series of formulas and prescriptions, he observes certain signs, certain appearances, and acts accordingly, irrespective of the connexion of these symptoms with the organs themselves.

On the other hand, a highly theoretical, systematic education has this defect in it: first, as regards disease, it describes that which the student has never seen; second, it is apt to lead him from practical pursuits to the purely scientific, unfitting him thereby for the great drama of life. To use a homely phrase, this kind of education is likened by some to placing the cart before the horse—a plan which succeeds perfectly in England.

Bichat's education, then, was at first practical—ought we not rather to say empirical?—that is, his father taught him the application of drugs and instruments before he had been taught a knowledge of the human frame. But neither this false step—for such I think it is—nor any other, could arrest in its grand career a genius of the highest stamp. To bring him in contact with other minds was simply to enable him rapidly to overtake and to outstrip all other men. Like every great man, he speedily left each master far behind, learning rapidly all he could teach him, turning over the knowledge so acquired in his own mind, and reproducing it under forms till then unknown. From his earliest years he saw the truth face to face, without the interposition of that hazy veil obscuring her true form from ordinary minds.

Bichat, I have said, was born in 1771. He commenced his studies at Lyons, and it was there he first studied anatomy. I can well imagine what difficulties he must have encountered; he began his career near the termination of a declining era, which, as regarded his pursuits, it was his destiny to close for ever. The anatomy of man, and, indeed, of all animals, at the period I speak of, was a hap-hazard sort of study, fragmentary, at times minute and complex, at times coarse and contemptible. Such I saw it in 1810 in Edinburgh; such I found it still in 1814-15 in the metropolis; and such it still was in 1825, when I delivered my first course of lectures "*On Descriptive Anatomy*." Nobody seemed rightly to understand what descriptive anatomy meant; the general anatomy of man was unknown.† There were in the metropolis but two great schools. In one of these the course began with hernia and the fasciæ, and ended with harnia and the fasciæ. The lecturer read the descriptions of the muscles from Fyfe's wretched

\* *Great Artists and Great Anatomists: a Biographical and Philosophical Study.* Van Voorst.

\* Bulson.

† See my work, *Great Artists and Great Anatomists*, Van Voorst, 1852.

work. At the other, a man of high genius,\* affecting to despise descriptive anatomy, which his natural indolence and the spirit of his age and country prevented him mastering, talked of the abdominal muscles as so many steaks, which he buffoon-like tossed over each other, when dissected, counting them as steak first, steak second, steak third, muscles and tendons which the first of descriptive anatomists have failed clearly to describe. Yet Bichat had lived—nay, more, he had written his great works, the “*Traité sur les Membranes*,” the “*Anatomie Générale*,” the “*Anatomie Descriptive*,” but Napoleon had sealed continental Europe against England, and French works were rare. Still Bichat’s works had crept into Britain. I saw them early in 1811-12, and, comparing them with the school books and school methods of the age, I felt that a man had appeared whose destiny it was to bring to a close the era of his youth and of mine, substituting for it other thoughts, other terms, and other views.

In Bichat’s early youth, surgery was in the ascendant. J. L. Petit, De la Peyronie, Morand, Frère Come, distinguished men, led the schools, and gave the tone of the day. Sydenham and Boerhaave were about to be forgotten for ever. Dessault, the successor of the great surgeons just mentioned, the Dupuytren of his day, led all minds towards surgery. The times, moreover, conduced to this. The integrity of France was assailed by the hereditary dynasties of Europe, who found in England, or rather in its Government, what it was then and what it is now, the never-failing “conservator of hereditary despotisms.” The war spirit of the most warlike race on earth was roused and brought into action. Republican France desired repose, peace; England’s Government refused both. And England—grasping, avaricious, war-seeking England—would have granted to France of 1798 what she refused to France of 1748, because, having neither colonies nor fleets to seize, France had nothing which made it worth England’s while to prolong the war. But she could not, for now all men within the sea-girt isle of Britain instinctively felt that a life and death struggle approached with the man who had already conquered at Arcoli, Lodi, and Austerlitz.

The imbecile dynasties of Hapsburgh, and Brunswick, and Hohenzollern discovered too late their terrible error. They fancied that republican France would continue to employ the insufferable dull-headed idiots who, in the fat and drowsy times of peace, fill all offices of trust and profit under a well-conducted model hereditary dynasty! But the revolution had relieved France of the soul-destroying influence of a hereditary dynasty—the most odious incubus which ever pressed on man—and thus placed at the disposal of the Government an amount of genius, talent, and ability unequalled, unapproached, at any period, saving one, of human history.

In the early days of this stormy period, Bichat was still at Lyons, but after the siege he was obliged to leave for Paris. Politically marked out, already he felt only safe in the capital, where, attaching himself to the practice of the celebrated Dessault, he proposed qualifying himself as a surgeon, his intention being to join the army, and to remain as quiet as possible. Chance ruled otherwise. The ninth thermidor arrived and restored confidence; Bichat took courage; the republic one and indivisible was now in the grasp of a dictator, who suffered genius to thrive merely because he required it; order prevailed everywhere; the nation of *sabreurs*, *par excellence*, had Europe now before them as a battle-field; the fortunes of nations hung upon a battle. Bichat instinctively turned to science. Chance again favoured him. Dessault’s mode of teaching required certain students to reduce his oral lecture to an extract; this extract was read next day; the student on whom devolved the duty was absent, and Bichat supplied his place; the subject happened to be the treatment of fracture of the clavicle, and Dessault’s bandage. The reading of Bichat’s extract, or abstract, caused the strongest sensation in the class; the purity and expression of style, the clearness of ideas, the scrupulous exactness of the *résumé*, stamped it as the work of a genius and a master. He was evidently nature’s professor. Dessault informed of the circumstances by Manoury, sent immediately for the young Bichat, offered him a home, and henceforward treated him as a son. These were republican times; no impediment lay in the way; France had shaken from off her shoulders “the old man of the sea,” the soul-crushing, hereditary dynasty; the path was open for genius; Cuvier was in the field; Napoleon was soon to be First Consul; and France presented an amount of talent unparalleled in the history of man. This talent, the immediate product of the revolution, lay ready for employment. Under a model dynasty, and under a pure despotism no such amount of talent could have been brought forth in twice ten thousand

years. Napoleon found it prepared to his hand; he employed it to enslave the world.

As Bichat was born in 1771, he must have been about twenty-two years of age when he became first known to Dessault. Located in Dessault’s house, his genius expanded and grasped at everything. He now read extensively and deeply, thinking still deeper; assisted Dessault in composing his lectures; and the facility with which he acquired and imparted knowledge is spoken of by his contemporaries as something prodigious. Dessault died suddenly, on the 1st of June, 1795; Bichat, thrown on his own resources, did not despair. In 1797, he gave his first course of anatomy; it seems to have been merely a course of demonstrations—a private course no doubt—delivered to a few private students. During the course he experimented on living animals, a practice I never could witness, and have always held in extreme abhorrence; it was not by this that he acquired an immortal reputation. Unconsciously he had entered on a new path; he had commenced the era of facts against hypotheses; his demonstrations, of which in all probability he thought but little, constituted a new era in the history of medicine. He simply taught facts. It is as if he said, let your *elementary knowledge* be precise, clear, undisputed, and indisputable; if your anatomy be confused, your physiology must partake of the same character; and, as to “your pathology, read Bonetus, Lientand, Morgagni, and Ruysch, and say what are the conclusions to be drawn therefrom?” And, had he lived now, to the labours of these ingenious and laborious men he might have added the “*Morbid Anatomy*” of Baillie, and the “*Pathological Anatomy*” of Cruveilhier. “You have brought to a conclusion,” I said to my esteemed friend, M. Cruveilhier, “your great work on *Pathological Anatomy*.” Alas!

There is a period of life when most men call in question the powers of physic. This scepticism extends from Napoleon to the merest boor. It occurs when the mind is in its highest vigour; at a period when nothing is acceptable but *facts*; no theories listened to but the geometrical; all things doubted which admit not of direct proof. It is the age when men doubt the liquefaction of the blood of St. Januarius, but not the reign of Napoleon Buonaparte. The period I speak of ranges from thirty to fifty. At this period, physic has no hold of the mind; surgery, mechanical surgery, anatomy, positive and obvious, alone have sway. That Bichat, so young, should have leaned to surgery and anatomy arose not, however, from his years, but from fate or destiny—that is, chance, which rules all living things, uncontrollable chance, setting at defiance all human calculations. Chance willed it that he lived at the commencement of the French Revolution—that mighty event which for a time promised to restore to mankind those rights, the “*rights of men*,” filched from them by fraud and violence. For ages and ages the dominancy of the crozier and the sword, church and state, had held the human mind in a state of the most pitiable thralldom. In Europe, continental and insular, liberty had not a spot to rest on. In no country, not even in Russia, were the rights of men so thoroughly trodden down at that period as in England. The French Revolution promised to restore the rights of men.

Bichat, without being conscious of it, was the child of this Revolution. But for it an obscure, ignoble destiny awaited him. The dynasty of France, like every other dynasty, prudently rejected all bold-thinking men—men of genius and action. “We want *good men*,” said the miserable imbecile, Ferdinand of Austria, to the illustrious Scarpa, “not *great men*.” The same language was, and is, that of all dynastic governments. Based on fraud or on violence, they seek for support by crushing the mind of the nation. Not so Republican France! Menaced by the despots of Europe, she felt that genius alone could save her. The nation responded to the call, and a mass of intelligence appeared at once which throws into the shade the genius and ability of every other age.

Republican France, which produced Arago, Cuvier, Malus, Geoffroy, La Place, and Sévigny, also produced Bichat. That their career was unchecked by Napoleon was an accidental chapter in his history; for, like all despots, he hated genius and despised the rights of men; but he required their aid to consolidate that empire, to establish that central power, which chance and his own mighty genius had placed in his hands.

It was natural for a gigantic mind like that of Bichat to pass rapidly through the infantile and juvenile stages of intellectuality, described by M. Comte so happily and so simply as “the theological and metaphysical conditions of mental existence.” He scarcely seems to have been aware of those deep oceans of error in which so many men and nations and races have wandered, and been shipwrecked. His

\* Mr. Abernethy.

mind shot at once into "the positive," the real, and the absolute; for we find that already in 1797, when only twenty-six, he gave his first course of demonstrations. In 1799, he published the "*Traité sur les Membranes*," which first introduced him to Europe; and although it has been objected to Bichat that Bonn in Germany; Carmichael, Smith, and the Hunters, in England; Pinel, in his own country, France, had anticipated him in the announcement of the primitive idea, both as regards the serous membranes and the cellular tissue, it may yet be safely asserted that the "*Traité sur les Membranes*," viewed in conjunction with the "*Anatomie Générale*"—a term difficult of translation—placed anatomy in an entirely different point of view, and formed an era in medicine. Admitted that the view thus taken, which seemed for a moment to rescue medicine from pure empiricism, and to give to it a rational form, proved ultimately defective, ultimately a failure; that it explained neither diseases nor their treatment; that it shed no light on the animal sympathies; that it left biology nearly where it was,—yet was it a powerful generalization in the right direction, a step as great as that of Harvey, equally necessary to be known, equally unproductive in practical results.

The "*Traité sur les Membranes*," of which the "*Anatomie Générale*" is but the extension, was followed by the celebrated attempt to determine experimentally the essential conditions of human life. This he attempted in the brief essay, "*Sur la Vie et la Mort*," published in 1799. At that time he was twenty-eight, a fact incredible were it not quite certain. Unknown to each other, as if they had lived at different epochs and in different lands, Cuvier—the immortal Cuvier—was labouring at the Jardin des Plantes. Cuvier had already discovered the value to zoology of the new element, descriptive anatomy, and was applying it to the history of the earth. Bichat discovered that in point of fact it had never been applied to man. Retracing his steps, as it were, he might be supposed to have thus reasoned, if genius ever reasons, which is doubtful:—"For thousands and thousands of years physicians have conjectured, guessed, and theorized; surgeons have operated; physiologists have idly dreamed, respecting the operations in health and disease, of organs not yet properly described—not completely understood; what must that medicine be so exercised? It has been described by Celsus; he calls it empiricism. What must that surgery be so carried on? A hap-hazard, brutal art, which ought to have been long ago suppressed."

It was by the force of genius, instinctive, profound, that, arriving at certain generalizations, he formed a new era—the era of facts: he taught the scientific world to speak and think as he did. If he did not succeed in laying a true basis for biology, it must be remembered that the laws of life transcend, in seeming complexity at least, the laws of inert matter; in living bodies all is mystery—their origin, persistence, extinction. He failed where Hunter failed; he attempted *physiologie positive*, but it would not do. Is Cuvier's merit the less that he could not explain the successive zoologies which have appeared on the globe but by the clumsy interposition of a succession of miracles? But Bichat's merit does not lie here; in anatomy he formed a new era; in the descriptive he gave men "the method;" prior to him the anatomy of tissue did not exist. His brain was a mine of new ideas; every fact he turned to account. He was also much better read than many suppose; yet it has been said that his evenings were passed in senseless debauchery. Devoted to positive knowledge, he attempted a course of operations on the anatomical subject with tolerable success, mustering a class of some eighty students. Haller had done the same, that is, had delivered lectures on operative surgery before operating on the human body. But I cannot find that Bichat ever operated on the living body.

Scarcely had he completed his "*Anatomie Générale*," when we find him deeply engaged in the "*Anatomie Descriptive*;" the third volume touched a close when, accidentally slipping down on the stairs of the hospital, as he was proceeding to examine some pathological preparations in all states of decay, he fell; the nervous system was shaken; fever succeeded, super-added to a spitting of blood, to which he had been for some time subject, terminating the career of one of France's greatest men. Thus died one of the children of the Revolution; one of that bright constellation which, as yet, forms the grandest era in man's career on earth, always excepting the era of ancient Greece. Gradually they become extinct, disappearing from the field of science, their place marked by a void which none can fill. La Place, Cuvier, Geoffroy, Arago, Malus, Sévigny, Gay Lussac, De Blainville, all are gone.

The incurable Bourbons succeeded the mighty Napoleon, and with "the dynasty" dynastic views succeeded. "We don't want great men," was the cry again; "we want slaves and

beasts of burthen; supple courtiers, notable only for utter want of principle and ability." Gradually the men of the Revolution became extinct; now it is the reign of the *Sabreurs*, *simple et pur*. That it will be brilliant need not be doubted; that it will hold a distinguished place in history is at least probable.

Chance willed that the Ossements Fossiles and the visitation of Napoleon the Great should be cotemporaneous; between them there is no necessary connexion. The *grand Ourrage sur l'Egypte* belongs to the same category; they redeem the reign of Napoleon, and posterity may even fancy them in some way connected with each other. I have shown in what that consists. Posterity will class the reign of the Sabreur who now rules in France, with Timour Beg and Zenghis Khan.

In private life, Bichat was most amiable, patient, generous, at all times accessible, frank, and candid. His death happened on the 3rd thermidor of the year 10. Napoleon was then First Consul. The lamentations of the School of Medicine for the death of Bichat reached the ears of the mighty warrior. By an official letter of the 14th of the same month, he ordered a bust of Bichat to be placed in the Hôtel Dieu, (of which Bichat was physician,) to the left of the vestibule.

Yet there must, if I recollect rightly, be also a bust or painting of the great man in the reception-room of the Faculty of Medicine, where I first met Bécclard. This was in 1820-21. Glancing at the bust or painting, Bécclard remarked to me, "that man never performed the experiments given under his name." I was shocked and deeply grieved at human nature. Thanking him for his kindness and politeness to me, I withdrew from the hall of the Faculty, resolving not to return. The idol I worshipped had been too rudely treated, and men do not readily forget injuries to their feelings. I saw it all at a glance. Bécclard was about to publish, or had published, a work "On General Anatomy," compiled from Meckel. By this he hoped (vain hope!) to blot from the memories of men, the "*Traité sur les Membranes*," the "*Essai sur la Vie et la Mort*."

Nothing is more common, even for contemporaries, to mistake the claims of great men to the distinction accorded them by the world. I have already shown in the work already quoted,\* that in France, in the Institute itself, it is still the fashion to talk of Cuvier as a great naturalist; he who discovered and applied to the living and fossil world the grand element of descriptive anatomy, *which none had done before*; he, the great anatomist, who first made men acquainted, through the animal kingdom, with the structure of the globe, is classed, I believe intentionally and maliciously, with the dabbles in the "*Histoire Naturelle*;" with the men who count the primary feathers on the wing of a bird; the scales or head of a reptile—and call it science!

As with Cuvier so with Bichat. He is known, in this country at least, and perhaps even in France, as the author of an ingenious treatise on the "Membranes applied mainly to Man;" others connect his name with the "*Essai sur la Vie et la Mort*;" others again, as the distinguished Comte, whilst admitting him to be the founder of a new era in science, view him as an unsuccessful inquirer into the laws of biology, which, from preconceived views, he did not look for in general physics, where M. Comte thinks they are to be found. But of his grand claim as the discoverer of the descriptive anatomy of man they seem ignorant. On this, though not on this alone, rests his great fame. With his "*Anatomie Descriptive*" closed the era of anatomical monographs, of the Santorinis, De Graafs, Hallers, Ruyischs, Winslows, Hunters. The method met with most opposition in England, and in Holland amongst a race no less remarkable for methodical action, and immethodical writing, as for the false estimate they form of the characters of other races and nations. "Your Bichat," said Sandifort to a French *savant*, "will in a few years eclipse our Boerhaave." Such an idea could come only from a Dutchman, for never were two persons more opposed in character than Boerhaave and Bichat.

With Bichat ended the immethodical teaching of anatomy. I introduced his method into Britain; but the immethodical still lingers in England, under the pretence of its being practical! Yes, practical! Works on anatomy, descriptive anatomy, still appear, commencing with the microscopic history of the tissues, and terminating with the method of operating for strangulated hernia and with lithotomy! I have even seen the title of a work "On the Descriptive and Physiological Anatomy of the Nerves of the Neck!" Were the Continent again closed to England, I should not be at all surprised to see the *good old plan* again in the ascendant. But be this as it may, wherever true science exists the names of Cuvier and Bichat will always be revered. He had the mis-

\* Great Artists and Great Anatomists, Van Voerst.

fortune, like Hunter, to be classed with medical men—his writings to be confounded with medical writings; but their works were as strictly scientific as were those of Euclid and of Newton. Like all other men, he had his theories: one is remarkable, in so much that in the form of his own head was found its complete refutation. He fancied that, in accurate thinkers the brain, and, as a consequence, the skull, must be symmetrical. His own, as was proved after his death, was remarkably oblique, and the very reverse of symmetrical: obliquity of head implying obliquity of vision neither bodily nor mentally. In early life he ought to have abandoned the sterile field of medicine, and cultivated pure science.

The relative reputations of these two great men may be measured by the degree of universality to which their discoveries led. That of Cuvier spoke to mankind: it was Bichat's fate and misfortune to limit his researches to one animal—that animal, it is true, was man, great and all-powerful only in his own conceit. To the study of man alone Bichat devoted his genius and the labours of his life. The art of medicine he hoped to improve. Alas! his works, like those of Hunter, have ceased to be read by those for whom he wrote; but his name and the influence of his discoveries and views will remain for ever.

*Conclusion.*—The true descriptive method of anatomy was first discovered and applied to human structure by Bichat. Its relation to zoological science is direct—to medicine, as a science, indirect, exercising scarcely any influence over medicine as an art. Mechanical or operative surgery is based upon it. With physiology it has a few direct relations; but the greater number are indirect, vague, and of no account. Without it, the art of medicine would lose its best claim to be ranked as a profession; but it has not advanced it much, and probably never will. The springs of the action constituting life cannot be displayed by the scalpel and forceps: by its means we discover the effects of disease only, not diseases themselves. The nature of healthy or physiological action being entirely unknown, so also must be that of the pathological. Still more obscure are the effects of medicaments. In vain attempts to discover these relations were the lives of Bichat and of Hunter passed. Cuvier more fortunately applied the same element of research simply to science—to zoology—and so acquired immortal renown.

## DELIRIUM TREMENS TREATED WITHOUT OPIUM.

By E. L. DIXON, Esq., M.R.C.S. Eng.

In the treatment of delirium tremens, when the disorder is pure and uncomplicated, the use of opium has generally been considered to be of prime importance, indeed it has been thought an essential. But I observe that of late the administration of tartar emetic, in moderate doses, and without opium, has been ably advocated by Dr. Peddie. Now the object of this communication is to put forward a mode of treatment relying for success simply upon supporting diet of an unstimulating nature. I was led to adopt this method, which I have found succeed beyond my anticipations, in consequence of having had occasion to see one or two fatal cases, treated by full doses of opium, which presented all the symptoms of narcotic poisoning. Indeed, for some years past I have been in the habit of treating all my cases, which have been numerous, in this way, and with an equally satisfactory result, the duration of them being tolerably equal. Of the last of them I subjoin a short account.

A tall, robust quarryman, aged thirty-eight, had been making use of intoxicating liquors of various kinds in great excess for seven weeks, when, (October 10th, 1854,) from causes over which he had no control, he was at once deprived of them. On the morning of the 12th he was first observed to be delirious, and when I saw him at nine A.M. I found him tremulous, very talkative, and labouring under ocular illusions, being particularly distressed about some little fishes crawling up his legs. His skin was warm and perspiring; the tongue coated with a moist whitish-brown fur; appetite good; bowels confined. Pulse 100, soft and full. There was no headache, heat of scalp, or injection of the conjunctivæ.

Two strong men were ordered to remain constantly with him, to prevent him injuring himself or others. His diet to consist of beef-tea, strong broths, with tea and bread and butter. To have also a dose of common aperient mixture.

October 13th.—He has been very restless and talkative during the night, and this morning the tremulousness is increased. Skin bathed in a profuse perspiration of a disagreeable

odour; pulse 102, soft and full. Tongue coated with a fur of a brown colour, exhibiting a tendency to dryness; has taken all his allowance of food; the bowels have not been opened. Repeat the aperient.

14th.—The delirium during the past night has been of a more violent character, but now (nine A.M.) he is very tranquil, and appears exhausted, and oppressed with sleepiness. Tongue moist, and coated with a dirty-white fur; appetite continues good; pulse 100; the bowels have been opened once by the medicine.

15th.—Nine A.M.: He fell asleep yesterday at 11 A.M., slept three hours, awoke, slept again for an hour, and since one o'clock this morning has been asleep with trifling intermissions. Has no illusions, but is in a condition of bewilderment. Tremor; skin moist; pulse 85, soft and full.

16th.—Yesterday slept an hour during the day, and all last night. Is perfectly rational, but the tremulousness is very great. He walks in a manner very similar to that of one under the influence of the exciting cause of his disorder. Pulse quiet, tongue somewhat coated; bowels open once yesterday.

17th.—Slept well last night, and is less tremulous this morning; tongue cleaning; appetite voracious; bowels confined; pulse quiet. Repeat the aperient; to have a chop.

19th.—Tremulousness subsided; is rapidly gaining strength; tongue almost clean; appetite good; bowels open.

In contrast with the above, I place an epitome of a case I attended some time ago, in conjunction with another medical man, and in which opium was, I think, fairly tried.

On the evening of August the 10th, 1854, I saw a tradesman of this town, who was recovering from an epileptic paroxysm, the occurrence of which, by-the-bye, I may remark I have frequently observed at the commencement of an attack of delirium tremens. I found that for some time previously he had been in the habit of drinking very freely, although he had never been intoxicated. During the whole of that day he had been in bed, and had vomited very frequently, the ejections containing bile; his bowels were open, but not purged. He was in a very tremulous condition, and mentally rather confused. An opiate draught was ordered to be taken directly, and an effervescing mixture every two hours.

He slept little during the night, and the next morning he was found to be labouring under a decided attack of delirium tremens. He was ordered to take fifteen minims of Battley's sedative solution every four hours, the diet to consist of strong broth; one or two persons to remain constantly with him, and the room to be darkened.

Although the opiate was continued without intermission, and a draught, with a grain of morphia, administered for two or three nights, he continued in the same state of busy delirium for five whole days, when he fell asleep, and awoke comparatively well.

Though, perhaps, it is scarcely fair to compare any two cases of a disease such as this, yet the circumstances of these, irrespective of their medical treatment, were as nearly similar as possible; and from their respective duration we see that the method of treatment without opium was the more advantageous, sleep being induced much more rapidly, and certainly it is less homicidal. In other diseases, however, the non-employment of a patent remedy may be equally culpable with its administration when not required.

To conclude, I consider that the chief indication in the treatment of delirium tremens is, to support the patient by plain and nutritious unstimulating food, until the brain has been restored to its normal state of nutrition, and the natural eliminative powers have removed from the system the poison producing the disorder. And such is the confidence I have in the treatment without opium, that I may say I consider those cases treated successfully with it get better in spite of it, and not by its assistance.

Preston, November, 1854.

**INCREASE OF BIRTHS.**—154,735 births were registered throughout England in the quarter ending September 30th. This number, which exceeds by 7154 the number of births in the summer quarter of 1853, is the largest number ever registered in the summer quarter, and allowing for increase of population, the rate of births, 3.294 per cent. per annum, exceeds the average (3.179). The chief increase of births has been in the counties of Essex, Suffolk, Norfolk, Wilts, Somerset, Stafford, Worcester, Lincoln, Durham, Northumberland, Monmouthshire, and South Wales. As 113,939 persons died in the summer quarter, the natural increase of population in the quarter was 40,796. The increase of population is below the average.—*Quarterly Report of the Registrar-General.*

## OF THE PRACTICE OF MEDICINE AND SURGERY IN THE HOSPITALS OF LONDON.

*Nulla est alia pro certo noscendi via, nisi quam plurimas et merborum et dissectionum historias, tam aliorum proprias, collectas habere et inter se comparare.*—Monsaceni. *De Sed. et Caus. Morb.* lib. 14. Procerimus.

### KING'S COLLEGE HOSPITAL.

#### MEDULLARY CANCER OF THE ILIUM, PRESENTING VERY STRONG PULSATATIONS.

(Under the care of Mr. FERGUSON.)

(Concluded from p. 379.)

FROM its first appearance to the present time the tumour had been steadily increasing in size.

*State on admission.*—There is now seen on the posterior part of the dorsum ilii, on the left side, a pulsating tumour, situated above and slightly over the great sacro-sciatic foramen; and the crest of the ilium can be felt distinctly above it. The tumour measures five inches across in one direction, four in the opposite, and the circumference is nearly circular. The growth stands out from the surface of the body about one inch. When the fingers are firmly pressed on the tumour, it recedes before them; but on removing the latter, it immediately resumes its original size and position. The growth is not at all tender to the touch, and the pulsations are very manifest in it, as the tumour may even be seen to throb, and each pulsation is synchronous with those of the heart. A strong bruit de soufflet is heard with the stethoscope. As regards the patient's general health, he is in a state of great debility, a condition which has been coming on for the last two years; the appetite is, however, good; the man sleeps well; the pulse is 90, weak; but the bowels are never moved without a purge.

The patient continued in about the same state for the next three weeks, his case exciting much interest, as he had been sent up from the country as suffering from gluteal aneurism. It was, however, soon manifest to Mr. Fergusson that the symptoms above described, the emaciation, helplessness, pain, &c., were more characteristic of malignant disease than aneurism; and, in spite of the pulsations, the affection was looked upon as a medullary tumour connected with the bone, the former being raised and made to pulsate by an arterial trunk lying either within it or in its immediate vicinity.

On May 30th, about twenty-six days after admission, the patient was seized with severe pain in the hip and down the left leg, for which an opiate was ordered.

On the following day, the man complained of very severe pain in the affected part; his speech became inarticulate, and there was inability to pass water. The emaciation and weakness, which had been gradually increasing since admission, were now extreme, and it was perceived that the left leg was shortened by three inches and a half. On examination of the hip, a good deal of thickening was found about the trochanter, and moving the limb gave the patient considerable pain. When the severe suffering was somewhat abated, the thigh was carefully examined, and found broken just below the trochanter. The tumour had, at the same time, lost in a great measure its pulsations; a spreading upwards had obscured the margin of the crest of the ilium, it being now easy to feel the tendons of origin of the erector spinae over the surface of the tumour.

For the next twenty-four days the growth scarcely altered in its appearance, the inguinal glands became enlarged, and it could be felt that a good deal of callus was thrown out around the fracture. The poor man was breaking down very fast, both in body and mind, there being a good deal of wandering, especially at night. On the 24th of June he attempted to cut his throat, but the knife was blunt, and he merely divided the skin.

The patient soon, however, sunk under debility and irritation, and, on a post-mortem examination, it was found that the tumour lay on the external and posterior part of the ilium, just above the notch, exactly verifying the diagnosis. It pushed up the veins and the plexus going to form the crural nerve, and also extended inwards towards the sacrum, interfering with the sciatic nerve. The tumour was composed of

a mass of medullary matter, about the size of an adult fist, and exhibited, under the microscope, the characteristic cells. Medullary tumours were also found in the lungs and kidneys. The pulsations seemed to have been due to a ramification of vessels around the growth, which latter had yielded to their impulse. The fracture, which had spontaneously taken place during life, was found to be situated just below the trochanter, and it was evident that a certain amount of callus had been thrown out.

In the course of clinical lectures given on this case, Mr. Fergusson took occasion to say that the man had been sent up from Birmingham as a case of gluteal aneurism. It did not, however, seem to him to be such at first, but rather a case of disease of bone, very vascular, and hence the pulsation which was present in it. It was not, however, actual aneurism of the bone. Medullary sarcoma, we know, is likely to present great expansion, throwing out in various directions the malignant matter of which it is composed, cysts containing fluid or blood being often connected with it.

If a ligature is placed on the internal or external iliac in such cases, we must not condemn the operator, but avoid making the same mistake ourselves. The reasons for supposing the present case to be one of tumour, and not aneurism, were, the man's pallid face, his emaciation, and inability to walk on account of pain, &c. In the worst forms of internal aneurism, patients are not inclined to stay in bed, except in the very last stage, and they do not fall away at all.

Mr. Fergusson, on looking at the man, had said that the pulsating tumour must be more than aneurism; it was, in fact, situated too high to be an aneurismal dilatation, and the muscles were raised above the tumour, which they would not be in aneurism. The case had been sent up for deligation of the common or internal iliac; but he had hesitated, and had availed himself of as many good opinions as it was desirable. Mr. Hodgson, Mr. Stanley, Sir B. Brodie, and Mr. Guthrie, all stated that the disease was obscure, but yielded to the opinion that it was disease of bone, and not aneurism. Nor were the man's weakness and pain, for two years, symptoms of aneurism. Besides, the tumour was situated above the sacro-sciatic notch, out of the way of the gluteal artery. In a common aneurism, the blood can be expelled from the tumour by pressure; but this could not be done in this case, nor did the pressure give the patient pain, which he would certainly have experienced had the disease been aneurism.

Now, if we cannot cure disease, we should not increase it; and errors, which we should strive to avoid, have been made by very great men; but we learn more from mistakes than good treatment. He (Mr. Fergusson) had been asked by a friend, a long time ago, to see an aneurism of the hip, and the case turned out to be a large medullary sarcoma, more vascular than usual, undulating and pulsating wherever vessels interlaced. Since that period, a tumour inside the knee had come under his observation, looking like a growth from the bone; it subsequently began to pulsate, and popliteal aneurism, extending inwards and forwards, was suspected; but Mr. Fergusson looked upon it as tumour of bone.

This case, as we stated on a former occasion, created very great interest at this hospital; for whether aneurism or pulsating medullary sarcoma, it must be looked upon as very rare. The idea of its being aneurism of the gluteal artery was not entertained in town as it had been in the country, for the reasons stated by Mr. Fergusson in his clinical lectures; and every symptom, except the pulsations, pointed on the other hand to malignant disease. Now, it is well known that a ramification of rather large arterial vessels will, according as the tumour is more or less free, give the latter an impulse synchronous with the pulse at the wrist. Cases of medullary disease have been recorded in which the pulsations were very strong; and we would here mention one under the care of Mr. Lawrence, which is related in the seventeenth volume of the "Medico-Chirurgical Transactions":—

"I was consulted on the 21st of February, 1825, by Mr. K—, twenty-two years of age, about six feet high, with large limbs, light hair, and fair complexion; the latter having, however, a rather pallid and doughy appearance. He had been quite well on the preceding Christmas, and two or three days after had felt pain in the knee. He had been told that this was rheumatic, and would probably go away by exercise; he accordingly attempted to dance it off in the beginning of January, but found himself worse for the effort. He repaired, however, to Cambridge to prosecute his studies; the pain increased, and a slight fulness was observed below the knee.

"When I saw him in February, there was no defined tumour, but an inconsiderable general swelling, with a little redness, more particularly about the head of the tibia. The motions of the joint were unimpaired; but exercise brought on pain,

which went off by rest. Leeches, aperients, and repose of the affected part were directed, and Mr. K— went back to the University.

"He returned to London much worse on the 4th of March. Pulsation had been felt in the swelling, and had led to the suspicion that it might be aneurismal. There was now an elastic tumour between the bones and below the knee, with general enlargement in the same situation, and slight oedema below. No beating could be felt in the swelling; but the pulsation of both tibial arteries was suppressed, although it was readily and plainly perceived in the opposite limb. The pulse was accelerated, and the tongue foul; there was loss of appetite and costiveness, and the patient obtained very little rest at night. Two surgeons of great experience who saw him were doubtful about the nature of the complaint, but pronounced positively that the tumour contained fluid.

"It increased rapidly, the whole upper part of the leg being enlarged, with a considerable protrusion under the knee. When this part began to project more decidedly, the pulsation of the tibial arteries in the lower part of the limb returned. As the local complaint advanced, the constitutional disturbance increased, in spite of every effort to lessen it. The anterior prominence was now so soft as to make us believe that suppuration had occurred; this opinion being corroborated by the increased pain and redness of the part. Under this impression it was punctured deeply, after consultation, on the 2nd of April, but nothing flowed, except a little blood.

"It was now clear that the disease was a growth of a medullary character, and that amputation, although its result was considered doubtful, offered the only chance of saving life. A small, bleeding fungus slowly protruded from the opening of the puncture. There had been lately slight enlargement of the inguinal glands, without pain.

"After the amputation, which was performed a week or ten days subsequently to the puncture, the case went on most favourably till the night of the sixth day. Mr. K— had been very well and in excellent spirits; he went off quietly to sleep, and in the night rang for the nurse, who, lifting the sheet, saw a most violent rush of blood from the wound. The patient died without uttering a word.

*Examination of the limb and body.*—"The head of the tibia was largely excavated by a medullary tumour, [see the case of medullary cancer of the head of the tibia, under the care of Mr. Erichsen, in last week's "Mirror,"] of soft, brainlike consistency, in which there were small deposits of coagulated blood. This growth extended forwards and backwards, being irregularly deposited between the muscles and in the interval of their fibres. It had protruded from the bone just at the division of the popliteal artery, and the passage of the anterior tibial through the inter-osseous ligament. This circumstance accounts for the pulsation felt in the tumour at an early period; for the suppression of the pulse in the tibial arteries, when the morbid growth was confined by the fascia of the leg; and for its subsequent return, when the progress of the swelling through the fascia had liberated the arteries from pressure.

"An absorbent gland, situated close to the artery, and cut through in the operation, was diseased.

"The end of the femoral artery was completely open, without any trace of coagulum or effused lymph. The ligature, with its knot entire, was found in the stump.

"The inguinal glands were diseased; they presented, when cut through, a marbled appearance, from intermixture of white medullary matter with the natural texture of the gland. One or two glands on the side of the pelvis were diseased in the same manner.

"There was a soft medullary tubercle, as large as a gooseberry, in the thin edge of the liver."

But the fact of medullary tumours sometimes pulsating very strongly should not make us forget that actual aneurism may occur, and has been observed by no less a pathologist than Scarpa. It is well known that tumours, be they malignant or not, may be given an arterial impulse either by an artery of pretty large size lying in contact with it, or by the congeries and interlacement of the vessels which permeate the tumour. This latter mechanism seems to have obtained in Mr. Fergusson's case; and we find accordingly, that when the patient was much reduced the pulsations ceased, as the central impulse was too weak to communicate sufficient force to the arterial ramifications pervading the tumour. But actual aneurism of bone may, according to Scarpa, be formed between the surface of the bone and the periosteum. The Italian surgeon has given a well-known example of this pathological phenomenon in his work "On Aneurism;" and we beg to transcribe the description for the benefit of those who may not have the volume at hand:—

"A young countryman, twenty-four years of age, apparently of good constitution, had for a long time had a pulsating tumour upon the spine of the left tibia, about six fingers below the patella. The bone of the tibia formed the base of this tumour, and therefore it was hard at its root; but at the apex, and above the spine of the tibia, it was soft; and on applying the hand, a strong pulsation was felt in it, which raised the hand as a large aneurism does. There was some swelling also behind the tibia and the upper part of the calf of the leg; but the greatest elevation of the pulsating tumour was, properly speaking, upon the spine of the tibia.

"About seven years before the examination, an ox had struck the portion with its horn on that place; a small tumour had afterwards appeared, which, however, some days after, vanished again. No inconvenience was felt for three years, when an indolent, but pulsating tumour rose on the spine of the tibia; it had increased gradually to the size of the fist without confining him to bed. Scarpa was clearly of opinion, that it was an aneurism, but could not determine whether the pulsating tumour proceeded from a wound of the popliteal, or of the anterior or posterior tibial arteries. He was inclined to believe that it was formed by a rupture of the anterior tibial, and that extravasated blood, by resting upon the anterior surface of the tibia and compressing it, had excited the absorption and destruction of a portion of the body of that bone.

"After some delay the leg was amputated above the knee, and the limb having been injected, all the arteries above named were found quite healthy. The aneurismal sac was covered with a network of arterial vessels; and on being cut open longitudinally, it was found full of fibrinous layers, after the manner of aneurisms, and the wax which had been injected was mixed with those layers of blood. After cleaning the aneurismal sac, it was wonderful to see from how great a number of arterial orifices the wax injected into the popliteal artery had been effused into the cavity of the aneurism. Scarpa was of opinion that the disease at first had only been a softening of a portion of the inside of the body of the tibia, followed by an absorption of the substance of that bone from the inner towards the outer side, the periosteum covering it remaining entire, and in a state of perfect vitality; in the second place, that the greater than usual afflux of blood had thickened the periosteum, and greatly enlarged in diameter the arteries of that membrane. From the open extremities of these arteries, the arterial blood being poured in great quantity, and with great impetuosity, in the cavity left by osseous absorption, the periosteum, compressed and thickened, had been converted into an aneurismal sac.

"The man died six years after amputation, the stump, one year previous to death, having been converted into a huge aneurism, which, on being opened, was found full of fibrinous clots, similar to those found in the cavity of an aneurism. The substance of the os femoris had been absorbed through the whole space, from the apex of the stump to the vicinity of the great trochanter; and the absorption was about to proceed, likewise, to the neck of the thigh bone. The periosteum of all this portion of the thigh bone had remained untouched, thickened, interspersed with bloodvessels, very much dilated, and converted into a sheath, which supplied the place of an aneurismal sac."

Another feature of interest in Mr. Fergusson's case is the fracture of the patient's femur, which occurred a short time before his death. Surgeons are, indeed, familiar with spontaneous fracture occurring in persons suffering from syphilis, cancer, rickets, scrofula, and scorbutus. Sir B. Brodie mentions the case of a patient of his who suffered fracture of the clavicle at the spot where a venereal node had become developed. Mr. S. Cooper, in his "Dictionary," quotes a case from Sarazin, a physician of Lyons, in which the patient, who was very gouty, and sixty years of age, broke his arm above the elbow, on putting on his glove. "Dessault," continues Mr. Cooper, "used to speak of a nun at the Salpêtrière, whose arm was broken as a person was handing her out of a carriage. Louis, who was vexed that no union took place, was not a little surprised to find her thigh-bone experience a similar fate, one day as she was changing her posture in bed. It was then learned that she had a cancer in her right breast." In 1837, there was, in the North London Hospital, a woman with cancer in the breast, whose humerus was fractured by the ordinary action of the muscles. A few months before she had been in the same institution for a similar occurrence, and she had previously sustained the same kind of injury in other bones. It is to be supposed, from the foregoing, that union used to take place before another bone gave way. At all events, it is plain that, in the case of medullary sarcoma under the care of Mr. Fergusson, the disease had in-

vaded the femur, which broke on a slight effort being made, and that abundance of callus was thrown out.

Now, the formation of a firm callus, and eventual union after a fracture of this kind, seems at first startling, and looks like a deviation of the destructive and anti-formative tendencies of cancer. But as these cases are put upon record by trustworthy and respected observers, we are driven to suppose that the very fact of the fracture excites an inflammation which, in spite of the malignant disease, gives rise to an effusion of a fibrinous kind, which is soon converted into callus. Or may it not be supposed that the substance which looks like callus is largely contaminated by cancerous matter? However this may be, and whichever may be the explanation of the phenomenon, the facts are well ascertained, and we may even refer to a very recent one, which has been observed at the Royal Free Hospital. We beg to subjoin the case.

### ROYAL FREE HOSPITAL.

#### FRACTURE OF THE FEMUR AND HUMERUS IN A CANCEROUS PERSON, FOLLOWED BY UNION.

(Under the care of Mr. WEEDEN COOKE.)

ELIZA S—, aged seventy years, was admitted, May 27th, 1854, having fallen upon the flag-stones in the Gray's Inn-road.

Upon examination of the right leg and thigh by the house-surgeon, it was found that the femur was fractured a little below the trochanter. The leg could be rotated with great freedom, and some slight crepitus was perceptible, but no shortening of the limb. The patient was seen the same day by Mr. Cooke, who verified the diagnosis of the house-surgeon, and ordered the usual treatment—viz., a long splint, with perineal bandage.

Upon inquiry it appeared that she had had a cancer of the right breast, which has remained in a quiescent state for five or six years; and a few weeks only before this accident occurred she fractured the right humerus, of which there was good evidence in the callus thrown out. The woman had suffered for some time from pain, supposed to be rheumatic, in the right leg, incapacitating her from much exertion.

Being somewhat depressed from the accident and a rather scanty diet, she was ordered at once good food, with porter, and a draught of ammonia and cardamoms three times a day.

Fifteenth day.—Callus thrown out, doing well.

She continued to progress favourably, and at the end of the second month was daily lifted out of bed into an easy chair, but was quite unable to stand, or use the crutches, owing to the weakened arm and affected breast.

The patient remained in the hospital, still unable to stand, for about three months, when she was sent home by railway into Wales.

There was at this time much enlargement of the bone at the seat of fracture, and some pain, though the latter had not been complained of whilst she lay in bed with the splint on. Her general health had improved under the good feeding, and the breast remained as when she came in—viz., a small, hard tumour, with the skin adherent, drawing in the nipple.

From the inability to bear the weight of the body upon the thigh-bones after union had taken place, it was pretty evident that these bones, and perhaps others, had become softened by medullary cancerous deposit, and that the callus thrown out was likewise of this character; so that whilst the poor woman might be congratulating herself that the disease in the breast was dormant, the same fell messenger was in a more occult manner hastening her to her end.

In the fifteenth volume of the "Medico-Chirurgical Transactions," Mr. Salter, of Poole, recorded two cases of fracture of the femur, produced by the very slightest cause, and in both cases the bone had given way just below the trochanter. There was likewise cancer of the mamma, considerable pain in the limb previous to the fracture, and relief from this pain after the accident. Both patients were females advanced in years, and both died from exhaustion a few months after this occurrence.

Post-mortem examination in one case showed a soft, flexible condition of the bone, permitting the easy passage of the knife through its structure, with deficiency of earthy matter, and union at the seat of fracture. In the other case there was no post-mortem examination; "but," says Mr. Salter, "the case was treated in the usual way, and at the end of three months the bone had acquired some firmness."

Sir B. Brodie, in the *Medical Gazette* for 1833, mentions, as we stated above, a case of spontaneous fracture of the thigh-bone in a woman having cancer of the breast. He concluded that union would not take place; but it did so as well as under ordinary circumstances. He likewise gives two cases of fracture

of the clavicle, occurring without violence, in diseased systems, and uniting as in healthy ones.

Mr. Liston had a cancerous patient, who broke several of her bones one after another, and they all united.

Dr. Mason Good quaintly records the fracture of both thigh-bones in an old lady of seventy-two when kneeling in church, and of the os humeri when the attendants raised her for the purpose of removal. "Hardly any constitutional disturbance ensued, and in a few weeks the bones united."

There is a specimen in the University College museum, of commencing union in a thigh-bone, broken in this manner, contributed by Mr. Samuel Cooper; and others in the museum of St. Thomas's Hospital; so that, although disease and old age combined would seem to forbid any anticipation of reparation in the bony structures, experience shows us that *nil desperandum* should be our motto in the most desperate cases. Although the union obtained may not be of that solid nature which would give strength to the limb, and free power of locomotion, (a condition indeed scarcely to be expected, seeing that in all probability the whole bone itself is softened,) still the amount of union suffices to permit the action of muscles upon the bone, and the limb to be raised or depressed; not hanging or dragging as a useless log, which would indeed be the case if no union had been effected.

In all the foregoing cases, cancer had invaded some external portion of the frame, as the breast, and had subsequently affected the nutrition of the bony tissue. Whether these patients had also cancer in any of the viscera is not stated, and can only be guessed at; but we may, at all events, pause one moment, and consider the contrast between cases of this kind, and those in which cancer produces the most deadly ravages in the principal viscera, and leaves both the external regions and the skeleton perfectly free from contamination. Cancer, according to modern pathologists, lies originally in the blood, and becomes manifest in that region which, by some accident, becomes an appropriate *habitat*. When the cancerous growths are therefore confined to the viscera we may perhaps suppose that the latter at some particular period become fit receptacles of the malignant deposits. Look at the following case.

### GUY'S HOSPITAL.

#### MALIGNANT DISEASE OF THE PRINCIPAL VISCERA.

(Under the care of Dr. BABINGTON.)

EMILY G—, aged forty years, a widow, was admitted May 18th, 1853.

About six months before admission, she perceived a swelling just at the angle of the left lower jaw; it gave her but little uneasiness at first; but at length it increased in size, and she was treated at this hospital with iodine in its various forms, in conjunction with sarsaparilla, cod-liver oil, blisters to the neck, scarification of tonsils, and generous diet, with wine.

The patient had not been in the hospital long before other lumps made their appearance, some in the front part of the neck, causing great difficulty of breathing, and others in the abdomen producing tenderness and burning heat.

Shortly after this another complication took place: the tonsils became considerably enlarged, this circumstance causing great difficulty of deglutition. The legs now became oedematous and painful, and the treatment seemed to afford her but little relief. The pulse was intermittent, the tongue coated with a brown fur, and the urine albuminous.

She was ordered chalybeate medicines, in the form of the iodide of iron, with sarsaparilla and generous diet.

But the breathing, after some days, became extremely difficult, and the swelling in the neck and tonsils very painful. All the symptoms assumed, about two months after admission, a very aggravated character, and the poor woman died exhausted after having suffered considerably.

*Post-mortem examination, fifteen hours after death.*—Body much emaciated; abdomen distended and globular; lower extremities oedematous. The lungs were not adherent, but contained portions of malignant disease, about the size of walnuts, especially the lower lobe, on the left side. The heart was small and contracted, with atheromatous deposit on the mitral valves. The liver was enormously enlarged, weighing six pounds and a half, and its whole substance was infiltrated with malignant tumours, as was also the gall-bladder. The spleen was very much enlarged, and weighed three pounds and a half; the kidneys pallid, and filled with malignant deposit. The stomach was small but healthy. A mass of malignant disease was found in the lumbar glands, which, pressing upon the vena cava, had caused the oedema of the lower extremities. The enlarged glands of the neck were of the same malignant character as was noticed in the lumbar glands.

## Reviews and Notices of Books.

*On the Special Treatment of Pulmonary Consumption and Hooping-Cough.* By JOHN HASTINGS, M.D. London. 1864. pp. 171.

There are few members of the profession who, we think, have more fully entered into the spirit of the well-known saying of a veteran practitioner to his rather enthusiastically scientific pupil—viz., *Juvenis tua doctrina non promittit opes plebs amat remedia*—than Dr. John Hastings. If report speaks truly, he has had no great cause either to regret his early rejection of the one maiden (*doctrina*) for the graces of the other—*remedia*. Be this as it may, however, ten years ago we found him charming the expectant ear of the public by a book entitled “Pulmonary Consumption successfully treated with Naphtha,” in which work Dr. Hastings informed us that—

“From the very first moment I employed naphtha in pulmonary consumption up to the present time it has been so successful in my hands, that I have no doubt it will be found, upon careful and judicious use, to be *little less than a specific* in the earlier stages of the disease.”—p. 8.

“Single-handed, if I may be allowed the use of the expression, it has cured pulmonary consumption in almost every case in which it has hitherto been used, when the disease has been treated in an early stage; and from what I have more recently observed, although I do not consider myself justified at present to publish it, I am most sanguine that, even in the *later stages* of this disease, a restoration of health may generally be calculated upon.”—p. 120.

Need we say here how thankfully the public received this new remedy from the hands of its author, though warned by the proper professional arbiters on such matters as to the consequences of too great a confidence?—or how they released their sick friends from the care of scientific and sober-minded men, and placed them where they might reap the benefits which naphtha and Dr. Hastings had to offer them? Need we do more than just recall to mind the result—viz., that the public has now become of one mind with the profession in the knowledge that naphtha as a “cure for consumption” is altogether—a delusion? But there is one thing we must dwell upon a little more in detail—viz., that of informing our readers that, as the “naphtha treatment” no longer “brings grist to the mill,” its original proposer himself is inclined to regard it very suspiciously. In the new work before us the merits of the once-lauded naphtha are thus delineated:—

“About eleven years ago I introduced to the profession, through the medium of THE LANCET, the treatment of consumption by naphtha, or pyroxylic spirit, which was attended with much success; but whether this arose from some peculiarity in the constitution of that year, making it more particularly adapted for the treatment of phthisis, I am unable to say; but this I do know, that my subsequent success has not equalled that which attended the first year of its trial.”—p. 11.

“Look here upon this picture, and on that!”

Naphtha thus no longer being “a specific” “single-handed” for the cure of consumption, but the *amor remedii populi* as great of course as ever, Dr. Hastings (other things being considered also) was consequently obliged to investigate anew. The *bisulphuret of carbon* appeared at first to be all that was desirable, arresting for a time the progress of the disease! and, where the deposit of tubercle was small, effecting a cure! (*vide* pages 13, 14, &c.) But this remedy having some drawbacks, (for an account of which we must refer to the treatise,) it was necessary to institute yet further inquiries. “To detail their results and,” remarks the author, “to introduce to the notice of the profession two new agents, which I believe have enabled me to advance still further the curative treatment of phthisis,” (p. 49,) are Dr. Hastings’ motives for “writing again on this disease.”

The two new agents are *fluoric* and *oxalic acids*; and if we may accept Dr. Hastings’ account of their virtues, wonderful and valuable truly they are.

“The good effects of oxalic acid in phthisis are quickly de-

veloped; two or three doses afford marked relief to some of the most distressing symptoms of the disease.”—p. 54.

“The difficulties of breathing and cough were quickly relieved, the expectoration diminished, the perspirations disappeared, and the appetite greatly improved. The physical signs likewise, in all such cases, underwent a speedy change for the better; the gurgling *râle* rapidly gave way to cavernous respiration,” &c.—p. 56.

“When the disease has reached the cavernous stage, I would recommend that the treatment be commenced with the oxalic acid, as its good effects are developed more rapidly at this point than those which result from the employment of the *fluoric*.”—p. 57.

We hope so; but—

“Were such things here as we do speak about?  
Or have we eaten of the insane root  
That takes the reason prisoner?”

In respect to the *fluoric acid*, Dr. Hastings remarks:—

“I have employed it in every stage of phthisis with most satisfactory results” ..... “It removes the congestion from the neighbourhood of the tubercles in a more effectual manner than any other remedial agent with which I am acquainted.” ..... “Its good effects were in most instances persistent, as will be shown by the cases subjoined.” ..... “Although, however, it may be administered with benefit in every stage of the disease, it seems to act more promptly in that where cavities exist.”—p. 53.

The fullest proof of the very strong test to which Dr. Hastings has so satisfactorily subjected his two new cures for consumption will appear when the following extracts from the work are reflected on:—

“Before I proceeded to the employment of these acids in the following cases, the great majority of them, and more especially those in which the disease was far advanced, and where large cavities already existed, had experienced the advantage [uselessly, of course] of the most approved modes of modern treatment.”—p. 61.

“The season of the year in which I commenced this treatment was the most trying that could have been selected for the experiment. Many of the patients were in that rank of life in which they were compelled to labour to keep their families from starving, and obliged to live on food not very proper for invalids, while their clothing was but too often insufficient to protect them from the cold of the late severe winter. Under all these disadvantages, however, a great amount of success has been realized.”—p. 63.

Great indeed, according to Dr. Hastings’ own showing, we may say almost more than might have been expected! In the face, it will be seen, of the “single-handed” “almost a *specific*” for phthisis, discovered ten years back, and which is still considered “as one of the most valuable agents we possess in the treatment of this affection when carefully and skilfully employed,”—(p. 13,) and in spite of the most defective hygiene of the patients, and desperate condition of their malady, *fluoric* and *oxalic acids* carry off the highest prize!!

There is one slight disadvantage which the want of early education in the *doctrina*, and the too full a preference for the *remedia*, cause to be associated with the therapeutic history of *fluoric* and *oxalic acids*, as developed by Dr. Hastings. It will be indicated when we say the learned author has allowed himself to write—we were about to say *reason*—in total ignorance of what is understood by the “theory of perturbations.” Whether the ignorance or simplicity of the affair be more regarded, however, it is, under the circumstances, amusing to find Dr. Hastings, whilst vaunting his two new specifics, laying stress upon employing, “in addition to these acids, local treatment over the seat of the congestion and tuberculous deposit, either by means of occasional blisters, croton oil, or any of the numerous irritating liniments or ointments usually employed for this purpose,” (p. 5;) and advising that, during the use of his acids, *cod-liver oil* be used, (p. 58,) as also that in many cases the larynx and trachea be sponged with a weak solution of the nitrate of silver.—(p. 83.)

Now we freely admit no one could maintain, *a priori*, that *fluoric* and *oxalic acids* are not “cures for consumption,” but the

*a posteriori* evidence which can alone establish the fact, must, in our opinion, be something very different from that we have met with in Dr. Hasting's new treatise. The whole principle is bad in the extreme which thus attempts to catch the ear of the public, and at the same time degrades the profession. It may happen that specifics for cancer, consumption, cholera, nervousness, &c., may hereafter be discovered to benefit humanity, but should they be, we may rest assured they will come before us associated with other names and other evidences than have been as yet witnessed in the very sorry *miscellanies* they have hitherto formed. We have no space to dwell upon Dr. Hastings' discoveries as relate to *pertussis*, suffice it to say that he recommends

"The treatment of whooping-cough to be commenced with oxalic acid, but if no amendment be perceptible when it has been employed for four days, it should be withdrawn, and the chloride of strontium given in its stead. Should this too fail . . . the sulphate of strontium may be resorted to with advantage."—p. 139.

We leave this very disagreeable, yea discreditable, subject, by remarking that fluoric and oxalic acids cannot be trifled with in their administration, as fatal results have already occurred.

*Lectures on Polarized Light; together with A Lecture on the Microscope.* Delivered before the Pharmaceutical Society of Great Britain, and at the Medical School of the London Hospital. By the late JONATHAN PEREIRA, M.D., F.R.S.E., F.L.S. Illustrated by numerous Woodcuts. Second Edition, greatly enlarged from materials left by the Author. Edited by the Rev. BADEN POWELL, M.A., V.P.R.S., &c. London: Brown, Green, and Longmans. 1854.

To those desirous of investigating the beautiful and interesting subject of Polarized Light, these Lectures will prove of great service in laying before them, in a concise and familiar manner, the principal facts and phenomena which have as yet been observed in connexion with that science. The Editor has somewhat altered Dr. Pereira's original arrangement, having had fresh matter to introduce, partly from notes left by the lamented Author, and partly where he himself considered the subject capable of receiving further or more apt illustration. In a second edition, moreover, of lectures which were originally orally delivered, there is, of course, opportunity for making improvements in the relative positions of various portions, in a manner more adapted for the convenience of study than would be admitted of in a course of lectures, each of limited length. The account of the phenomena of Polarized Light, in particular, is preceded by a short, but remarkably lucid, summary of the general Laws of Optics, at least, in so far as is necessary in order to serve as an introduction to the due comprehension of what follows. The woodcuts are numerous, and well-selected for the purpose of facilitating the study of a somewhat complex and difficult branch of science.

*The Climate of the Island of Madeira, and the Errors and Misrepresentations of some recent Authors on the Subject considered, in a Letter addressed to George Lund, M.D.* By JAMES MACKENZIE BLOXAM. London. 1854. pp. 32.

We have heard it said, that whilst Malaga and Egypt are becoming the more fashionable resorts for probable or really phthisical patients with well-filled purses and no necessity for exertion, the reputation of Madeira is rapidly on the decline. How the case truly stands we cannot say, nor what ratio of diminution of yearly arrivals of tuberculous patients has been experienced in the island. Messrs. Lund and Bloxam, feeling hurt, however, at the slanderous climatorial insinuations of Drs. Burgess and Mason, enter the lists in favour of the island in question. We cannot stop to see the joust, but announce its performance to those interested in the matter.

## THE CROYDON BOARD OF GUARDIANS AND THE NEW VACCINATION ACT.

To the Editor of THE LANCET.

SIR,—I beg to forward to you a letter which appeared in the *Croydon Journal* of last Saturday. We made a stand against the board of guardians upon the vaccination question, but were defeated by the appointment of a stranger, who in six weeks sent in his resignation. We then thought ourselves secure; but no! an ally of the guardians appeared in our camp, who now seeing a favourable opportunity for regaining a standing amongst those who had formerly treated him with ignominy and insult, thrusts forward his assistant, and gets him elected as vaccinator. It then became the province of the board to reward their ally. The guardians therefore raked up cases of neglect against one of their medical officers, turned him off, and appointed the vaccinator in his stead. It next became requisite to appoint a cholera staff. Now, in 1849 all the surgeons in Croydon attended any cases they were called to at 10s. 6d. each case. They agreed this year to do the same; but the board rejected their terms, offering 3s. 6d. and 7s. 6d. for diarrhoea and cholera respectively. We rejected this sum as inadequate, and offered our services to the poor gratuitously. The only exception to our compact was the former ally of the board, who offered his services again to them. He was again rewarded by being appointed medical superintendent at five guineas a week. Upon this all the surgeons in Croydon (except, of course, the union medical officers) informed the board that they declined to have any communication with their so-called medical superintendent.

Thus, Mr. Editor, stands the contest: we accuse one of our ranks of helping those who continually insult us by their language as well as by their pecuniary offers. It is quite evident, from the vindictiveness shown by boards of guardians generally, that their officials are not the persons to stir up opposition. It remains, therefore, a duty of those who do not fear such tribunals to make a stand against tyranny and insult. We intend to petition the Legislature against boards of guardians, having the power of election of Poor-law medical officers, and to propose that they be elected for life, and removable only for neglect by the Poor-law Board alone.

Those who will co-operate with us will help to raise the profession, removing the cause of many unseemly squabbles, the poor will get better attendance, and medical men will be better paid for their services.

I shall be happy to act as secretary to any who will forward their petitions or communications to me, and will affix to our memorial the names of any who will give me authority to do so, the substance of which shall be published shortly. We are determined not to let the matter rest until we have brought it to some successful issue.—I am, Sir, your obedient servant,  
Croydon, October, 1854. ALFRED CARPENTER.

## THE LATE EPIDEMIC.

To the Editor of THE LANCET.

SIR,—Since the commencement of epidemic cholera in May last, the total number of diarrhoea and premonitory cholera cases treated at the Eastern Dispensary, up to October 31st, have been 1692, many of these being decided premonitory cases, several of which I sent to the cholera hospital established by the Whitechapel Board of Guardians. I have all along observed, in those districts where the drainage was defective, that then the diarrhoea was of the most obstinate character.

In obstinate diarrhoea occurring in the adult, and which did not yield to the treatment described in my first communication to THE LANCET on the subject, I found the following mixture to answer very well—viz., Tincture of catechu, six drachms; tincture of opium, one drachm; prepared chalk, aromatic confection, of each two drachms; cinnamon water, six ounces: mix. A fourth part every four hours.

For children the following answered best—viz., Tincture of catechu, tincture of kino, tincture of rhubarb, of each half an ounce; water, to four ounces: then dose according to age. In the premonitory cholera symptoms, my treatment has been the same as that described in my first communication, with the exception, that when I saw the cases were running into cholera, I always sent them to the hospital, where I knew they would get that constant care and watching which they could not obtain at home. I hope the Board of Health will at all times see that the local authorities do their duty, whether cholera be raging or not.

I am, Sir, your obedient servant,

JOHN C. BARRY,  
Resident Medical Officer.

Great Alle-street, Nov. 1854.

# THE LANCET.

LONDON: SATURDAY, NOVEMBER 11, 1854.

WE think it our duty to call the attention of the profession, and more especially of that very large portion whose practice it is to supply their patients with medicines, to a case which places their relations to dispensing druggists in a most unexpected light. The leading facts are briefly as follows:—Mr. SWEETNAM, of Clerkenwell, had the misfortune to number amongst his patients a Mr. J. C. READ, living at Islington, a man of a speculative turn of mind. This READ brought an action against Mr. SWEETNAM, “to recover damages for an act of gross negligence, whereby the death of ‘the plaintiff’s child was occasioned.’” This is the alleged ground of action. Let us see how far it is supported by facts. Mr. SWEETNAM had been consulted by the plaintiff’s wife for a sore on the back of an infant three weeks old, and the plaintiff himself consulted him at the same time for some rheumatic affection. The visit was made after ten o’clock at night; and in order to avoid the loss of time that would have occurred by sending the medicines from his own house, Mr. SWEETNAM asked Mrs. READ if she knew of a chemist’s shop close at hand? He was directed by Mrs. READ to “a nice chemist’s shop,” kept by a Mr. ATTRILL. Mr. SWEETNAM went to that shop, as directed, and asked for pen, ink, and paper. He wrote a very legible prescription, and in order to be sure that it was understood, asked ATTRILL to read it over in his presence, which was done. The prescription carefully distinguished the medicines intended for the father and for the child. It began “Mr. READ,” for whom a mixture and powder were ordered. Under this a line was drawn, and a new head, “Infant,” was written above the prescription for a lotion. Having thus accomplished his duty with all the scrupulosity in his power, and with more minuteness than would be necessary in the case of a chemist supposed to be competent in his business, Mr. SWEETNAM left the care of dispensing and forwarding the medicines, according to the instructions of the prescription, to ATTRILL. The next morning, on visiting the READS, he was astounded at finding the infant in a moribund state. The mother and the grandmother between them had administered the powder ordered for the father, containing ten grains of Dover’s powder. The poor child died in the course of the day from the effects of the opium in the powder. Who was responsible for the fatal error? Upon this point, no man, woman, or child endowed with common sense, provided it be not altogether distorted by legal subtleties, can go wrong. It appears that ATTRILL, the chemist, with the prescription in his hand, specifying precisely which medicines were meant for the father, and which for the child, having read over the prescription in the presence of Mr. SWEETNAM, and knowing, or grossly ignorant of his business if he did not know, that a grain of opium would, in all probability, destroy an infant, had sent the powder and the lotion in one packet together, and the mixture in another packet, *with no name on either packet* to secure the administration of the right medicine to the right party; and to exhibit his utter recklessness in its full light, *the powder ordered for the father was put up in the same packet with the child’s lotion.* The fatal

inference drawn by the parents was, that the powder was meant for the child. It was given to the child, which died, poisoned. And whom do our readers suppose is made to bear the blame and the legal penalty of its death? ATTRILL, the chemist: No! Such would indeed be the decision of common sense and justice. But the law was invoked: the law had to decide: and the law, through a jury, has decided that the responsibility lies with Mr. SWEETNAM! There is a pleasant maxim current amongst lawyers, to the effect, that “for every wrong there is ‘a remedy.’” The correct interpretation of this maxim is, that “for every wrong, real or fictitious, you may have an action at ‘law,’” and this may or may not bring a remedy. Now Mr. READ had sustained a wrong: he had, through the flagrant negligence of his chemist, and the mistake of his wife and mother, lost his child. Where was the remedy to heal his paternal grief? In an action at law. He is introduced to a “furraging” attorney, who finds in the resources of the law abundance of remedies. He sees that not one only, but two actions may be laid. He first attempts to persuade Mr. SWEETNAM to bring an action against ATTRILL: this would have been an acknowledgment on the part of Mr. SWEETNAM that ATTRILL’s fault was against himself. This point gained, the astute lawyer, having pocketed costs for one action, would immediately have been in a position to commence another in the name of READ against Mr. SWEETNAM. Mr. SWEETNAM declined this “remedy.” With admirable assurance, the attorney then proposed to Mr. SWEETNAM that he should allow an action to be brought against himself, and suffer judgment to go by default—the solicitor still making comfortable provision for two actions; for, in this instance, the second action would be SWEETNAM *v.* ATTRILL. This “remedy” Mr. SWEETNAM also declined. Mr. SWEETNAM not being found consenting to his own condemnation, in order that READ might find a remedy, and the attorney double costs, it was resolved to make him the victim. The remedy, therefore, now assumed the shape of READ *v.* SWEETNAM; the damages claimed by the distressed father being £3 14s. for the burial, £1 10s. for medical attendance, £4 for his loss of time, and £8 for mourning. But on what pretence, or what possible quibble, could READ claim all this from Mr. SWEETNAM? ATTRILL is Mr. SWEETNAM’s agent! It is asserted, that the chemist being employed by the apothecary, is, for the occasion, his servant! And is not the master responsible for his servant? That both READ’s healing remedy and the attorney’s action were well conceived is proved by their success. The jury sanctioned the monstrous proposition that a chemist, keeping a shop of his own, becomes the servant of a medical man whom he has never seen before, by the act of making up a prescription, his business consisting in such acts! Nicely adjusting the balance between grief and coin, they awarded £14 14s. damages as compensation to the father; who, no doubt, having himself estimated his loss at about that figure, allowing for funeral expenses, interruption to his ordinary business, and mourning apparel, was amply contented. It is, however, some satisfaction to have to record that the “remedy” was diminished in value, and the action rendered less profitable to the attorney, by the excellent conduct of Mr. Justice CROMPTON. His lordship declared that, “as against Mr. SWEETNAM personally he did not see anything ‘but very great care on his part; they could not blame him, ‘when he went into a respectable chemist’s shop, that he did ‘not stop and see the medicines made up; but that would not ‘not interfere with his legal liability, if the jury considered

"ATRILL as his agent." . . . "He did not think the plaintiff "could recover for the mourning, and he therefore entered the "verdict for £6 14s." We have also learned that the attorney met with some disappointment in the matter of costs.

Such is the summary of this memorable trial. It behoves the medical profession by its light to study carefully their relations with patients and chemists. We will say nothing here upon the moral bearings of the case. There is often a wide difference between morality and law. We are governed by law. To the law we must either conform, or shape our course so as to avoid its "penalties." We pass over all comment upon the conduct of the plaintiff; we will not waste time in discussing the measure of that affliction which had so subverted his understanding as to induce him to bring an action against his medical adviser, whom he knew to be utterly blameless, for the loss of his child; nor will we stop to consider the difference between his conduct and that of those wretched beings who are said to enter their children in burial-clubs with a premeditated view of realising a profit out of their death. Our concern is with the relations of medical men to the public. Assuming the law, as laid down in this case, to be correct *as law*, what are medical practitioners to do? The physician may be eliminated: he leaves the patient to take his prescription where he pleases; the patient pays the chemist, and we presume that not even legal astuteness can in such a case make the physician liable for the blunder of the chemist. But it is the custom with many general practitioners, either habitually or in cases of emergency, to have their medicines made up at a chemist's, themselves charging the patient. Medical practitioners so acting must bear in mind that they thus make themselves liable for all the blunders and criminality of the chemist. They will therefore consider whether they are willing to encounter this responsibility; whether they will put themselves and their professional honour unreservedly into the hands of men who *may be* both ignorant and dishonest. They will decide whether it be not better, in cases like the one which forms our text, to write a prescription and leave it with the patient to get made up at his own cost and risk. There are few practitioners to whom it does not often occur to visit, give advice, prescribe, and pay for the medicines *gratuitously, out of simple humanity*. Let such beware how they tread. If they carry their charity so far as the last act of *paying for the medicine*, they may find themselves responsible for the ignorance or negligence of the chemist, the object of an action at law, the victim of a grateful patient seeking a remedy, and of an attorney "furraging" for costs! It really appears to us that the medical profession can expect neither justice from the law, nor common fairness from the public.

THE Quarterly Return of the Registrar-General, ending September 30th, continues to supply the most conclusive evidence as to the failure of the Vaccination Act. It is stated that, "the Registrars complain generally of the working of the "Vaccination Act as it affects the medical profession, the "Registrars themselves, and the public." Some of the Registrars are specific in their complaints; and we think it useful to cite observations which flow directly from practical experience. The Registrar of St. Peter's, Brighton, says: "Vaccination seems very little cared for or attended to, although "notices are delivered by me to every parent. The Act is

"imperfect, and is negligently carried out by the parent and "some medical practitioners." The Registrar of Henley: "Vaccination is not sufficiently attended to by parents of "children born since the passing of the Compulsory Vaccination Act; some are negligent, and others are prejudiced "against vaccination, and some of the medical practitioners "are irregular in giving certificates of successful vaccination." The Registrar of St. Margaret's, Ipswich: "The Act for "Compulsory Vaccination has not at present the desired "effect; amongst the labouring classes it is very unpopular, "owing to the mistaken notion, that other diseases are produced by vaccination. Some are very violent when served "with the notice requiring them to have their children vaccinated." The Registrar of East Dereham, Mitford: "I am "sorry to state, that the new Vaccination Act appears to be a "total failure in my district; for, although I have registered "224 births within the last thirteen months, only eighty-one "children appear to have been vaccinated." At Glastonbury, Wells: "The Vaccination Act works very badly, few successful cases being returned in proportion to the number of "children registered, *say one in five*. The lower orders are "prejudiced against it in many instances, and the profession "careless in their certificates." From Basford and Barnsley, the reports are somewhat more favourable; in those places it is said vaccination is better attended to. The Registrar of Wrexham says: "Respecting the Vaccination Act, the people "in general approve of it much. I have given to parents, "since October, 1853, 550 notice papers, and have only "received from the public vaccinators and other medical men "115 certificates of successful vaccination. Though the people "speak well of the Act, it appears there is a lack in the "working of it." In addition to this summary expression of the general experience of some of the Registrars, as to the working of the Act, the continued prevalence of small-pox throughout the country shows, in a still more precise and more incontrovertible manner, the neglect of prophylactic means, and consequently the inutility of Lord LYTTLETON'S measure. Some of these notes we think it desirable to extract. In Portsea Island, "29 cases of death from small-pox have been "registered." "Small-pox prevails in Thuley to a considerable "extent." In Ipswich, "9 deaths." At St. Thomas's, Heavitree, "small-pox is very prevalent and fatal." At Plymouth, "small-pox has been prevalent, 18 deaths being registered." In London, the deaths from small-pox, registered in the quarter ending September 30th, 1853, were 42; in the same quarter of the present year there were registered 142. Evidence of this kind would have been far more striking, had not attention been directed almost exclusively to the spread of cholera.

But the evidence adduced is of a nature that cannot be disputed. It tells too plainly that vaccination makes no progress in this country; and if vaccination is not extended, it follows that the Compulsory Vaccination Act has failed in its purpose. One feature in the Registrars' Reports we ought not to pass over without comment. Some of these gentlemen state that the duty of forwarding certificates of successful vaccination is neglected by the medical practitioners. It might be inferred that the profession is hostile to the Act, and is partially responsible for its failure. That the profession has done what could reasonably be expected from it, might be easily shown. It is not reasonable to expect that they should evince any extraordinary zeal, or incur any great amount of personal labour, in promoting the success of a measure the executive provisions

of which have been framed in open contempt of their judgment; which connect the duty of preserving the entire population, rate-paying and pauper, from small-pox, with the administration of the Poor-law; and which, arbitrarily imposing upon it the onerous duty of giving effect to the Act, altogether neglect the obvious propriety of securing due remuneration for professional labour. It is, indeed, one of the greatest blunders in the Act, that the good-will of the medical profession was not secured.

Another passage in these Reports claims a remark. The Registrar for Ipswich says: "The Act is very unpopular amongst the labouring classes, owing to the mistaken notion *'that other diseases are produced by vaccination.'*" If this opinion be a prejudice, we can vouch for the fact that it is not confined to the labouring classes. Parents in the wealthier classes are quite as anxious with respect to the health of the child from which vaccine lymph is taken; and so widely extended is the dread, that along with the prophylactic remedy something else may be inoculated, lest the germ of future diseases may be planted, that few medical practitioners would care to vaccinate their own children from a source of the purity of which they were not well assured. It is in consequence of the universal prevalence of this feeling that the compulsory clauses of the Act are doubly and justly obnoxious. Were it not for the implicit confidence reposed by the heads of families in the honour and judgment of their medical advisers, it is more than probable that even amongst the easier classes vaccination would meet with many opponents. But these classes have the privilege of selecting their own medical attendants. Confidence is the natural offspring of long intimacy in their mutual relations. Now, it is one of the peculiar and objectionable features of this Act to respect the prejudices of the rich, and to disregard those of the poor. The poor are compelled to take their children to the Union surgeon, or other vaccinator appointed by the Poor-law Guardians, whom they may never have seen before, in whom it is impossible they can feel that confidence which they repose in their own medical attendants, and whose selection of lymph they cannot question or control.

Thus the Act, invested with every attribute of unpopularity, by studied disregard of the judgment and interests of the medical practitioners,—that is, of those through whose agency alone it is possible to give it effect; by unnatural association with the Boards of Guardians, which can have no pretence to take charge of a sanitary measure affecting the entire population; and by an arbitrary and harsh contempt for the feelings of the poor, sure to be still further alienated by the appearance of compulsion,—could have no other fate than utter failure.

It has already been admitted, even by the framer of the Act, that its amendment is necessary. It is generally felt that in the next session of Parliament the subject must again come under consideration. We earnestly trust that the opportunity will not be lost of averting all sources of discontent with, and opposition to, a most necessary measure, by entrusting the charge of superintending and directing vaccination to the General Board of Health, whose special function it is to provide for the prevention of epidemic diseases, to which class none more especially belongs than does that disease against which the discovery of JENNER is the most effectual preservative.

WHEN a man takes away his life, in ninety-nine cases out of a hundred he is incapable of acting otherwise; when a soldier falls in the ranks, fighting against the enemies of his country, he dies in the performance of his duty; when a patient sinks in the hands of the surgeon, his death is the result of an earnest effort to prolong life. Such events are inevitable; there is no individual responsibility, and there is no blame. This cannot be said when life is destroyed by carelessness, or by a want of prudence in appreciating and avoiding danger. Weeks after week deaths by chloroform are recorded, until at length these events have become so common that they scarcely attract attention. This cannot and must not be. Had a tenth part of the catastrophes thus caused in the surgeon's hands resulted from the use of aconite or opium, these valuable drugs would have been excluded from the pharmacopœia. What, then, is to be done with chloroform? Is its use to be altogether prohibited, or can it be persevered in under the precautions which direct the administration of other powerful agents? We are accustomed to administer in medicinal doses the most deadly poisons, and to see them produce the most beneficial effects. Aconite, arsenic, and prussic acid, become, with many other equally destructive agents, most valuable remedies, never, with ordinary precautions, proving dangerous. Is it not possible to use chloroform in the like manner? There seems no reason why it should not be so.

In the first place, the indiscriminate administration of this agent must be given up. There is no doubt that the novelty of the practice, the remarkable effects produced, and the freedom from risk, too unhesitatingly asserted, have led to very grave abuses. Had it been otherwise, had chloroform never been inhaled, save when its use was necessary, lives would not have been sacrificed to the removal of a tooth, a toe-nail, or a little finger, in tapping a hydrocele, or touching a sore with caustic. In the first instance, then, chloroform must not be administered almost *ad libitum*, as has hitherto been done. Its use must be reserved for those cases in which the intensity or duration of the pain in an operation constitute serious complications, or where insensibility is essential for the success of the surgeon's proceedings. To this the practice must come at last. The sooner it does so, the less will be the expenditure of life.

In the second place, due care must be used in the mode of administering the drug. An atmosphere of chloroform will asphyxiate, by excluding respirable air, as effectually as would carbonic acid or a ligature round the throat. No one should attempt to take upon himself the delicate operation of thus manipulating, if we may so speak, the vital air breathed by a human being, without acquiring, under proper tuition, that skill which would render him fully competent for this duty.

Lastly, there are cases in which chloroform should not be given, even under pressing necessity, or by the most judicious hands. There are cases in which it is impossible to say how small a dose will destroy life. How fearful has been, in several instances, the position of the surgeon, who, using every apparently necessary precaution whilst performing some comparatively safe operation, confident in the hope of witnessing the success of his proceedings, and rejoicing too that his good work was being done without pain to his patient, when he suddenly receives the overwhelming announcement that the pulse is quivering, that it has ceased, that life is extinct! We have witnessed such cases—we never wish to see them more. But to return. We have said that a dose of chloroform, fatal

in one case, will be borne with impunity in others. What constitutes the difference? It would seem that those diseases of the lungs and heart which interfere with respiration are those which render the subjects of them more particularly prone to the dangers of chloroform. In some of these diseases—for example, emphysema, bronchitis, valvular diseases of the heart seriously interfering with the circulation, no one would for a moment think of incurring the risk of producing insensibility by chloroform. These are palpable conditions not difficult to discover. The danger has been prominent in such cases; hence death has not often followed the use of chloroform in any of these diseases. There is, however, one less manifest disease of the heart, from which death has far more frequently occurred in subjects under the influence of chloroform than from any other. This is fatty degeneration of the muscular walls of the organ. Here death seems to be caused by a directly paralyzing influence of the drug on the already feeble and flagging fibre. In the vast majority of "fatal chloroform cases," this condition, unexpected or unsought for during life, has been, after death, discovered. It has then, too late, solved the mysterious event, and afforded a *quasi* relief to the conscience of the operator. Questions of truly vital importance hence arise. Can we distinguish in the living subject this state of heart? or, failing to do so, are we liable, in administering chloroform when necessary, and under all reasonable precautions, to meet with unexpected and fatal accidents? The whole subject of fatty degeneration is a new one. Our knowledge of its nature dates back not more than four or five years, our acquaintance with its effects therefore must be limited; the greater opportunity, however, exists for close and complete investigation. For we cannot, under all circumstances, help believing that if the ruddy, vigorous, muscular walls of that all-important organ, the centre of the circulation, are converted into a pallid, flabby, fatty tissue, its functions will be found seriously interfered with. There cannot but be evidence in such cases of a faltering circulation. The latest and best researches on the subject show that it is so.\* We cannot here enter fully on these conditions; they may be traced in the flabby composition, and the feeble, flagging energies of the individual, in the shortened breathing, and the general want of power in the circulating system. We may expect to find such features in those whose vigour has yielded beneath the influence of want or chronic disease, in the aged, or the young grown prematurely old by over-application or constitutional decay, and in the dissipated, whose physical constitution is as degraded as their moral attributes. In all such cases, the paralyzing influence of this agent on a fatty, feeble heart may be feared, and its use should be avoided. With the precautions we have insisted on, the administration of chloroform will prove a blessing; without them, its abuse threatens to be a curse.

In whatever direction we turn when examining the defensive measures adopted to prevent or to contend against the epidemic, we are sure to discover, in the unreasonable powers and capricious conduct of the Boards of Guardians, an obstacle that effectually neutralizes the zeal of the medical profession, and baffles the best-directed counsels of the General Board of Health. The town of Croydon has been visited with cholera. Like every other town in the kingdom, it possesses a body of

medical practitioners zealous in the public service, ready for any personal exertion and sacrifice which a moment of general calamity may demand; but, we are also happy to say, not altogether unmindful of what is due to themselves and to the profession to which they belong. It will be manifest to any one who may reflect upon the extensive area embraced in such an union as Croydon, and upon the suddenness of attack and rapid march of Cholera, that the services of every medical practitioner in the district should, in justice to the poor, and in the interest of the community, be engaged in an emergency like the present. Unfortunately, the health of the entire community of Croydon is in the hands of a Board of Guardians of scarcely the average liberality of sentiment. Croydon contains a population of 21,000 inhabitants, and embraces an area of 10,000 acres. For the sanitary care of this population, the ordinary Board has not thought it necessary to make any addition to the medical staff of the Union. Two medical officers, one of whom is also Public Vaccinator, are stated by the Board to be amply sufficient for the emergency. The absurdity of this assertion is sufficiently obvious. Its dishonesty is revealed by the conduct of the Guardians themselves. In 1849, all the medical practitioners in the town were engaged to attend cases of Cholera. The not over-liberal and not ruinously-extravagant fee of half a guinea a case was allowed. On the present occasion, the medical practitioners in the town offered their services on the same terms. But the Board of Guardians, improving in penny-wise economy, tendered three shillings and sixpence a case for diarrhoea, and seven shillings and sixpence for cholera. With becoming indignation this ridiculous proffer was refused—and now the Board was reduced to depend solely upon its permanent officers. It had admitted, by the act of seeking the assistance of other medical men, that extraordinary aid was necessary. But not finding men willing to consent to their own degradation, the Board has the assurance to declare that the ordinary staff of two surgeons is sufficient for the protection of a population of 21,000 inhabitants! Such is the provision made to meet the pestilence by those in authority. But for the public spirit of the medical practitioners, it is impossible not to see that the mass of the poor might, in a time of imminent need, be hopelessly abandoned. But we are happy to have it to record that the surgeons of Croydon, while repudiating all subjection to the Board, have evinced the true spirit of their profession, and have publicly announced their readiness to give that aid in the name of humanity, which the Guardians estimate at the value of seven shillings and sixpence.

In thus recording our sense of the spirited conduct of the medical practitioners of Croydon, we cannot but express our regret that they should have suffered any feeling of discord to arise amongst themselves. We observe, with pain, that the perfect harmony and unity of purpose which it is so essential for the profession to maintain in all matters bearing upon its relations to Boards of Guardians has been interrupted. We entreat our brethren to beware how they suffer the policy conveyed in the maxim, *Divide et impera*, to be exerted by Boards of Guardians to their disadvantage.

WITH the view of affording a supply of competent surgeons for the army and navy, the following notice has been issued by the Royal College of Surgeons:—

"SURGEONS FOR THE PUBLIC SERVICE.—The Court of Examiners having taken into their consideration certain appli-

\* We refer more especially to Dr. Quain's Memoir in the *Medico-Chirurgical Transactions*, and to the recently published work of Dr. Stokes.

cations from students in various recognised hospitals, requesting examination before the completion of their third session of hospital and anatomical study, in April, 1855, on the ground of being offered commissions as assistant-surgeons in the public service, provided they can obtain the qualification ordained by the warrant of her Majesty of the 6th October, 1854, will admit to examination for the diploma of the College all such students of a proper age, at the end of the month of December next, on their presenting a certificate or letter from the head of the public department proposing to employ them, signifying such intention when they have been proved competent.

"November 3rd, 1854."

"EDMUND BELFOUR, Secretary."

## Medical Societies.

### MEDICAL SOCIETY OF LONDON.

MR. HEADLAND, PRESIDENT.

SATURDAY, NOVEMBER 4TH, 1854.

#### SYPHILITIC DISEASE OF THE PLACENTA.

DR. MACKENZIE exhibited a placenta which had undergone very marked morbid changes in connexion with syphilis. He observed that his object in bringing it before the Society was not merely to exhibit an instance of extensive and peculiar disease of the organ, but to show also that disease of the placenta had in some cases a direct dependence upon syphilis. It was below the average size, felt firmer and denser than natural, and had generally a dingy red or coppery tint. Immediately below the membranes, its surface was extensively covered with a thick deposit of a white, fatty-looking substance, which upon careful examination was found to consist almost entirely of fibrin. The villi were not affected with fatty degeneration; but the membranes had a somewhat opaque, fatty appearance in places, which was found to be dependent upon an accumulation of loose epithelial scales of the squamous kind, closely resembling those of the epidermis, and derived from one of the membranes, most probably the chorion. This was considered by Dr. Hassall, who had kindly examined and reported upon the specimen, to be extremely curious, and such as he had never previously met with. The umbilical cord, it should be added, had a mottled appearance, and the darker portions had a copperish hue. The dependence of this morbid condition of the placenta upon syphilis was proved by the fact that the infant was born with unmistakable signs of that disease. Its skin had a copperish tint, the integuments of the neck were scurfy, several small pustules were seated upon the scalp, a muco-purulent discharge issued from the vagina, and its body generally was attenuated and shrivelled. It moreover appeared that the mother had three times contracted syphilis in the last eleven years, and during that period had frequently aborted and given birth to syphilitic children. It was, however, remarkable that during the six weeks she had been under observation before labour she had no appearance of having syphilis, but, on the other hand, looked clear, healthy, and strong; and, with the exception of having had a sore throat three years previously, had never had any eruptive appearance, or other sign or symptom of constitutional syphilis. The facts connected with this case appeared to Dr. Mackenzie to warrant the following conclusions:—1. That extensive fibroid deposition or disease of the placenta is proved to be not always the result of a normal degeneration of portions of the organ whose functional activity has ceased to be required, but, in some cases at least, specifically depends upon an abnormal action or force. 2. That these morbid conditions of the placenta have sometimes their origin in certain constitutional taints or causes, of which syphilis was undoubtedly one. 3. Looking to the coppery tint of portions of the placenta and cord, we may almost assume that this peculiar characteristic of syphilitic eruptions depends less upon any specific inflammatory action of vessels of the skin, than upon an altered condition of the colouring constituents of the blood. 4. That the uterine organs do separately and specifically suffer from the constitutional actions of syphilis upon the female economy—a doctrine which he (Dr. Mackenzie) had endeavoured to establish in a paper presented to the Royal Medical and Chirurgical Society during the last session; and he was convinced that the further prosecution of this subject would conclusively show that a numerous class of uterine ailments had their origin in this cause—one which, although often latent, was yet very widely spread in its operation.

Dr. GIBB related the following case of

#### EPILEPSY AND DELIRIUM TREMENS.

On the 5th of September he was requested to see a young man, aged twenty, who appeared to be suffering from an attack of ephemeral fever. He had had a very long and severe epileptic fit the day before, for the first time in his life, and subsequently it recurred almost daily. Whilst under treatment for the epilepsy, on the morning of Sunday, the 10th, symptoms of mild delirium set in; these increased the next day, and had all the characters of delirium tremens. They proceeded with great violence and severity, and terminated fatally on Wednesday, the 13th, being the fourth day of their appearance, and the tenth day from the commencement of his illness. He had a fit on the Sunday when suffering from the mild delirium, and altogether had had about seven fits, two occurring on one day, and none the three last days of his illness. The history in regard to the delirium is the point of interest in the case. It appeared that he was employed in the cellar of a publican, and was constantly exposed to the various odours of spirituous liquors. He was not addicted to drinking, but occasionally took a glass of porter, and to the influence of these constant inhalations may be attributed the attack of the delirium tremens. His father is epileptic, and that disease is therefore hereditary; but most probably the first fit was induced here from the state of system, which acted as an exciting cause in developing what otherwise might have remained latent for some time longer. He (Dr. Gibb) had never witnessed but one other well-marked case of these two affections combined, a brief notice of which he brought before this Society at its last session, together with a piece of the skull showing an exostotic growth. In the case just detailed no post-mortem was obtained, and he is disposed to believe that the combination of the two diseases may not be so rare as is imagined.

#### EXTRACTION OF A TOBACCO-PIPE FROM BEHIND THE EAR.

MR. HENRY SMITH showed a portion of tobacco-pipe, nearly two inches in length, which he had extracted from behind the ear of a boy who, between two and three years previously, had fallen down whilst holding a long clay pipe between his teeth. When the child was brought to him, there was a swelling over the mastoid process, and a small aperture on it, by which some foreign body was detected, which at first was thought to be dead bone, as no history of the accident with the pipe had been obtained. When, however, the foreign body was extracted, the mother of the child first mentioned it. She stated that after the accident the boy had been seized with a severe illness, accompanied with great pain in the head. These symptoms, together with an inability to open the mouth, continued for some months, at the end of which they subsided, when the swelling first appeared behind the ear, and continued there for two years; it had been thought to be merely an abscess, and treated accordingly. On examining the interior of the mouth, which could only be opened about half-way, Mr. Smith could see an opening in the mucous membrane, just at the base and inner side of the ascending ramus of the lower jaw, through which the piece of pipe had penetrated. It must have passed along the inner and posterior border of the jaw, amongst the important vessels and nerves, and gradually made its way towards the surface, where it had remained for two years.

Mr. HANCOCK read a paper

#### ON TUMOURS OF THE UPPER JAW.

He observed, that it is a prevalent opinion that tumours of the upper jaw originate within the antrum of Highmore, either as the result of diseased teeth, or of irritation of the lining membrane of that cavity. Messrs. Stanley, Bordenhalve, Dupuytren, Liston, and Fergusson, were of this opinion, whilst Mr. O'Shaughnessy states that in no instance could he trace the affection to these causes. He (Mr. Hancock) differed from those who advocated these opinions. From what he had observed, he did not believe that tumours of the upper jaw at all depended upon the causes assigned. Time did not permit him to enter systematically into the diseases of the upper jaw, he would therefore confine himself to tumours of that part. According to Mr. Ormerod, these consisted of cystic, cartilaginous, osseous, fibrous, and medullary; in addition to which Mr. Stanley enumerates fatty and erectile tumours; whilst Mr. Paget adds myeloid tumours; but the true characters of these latter, whether malignant or otherwise, are not as yet decided. He (Mr. Hancock) had never met with any examples of the three last-named diseases. He related a case, and exhibited a specimen, of fibrous tumour which he showed had arisen from the pterygoid process of the sphenoid bone, whence he had

removed it. With regard to bony tumours, he considered, in opposition to the opinion that they originated within the antrum, that they obtained from hypertrophy and general thickening of the bone; whilst, in medullary sarcoma, he was convinced, from what he had seen, that this commonly commenced in the cancellated structure of the bones at the base of the cranium, and could therefore never be eradicated by operation, which he thought should not be attempted, as he had performed and witnessed several operations for this form of disease, and in no single instance did the mischief fail to reappear. He (Mr. Hancock) concluded his paper with some remarks upon the means of diagnosis between these several forms of tumour.

Mr. DE MERIC, whilst complimenting Mr. Hancock on the value of the paper, and the skill with which he had performed the operations in the several cases before the Society, remarked, that the most important point connected with tumours of the upper jaw was their diagnosis. The skill of the surgeon might often be more beneficially displayed in withholding the knife in certain cases than in its use. How were we then to diagnose the nature of these tumours? He agreed in most that had been said upon this point by Mr. Hancock, and had been gratified to find that he had omitted the microscope from the means which he had employed to test their malignant or non-malignant character. In the cases in which he had seen the microscope used as a means of diagnosis, the opinions arrived at had been usually erroneous; and this might result from the almost impossibility of getting a fair specimen of the tumour for examination. With respect to the views advanced by Mr. Hancock in opposition to Mr. Stanley, he must say that the opinion of the former, that the growth originated in the pterygoid process, in opposition to the latter, that its primary seat was in the antrum, did not appear to him (Mr. de Meric) sufficiently proved by Mr. Hancock's solitary case in support of his opinion, which case too was not satisfactory. Passing on to the operative part of the paper, Mr. de Meric remarked that the hæmorrhage in these cases was by no means so formidable as might be expected, and the deformity in some instances scarcely perceptible. He urged the importance of not operating in any case in which malignancy was suspected, as the disease would surely return in some other form, and destroy the patient.

Mr. JABEZ HOGG joined issue with the last speaker respecting the value of the microscope as a means of diagnosis in these cases. The failure arose not from the instrument, but from the ignorance of those who employed it. Mr. Paget had proved its value in these cases.

Mr. BISHOP remarked that Mr. Hancock had not alluded in his paper to enchondromatous tumours of the jaw, nor to the myeloid tumours described by Mr. Paget, which had a character altogether independent of the common fibrous tumour.

Mr. HANCOCK regarded one of the specimens before the Society as consolidated enchondroma.

Mr. H. SMITH had never met with an enchondromatous tumour in the upper jaw. He agreed with Mr. de Meric in respect to non-interference in cases of malignant disease, and referred to one form of tumour of the upper jaw which had not been mentioned by Mr. Hancock, and which consisted of a fluid contained in the antrum, consisting, amongst other matters, of cholesterine, and having a bony wall towards the surface. With respect to the little deformity resulting from operations on the jaw, he mentioned a plan lately proposed by Mr. Fergusson, in which this would even be less than by the present mode. This operation consisted of an incision simply through the mesial line of the upper lip into the nostril, and reflecting back the soft parts. This proceeding could not have been resorted to in Mr. Hancock's cases, however, from the great prominence of the tumours.

Mr. CANTON had never seen enchondroma of the upper jaw. The microscope, though not infallible, might, at all events, be used to assist us in our diagnosis. The deformity in cases of removal was little, even when parts as far back as the pterygoid process were involved in the disease. He alluded to a form of tumour of the upper jaw, which had not been mentioned, and which consisted simply of hypertrophy of the dentine.

Mr. BISHOP could see no reason why the upper jaw should be exempt from enchondromatous disease.

Mr. WEEDON COOKE mentioned a case of malignant disease of the jaw, which had lately come under his notice at St. Mary's Hospital, in which the microscope, applied as a means of diagnosis, failed to detect any cancer cells. With respect to the views advanced by Mr. Stanley and Mr. Hancock, respecting the original seat of tumours of the upper jaw, he suggested that both might be right, as in some cases it might be in the antrum, in others in the pterygoid process.

Mr. HANCOCK had not founded his observations on one case, though Mr. Stanley had based his views on a single specimen of the disease, and this by no means a satisfactory one. He had omitted to include the myeloid tumour in his paper, because Mr. Paget himself had not yet decided on its true nature; for in one case in which he had operated the tumour was found analogous to the common fibrous growth, whilst in another instance it was similar to fungus hæmatodes, and had returned after operation. He (Mr. Hancock) had not seen a case of true enchondroma of the upper jaw, but regarded it as an early stage of the osseous disease which was exhibited in one of his cases. He had not entered into the question of the operation at all, nor all the diseases of the upper jaw, as the limits of his paper would not admit of these.

## THE LATE DR. GOLDING BIRD.

THE grave has now closed over the remains of this able and scientific physician. On Saturday last they were privately committed to their last resting-place in Tunbridge Wells cemetery, attended by the only member of his family in this country, Dr. Frederick Bird.

Born in Norfolk, he was at an early age placed with a clergyman at Wallingford, in Berkshire, as a pupil, subsequently completing a hurried education in his fourteenth year at a private school in London. In this latter position the tendencies which ever after influenced his future life became apparent. Gaining credit with his schoolfellows for an acquaintance with subjects out of the common routine of education, he was requested by the more industrious of them to become their instructor. He gave lectures before school hours on botany, the scanty illustrations for which were furnished by a few poppy-heads and leaves gathered from the school-ground. The boy-lecturer soon extended his instruction into that science which in after years he so well applied to pathology, and which, contributing in his hands largely to the advancement of medical science, was to him a rich source of intellectual pleasure. He quitted school, and in accordance with his own wishes, was declared a candidate for the medical profession by being apprenticed to a very respectable practitioner, who still lives to regret the loss of a pupil of whom he had long been proud.

It was during his apprenticeship that he was once despatched to seek the aid of the late Dr. James Johnson for one of his master's patients. That amiable and sound physician saw in the young apprentice evidences of developing talent. He asked his views; was told that the path of general practice had been selected for him. "Do not stop there; become a physician, and you will succeed," was the reply. It was never forgotten, but formed the early stimulus to the exertions of after years.

Before the term of his apprenticeship had expired, he entered as a student at Guy's. How he entered, and how his early talent was appreciated and supported, his own words, addressed to Dr. Addison, will best tell: "It is now thirteen years since I found myself within the walls of Guy's Hospital, a stranger and unknown. In a short time my admiration and respect were excited for your profound knowledge and experience as a physician, and for your zeal as a teacher. But I soon experienced another feeling—that of gratitude for numerous acts of the most disinterested friendship, and for which I must ever remain your debtor."\*

The days of his pupilage were marked by the same untiring industry for which he was afterwards remarkable. Gaining all the principal rewards in the medical school for which he contended, he acquired the still greater one of the lasting esteem and respect of his teachers, a most gratifying instance of which was that of having been requested by the late Sir Astley Cooper to assist him in the important work "On Diseases of the Breast," on which that great surgeon was then engaged.

As soon as his age permitted, he presented himself for his licence at the Apothecaries' Hall; but his reputation as a student had preceded him, and, after passing through the mere form of examination, he received the honours of the court, accompanied by a kindly expressed allusion to his having previously carried off one of the botanical medals awarded by them. So strongly were the court impressed with the merits of their young licentiate, that they addressed a communication highly commendatory of him to the authorities of Guy's. He was very soon after appointed to the lectureship of natural philosophy in that school, and subsequently to that of medical

\* Dedication of Work on Urinary Deposits.

botany, both of which he subsequently resigned on being appointed, conjointly with his former teacher and early friend, Dr. Addison, to that of *materia medica*. He also gave a short course of lectures on chemical pathology, which, appearing in the *Medical Gazette*, were soon afterwards translated into German by Dr. Behrend, at Leipzig, and also published in another form at Vienna. In 1840 he passed the Royal College of Physicians, and, as soon as the necessary time had elapsed, was raised to the fellowship. In 1843 he was appointed assistant-physician to Guy's Hospital, thus attaining a position which through many years he had looked forward to with hope, and in seeking to be worthy of which he had robbed himself of health. He thus acquired a position of importance in the public capacities of teacher and physician; but his success in private had been far greater.

Although at the commencement of his career he had not assumed the position of a consulting practitioner, yet he can scarcely be said to have been in general practice: the few months spent in that capacity brought him no patients, and it was not until he had taken the *status* of the physician that he began to acquire the confidence of the public. That confidence quickly came. Having graduated at St. Andrew's College, and afterwards received from the Senate the degree of M.A., he took up his residence in the inexpensive neighbourhood of Myddelton-square, having been invited to that locality by his election as physician to the Finsbury Dispensary. A field thus opened to his indomitable energy, he left nothing unheeded—no hour unemployed. Each day had its appointed work: the early morning saw him attending to the sick poor who thronged to his house; his private professional engagements and literary labours engaged him till evening; and many hours of the night—often, too often, the entire night—has passed in unbroken study. Soon his reputation extended; success never stayed, but only stimulated, labour; he worked on, and the effect of so much mental toil soon became apparent. The youthful aspect which had for some brief time barred his advance into practice, was quickly replaced by the first indications of that failing health which in a few short years was to carry him to an early tomb. It was at this time that he was, on walking home from Guy's one night, attacked with slight hæmoptysis, and although he never afterwards presented any symptoms of pulmonary disease, yet from that time he always looked upon his health as too feeble to promise length of years. This conviction never depressed him, but probably caused him to devote every hour of his life to the still harder pursuit of medical knowledge. He never went into society, scarcely ever allowed himself a week's repose; but when the signs of an exhausted brain became too evident to be overlooked, his only relaxation was a temporary attention to the lighter studies of botany, natural history, or electricity. But such resources were insufficient; they relieved his mind by change of thought, but they did not bring it repose. His already weakened constitution became yet more enfeebled, and in this powerless state he was, after slight exposure to cold, attacked with acute rheumatism, complicated with endocarditis. His convalescence was slow, and long interrupted by frequent attacks of palpitation. As soon as he could do so, he again adopted his old course of work. His practice daily increased, until, in 1850, he was obliged to leave Myddelton-square, his reception-rooms being too small to contain the patients who flocked to him for assistance. He removed to Russell-square, and his engagements continued to increase until, in the present summer, when compelled by illness to retire from practice, his income was little less than £6000 a year.

A few words descriptive of the amount of mental labour through which he passed in the short space of fifteen years, form the best commentary upon his talent, industry, and zeal. In addition to acquiring the large practice we have alluded to, he filled the public medical appointments of a professor in a large metropolitan school, and of a hospital and dispensary physician. He had passed through the necessary examinations for his degree, and for his licence from the London College. He yet had found time to cultivate the collateral sciences sufficiently to secure his election as a fellow of the Royal, Linnean, and Geological Societies; time, also, to prepare three courses of lectures delivered at the Royal College of Physicians; and still leisure to write three editions of his book "*On Natural Philosophy*," to compose his work "*On Urinary Deposits*," and to almost rewrite it in the four editions through which it has passed; and all this before he had attained his thirty-ninth year.

Robust health could scarcely have been adequate to labour such as this, and his feeble powers gave frequent and certain indications of rapid exhaustion. Often during the last three years had he been compelled to seek repose by visits to the

country, but no sooner did he find himself free from positive suffering than he at once returned to London and to labour. On each occasion it became evident that the restorative action of country air and quiet had been less and less, until, on his return from Barchin, a few months ago, he was so conscious of his unfitness for exertion, that he for the first time listened to the often-repeated solicitations to retire from practice. To him the relinquishment of his duties was a great trial; he had already resigned his appointment at Guy's, from inability to afford time for their fulfilment, and in doing so had sacrificed the strong attachment he had always felt for his alma mater; his remaining step was a painful one, "I do really think" (he writes in a letter to his brother, Dr. F. Bird,) "that no one, save those who have had to struggle with the difficulties of our profession, can have any idea of our peculiar position and anxiety when it pleases God in His mercy to call us from our work by illness." No sooner, however, was he convinced that his retirement was in the path of duty than he adopted it, and in June last he finally left London for Hastings, afterwards going to reside on a small estate he had purchased at Tunbridge Wells.

He had now taken the only course which held out the slightest hope of preserving his valuable life, and this he had delayed to the last, and until he was physically incapable of continuing his profession. He carried with him expressions of hope from all who knew him that he might yet be spared, but the more observant could not fail to see in his attenuated features, and shrunken, bending form, sad presages of the future. For a time, a very brief time, his health seemed to improve; he gained a little in strength, and was able to occupy himself partly in microscopic anatomy and physics, partly in those religious pursuits which, claiming his attention through life, had now become still dearer to him. The action of his heart, for some time rendered distressing by regurgitant disease of the aortic valves, became less violent, unless under exertion, the slightest attempt at which never failed to renew palpitation; but this alleviation of one symptom was replaced by a new one; hæmaturia occurred, not to any great extent, but persistent; he did not regard it himself, or draw the attention of others to it. Then it was that the disease which was soon to carry him to his grave began—the occurrence of constant sickness for many days, at once pointed to the cause of suffering, and finally depressed the little strength previous disease had left him. Renal calculus impacted, congestion, pyelitis, and fatal exhaustion, were the next links in the chain of disease; the last came soon—death. On the evening of the 27th of October he sank, without pain or suffering of any kind, in perfect possession of intellect and in happiness.

Dr. Bird, in the early part of his career, was an almost constant visitor to the Medical Society of London and the Westminster Medical Society, of which, after passing through the various offices, he became president. That important position he filled with great dignity and urbanity. His oration, delivered before the Medical Society, expounding his views with regard to the state of the profession, he published in *THE LANCET* at the time, and is a most eloquent and able production.

It was as a speaker at the societies that Dr. Bird, however, was singularly conspicuous. His delivery was easy and graceful, without the recall of a word, and he always brought to bear upon the point of discussion a copious fund of knowledge. He had the happy talent in a speaker of being able to bring all he knew upon any subject with apparent ease, and as though he had made that subject alone his study, consequently he always produced a most favourable impression upon his audience. And this was not an acquired talent, for well do we remember his first appearance at the Westminster Medical Society in the session 1837-38, in the celebrated discussion on Dr. Schmidt's views on magnetism. The youthful combatant (and even more youthful in appearance than in reality) entered the field against the veteran Ritchie and the shrewd author of the paper, and fought with a skillfulness and ability truly remarkable. Some regarded him as presumptuous at the time, but his after career showed that he was not even then an unworthy antagonist of the men we have mentioned.

It has been attempted to be shown, by interested parties, that he was inimical to this journal; but this was not only untrue, but the very opposite of the truth. Dr. Bird always expressed himself towards *THE LANCET* with the kindest feelings, and has often, both orally and in writing, made acknowledgments of being indebted to that journal for bringing his views at the societies before the professional public, and by this means assisting him in his early career. Indeed, when a testimonial was proposed to be given to a gentleman connected with *THE LANCET*, Dr. Bird's name was second on the list of subscribers, and he expressed his regret that the

subscription was limited to two guineas, and declared he would cheerfully have "given ten times that sum."

To speak of Dr. Golding Bird as an author is unnecessary, the verdict of the profession has already stamped his works with a value which time will not lessen. Almost all that he has written has been for the purpose of applying the aid of collateral sciences to the advancement of that of medicine—to quote his own words in his address to the College of Physicians—"To show the importance of the physician frequently making excursions into the domain of the physical sciences, and culling from it whatever blossoms he thinks likely to bear fruit in his own peculiar department. That he may often find his cherished sucklings abortive is probable; but that he will as often thus graft a vigorous shoot on the venerable trunk of medicine is certain."

As a lecturer, he was clear, accurate, and impressive, and a great favourite with his pupils. He had a singularly happy mode of imparting knowledge, and was always open to inquiries from those he instructed.

As a physician, he was laboriously careful, and seldom arrived at an opinion upon a case without a severe scrutiny; when that opinion was formed, he stated it briefly to the gentlemen in consultation with him, and gave unreservedly his views respecting the pathology and treatment of the disease. His diagnosis was usually correct: his treatment simple, but energetic.

In appearance, Dr. Bird was about the middle height, and singularly delicate in conformation. Before illness had weighed heavy upon him, his countenance was animated and cheerful; and if in later years it was

"Sicklied o'er with the pale cast of thought,"

it was always expressive of kindness and urbanity. His manner was frank and cordial, and he had a remarkably happy talent of "making friends."

Lastly must we speak of him as one not only eminent in science but eminent in piety. Religion to him was not a holiday garment, merely to be exhibited on great occasions, to be publicly displayed, or degraded by subserving professional advancement. It influenced him through life, and as his health yielded beneath the pressure of bodily suffering, it so sustained and comforted him that no word of complaint, no murmur, either in sickness, or on his bed of death, ever escaped him. Words of thankfulness, of hope, and of reliance on divine mercy, proved the contentment of a mind which remained undisturbed and happy to the last moment of life.

### THE EASTERN WAR.

#### ATTACKS UPON OUR ARMY AND NAVY MEDICAL BOARDS.

To the Editor of THE LANCET.

SIR,—As there has been so much public opinion expressed in the papers—or rather, I should say, that opinion represented by a few unprincipled persons, who cannot be aware what has been done by those responsible boards—must it not hurt the feelings of those who are at the head of the above departments to have such false accusations brought against them, especially seeing them so frequently expressed in our periodicals? They have provided everything that any living person could suggest for the use of our noble soldiers and sailors in the field of action; and have appointed additional qualified men to attend to them, the number of which has been already laid before the public; and, in the Army Medical Department, has been nearly three times as many as on any previous occasion. Certainly the Admiralty might have used a little more energy. There is an attack on our Army and Ordnance Medical Board, by a person signing himself "A Patriot," in your last number. I should strongly advise that person to try and pass the examination of that board, and see if it consists of unprofessional men, or not, and then he can give his opinion; for I feel assured he has not done so, nor is aware of what kind of an examination is required of candidates for their reception by the so-called unprofessional board. With respect to the numerous indirect attacks on the Director-General of the Army and Ordnance Medical Department which have been made, they are most unjust and undesired; for no living man can have used greater exertions, or have been more anxious in procuring every assistance for the relief of our brave expeditionary army at present in the East,

than Dr. A. Smith has done, and for which he ought to have received his country's thanks and praise, instead of the unjust abuse to which he has been subjected. If the public are not satisfied they have their remedy. Let them call a meeting amongst themselves, and form a deputation of professional men, who stand A 1 in the profession, and make inquiries into the matter, and then report to the proper quarter if things are not as they ought to be. But, Mr. Editor, I am sure you will think with me—as you are always ready to hear both sides of the question—that from the beginning of these attacks up to the present time, they have not been a legitimate or mainly way of proceeding, in trying, by letters, to prejudice the public mind against a gentleman who holds one of the most responsible offices—that of a medical director-general over the whole of our noble army—by such false and exaggerated statements, instead of rendering that credit and praise which he deserves from his professional brethren, for the great ability he has displayed in so laborious an office.

I remain, Sir, yours most obediently,  
St. George's Hospital, November, 1854. W. I. CLAFF.

### THE MEDICAL ARRANGEMENTS IN THE CRIMEA.

To the Editor of THE LANCET.

SIR,—The medical arrangements for the sick and wounded in the Crimea have had the severest censure passed on them it is possible to conceive. In fact, so bad are they, seemingly, that the commander-in-chief has thought it necessary to issue a general order. That any one in the situation of Dr. Dumbreck should lay himself open to such an order, discloses a state of things reflecting anything but credit on the medical department. With Dr. Dumbreck I have the pleasure of a personal acquaintance.

That in a moment like that a verbal instead of a written order should have been given, must in all charity be ascribed to the hurry and agitation consequent on the novel position in which he was placed. Therefore, I think the profession should withhold its opinion in the matter for a while yet. A more humane man, and one more alive to the responsibility of his post, than Dr. Dumbreck, is not in the service. I do not write in his justification at present. I write to call your attention to a subject that is at present the sole topic of newspaper paragraphs and private conversation—namely, Miss Nightingale and her staff of nurses. No one will doubt the spirit with which Miss Nightingale, sacrificing everything in the shape of comfort, and the society of those moving in the sphere of life to which she has been accustomed, nobly and disinterestedly goes forth to alleviate the suffering, and comfort the dying. All honour to her!

But if the staff of nurses are to meet the same fate that hitherto seems to have attended everything medical, in what better position will the wounded be? It is a fact pretty generally known, that the last in an army (excepting the surgeon) cared for, are the women. Now, where is Miss Nightingale and her staff to be?—at a distance or near? If at a distance from the army, in what manner is it purposed to render her services useful? If near, where are the hospitals?—tents or solid structures? Any information on this subject will be thankfully received by

Your obedient servant,  
ONE INTERESTED.

London, November, 1854.

### UNQUALIFIED PRACTICE.

To the Editor of THE LANCET.

SIR,—I quite agree with your correspondent, "Medicus," of last week, and think if the enormous amount of unqualified practitioners were collected, it would have some good effect in the event of a medical bill ever being discussed in the House of Commons. The borough in which I reside contains about thirty who do not possess a qualification of any sort. Now, taking these at £200 per annum each, makes £6000 taken from the legitimate practitioner. I beg to say, I shall be ready to furnish the names and addresses if the movement is carried out.

November, 1854.

I am, Sir, yours,  
FERRELL.

CONSUMPTION HOSPITAL.—This excellent institution has just been enriched with the munificent legacy of £5000 from the late Mrs. Wilson, of Eaton-square.

## THE WAR.

**WANT OF NAVAL ASSISTANT-SURGEONS.**—The following paragraph is extracted from a letter of *The Times'* correspondent off the Katcha :—"I cannot conclude my letter without alluding to another just cause of complaint, the effects of which are most terribly felt at the present moment—I mean the want of assistant-surgeons. You remember, of course, their representations to the Admiralty, that they ought to be treated as officers, and mess in the ward-room; for circumstances have changed, and the assistant-surgeons, who were formerly chosen from apothecaries' boys, are now men who have passed in medical colleges, and received the education of gentlemen. The Admiralty was shocked at their request; the consequence is, that there are not half-a-dozen assistant-surgeons in the fleet of the Black Sea. After the action the other day, they were borrowed from one ship by the other, and, of course, the wounded had to wait for hours and hours without having their wounds dressed. The next day, by order of the Admiral, all wounded and sick were transported on board the *Vulcan*, in order to go to Therapia. They remained there for more than another day without anybody taking care of them; so that several of the men actually got no food for more than twenty-four hours; and all this on account of the prejudice of a few old gentlemen."

**NAVAL MEDICAL STORES.**—In confirmation of the statement made by *The Times*, of the neglect of the medical wants of our sailors, and as frequently contradicted by interested parties, we may state, on good authority, that only last week the necessary medical stores were sent out from the Apothecaries' Hall to those sailors who nobly volunteered to serve ashore; the officers of that establishment working almost night and day to complete the hurried order. From *The Times* we find that the stores for hospital use sent from England are very scarce, and badly arranged. There is not one of the much-made-of ambulance waggons in the Crimea; a jolting araba is the only English conveyance for men dying of cholera. After the battle of the Alma, the wounded were carried down in hammocks, slung between two oars, and carried by sailors in the gentlest manner. The second day, the French put their excellent ambulance corps at our disposal. The surgeons are worked to death, and have to endure the misery of seeing men imploring relief and being unable, from the bad arrangements of the home staff, to give it them.

**THE SIEGE OF SEBASTOPOL.**—On the first day of the siege, Mr. O'Leary, assistant-surgeon of the 68th, was amongst the killed. Assistant-Surgeon J. Gibbons, of the 44th regiment, was wounded in the trenches, whilst performing surgical duties in the field. During the bombardment, the surgeon of the *Albion* was likewise wounded.

**SANITARY STATE OF SEBASTOPOL.**—The condition of Sebastopol is still said to be horrible, with heaps of dead bodies lying in the streets, and no one caring or having leisure to bury them. It is feared that when our troops enter and occupy the place, it will be fatal to their health.

**APPOINTMENTS.**—Surgeons: James Salmon, (1840,) from the *Neptune*, 120, at Portsmouth, to the *Excellent* gunnery-ship, at that port; Lenox T. Cunningham, M.D., (1840,) from the *St. Vincent* to the *Neptune*, vice Salmon.

## THE CHOLERA.

WE are happy to be able to state that the cholera exhibits a continued decrease. The deaths from it, which in four weeks of October were 411, 249, 163, and 66, in the last were only 31. In the same five weeks, diarrhoea was fatal in 98, 102, 78, 46, and 33 cases. The 31 deaths from cholera occurred in sub-districts as follows :—In Paddington, St. John, 1; in Chelsea South, 1; in Belgrave, 1; in Westminster, St. John, 1; in Gray's-inn-lane, 1; in Camden-town, 1; in Islington West, 1; in St. Clement Danes, 1; in Whitecross-street, 1; in Cripple-gate, 1; in City of London South, 1; in Bethnal-green, 1; in Bethnal-green Town, 1; in Whitechapel Church, 1; in Bow and Bromley, 1; in St. Saviour, 1; in St. Olave, St. John, 1; in London-road, 2; in Waterloo (second part), 1; in Lambeth Church (second part), 1; in Kennington (first part), 1; in Kennington (second part), 1; in Clapham, 1; in Peckham, 1; in Rotherhithe, 1; in St. Paul's Deptford, 1; in Greenwich East, 2; and in Woolwich Dockyard, 2. Of these, 9 were below 15 years of age; 16 were between 15 and 60; 6 were above 60 years old. 33 persons are said to have died from diarrhoea.

From the Report of the Registrar-General it appears that 10,530 persons died in London, being 45 to every 10,000 people. 2018 persons died of the epidemic in the west districts, comprising, Kensington; Chelsea; St. George, Hanover square; Westminster; St. Martin-in-the-Fields; and St. James's, Westminster. The mortality by cholera was here at the rate of 54 in 10,000 inhabitants. The mortality in the five north districts, Marylebone, Hampstead, St. Pancras, Islington, and Hackney, was 15 in 10,000 inhabitants. The average annual value of the houses in the west districts, ranged from £29 to £128; in the north district, from £35 to £71. The mean density of the population is nearly the same. In the west districts it is 35, in the north districts, 36 persons to an acre. The west districts are supplied chiefly by the Chelsea, the West Middlesex, and the Grand Junction Companies, with water taken from the Thames at Battersea, Hammersmith, and Kew. The north districts are supplied by the New River Company, the West Middlesex, the East London, and the Hampstead Companies. The mean elevation of the west districts is 30 feet, of the north districts 86 feet above the Trinity high-water mark. In the Hanover-square sub-district, 9 in 10,000 people died of cholera; in the Golden-square sub-district, 189 in 10,000. In the northern districts, the mortality ranged from 6 in the Cavendish-square sub-district, Marylebone; to 52 in All Souls; but a large number of the deaths in the latter sub-district occurred in the Middlesex Hospital, and came chiefly from the district of St. James's, Westminster.

## Medical News.

**ROYAL COLLEGE OF SURGEONS.**—The following gentlemen having undergone the necessary examinations for the diploma, were admitted Members of the College at the meeting of the Court of Examiners on the 3rd inst. :—

BUZZARD, THOMAS, St. John's-wood.  
CARDELL, JOHN MAGOR, St. Columb, Cornwall.  
GAMGER, JOSEPH SAMPSON, Stanhope-street, Camden-town.  
GREGORY, CHARLES FOSTER, Tunbridge.  
HICHENS, JOHN LEY, St. Ives, Cornwall.  
KITCHING, JOHN, Lower Sackville-street, Dublin.  
NICHOLSON, GEORGE, Castletown, Berehaven, co. Cork.  
ROWCLIFFE, EDWARD HANCOCK, Tarporley, Cheshire.  
SHERLOCK, HENRY, Army.  
SUTCLIFFE, JOSEPH HARVEY, Camberwell-grove.  
WEBB, RANDOLPH, Trowbridge, Wilts.

**LICENTIATES IN MIDWIFERY.**—The following Members of the Royal College of Surgeons, having undergone the necessary examinations, were admitted Licentiates in Midwifery, at the meeting of the Board, on the 7th inst. :—

HARRIS, SAMUEL, Quorn, Leicestershire, Diploma of Membership dated July 14th, 1854.  
HORSFALL, JAS. SMITH, Halifax, Yorkshire, July 14th, 1854.  
FOY, CHRISTOPHER, Calcutta, October 13th, 1854.  
FOY, JAMES AUGUSTUS, Calcutta, October 13th, 1854.  
NOWELL, JAMES, Bradford, Yorkshire, August 6th, 1854.

The death of Dr. James Reid causes a vacancy in this Board.

**THE FELLOWSHIP.**—From a notice in our advertising columns it will be seen that the next professional examination for this distinction will take place on the 28th and 30th inst.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, November 2nd, 1854.

ARRAS, WILLIAM, Warwick-bridge, Carlisle.  
EGERTON, JOSEPH SAVORY, Wedover, Bucks.  
NEWFIELD, STEPHEN, Whitby, Yorkshire.  
ROBERTS, JOHN, Cricketh, Carnarvonshire.

**HUNTERIAN SOCIETY.**—Dr. Peacock will read a communication on a Case of Plastic Bronchitis.

**HARVEIAN SOCIETY.**—Mr. Anderson will read a paper at the Harveian Society, on Thursday, 16th Nov., upon the Operation of Turning in Midwifery.

**FEARFUL HAVOC BY DISEASE ON BOARD EMIGRANT SHIPS.**—The mortality on board emigrant ships arriving at New York is frightful. On the 12th ult. the packet-ship *Harvest Queen* arrived from Liverpool, and her report gave seventy-four deaths on the passage. On board a French vessel, called the *Piscatore*, also arrived on the 12th ult. from Havre, fifty deaths from cholera occurred on the voyage.

**THE LATE DR. THOMSON, OF THE 44TH REGIMENT.**—We understand that this gentleman, to whom was assigned the hazardous but honourable duty of tending the wounded Russians on the plains of Alma, and whose melancholy death from cholera occurred on the 5th ult., after his rejoining the camp, as recorded in *THE LANCET*, was a native of Cromarty, in the north of Scotland. Dr. Thomson entered the army in the month of February, 1848, and at the period of his death was in the thirtieth year of his age.

**TESTIMONIAL TO WILLIAM MEE, ESQ., SURGEON, OF EAST RETFORD.**—Some months ago it was determined, by several gentlemen in the town, to present Mr. Mee with some substantial token of esteem, on his retirement from public life. It was agreed upon that the same should be a full-length portrait of himself; the artist to be chosen by the subscribers. Mr. Beetham was the gentleman chosen to paint it; who having completed the portrait, Thursday last (26th ult.) was the day fixed upon for its presentation; this took place at Mr. Mee's own residence. Mr. Allison, who had been partner with Mr. Mee so long in the medical profession, formally presented the gift, and said—"In the names of the subscribers for a testimonial, and on their behalf, the gratifying duty of presenting to you this painting of yourself, devolves upon me, as the chairman of a committee appointed by the contributors for applying their fund to this purpose. It is presented to you on your retirement from public to comparatively private life (for you are still a magistrate) by a body of your townsmen and neighbours, amongst whom you have resided upwards of forty-two years; about forty years of which time you practiced the medical profession, and during the latter part of which period you have three times, within the space of four years, filled the office of mayor of this borough; and consequently, you have rendered yourself amenable to public opinion, which you can neither stifle nor evade; and I have been deputed by a great number of gentlemen to make known to you the result of their observations, which conclusion, so far as they can judge, is in accordance with the sentiments of an immense majority of that part of the public amongst whom you have passed the greater portion of your lifetime."—Mr. Mee made a suitable acknowledgment. A sumptuous luncheon was provided for the occasion by Mr. Mee, and both his health and that of Mr. Allison were given and drunk in the warmest manner.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, NOVEMBER 4TH.**—The returns for London for the week that ended last Saturday give 1252 as the number of deaths registered from all causes. In the corresponding weeks of the ten years 1844-53 the average number was 983, and if this is raised in proportion to increase of population the result obtained is 1081. Hence it appears that 171 deaths occurred above what the calculated rate of mortality would produce.

### Obituary.

On Sunday, Nov. 5th, at his residence in Brook-street, Grosvenor-square, JAMES REID, M.D., Physician to the Infirmary of St. Giles and St. George, Bloomsbury, and Examiner in Midwifery of the Royal College of Surgeons. Dr. Reid's last contribution to medicine appeared in *THE LANCET* in the early part of the present year, "On the Duration of Pregnancy in the Human Female."

Suddenly, at Birkenhead, W. R. CROUCH, Esq., Surgeon to the Birkenhead Hospital. The deceased was attending patients the evening preceding his death, which took place at four o'clock in the morning, when there was nothing in his manner to lead to a supposition that he was so near his end. He had complained of indisposition for a few days, but no alarm or uneasiness was felt by his friends for his welfare. His death was attributed to quinsy, although it is alleged that the immediate cause was an overdose of morphia. The deceased's mortal remains were conveyed last Saturday to their final resting-place, in St. Mary's Churchyard, the funeral cortege consisting of the whole of the medical practitioners in Birkenhead, and the committee of the institution which he had the honour to represent.

At Hilhead, near Fones, Dr. WILLIAM SMITH, late of the 17th Regiment.

At Jersey, G. TURNBULL, Esq., late surgeon in the Hon. East India Company's Service.

At Wye, Kent, JAMES LOVELL, Esq., surgeon, aged thirty-one. In the Crimea, of cholera, Assistant-surgeon BECKWITH, of the 49th Regiment.

### TO CORRESPONDENTS.

**A Late Guardian of the Strand Union.**—The Board of Guardians of this Union are not open to all the animadversions of their former colleague. During the late epidemic they promptly and effectively joined the Board of Health in carrying out measures for the arrest of the cholera. Those measures were productive of the greatest possible benefit. It is to be regretted that the Board has refused its sanction to the appointment of an officer of health for St. Anne's parish, the state of that locality urgently requiring the duties of such an officer. Probably fresh powers will be granted to the Board of Health on many subjects connected with sanitary reform, one of the most desirable of which would be the appointment of permanent local inspectors, armed with authority to carry out measures for the preservation and protection of the public health.

**A Country Clergyman.**—A review of the work named appears in the present number of *THE LANCET*. Nothing can be more unjustifiable and dangerous than the resort to powerful medicines by an unprofessional person. Even in the hands of duly-qualified practitioners the "remedy" has been proved to be anything but safe. The law takes no cognizance of a person practising in such a manner, provided it be not for gain.

**A. B. C.**—At that time the Westminster Hospital was situated in York-street, and had attached to it as surgeons four members of the Board of Examiners of the College of Surgeons—namely, Sir Anthony Carlisle, Mr. Lynn, Mr. Anthony White, and Mr. Guthrie.

**A Student.**—In the volumes of *THE LANCET* for 1837-38.

**Juvenis.**—Books of the kind are merely circulated for the purpose of producing alarm in the mind of the reader, and to induce him to place himself under the care of their unprincipled authors. Such works are a compound of ignorance and obscenity, and should be treated with the utmost scorn and contempt. No doubt, in the present instance, the titles assumed by the writer of the book are fictitious. The only mode in which "Juvenis" might obtain redress would be by proceeding against the delinquent for obtaining money under false pretences. There is a precedent for such a course of action, and we believe, in the present case, a similar course of proceeding would be successful.

**M.D.**—No cases have come to our knowledge in which the "Japanese Remedy" has been productive of benefit.

**A Candidate.**—The first examination under the new rules will take place in January next.

**B. (Bath).**—Nothing is more difficult than to lay down any strict laws upon such a subject. Much must be left to the honour and discretion of the gentleman in attendance. There are no stated charges for such operations. Those that have been made in the present instance we think are fair and reasonable.

**Mr. Craigie, (Hamilton, Canada West.)**—The letter to Dr. Ayre, relative to the treatment of cholera by calomel, shall be published.

**Discipulus.**—The papers of Mr. Gream appeared in *THE LANCET* for 1849. Apply to the publisher, at the office.

**Dr. Aitken (Glasgow)** is thanked for his communication.

**Mr. George Sprogden.**—Application should be made to Dr. Andrew Smith, Medical Superintendent of the Army. The qualification necessary is membership of one of the Royal Colleges of Surgeons.

**Chirurgus in Bure.**—The articles in the *Daily News* and *Morning Advertiser* relative to the treatment of the medical officers of the army and navy, are highly creditable to the editors of those journals. It is extremely satisfactory to observe that the just claims of the army and navy surgeons to the gratitude of the country are supported by the public voice, however much they have been ignored by those in power.

A CORRESPONDENT who has addressed us on the state of medical officers engaged in the present war, will perceive that we have cursorily alluded to the subject of his communication. Probably it will be treated more fully at an early period.

**A Visitor.**—The effect is produced by a reflector.

**J. P.**—The Cork Schools have a good reputation.

**An Irish Militia Surgeon.**—Next week the question shall be answered.

Owing to the great pressure upon our columns in the present number, we are obliged to postpone many valuable papers already in type, including the Reports of the Harveian, Western Medical, and Epidemiological Societies; also numerous advertisements.

COMMUNICATIONS, LETTERS, &c., have been received from—Mr. Coulson; Mr. Hancock; Mr. George Bodington; Mr. William Craigie, (Hamilton, Canada West); The Secretary of the Epidemiological Society; Discipulus; Mr. Thompson; Mr. Barry; Mr. Allison, (East Retford); Ferret; Dr. J. Tatam Banks, (Hougham, Devonshire); Dr. Marshall Hall; Medicus; The Hon. Secretary of the Harveian Society; Mr. L. F. Crumney, (Middlesbrough); Dr. Knox; Mr. Davey; Mr. Dalrymple; Mr. M'William; Dr. Piddock; Dr. Ramskill; Mr. Clapp; Mr. Bishop; Mr. R. Wilkinson, (Manchester, with enclosure); Mr. T. Barron, (Holbeach); Mr. B. Hobrom (Leeds, with enclosure); Mr. C. R. Saffield, (Droitwich, with enclosure); Dr. Bagnell, (Cahir, with enclosure); Dr. Somerville; Mr. Hamilton (Milton); Dr. Gilbert King; Mr. Tucker; An Irish Militia Surgeon; Mr. Sprogden, (Macclesfield, Notts); Chirurgus in Bure; A Late Guardian of the Strand Union; A Country Surgeon; A. B. C.; A Student; Juvenis; Mr. William Luxton, (Sutton Benger, Wilts); Dr. Ar. N. Holmes, (Leeds); M.D.; A Candidate; B.; (Bath); Dr. Aitken, (Glasgow); A Correspondent; A Visitor; J. P.; An Irish Surgeon; &c. &c.

## GOLD CHAINS AND JEWELLERY.—PRIZE MEDAL.

**W**atherston and Brogden's Gold Chains, by troy weight, at realizable value, and the workmanship at wholesale manufacturer's prices.—The Great Exhibition having established the advantage of purchasing from the wholesale manufacturer wherever it can be accomplished, and thereby dispensing with an intermediate profit, WATHERSTON and BROGDEN beg to announce that, in obedience to the numerous calls made upon them, they have thrown open their Manufactory to the public at the same prices they have been in the habit (for the last half century) of charging to the trade in London, India, and the Colonies. The system of weighing chains against sovereigns being one of the greatest frauds ever practised on the public, WATHERSTON and BROGDEN guarantee the gold in their chains, and will repurchase it at the price charged,—the workmanship, according to the intricacy or simplicity of the pattern. Example:—Intrinsic value of a chain of 15 carat gold, weighing 1½ ounce, £3 19s. 7d.; supposing the workmanship to be £2—total, £5 19s. 7d. By this arrangement the purchaser will see at a glance the proportion charged for labour compared with the bullion in a gold chain, and being always able to realize the one, will have only to decide on the value of the other. An extensive assortment of jewellery all made at their Manufactory, 16, HENRIETTA-STREET, COVENT-GARDEN.—Established A.D. 1798.

## CAUTION.

KNEE CAP AND ANKLE PIECE.

ABDOMINAL SUPPORTER.

SPINAL SUPPORTER.

STOCKING AND THIGH PIECE.

**Mr. Bourjeaud**, in submitting the above four Engravings as illustrating the nature and special design of his Apparatuses, most earnestly begs to call the attention of Professional Gentlemen to the gross and nefarious practices of unprincipled parties, who attempt to impose on the Public by advertising their spurious apparatuses, accompanied with the closest imitations of his diagrams, and with the use even of the same words and plan of measurement, in order to obtain, by these fraudulent means, a portion of the patronage with which he has been especially honoured by the Profession. Mr. Bourjeaud wishes, therefore, to caution Medical Gentlemen against the dishonest proceedings of his imitators, and hopes they will not accept any of the appliances put forward under the name of Spiral Supporter, except the articles come from his own Establishment, No. 11, Davies-street, Berkeley-square, (opposite Mivart's Hotel,) London; and No. 17, Rue des Beaux Arts, Paris.

**Mr. Edwin Osborne**, of 24, Savile-row, LONDON, the Sole Licensee and Maker of PALMER'S PATENT LEG, adapts this beautiful substitute to every form of amputation; and having had great experience in its manufacture, feels confident of giving comfort and satisfaction to those persons who may favour him with their patronage. References given, (if required.)

**Mr. Bourjeaud's Registered Elastic** APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1.

FIG. 2.

**FIG. 1.**—MR. BOURJEAUD'S NEW SUSPENSORY BANDAGE, as applied to a patient.—Mr. Bourjeaud begs to state that the bag supporting the scrotum is made of a delicate webbing of silk and india-rubber; the bands running round the thighs consist of the most yielding elastic tissue, and will stretch to twice their length; a third band is adapted to the upper part of the bag, the former being intended to be fastened to the flannel waistcoat of the patient. The scrotum is thus kept raised and fixed *in situ*, without distressing the organ in the least, the suspensor allowing of the most varied movements of the body.

**FIG. 2.**—The same Suspensory Bandage taken off.

**Anatomical and Dental Repository**, 46, Museum-street, Bloomsbury, London.—JOHN HARNETT begs most respectfully to call the attention of Lecturers, Students, and Gentlemen connected with the Medical Profession, to his large and select Stock of Anatomical Preparations, consisting of Skeletons, loose and articulated Skulls, Hands and Feet, Vertebrae, and Loose Bones, at the lowest possible prices.

**M. Pillischer's Newly-Constructed** STUDENT'S MICROSCOPE, which, for solidity, portability, and reasonable price, surpasses any Microscope hitherto made by any English or Continental maker. The Student's Microscope, with coarse and fine adjustments, single mirror, one eye-piece, a one-inch and one-quarter-inch French achromatic object-glasses of best quality, the whole packed in mahogany case, 7in. by 6in., £5 10s.; or with M. Pillischer's own-made, 1in. of 16 degs. angular aperture, and ¼in. of 60 degs., £7. The above stand with lever stage, extra eye-piece, double mirrors, animalcule cage, &c., £8; or with Pillischer's glasses, £9 10s. A list of prices will be sent free on application to M. Pillischer, 83, New Bond-street.

## Huxley's Fulcrum

**ABDOMINAL BELT** will be found, from its mechanical arrangement, (acting diagonally,) and producing the required support for the lower part of the Abdomen, to be the most complete and comfortable arrangement ever invented. It is extremely light, weighing only 4oz. Price 18s.

Measures required.—Circumference at A, B, and C; depth from A. to C.

A discount of 20 per cent. to the profession.

HUXLEY and CO., 8, Old Cavendish-street, late of 5, Vane-street, Oxford-street.

**Mr. T. H. Wakley's Stricture Instruments.**  
MENTS. Complete Sets of these Instruments may now be had of  
WHISS & SON, 62, Strand, London.

**Henry Bigg, 9, St. Thomas's-street,**  
Borough, Surgical Instrument-maker to Guy's and St. Thomas's Hospitals, begs to call the attention of the Medical Profession to the following valuable Instruments, made from designs and suggestions kindly given by the Gentlemen whose names are attached—viz., Mr. Le Gros Clark's Talipes Instrument; Mr. Bransby Cooper's Ovarian Trocar; Mr. Cock's Recto-Vesical Trocar; Mr. Cooper Foster's Ear Speculum; Mr. Hilton's Speculum Ani; Dr. Lever's Midwifery Instruments; Mr. Solly's Elastic Catheter, with Catgut Director. These Instruments being constructed on the premises secure their excellence and perfect finish.  
9, St. Thomas's-street, Borough, London.

**Dr. Lever's Improved Elastic Utero-ABDOMINAL BELT** being constructed by Mr. H. Bigg, 29, Leicester-square, under the immediate suggestion of Dr. Lever, will be found to combine every advantage possible to obtain. It upholds the parietes of the abdomen, secures support to the uterus, and admits of the elastic force immediately above the pabes being increased by the patient after the Belt is applied.  
To be had only of Mr. H. BIGG, 29, Leicester-square.

**Spinal Curvature.—Mr. H. Bigg, 29,**  
Leicester-square, particularly invites the attention of the Faculty to two new and distinct forms of SPINAL APPARATUS he has recently invented. The principle on which they are constructed, thoroughly supplants the "brute force" of the screw, yielding instead an elastic power analogous to muscular motion; it also encourages respiration, admits of the spine being moved in any direction, and possesses a weight so trifling as hardly to be felt by the wearer.—PATENTED.  
To be had only of the Patentee, 29, Leicester-square.

**Treatment of Club Feet, Spinal CURVATURE, &c., WITHOUT THE EMPLOYMENT OF THE SCREW.—MR. HEATHER BIGG, 29, Leicester-square,** begs to invite the attention of the Faculty to an entirely new principle he has discovered for constructing the various apparatus for deformities of the feet and spine.  
"The living structures do not with impunity tolerate the brute force of the screw." "In any case in which the force of the screw is employed, unless for a very brief period, excoriation, sloughing, intolerable pain in the parts compressed will inevitably result." "Dr. LITTLE, on 'Deformities,' PP. 34, 36.  
Mr. H. Bigg has recently invented four distinct forms of Orthopedic Instruments for Talipes Varus, T. Valgus, T. Equinus, Lateral Curvature, &c., in all of which the principle of muscular elasticity is simulated and the "brute force" of the screw ignored.—PATENTED.  
29, LEICESTER-SQUARE.

**New Spinal Support.—Fr. G. Ernst,**  
Lamb's Conduit-street, Foundling Hospital, begs to draw the attention of the Faculty to his recently-invented SPINAL APPARATUS, which, after some months of trial, has proved superior to any of the various kinds hitherto used, and produced the most satisfactory results. This appliance, being self-adjusting, free bodily motion is permitted; thus, while equal and necessary support is given to the wearer, all injurious or painful pressure is avoided, and a great amount of comfort and benefit consequently yielded. It can be modified so as to suit any FORM OF SPINAL DEFLECTION; its weight is comparatively trifling, and from its capacities for nice adaptation elicits no observation when on the body.  
To be had only of the Inventor, 48, Lamb's Conduit-street.  
TO THE MEDICAL PROFESSION.

**Fr. G. Ernst, Anatomical Machinist**  
and MANUFACTURER OF SURGICAL INSTRUMENTS, 48, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF of BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam Ernst (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &c.

**The Eye Douche, for applying Lotion**  
to or bathing the Eye, is self-acting, simple, and portable. The immediate relief obtained from its use particularly recommends it to the notice of all who are much engaged in reading, writing, or designing; it has been employed with the most favourable results by patients under the care of Haynes Walton, Esq., Surgeon to the Central London Ophthalmic Hospital. Price 20s.; carriage paid to any railway station.  
Manufactured by WILLIAM T. COOPER, 26, Oxford-street, London.

**COOPER'S LAVEMENT APPARATUS** is the most perfect ever invented; the possibility of air entering the bowels is prevented, and the labour of pumping is avoided; being constructed entirely of metal, without valves, it cannot become out of order, which renders it particularly suitable for use in the country or in foreign climates. Price 35s. Enema Apparatus from 10s.; Superior Reservoir Apparatus from 25s.—Each instrument in mahogany box with lock and key.  
Manufactured by WILLIAM T. COOPER, 26, Oxford-street, London.

**THE CORK RESPIRATOR** is the lightest, cheapest, and most efficacious ever produced; allows free respiration, and from being easily applied and removed, is specially adapted for the use of Invalids, or Ladies attending evening meetings or places of amusement. Price 8s., free by post.  
Wholesale only of WILLIAM T. COOPER, 26, Oxford-street, London.  
Illustrated Catalogues free by post.

**Water Filter for the Pocket, with**  
DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 6d.  
J. SOLOMON, Wholesale Optician, and Photographic Depot, 22, Red Lion-square.

**Teeth.—Mr. Alfred Jones, of Grosvenor-street,** has recently completed a new and important improvement in the construction of ARTIFICIAL TEETH. The superiority of their appearance, and the unerring accuracy with which they are fitted to the mouth, without wires, springs, or ligatures, and the lightness of their construction, gives greater facility in mastication and freedom to the speech, and imparts a more youthful appearance to the countenance than has hitherto been attained; they support any teeth that may be loose, and have been tested by many of the first medical men, the nobility, and gentry, from whom he has received the most flattering acknowledgments of success. Supplied only by Mr. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of Gloucester, her late Royal Highness the Princess Augusta, and his late Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street, Grosvenor-square.—At home from Eleven until Five.

**Purification of Linen—Prevention of DISEASE.—J. BOILESSVE, 55, King William-street, City, London,** solicits the attention of the Nobility and Gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.  
69, Marylebone-lane, London, Feb. 2nd, 1854.

SIR,—I have much pleasure in informing you, that I am entirely satisfied with the performance of your No. 3 Calorifere, lately put up for warming my manufactory; it has been in operation for a month, and I believe it to be the best and most economical means of drying yet invented, and particularly suited to my business, as there is no dust arising from its use, as there is from the old stoves. The consumption of coke is about one basket per day.  
I am, Sir, yours truly,  
SAMUEL HUBERT,  
To J. Boilessve, Esq. Firm of JOHN WOOLLANS and Co., Paper-stainers.

**Warming and Ventilating by Hot AIR, CHURCHES, HOSPITALS, TOWN-HALLS, and other PUBLIC BUILDINGS.—J. BOILESSVE, C.E., 55, King William-street, City of London,** respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment.  
4, Leadenhall-street, London, May 6, 1854.

DEAR SIR,—I have great pleasure in testifying to the value of your Calorifere, or Heating Apparatus, on the score of economy and utility; it combines warmth and purity of atmosphere, and is a vast improvement on our present absurd system of putting a current of cold air over our bodies, to be warmed in our fire-places, and then to be wasted up our chimneys.  
No doubt your Calorifere will soon be used for our conservatories and green-houses, and most likely for warming our cattle, and drying our corn. I find no difficulty in warming our upper rooms by your Calorifere.  
I am, dear Sir, your obedient servant,  
J. MURCH.  
To J. Boilessve, Esq., 55, King William-street, City, London.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.  
**Important Saving, by Pre-payment,**  
in the PURCHASE of  
NEW WHITE MOULDED VIALS.  
APSPLEY PELLATT and CO. submit the following PRICES of VIALS, for PRE-PAYMENT only:—  

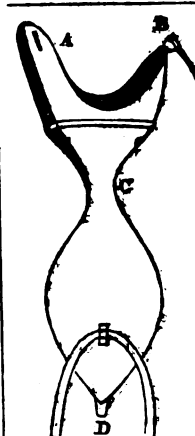

1 oz.	1 oz.	1 1/2 oz.	per Gross, 6s.
2 oz.	"	2 oz.	7s.
3 oz.	"	3 oz.	8s.
4 oz.	"	4 oz.	10s.
6 oz.	"	6 oz.	12s.
8 oz.	"	8 oz.	15s.

4 1/2 oz.	graduated in 3 doses	12s. 6d.
-----------	----------------------	----------

  
In quantities of not less than Six Gross, assorted to suit the convenience of the purchaser, delivered to carriers in London. No charge for Package. Breakage at risk of Purchaser.  
The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,  
APSPLEY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

**Walters' India-rubber URINALS.**  
F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.  
Made of Solid India-rubber, with Patent Valve, and adapted for Ladies, Gentlemen, and Children.  
Manufacturer also of the PATENT HYDRO-STATIC TRUSS. One of the advantages of this Truss is, that the pad, being filled with water, adapts itself with perfect accuracy to the form of the body, thereby keeping up a firm but easy pressure on the internal ring.  
F. WALTERS,  
16, MOONGATE-STREET, LONDON.

**Aërated Waters of sufficient and uniform strength.** BLAKE, SANDFORD, and BLAKE, 47, Piccadilly, having given great attention to the manufacture of Mineral Waters, and feeling it important that medical men should be assured of the quantity of Alkali contained in each kind, beg to submit the following list of their preparations:—  
Potash Water, 18 grains of the Bicarbonate in each bottle; Citrate of Potash, (a new and valuable auxiliary in Gout and Rheumatic affections,) 30 grains; Soda, 16 grains; Magnesia, 12 grains, and Ammonia, 10 grains.  
B. S. & B. would especially recommend their Seltzer and Vichy Waters; the latter now bottled in half-pints as well as pints.  
BLAKE, SANDFORD, and BLAKE, 47, Piccadilly.

## HYGIENIC BATHS.

JENSON'S TONIC

### DAPHNE MARINA SALT FOR BATHS

When dissolved in a Cold, Tepid, or Warm Bath, imparts so eminently strengthening and beneficial properties to the same, that, when once tried, a Bath will scarcely ever be taken without it. In the buoyancy and freshness it produces in the system, it is far superior to any known Sea Bath.

Sold at 6d. and 1s. per packet, by the Proprietor, C. MARIE, 103, Leadenhall-street, and 213A, Piccadilly, (near Regent-circus,) and by all Chemists, and Bathing Establishments.

**W. Twinberrow begs to draw the attention of the Medical Profession to his EXTRACT of INDIAN HEMP,** prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible; also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atropo, Belladonna, Cotyledon Umbilicus, &c.) also to his Liq. Taraxiel, Liq. Galli Aparinis (a valuable alternative), Liq. Parietarie (diuretic), and Liq. Bece (prepared from the Egle Marmelos, or Indian Bael), for Dysentery and Diarrhoea.

W. T. has a large supply of INDIAN BARK on hand.  
2, Edward's-street, Portman-square.

## Mathey Caylus' Gluten Capsules

contain the purest Copaliba, either simple or combined with Citrate of Iron, Ratanhy, Cubeba, &c.; acknowledged by the London and Paris Hospitals; also by the Lock Hospital; M. Lesueur, chef de Travaux Chimiques à l'Académie de Médecine; Dr. Ricord, Cullerier, &c., who have granted written attestations, to be the best prepared Medicine for the cure of certain diseases.

*Extract of a Letter from Dr. Cullerier:—*

"I cannot induce you too much to extend the use of your preparations; by so doing you will render a valuable service to the therapeutic of blenorraghie affections."  
"I am, &c.,"  
"CULLERIER,"  
"Chirurgien de l'Hôpital de Lourcine."

Sold in Bottles, at 2s. 6d. and 4s. 6d., sealed and stamped with the Government stamp, bearing the name of the Patente. To be had wholesale and retail of Robert King, French and English Pharmaceutical Chemist, 21, Princes-street, Hanover-square; and all respectable Chemists in the United Kingdom.—Country agents required.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lytta P.L., easily applied and removed, and will not produce strangury or troublesome after-sores. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing ten square feet, 6s. 6d.; and small Cases of five square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing ten square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1852.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.,

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c."

"To Mr. Brown."

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction.

"60, Grosvenor-street, London."

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. BROWN'S BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicatory, when carefully applied, and has not been productive of any degree of Strangury.

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. Brown, Druggist, Handsworth, Birmingham."

Prepared by Thomas B. Brown, Pharmaceutical Chemist, 43, Admiralty-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignee, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

## Purify Sick Rooms, and give comfort

to Patients and perfect Safety to Attendants.—The most offensive atmosphere is instantaneously purified, and the air impregnated with refreshing fragrance, by SAUNDERS' ANTI-MEPHITIC FLUID, prepared by J. T. Saunders, Perfumer, 315A, Oxford-street, Regent-circus. Sold by all Druggists and Perfumers. Price 1s.

## Drug Price Currents forwarded free

of Postage, on application, by Messrs. HEWLETT and GODDARD, Wholesale Druggists, 6, Arthur-street West, Upper Thames-street, near London Bridge, removed from Hatton-garden; containing the ready Cash Prices for Drugs and Pharmaceutical Preparations of the purest quality. Messrs. H. and G. solicit the attention of the Medical Profession resident in the Provinces, Infirmary Committees, Dispensaries, &c. &c., to the advantages attendant upon the above Price Current.

## The Pulvis Jacobi Verus, prepared

by WILLIAM HOOPER, 24, Russell-street, Covent-garden, from its identity with the more costly preparations, and its acknowledged efficacy as an Antimonial, merits the patronage of those gentlemen who have not hitherto included Pulvis Jacobi in their daily Materia Medica. An extensive continuous demand for Public Institutions has satisfactorily verified the ancient character of this medicine. It is sold in 1 oz. and 4 oz. bottles, at 2s. 9d. and 10s. 6d.; and in packets for transmission by post.

## Cotyledon Umbilicus.—Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.

Insipiated Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

Taraxacum (Davenport's) Liquor, or Fluid Extract, prepared by Spontaneous Insipiation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 83, Great Russell-street, Bloomsbury.

## The Arctic Expeditions.—The whole

of the Ships of the various expeditions which have wintered in the Ice, including those of Sir John Franklin and Captain Collinson, have been warmed by SYLVESTER'S HOT AIR APPARATUS.—For prospectus and prices, apply to SYLVESTER and CO., Engineers and Manufacturers of Heating Apparatus, 86, Great Russell-street, Bloomsbury, London.

## Cholera Prevented! Rettie's Patents.

SELF-ACTING SEWER AND SINK TRAPS, for Streets and Kitchen Sinks, to prevent all effluvia from Drains, Cesspools, and Urinals. Damp Houses cured at Fourpence per day, giving a dry, warm temperature, for sick or invalids.

PORTABLE CHAMBER CLOSETS, free from all effluvia.

Orders to E. M. and M. Rettie, 7, Brompton-road. (Enclose Stamp.)

N.B.—Beware of imitations on the above Patents.

## Gas-heating Apparatus.—H. Mather

begs to call attention to his GAS-COOKING STOVES, which will cook dinner for Twenty Persons at a cost of Fourpence.—Gas Gridirons, Broiling and Boiling in Five minutes.—Small Stoves to Boil and Fry, which can be put anywhere, Eight Shillings each.—Gas Stoves for Operative Chemists, Jewellers, and all purposes where heat is required.—Manufactured on the premises at 76, GRAY'S-INN-LANE, LONDON.

N.B.—Gas-fitting done in all its branches.

## Ten Thousand Stoves.—The Tenth

Thousand of the PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, and CO., 46, King William-street, London-bridge, and may be obtained of most ironmongers. The Improved Patent Ventilating Stove, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded, post free.

## Patent Perambulators.

C. BURTON, Inventor, Patentee, and Sole Manufacturer to Her Majesty by appointment.

The distinguished patronage, the flattering encomiums, and the increasing demand, are sufficient proofs of the utility and excellence of these fashionable, safe, and elegant Carriages for adults, children, and invalids, propelled from behind by the slightest effort. Country and Shipping orders. Illustrated Circulars.

OFFICE, 487, NEW OXFORD-STREET.

Also, C. BURTON'S PATENT PERAMBULATOR FOR THE MILLION. Price Two Guineas.

CAUTION.—To avoid unprincipled and dangerous imitations, look for Burton's Label on each Carriage.

**Recherché Wines.—Sherry: A very**  
fine Sherry, (Amontillado and Montilla.) Brown and Pale, for Cash, at 42s. per dozen; £21 per quarter-cask; £42 per hogshead; £84 per butt.  
Port.—Very fine old dry Wine (Vintage 1827, 1830, 1832, 1834), lately imported: from the Wood at 48s., 54s., 63s., and 68s. per dozen.  
First Class Champagne, (Ay, Avize, Piercy, Verzenay, and Sillery.) Sparkling and Still Moselle, Sparkling, Still, and Red Hocks, and Bordeaux Wines, at very moderate prices.  
These Wines are patronized and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples and List of Prices forwarded on application.  
H. H. HAMMICK, Importer, 11, Pall-mall, London, opposite the "Travellers' Club."

**Allsopp's Pale Ale in Bottle, as**  
supplied to the CRYSTAL PALACE; also in casks of 18 gallons Recommended by BARON LIEBIG.  
Address, HARRINGTON PARKER and CO., 54, Pall-Mall, London.

**Pale India Ale and Stout, 4s. 6d.**  
per dozen quarts; 3s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts. Delivered free within four miles of London, and carriage free to all railway stations in England at 6d. per dozen extra.  
WOOD & WATSON, 18, Clement's-lane, City.

**Soyer's Aromatic Mustard.—"M."**  
Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration.—THE LANCET.  
Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

**To Invalids and those desirous of**  
PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO.'S HOMEOPATHIC COCOA.  
Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

**Cocoa of the finest quality, prepared**  
in the best possible manner.—Our PURE GRANULATED COCOA was pronounced by the Analytical Chemists employed by THE LANCET, in their memorable researches into the Adulterations of the Food of the People, to be free from any admixture whatever. The Invalid, and Cocoa-drinkers in general, are requested to make trial of it. In pound packets, 1s. each. Arrow-root, genuine as imported, at 4d. per lb., 6d. per lb., 8d. per lb., 1s. per lb., 1s. 4d. per lb., and the very finest Bermuda in the Kingdom, 1s. 8d. per lb.; 7 lbs. of that at 8d. per lb., or any higher quality, packed in tin canisters, without extra charge. Good Ceylon Coffee, 1s. per lb.; Java Coffee, a rich and useful article, 1s. 4d. per lb. Good Congou Tea, 3s. per lb.; very excellent ditto, 3s. 4d. Orders to the amount of 40s., for any of the above articles, covering a remittance for amount of same, forwarded, carriage free, to the nearest railway station.  
HANDFORD & DAVIES, 61, High Holborn.

**DOMESTIC ECONOMY**  
**H. Sparrow and Co. beg to announce**  
that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer  
Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.  
Fine Souchong, 3s. 4d., 3s. 8d., and 4s.  
Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.  
Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.  
Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 6d.  
With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, paid rail, at any station in the kingdom.  
Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

**Pure as well as Fine Tea.—**  
Tea, when pure, is well-known to produce a most wholesome beverage; the impolicy of allowing it to be coloured by the Chinese is fully set forth by the Analytical Sanitary Commissioners, in THE LANCET, and also in THE TIMES, (October 6th, 1852.) The fact, therefore, is now familiar to most, that artificial colour is used to give the Spring crop and the spent Autumn gathering the SAME appearance. If this practice were discontinued, a twofold benefit would arise; first, the fine qualities would have all the fragrance and strength unimpaired; and, secondly, the inferior faded leaves could not then be passed off as good, causing the flat, insipid infusion, so frequently the subject of complaint. The uncoloured Tea imported from China, by HORNIMAN and CO., London, is perfectly pure; the Green, from the absence of the usual artificial colouring, is of a natural olive hue. The Black, and also the Green, are exclusively of the Spring product from young and vigorous plants, which yield not only more strength, but the full degree of fragrance which FINE Tea, when purely natural, and seasonably selected, alone possesses; ONE TRIAL induces a continued preference. The prices are REDUCED:—  
Finest Congou, 3s. 8d. Finest Lapsang Souchong, 4s. and 4s. 8d.  
Fine and Pure Green, 3s. 8d., 4s., and 4s. 8d.  
HORNIMAN and CO., Wormwood-street, London, Importers of the most approved Teas in general use, but free from the objectionable artificial colour on the surface.  
Agents in London, PURCELL, 80, Cornhill; and ELPHINSTONE, 227, Regent-street, and 396, Oxford-street.  
Sold by authorized Firms in all Towns, in 1 lb., ½ lb., and ¼ lb. packages only.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.  
**Robinson's Patent Barley, for making**  
superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.  
ROBINSON'S PATENT GROATS, for more than thirty years, have been held in constant and increasing public estimation as the purest farinæ of the oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and alternately with the Patent Barley, is an excellent food for Infants and Children.  
Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.  
The proprietors of ROBINSON'S PATENT BARLEY and PATENT GROATS, desirous that the public shall at all times purchase these preparations in a perfectly sweet and fresh condition, respectfully inform them that every packet is now completely enveloped in the purest Tin-foil, over which is the usual and well-known paper wrapper.  
Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets at 6d. and 1s., and in Family Canisters at 2s., 5s., and 10s. each.

**Pure Country Bread, supplied every**  
Day by Train by G. BILLINGS, of Sawbridgeworth, Herts.  
Sawbridgeworth, Herts, 1852.  
George Billings begs respectfully to call the attention of the Public to the subjoined Testimonial (vide THE LANCET, March 26th, 1852) as to the pure and unadulterated nature of Bread made by him.  
Having been earnestly solicited by numerous parties in London to introduce it to the public, he has appointed as his agents—MR. DAVID BILLINGS, 7, Ivy-place, Hoxton; MR. HOLLOWAY, 18, Liverpool-street, Bishopsgate.  
N.B.—All Bread supplied to the London public is stamped,—G. BILLINGS, Sawbridgeworth."

London Hospital, March 17th, 1852.  
I have made a careful analysis of the Bread manufactured by Mr. George Billings, Sawbridgeworth, Herts, and I find that it is perfectly free from everything of a deleterious nature: besides which it is of good colour and light texture, is pleasant to the taste, entirely free from acidity, easy of digestion, and apparently well suited to the wants of the dyspeptic.  
HENRY LETHBRIDGE, M.B.,  
Professor of Chemistry, &c., in the London Hospital,  
18, Upper Seymour-street, Portman-square,  
November 4th, 1853.  
Having submitted to careful analysis a loaf of bread, manufactured by Mr. George Billings, of Sawbridgeworth, Herts, and placed in my hands for that purpose by Mr. D. Billings, of Ivy-place, Hoxton, I find the bread to be well made, free from acidity and all deleterious matter, and accordingly well adapted for the sustenance both of invalids and of persons in health.  
ANDREW URE, M.D., F.R.S., Analytical Chemist.  
\*.\* Orders by post punctually attended to.

**The 16s. Trousers reduced to 14s.—**  
Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.  
**R. T. Pigram, Practical Tailor, and**  
Inventor of the Indicator of the Human Figure, whereby a perfect fit is secured, respectfully invites the attention of the public to his mode of art, since none can doubt the importance of an easy and exact adjustment of wearing apparel. Superior Trousers at 17s. 6d. per pair.  
B. T. PIGRAM, 61, Lamb's Conduit-street, Foundling Hospital.

TO THE NOBILITY, CLERGY, AND GENTRY.  
**Walker Babb's Two-Guinea Coats,**  
One-Guinea Trousers, and Half-Guinea Vests, made from Welsh, Scotch, and Irish Wools, in their pure state. Will stand any wear, and can be worn in any climate. For Fishing and Shooting nothing can equal them. The Black Tweed is well adapted for Clergymen's Riding Trousers. Waterproof Pocket Coats and Capes, Box Coats, Liveries, &c. &c.  
D'OYLEY'S SCOTCH WOOLLEN WAREHOUSE, 348, Strand, opposite Waterloo-bridge.

**Assistant-Surgeons.—Gentlemen**  
receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at  
L. PHILLIPS', 28, WEST STRAND, LONDON,  
the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, and every necessary information, may be obtained on application.

**The Mechian Dressing-Case.—The**  
most portable ever invented, being only the size of a pocket-book, containing one pair of Mech's Ivory-handled Peculiar Steel Razors, his Magic Strop, Comb, Badger-hair Shaving Brush, and Nail and Tooth Brushes, price 25s.; the same with Hair Brush and Soap-dish, 35s. To military men, and as a steam-boat or travelling companion, this invention is an invaluable acquisition. An immense variety of other Dressing-cases for ladies and gentlemen, either in fancy woods or leather, at all prices, to suit either the economical or luxurious. An extensive stock of Writing Desks, Writing Cases, Workboxes, Bagatelle Tables, Razor Strope, Table Cutlery, superb Papier Maché Articles, &c.  
Manufactory, 4, LEADENHALL-STREET, four doors from Cornhill.

**Royal College of Surgeons of England.**—Notice is hereby given, that the next Professional Examination for the Fellowship of the College will take place on Tuesday and Thursday, the 29th and 30th inst. Further information relating to this Examination may be obtained on application at the College.  
Nov. 8th, 1884. EDWARD BELFOUR, Sec.

**THE APOTHECARIES' HALL OF IRELAND.—TO THE APOTHECARY PROFESSION**

The Council of the Apothecaries' Hall of Dublin hereby Give Notice, that  
**The Subject of the Annual Prize of FIVE GUINEAS, for the year 1885, is the following:**  
"FOOD AND ITS ADULTERATIONS,"

including Solids and Fluids, with the Chemical and Microscopical Analyses of same.

The Examination will be held at the Hall, upon the first Monday and Tuesday in May next, and all Apothecaries' Apprentices are admissible.

The Prize will be awarded for superior merit, and in case of any candidate having obtained the Council's Prize upon a former occasion, and deserving the same again, he will receive a special *Certificate of First Honour*, and the next candidate in order of merit will obtain the Annual Prize.

By Order of the Council,

CHARLES HENRY LEEZ, M.D., Secretary.

Apothecaries' Hall, Nov. 1st, 1884.

**Matrimonial Institution.—Founded**

1946.—Offices: 12, John-street, Adelphi, London; and 18, Nassau-street, New York.—This Institution has been established many years, (with great success,) as a medium for the introduction of parties unknown to each other, who are desirous of forming Matrimonial Alliances, but who, from some cause or other, cannot find Partners in their own circle of acquaintance, suitable in position, &c. The strictest honour and secrecy is maintained in every case.

Prospectuses, Application Forms, Bales, and every information sent free to any name, initials, or address, on receipt of 12 postage stamps, by order of the Director, LAURENCE CUTHBERT, 12, John-street, Adelphi, London.

AT THE CRYSTAL PALACE.

**"The Duobus," a cheap close Carriage**

for a "Country Practice," having all the comfort and convenience of a Brougham, with the weight of an ordinary Gig. Price £42. This Carriage can be seen at the new Crystal Palace, and sketch and particulars obtained on application to T. R. Storey, Coachmaker, Nottingham.

**Metcalf and Co.'s New Pattern**

TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perforumery for the toilet.—At METCALFE, RINGLEY, and CO.'s only establishment, 130 and 131, Oxford-street, second and third doors west from Holles-street. Metcalf's Alkaline Tooth Powder, 2s. per box.

**Dr. Scott Alison's Prepared Corium,**

FOR WATER-DRESSINGS, &c.

PATENTED IN FRANCE AND ENGLAND.

"Admiralty, October 17th, 1884.

"By a Report from the Medical Officers of Haslar Hospital, who have made a trial for some time, and with great care, it appears that Dr. Alison's Prepared Lamb-skins are very useful in cases where Water Dressings are applicable.

(Signed)

"WILLIAM BURNETT, Director-General.

"To Mr. Hamilton, 27, North Audley-street."

Prices.—Impermeable, 5s.; Perforated, for Cooling Lotions, 2s. 6d.; Plain, to be used under oiled skin, 2s. 6d. per skin. Oiled and gelatinized skins at a moderate price.

**Hooper's Waterproof Sheeting, for**

protecting Bedding from Sloughing Sores, Incontinence of Urine, Hemorrhage, &c.

Mr. HOOPER has succeeded in obtaining Waterproof Sheeting, at a great reduction in price, soft, and inodorous; it is not affected by Urine, Heat, nor Cold, Acids, nor Alkalies, and may be washed as family linen.

Also, IMPROVED INVALID URINALS, with Valves, for sitting, lying, or travelling, in any position.

FOR EPILEPSY.

**COTYLEDON UMBILICUS.**—The introduction of this valuable agent has proved a valuable discovery. The satisfactory accounts Mr. HOOPER has received have induced him to pay great attention to its collection and preparation. He cautions medical men against the use of worthless preparations, passed off for his, and as prepared for Mr. Salter, &c. Mr. Hooper has instructions to state that Mr. Salter has never used any but that obtained from him. A copy of Mr. Salter's reports in the "Medical Gazette" sent free by post.

**GALUUM APARINE (HOOPER'S) FOR CUTANEOUS DISEASES, PSORIASIS, &c.**—Dr. Winn, of Finsbury-square, having published in "The Medical Gazette," October 4th, 1881, an account of the peculiar properties of the Galuam Aparine in Cutaneous Diseases, Lepra, Psoriasis, &c., Mr. Hooper has given his attention to preparing it in various forms. Dr. Winn finds the impregnated julee the most efficient preparation, which can be had from Mr. Hooper, or direct through the Wholesale Houses.

HOOPER, Operative Chemist, Pall Mall East, and Grosvenor-street.

**Memorial of the late Dr. Roupell.—**

It is proposed that a portrait of the much-lamented Dr. ROUPPELL, now in the possession of Mr. Pickersgill, R.A., should be purchased, and placed in the Hall of the Medical College of St. Bartholomew's Hospital, as a testimonial of respect for Dr. Roupell's memory. Dr. Burrows, Mr. Stanley, Dr. Baly, and Mr. Paget, have formed themselves into a Committee for carrying this object into effect, and will receive subscriptions in furtherance of it. The subscription is limited to One Guinea.

St. Bartholomew's Hospital, October, 1884.

**Mr. G. Hind, F.R.C.S., resumed his**

DEMONSTRATIONS on the morning of the 15th of September, at the usual hour.

Class-room, 29, Newman-street, Oxford-street. Private residence, 9, South-crescent, Bedford-square.

**Royal Free Hospital, Gray's Inn-**

ROAD.—In consequence of the great number of Applicants for relief at this Hospital, the Weekly Board have resolved to recommend the Election of three additional Medical Officers—namely, a Physician, Surgeon, and an Assistant-Surgeon. The Physician must be a Fellow or Licentiate of the College of Physicians, London; and the Surgeons, Members of the College of Surgeons, London.

Candidates are requested to send Testimonials on or before Monday, 27th Nov. instant. The Election will take place by the Committee, on Wednesday, 6th December next.

Board Room, Nov. 8th, 1884.

**Salford & Pendleton Royal Hospital**

and DISPENSARY, LANCASHIRE.—Wanted, an ASSISTANT-APOTHECARY, who must be a Licentiate of the Society of Apothecaries. He will have to dispense the Medicines, attend to the Patients in the absence of the House-Surgeon, and visit the Home Patients when required. Salary, £80 pounds a year.—Applications and Testimonials to be sent in to the Secretary, on or before the 30th November inst.

W. HENRY HORN, House-Surgeon and Secretary.

**Bucks General Infirmary.—House-**

SURGEON.—A Vacancy having occurred in the office of House-Surgeon, Gentlemen intending to become Candidates for the Appointment are requested to forward their Testimonials of character and qualification to me on or before Monday, the 27th inst. Salary, with board and residence, £55 per annum, with an annual increase of £5, to £70. It is required that Candidates be Members of the Royal College of Surgeons of London, Dublin, or Edinburgh, and Licentiates of the Apothecaries' Company, London. A Gentleman who has been a Dressing-Pupil will be preferred. The Election will take place on the 6th day of December next.

Aylesbury, November 6th, 1884.

HENRY HAYWARD, Secretary.

**Birkenhead Hospital and Dispensary.**

Wanted, for the BIRKENHEAD HOSPITAL and DISPENSARY, (in consequence of the death of Mr. W. R. CROUCH,) a HOUSE-SURGEON and APOTHECARY, who must devote his services exclusively to the Institution, at a salary of £80 per annum, with board and lodging. No person is eligible who is not a Member of the College of Surgeons of London, Dublin, or Edinburgh, or of the Faculty of the Physicians and Surgeons at Glasgow, and who is not competent to prepare the medicines prescribed by the honorary medical officers. Testimonials of character and qualification to be sent to the Secretary, Mr. W. W. St. George, Holt-hill, Birkenhead, on or before the 24th day of November. The candidates will be examined personally, and by their testimonials, at the Hospital, on Tuesday, the 25th of November, at 6 o'clock p.m., and the Election will take place on the following morning. Unmarried parties only need apply.

Birkenhead, November 2nd, 1884.

**Leicester Infirmary and Fever House.**

A Vacancy having occurred in the Office of HOUSE SURGEON and APOTHECARY to this Institution by the resignation of Mr. Bullock, any person qualified and desirous of offering himself as a Candidate is requested to send his testimonials, directed to the Secretary, eight days prior to the Election, which will take place at a Special General Board, to be held at the County Assembly Rooms, on Wednesday, the 13th December next, at Twelve o'clock at noon. The Salary will be £120 for the first year, rising at the rate of £10 per annum until the fourth year, when it will be £150 per annum, with Board, Lodging, and Washing, provided by the Institution. The Candidate must be a Member of the College of Surgeons of London, Edinburgh, or Dublin, also a Licentiate of the Apothecaries' Company of London, and have attained the age of twenty-three years. By order,

WILLIAM JACKSON, Secretary.

Infirmary Board Room, Nov. 7, 1884.

**School for the Sons of Medical Men.**

CLERGYMEN, OFFICERS OF HER MAJESTY'S ARMY, NAVY, AND CIVIL SERVICE, &c.

ST. JOHN'S FOUNDATION-SCHOOL, Greville-mount House, Kilburn, London.

Head Master—The Rev. Anthony F. Thomson, B.A. Lincoln College, Oxford, (eldest surviving son of the late Dr. Anthony Todd Thomson, of University College.)

Mathematics—Gowan Evans, Esq., M.A. Lincoln College, Oxford.

German—U. Green, Esq., (Newview College, Coblenz.)

French—Hy. Pottetvin, Esq., (Paris.)

Music—Dr. Charles Stegall, Trinity College, Cambridge; Professor of the Royal Academy of Music, London.

The system of this School is particularly adapted to prepare Boys for the Medical Profession, the Army, whether Line or Artillery, the Navy, and Civil Service.

The Terms are moderate and inclusive. The House is new, and has been built with a special view to its purpose, at a cost of over £3000. It is situated on high ground, in the most healthy and beautiful position in the north of London.

A Prospectus, with full details, may be had on application to the Head Master, at the School.

# Messrs. Lane and Lara, MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC ASYLUM REGISTRARS,

14, JOHN STREET, ADELPHI.

(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.

Office hours from 12 till 4.

## Lunatic Asylum.—An immediate

Purchaser required for an Establishment of excellent repute, without opposition, most advantageously situated in a Midland County. Time being an object to the vendor, £1000 will be accepted for goodwill and valuable lease, being considerably less than the estimated value, with furniture and fixtures at a valuation.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

TO YOUNG SURGEONS OF LIMITED MEANS.

## One Hundred Pounds Cash, if an

arrangement can at once be effected, is the price, including Stock and Fixtures, of an old-established GENERAL PRACTICE, with Retail, near Aldersgate-street. Profits to be divided during the first year, over which time, if desired, an introduction can be extended, as the vendor, though retiring, will not leave London. Receipts about £400 per annum, capable, with energy, of unlimited extension: Rent, only Fifty Guinea.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

TO THE PROFESSION.

## Mr. Bowmer, M.R.C.S. Eng., 50,

LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

## Janitor for a Medical School Wanted.

Salary from 20 to 25 shillings per week, according to the individual's capabilities.—Address, stating full particulars, to Mr. Southam, Surgeon, Salford, Manchester.

## Wanted, a qualified Medical Man, to

Assist in managing a Retail and General Practice.—Apply to Medicus, 3, Union-terrace, Commercial-road, Stepney, nearly opposite Portland-street.

TO SURGEONS AND GENERAL PRACTITIONERS.

## Wanted, by a Young Man, 30 years

of age, a Situation as Visiting and Dispensing ASSISTANT, competent to attend Midwifery, &c.—Address, Theophilus, care of Mr. Williams, Druggist, Tunstall Potteries.

## Medical Partnership.—A Surgeon,

M.R.C.S. & L.S.A., desires to meet with a SHARE of a PRACTICE, in London or its immediate neighbourhood. The advertiser has had much experience in Midwifery and General Practice, and would not object to work.—Apply, (in the first instance by letter,) M.R.C.S., 17, Chesapeake.

## A Gentleman attending Hospital

Practice, who can Dispense and attend Midwifery, wishes to Assist a qualified Medical Practitioner, provided his services be considered an equivalent for board, lodging, and gentlemanly treatment.—Address, X., THE LANCET Office, 423, Strand.

## Insanity.—A Medical man, well ac-

quainted with the treatment of the Insane, is desirous of an Engagement (temporary or permanent) either in an Asylum, or to take charge of a single patient. He would not object to travel with an invalid.—Apply to A. B., care of H. Stevens, Esq., St. Luke's Hospital, London.

MEDICAL.

## A Gentleman, thirty years of age,

who has had considerable experience in the various Branches of the Profession, is open to a re-engagement as Visiting, Obstetric, and Dispensing ASSISTANT. Reference given.—Address, Medicus, Post-office, Hockley, Birmingham.

TO SURGEONS AND CHEMISTS.

## To be Disposed of, with immediate

possession, a RETAIL and PRESCRIBING BUSINESS, established five years (well adapted for a Surgeon wishing to Commence Practice.) Rent low, coming in moderate in the extreme.—Apply to Mr. Edwin Young, Auctioneer, &c., New Church-street West, Edgeware-road.

TO SURGEONS, &c.

## An Established Practice and Retail,

near Kensington, for Transfer, in consequence of the severe illness of the Proprietor, who has conducted the same for several years. A good Practice can be secured. Terms only £150, with an introduction.—Apply to Mr. Jacobson, 38, Walbrook, City.

## Medical Transfer and Partnership.

30, Bucklersbury, London.

## Mr. Orridge, Medical Transfer Agent

and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RELINQUISH, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

## To Invalids.—A Married Medical

Man, of the first respectability, residing in a small town, pleasantly situated in a most healthy part of Somersetshire, wishes to receive an inmate. To any Lady or Gentleman requiring a quiet and comfortable home this would be found eligible.—Apply to A. B., care of Mr. F. Hogg, 40, St. James's-street.

## Wanted immediately, by a Medical

Man, an active Out-door ASSISTANT, not under twenty-five years of age, to take charge of a Branch Practice in a Mining District in the country. He must be of good moral character, and sober habits. A married man preferred. Address, A. B., Mr. Humphreys, Chemist, Bull-street, Birmingham.

## Somerset.—A General Medical

Country PRACTICE for immediate Disposal, on easy terms, with Union and Benefit Societies, realizing upwards of £300, and might easily be increased to £500 per annum. A good introduction can be given, and one-fourth only of the premium required immediately.—A Visiting and Dispensing ASSISTANT wanted, accustomed to Country Practice.—Address, S. B., Mr. W. Jones, Painter, 43, High-street, Islington, London.

TO SURGEONS COMMENCING PRACTICE.

## To be Disposed of, a small, but very

select PRACTICE, in Berkshire, for the sum of 200 Guinea, about one year's returns, including nearly £30 from clubs; excellent house and garden; close to a Station. No Union. So good a Nucleus for making a large Practice is seldom to be met with. Direct to A. B., care of Mr. Gordon, 17, Hemingford-cottages, Richmond-road, Islington, London.

TO SURGEONS AND CHEMISTS.

## A genteel Drug and Prescribing

Business for Disposal—a capital opportunity for a Surgeon commencing Practice, an open surgeon's shop being much required in the locality. Two sets of rooms can be let, as the house is commodious, and in thorough repair. For transfer immediately, the present owner leaving the business. Sum required, £250. Rent moderate.—Apply, by letter, to Medicus, 3, Hollow-street, Cavendish-square.

MEDICAL.

## Wanted immediately, by a General

Practitioner in the country, an In-door Visiting and Dispensing ASSISTANT, not under twenty-five years of age, possessing the double qualification, and experienced in Midwifery. One wishing for a permanent situation will be preferred. Salary, £50 per annum. Applications to be accompanied with a reference.—Address, W. A. E., Post-office, Lamberhurst, Kent.

## A Gentleman wishes to obtain a

Situation for his Coachman as Out-door SERVANT. The man can be recommended in the strongest possible terms for sobriety, honesty, and civility, and the care he takes of his horses. He is about twenty-five years of age, and married; knows London thoroughly well. Upwards of one year's unexceptionable character.—Address, post-paid, A. Z., THE LANCET Office, 423, Strand.

## A Gentleman, L.A.S., residing in a

beautiful locality, within a few miles of London, is in immediate want of an APPRENTICE. The duties will be light. Gentlemanly treatment, with a most comfortable home and every opportunity for study, will be afforded under the superintendence of the advertiser, and for reasons to be explained a very moderate premium only is expected.—Address, F. G., 30, Charlotte-street, New-road, Whitechapel.

## Medical Practice to be Sold, of £400

a year, in a good Country Town in the West of England, containing upwards of 5000 inhabitants; has realized the last two years in actual receipts upwards of £400. A Poor-law appointment, of the value of £100 yearly, is included in the business, may certainly be procured by a purchaser. The House is an excellent residence, with stable, coach-house, garden, and orchard, in perfect repair and order. As the proprietor is anxious to leave for a distant town, he would accept £300 paid down for an introduction till Christmas. Surgery Fixtures and Drugs, &c., are included in the premium, and a Horse.—Address, M.D., care of Gale, Baker, Warde and Co., Bouverie-street, Fleet-street.

## Wakefield General Dispensary and

CLAYTON HOSPITAL.—Wanted, a HOUSE-SURGEON to the above Institution, who is a Licentiate of the Society of Apothecaries, London, and will engage for the term of two years from the first of January next. Salary, £80 per annum, with residence at the Dispensary, Attendance, Coals, and Gas. The Medical Officers of the Institution will appoint, subject to the approval of the Committee, and the Election will take place on Wednesday, the 13th December next, in the Board-room of the Institution.  
8th November, 1864.

*Ready Next Week, the Fifth Edition, foolscap, 8vo, cloth, 12s. 6d.*

# A MANUAL OF MEDICAL JURISPRUDENCE.

By ALFRED S. TAYLOR, M.D., F.R.S.

LONDON: JOHN CHURCHILL, NEW BURLINGTON-STREET.

*Now Ready, Second Edition, fcap. 8vo, cloth, 4s. 6d.*

# WHAT TO OBSERVE AT THE BED-SIDE, AND AFTER DEATH, IN MEDICAL CASES.

Published by Authority of the London Medical Society of Observation.

"The favourable manner in which the first edition has been received, and the sale of a large impression in little more than one year, has encouraged the Society to believe, that the anticipations of the usefulness of this little volume have not been unfounded. In preparing the Second Edition, the whole work has been carefully revised by the Committee who drew it up, assisted by some other members of the Society."—EXTRACT FROM THE PREFACE.

LONDON: JOHN CHURCHILL, NEW BURLINGTON-STREET.

Just published, 8vo, cloth, 5s.

**On the Topical Medication of the LARYNX IN CERTAIN DISEASES OF THE RESPIRATORY AND VOCAL ORGANS.** By EBEN. WATSON, A.M., M.D., Lecturer on the Institutes of Medicine in the Andersonian University, Glasgow.  
London: John Churchill, New Burlington-street.

Just published, post 8vo, 1s. 6d.

**On the Triple Aspect of Chronic DISEASE;** having especial reference to the Treatment of Intractable Disorders chiefly affecting the Nervous and Muscular System. By WILLIAM BATES, M.D., Licentiate of the Royal College of Physicians, and Physician to the Brighton Dispensary.  
London: John Churchill, New Burlington-street.

Just published, Second Edition, revised and enlarged, post 8vo, cloth, 8s.

**On the Physical Diagnosis of the DISEASES OF THE LUNGS AND HEART.** By HERBERT DAVIES, M.D., Senior Physician to the Royal Infirmary for Diseases of the Chest.  
London: John Churchill, New Burlington-street.

Just published, with Plates, 8vo, cloth, 10s. 6d.

**On some Diseases of Women ADMITTING OF SURGICAL TREATMENT.** By ISAAC BAKER BROWN, Surgeon-Accoucheur to St. Mary's Hospital.

"We can recommend Mr. Brown's volume to the profession as the best treatise in our language on the Diseases of Females admitting of surgical treatment."—EDINBURGH MONTHLY JOURNAL.

"Mr. Brown has earned for himself a high reputation in the operative treatment of sundry diseases and injuries to which females are peculiarly subject. We can truly say of his work that it is an important addition to obstetrical literature. The operative suggestions and contrivances which Mr. Brown describes, exhibit much practical sagacity and skill, and merit the careful attention of every surgeon-accoucheur."—ASSOCIATION JOURNAL.

"We have no hesitation in recommending this book to the careful attention of all surgeons who make female complaints a part of their study and practice."—DUBLIN QUARTERLY JOURNAL.

London: John Churchill, New Burlington-street.

Just published, 8vo, cloth, 5s.

**Lettsomian Lectures on Insanity;** delivered at the Medical Society of London, by FORBES WINSLOW, M.D., D.C.L., late President of the Society.

"The Lectures are three in number, each being highly interesting and suggestive. The first is devoted to a treatise on the Psychological Vocation of the Physician, in which is vividly described how great is his responsibility; the second refers to the Medical Treatment of Insanity; and the third, to the all-important subject of Medico-Legal Evidence in cases of Insanity. This, with the other two, contains an amount of matter invaluable of its kind, and well worthy of its eminent writer, whose untiring labours in promoting the increased well-being and welfare of the insane entitle him to hold a high rank amongst the philanthropists and bright lights of the age."—DUBLIN QUARTERLY JOURNAL OF MEDICAL SCIENCE for November.

London: John Churchill, New Burlington-street.

Just published, 8vo, cloth, 7s. 6d., illustrated with Lithograph and Woodcuts, **Pathological and Surgical Observations:** including an Essay on the Surgical Treatment of Hæmorrhoidal Tumours. By HENRY LEE, F.R.C.S., Surgeon to the Lock Hospital.  
London: John Churchill, New Burlington-street.

Just published, 8vo, price 2s.

**On the Relative Merit of the two OPERATIONS FOR STONE.** By FREDERICK C. SKEY, F.R.S., Professor of Anatomy and Surgery to the Royal College of Surgeons.  
London: John Churchill, New Burlington-street.

Just published, 8vo, price 1s.

**A Memoir on Strangulated Hernia, FROM CASES OCCURRING IN THE LONDON HOSPITAL.** By NATHANIEL WADE, F.R.C.S., Assistant-Surgeon to the Hospital.  
London: John Churchill, New Burlington-street.

Just published, Second Edition, price 1s.

**On Syphilitic Eruptions, Ulcerations, AND OTHER SECONDARY SYMPTOMS, WITH ESPECIAL REFERENCE TO THE USE AND ABUSE OF MERCURY.** By THOMAS HUNT, F.R.C.S., Surgeon to the Western Dispensary for Diseases of the Skin.  
London: John Churchill, New Burlington-street.

Just published, the Fourth Edition, with numerous Engravings on Wood, 8vo, cloth, 24s.

**Comparative Physiology.**

By W. B. CARPENTER, M.D., F.R.S.

"Every anatomist, zoologist, and physiologist, will readily admit that it is the best exposition of the present state of Comparative Physiology in the English language."—MONTHLY JOURNAL OF MEDICAL SCIENCE.

London: John Churchill, New Burlington-street.

Just published, post 8vo, cloth, 7s. 6d.

**Elements of Psychological Medicine.**

An Introduction to the Practical Study of Insanity. Adapted for Students and Junior Practitioners. By DANIEL NOBLE, M.D., Physician to the Clifton-hall Retreat, near Manchester.

"We have great satisfaction in being able warmly to recommend Dr. Noble's little treatise, as extremely well-adapted to supply the desideratum which we have long felt and lamented."—BRITISH AND FOREIGN MEDICO-CHIRURGICAL REVIEW.

"The book is, indeed, full of instruction. Every student and every practitioner who reads it will be charmed with the cleverness and elegance of the diction. No one can close it without forming a high estimate of the intellectual capacity and the soundness of the practical views of the author."—THE LANCET.

"There is an earnestness of purpose and love of truth in every page, that win the attention of the reader, and are well calculated to excite in the mind of the student a taste for the study of this class of diseases."—DUBLIN MEDICAL PRESS.

London: John Churchill, New Burlington-street.

Also contains

A DESCRIPTIVE CATALOGUE OF

## HIGHLEY'S EDUCATIONAL COLLECTIONS,

Especially selected for facilitating the study of the Natural and Medical Sciences and Art, comprising Mineralogy, Geology, Palaeontology, Botany, Conchology, Osteology, Anatomy, Physiology, Embryology, Midwifery, Microscopy, Micro-Chemistry, and Micro-Photography.

Also,

## A CATALOGUE OF SCIENTIFIC WORKS

Published by

MR. HIGHLEY, LONDON, 32, FLEET-STREET.

2 vols. 8vo, with four hundred Engravings on Wood, price £2 cloth,

## Dr. Quain's Anatomy.

Edited by Dr. SHARPEY and Mr. QUAIN. Fifth Edition.

"By the introduction of a great amount of new information in general Anatomy and microscopical Anatomy, and by the rectification and improvement of the descriptive details through the whole work, it has been rendered the most complete treatise on Anatomy in the English language. It may be safely recommended to the student as the most useful work on Anatomy which he can study."—EDINBURGH MEDICAL JOURNAL.

"These 'Elements' may on the whole be regarded as constituting one of the most valuable works to which the medical student can apply for assistance in the prosecution of his studies; and we may further safely recommend them to those who are engaged in the more active duties of the profession, on the ground of the judicious combination herein effected, of sound scientific research with instructive practical details."—MEDICO-CHIRURG. REVIEW.

**LARDNER'S HANDBOOK OF NATURAL PHILOSOPHY AND ASTRONOMY.** Three Volumes. (Sold separately.)

**FIRST COURSE,** containing Mechanics—Hydrostatics—Hydraulics—Pneumatics—Sound—and Optics. Illustrated with upwards of 400 Engravings on Wood. One Volume, large 12mo, 12s. 6d. cloth.

**SECOND COURSE,** containing Heat—Common Electricity—Voltaic Electricity—Magnetism. One Volume, large 12mo, upwards of 200 Woodcuts. 8s. 6d. cloth.

**THIRD COURSE—Astronomy and Meteorology.** One Volume, large 12mo. 37 Plates and 200 Engravings on Wood. 18s. 6d. cloth.

\* Each Volume is complete in itself.

"Our examination of the work leads us to speak most favourably of it as a handbook for students. The author introduces in many parts of the work paragraphs comprising physiological physics, or the application of physics to the structure and functions of the human body. The laws of mechanics are exemplified in the skeleton, and those of hydrostatic pressure in the circulation of the blood. These additions render the volume of great value to the medical student. It is our opinion that the 'Handbook' will be an useful addition to the library of every medical student, as well as a serviceable guide to all who are about to commence the study of physics."—MEDICAL GAZETTE, Notice of the First Course

London: WALTON & MABERY, 23, Upper Gower-street, and 27, Ivy-lane, Paternoster-row.

**Ellis's Demonstrations of Anatomy.**  
 Third Edition, small 8vo, 12s. 6d. cloth.  
 A Guide to the Knowledge of the Human Body by Dissection. By G. V. ELLIS, Professor of Anatomy in University College, London.  
 "We think Mr. Ellis's 'Demonstrations' are in every way fitted for the purpose for which they are intended; and therefore strongly recommend the work to the notice of every member of the Profession. We are convinced that it will quickly become the general text-book of every working student in Anatomy."—BRITISH AND FOREIGN MEDICAL REVIEW.  
 London: Walton and Maberly, 28, Upper Gower-street, and 27, Ivy-Lane, Paternoster-row.

**Structure and Use of the Spleen.**  
 Octavo, with 64 Illustrations, 15s.  
 By HENRY GRAY, F.R.S., Demonstrator of Anatomy at St. George's Hospital.  
 London: John W. Parker and Son, West Strand.

**On Medical Testimony and Evidence**  
 This Day, Foolscap Octavo, 3s. 6d.  
 in CASES of LUNACY; Croonian Lectures delivered before the Royal College of Physicians. With an Essay on the Conditions of Mental Soundness, by THOMAS MAYO, M.D., F.R.S., Fellow of the Royal College of Physicians, late Fellow of Oriel College, Oxford.  
 London: John W. Parker and Son, West Strand.

**Practical Observations on Conical CORNEA.** By J. NOTTINGHAM, M.D., F.R.C.S., Surgeon to the St. Anne's Eye and Ear Institution, Liverpool.  
 London: John Churchill, New Burlington-street.  
 Liverpool: Deighton and Laughton.

**MR. TOYNBEE ON THE ARTIFICIAL MEMBRANA TYMPANI.**  
 Just Published, Second Edition, price 1s., with Woodcuts.  
**On the Use of an Artificial Membrana Tympani in Cases of Deafness dependent on the Loss of the Natural Organ.** By JOSEPH TOYNBEE, F.R.S., F.R.C.S., Aural Surgeon to St. Mary's Hospital; Consulting Aural Surgeon to the Asylum for the Deaf and Dumb; Lecturer on Aural Surgery at St. Mary's Hospital Medical School.  
 London: John Churchill, New Burlington-street.

On Thursday next will be published, in 8vo, with many Woodcuts,  
**Pereira's Elements of Materia Medica**  
 AND THERAPEUTICS. A New Edition of the First Volume. Edited by A. S. TAYLOR, M.D., &c., and G. O. REES, M.D., &c.  
 London: Longman, Brown, Green, and Longmans.

**NEW EDITION OF MACKENZIE ON THE EYE.**  
 In 1 vol. 8vo, with Plates and Woodcuts, price 30s.  
**A Practical Treatise on the Diseases OF THE EYE.** By WILLIAM MACKENZIE, M.D., Surgeon-Oculist in Scotland in Ordinary to the Queen, Lecturer on the Eye in the University of Glasgow, and one of the Surgeons to the Glasgow Eye Infirmary. The Fourth Edition, thoroughly revised and corrected, and much enlarged.  
 London: Longman, Brown, Green, and Longmans.

Fourth edition, just published, illustrated, price 1s.  
**Gilbert on the Extraction of Teeth;**  
 being a work descriptive of a new and much less painful method of operating, by means of GILBERT'S PATENT FULCRUM. The jaw cannot be fractured, or the gums lacerated; there is less danger of breaking the diseased tooth, and of hemorrhage, &c.  
 Mr. Gilbert invites the profession to inspect his invention from eleven till four, 3, Suffolk-street, Pall-mall.  
 "We can confidently direct attention to it as a boon to the profession and the public."—THE LANCET, Dec. 2nd.  
 "It allows of the extraction of teeth in the most scientific and easy manner; and in performing certain other surgical operations the chair will prove of inestimable value to the surgeon."—MEDICAL TIMES, Feb. 10th.  
 London: Henry Renshaw, 350, Strand.

Will be published on the 1st of December,  
**The Physicians', Surgeons', and GENERAL PRACTITIONERS' VISITING LIST FOR 1855.**

John Smith and Co., Medical Stationers and Publishers, 52, Long-acre, London.

Just published, price 1s.  
**On the Treatment of Spermatorrhœa**  
 AND SOME FORMS OF IMPOTENCE. Illustrated by cases. Reprinted from the Original Papers, published in THE LANCET. By JOHN L. MILTON; M.R.C.S. London.

London: S. Highley, 32, Fleet-street.  
 Just Published, price 7d., stamped,  
**The Asylum Journal, No. 9,**  
 containing Leading Articles; a notice of the Eighth Report of the Commissioners in Lunacy, by Dr. CONOLLY; A Lecture on the Classification of the Insane, by Dr. BAILLARGER. Also Communications from Dr. HUXLEY, of the Kent Asylum; Dr. CAMPBELL, of the Essex Asylum; Dr. TURNER, of the Retreat, &c.  
 London: Samuel Highley, 32, Fleet-street.

A SURGICAL HANDBOOK FOR THE CRIMEA.  
**Military Surgery; or, Experience of**  
 Field Practice in India during the Years 1849 and 1850. By J. J. COLE, M.R.C.S.E., H.E.I.C.E., late Surgeon to the Auxiliary Forces during the War in the Punjab. 8vo, 8s.  
 "Mr. Cole found himself, seven months after his arrival in India, (November, 1847,) in charge of Lieutenant Edwardes' Army, (18,000 strong,) then encamped before Moultan. The work shows talent, and is both truthful and original. Mr. Cole evidently had the welfare of the soldier at heart. The reader will find in it much that is interesting and useful."—MEDICO-CHIRURGICAL REVIEW.  
 London: Samuel Highley, 32, Fleet-street.

**PETER PARLEY'S TALES ABOUT EUROPE, ASIA, &c.**  
 In one large Pocket Volume, embellished with numerous Illustrations and Maps, engraved on steel, a new Edition, with great Additions, price 5s. in cloth, and gilt edges.

**Peter Parley's Tales about Europe, ASIA, AFRICA, AMERICA, AND OCEANIA.**  
 "The design of this work is to convey, by conversational remarks, a knowledge of Geography and History: it is interspersed with personal adventures, and adapted to the taste and knowledge of children. The author never fails to win attention and raise curiosity; he then uses such familiar terms in gratifying it that the rudiments of Geography are insensibly impressed on the mind, and science is rendered a pleasing study."  
 Also, a New Edition of

**PARLEY'S TALES ABOUT THE SEA AND THE PACIFIC OCEAN.** Cloth, gilt edges, price 3s. 6d.  
 London: William Tegg and Co., 85, Queen-street, Cheapside.

**PARLEY'S GEOGRAPHY.**  
 In one volume, illustrated with numerous Engravings, and 13 Maps, engraved on steel, price, bound in cloth, 3s. 6d.  
**A Grammar of Modern Geography.**  
 By PETER PARLEY, Author of "Tales about Europe, Asia, &c."  
 Also, a new edition of  
**PARLEY'S TALES ABOUT THE SEA AND THE PACIFIC OCEAN.** Cloth, gilt edges, price 3s. 6d.  
 London: William Tegg and Co., 85, Queen-street, Cheapside.

**Music.—"As in Literature, so in**  
 Music, there are publishers of eminence who find pleasure and success in reaching the 'million' by combining excellence with economy, and thus extending the wholesome influence of refined art to every class susceptible of its impressions. Messrs. ROBERT COCKS and Co., publishers to the Queen, have spiritedly pursued this road, and sent forth to the world many of the works of the most popular authors, in a form and at a cost that must ensure for them the most extensive acceptance. For instance, we have, in two neat library volumes, Händel's Oratorio of the MESSIAH, and Händel's Oratorio of the CREATION, both edited by JOHN BISHOP, at 6s. 6d. and 4s. 6d. respectively. They are elegantly printed, in a style worthy of the great men whose sublime strains they perpetuate and extend, and have elicited from the veteran Brahms the most unqualified approbation; he says: 'The arrangement is the best I have seen; the orchestral points are most accurately taken up, and presented in so clear a light, that the musical intellect can fully appreciate all the beauties of the sublime original.'—Vide Stamford Mercury, Feb. 10, 1854.  
 "This series of the Oratorios (Octavo Edition) is in rapid course of progress."

**NEW AND POPULAR MUSIC.**—Miss M. Lindsay's Excelsior Song (words by Longfellow), finely illustrated. 2s. 6d.  
 "The theme is powerfully and tenderly conceived. \* \* \* It is an exquisite lyric."—ELIZA COOK'S JOURNAL.  
 "This famous poem has been set to music scores of times, but never more successfully than in the present instance."—WEEKLY TIMES.  
 Also, by the same publishers, Mary Astor's; words by Mrs. Crawford, music by Stephen Glover, 2s.; The Sweet Vesper Bells of Ancona, by John Parry, 2s. 6d.; Fading Away, by Miss Anne Fricker, 2s.; Truth in Absence, by E. B. Harper, 2s.; Beautiful Leaves, by J. W. Cherry, 2s.; Moonlight on the Ocean, by the same, 2s.; The Tear, by Kücken, 2s.; The Star, by the same, 2s.; The Trysting Tree, by F. Abbott, 2s.; Sailing on the Summer Sea, by J. W. Cherry, 2s.; The Dreams of Youth, by the same, 2s. 6d.  
 London: Robert Cocks and Co., New Burlington-street, Music Publishers to the Queen.

**Mayall's Daguerreotype Portrait**  
 GALLERIES, 224, Regent-street, (corner of Argyle-place,) and 433, West Strand.  
 Mr. Mayall begs to invite inspection of his extensive collection of DAGUERRETYPE PORTRAITS OF EMINENT MEDICAL, SCIENTIFIC, and LITERARY MEN, Panoramas from Nature, and Views of the late Exhibition; together with specimens of every improvement in the art. The originals of THE LANCET PORTRAITS on view.

# MEDICAL BENEVOLENT COLLEGE.

The Council of the MEDICAL BENEVOLENT COLLEGE desire to announce that the TWELFTH LIST OF CONTRIBUTORS will be published in the MEDICAL JOURNALS on SATURDAY, the 9th of DECEMBER next; and to express an earnest hope that those Members of the Profession who have not yet favoured the Institution with their support may be induced to do so, in order that the Council may be able, in JUNE next, to open the College, and to render the assistance that is so much needed by many of their less fortunate brethren.

The names of Subscribers and Donors, if forwarded by the 5th of December, will be in time for publication.

Donors of TEN GUINEAS are LIFE GOVERNORS, and Subscribers of ONE GUINEA annually are GOVERNORS during the continuance of their Subscription.

By order of the Council,

EDWARD HENRY SIEVEKING, M.D.

HERBERT WILLIAMS, Assistant-Secretary.

Office, 37, Soho-square, Nov. 15th, 1854.

## H. Silverlock's Medical Label Ware-

house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.

The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letter-press, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent per post on application.

## Allen's Illustrated Catalogue, con-

taining size, price, and description of upwards of 100 articles, consisting of Portmanteaus, Travelling-bags, Ladies' Portmanteaus, Despatch-boxes, Writing-desks, Dressing-cases, and other travelling requisites, forwarded on receipt of two stamps.

ALLEN'S TRAVELLING-BAG (patented) has the opening as large as the bag itself, and therefore possesses an immense advantage over all others.

ALLEN'S REGISTERED DESPATCH-BOX and WRITING-DESK, and their New Quadruple Portmanteau (containing four compartments), are the best articles of the kind ever produced.

J. W. and T. ALLEN, Manufacturers of Portable Barrack-room Furniture, and Military Outfitters, (see separate Catalogue,) 18 & 22, WEST STRAND.

## The Pen Superseded.

The most elegant, easy, economical, and best method of MARKING LINEN, Silk, Books, &c., without the ink spreading or fading, is with the INCORRODIBLE ARGENTINE PLATES. No Preparation required. Any person can use them with the greatest facility. Name-plate, any style, 2s. 6d.; Initials, ditto, 1s. 6d.; Numbers, per set, 2s. 6d.; Crest, 6s. Sent, post free, with directions, on receipt of stamps or post order.

FREDK. WHITEMAN, Inventor and Sole Maker, 19, Little Queen-street, Holborn.

## If you require Family

ARMS, send Name and County to the HERALDIC OFFICE. Fee for Search and Sketch, 3s. 6d., or postage-stamps; Crest Engraved on Seals, Signet Rings, &c., 8s. 6d.; Arms, with Name, on plate, for books, £1 1s.; Arms Painted, Empeled, and Quartered.

TESTIMONIALS, Memorials, Addresses, and Votes of Thanks written, Illuminated, and Emblazoned on Vellum.

H. SALT, Lincoln's-inn Heraldic Office, Great Turnstile, Lincoln's-inn-fields.

## Anatomical and Dental Repository,

45, Museum-street, Bloomsbury, London.—JOHN HARNETT begs most respectfully to call the attention of Lecturers, Students, and Gentlemen connected with the Medical Profession, to his large and select Stock of Anatomical Preparations, consisting of Skeletons, loose and articulated Skulls, Hands and Feet, Vertebrae, and Loose Bones, at the lowest possible prices.

## A New Discovery.—Mr. Howard,

Surgeon-Dentist, 52, Fleet-street, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without springs, wires, or ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR OR DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed teeth rendered sound and useful in mastication.

52, Fleet-street. At home from Ten till Five.

## Hare-Lip.—Extraordinary Application and CURE.

Communication from Mr. BROADBENT, Surgeon, Ferry Hill, Durham.

MR. BENJAMIN NICKELS,

SIR,—I wish to state concerning your Plaster to the following effect. About ten days after an operation for Hare-lip, the boy fell against a stone step and ruptured the lip. The day previously I had received your Elastic Plaster, and on being summoned to the boy, (without much hope of success,) I applied three strips of the Plaster, extending from ear to ear, bringing the ruptured edges into apposition. Seven days after, the Plaster retained the cheeks in the position I had left them on the day of application. Fresh strips were then applied, and the edges ultimately united. In my opinion, no other plaster could have answered the intention, and I think it specially adapted to wounds on the face.

I remain yours obediently.

(Signed) G. W. BROADBENT.

NICKELS'S PATENT ELASTIC ADHESIVE PLASTER, and ELASTIC ADHESIVE BANDAGES, which are made on quite a new principle, rendering them a cheap, efficient, unvarying support as a spiral covering, or stocking (without the trouble of lacing), for varicose veins, sprains, weak joints, and all rheumatic affections. These Bandages may also be cut and applied as ordinary strapping.

The Patenteé has had the honour of receiving the highest testimonials in approbation of his ELASTIC PLASTERS from the following most eminent Members of the Profession, and many other Gentlemen, by whom they are patronized and used in their hospital and private practice:—J. C. W. LEWIS, M.D., Physician Accoucheur, Guy's Hospital. Mr. FERGUSON, Surgeon to his Royal Highness Prince Albert, Prof. Surgeon, King's College, London; Surgeon King's College Hospital. Mr. HILTON, Surgeon, Guy's Hospital, Surgeon to the City of London Hospital for Diseases of the Chest.

THE PATENT ELASTIC COURT PLASTERS are found most superior both in appearance and quality.

Sold by all principal Chemists in the United Kingdom, and by Mr. BENJAMIN NICKELS, Surgical Plaster Manufacturer, 9, Camberwell-green, London.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lytta P.L., easily applied and removed, and will not produce stranguary or troublesome after-sores. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing ten square feet, 6s. 6d.; and small Cases of five square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing ten square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1852.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.,

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown."

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction.

"60, Grosvenor-street, London."

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. BROWN'S BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicator, when carefully applied, and has not been productive of any degree of Stranguary.

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals,

"Mr. T. B. Brown, Druggist, Handsworth, Birmingham."

Prepared by Thomas B. Brown, Pharmaceutical Chemist, 42, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignees, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

# Bank of Deposit, National Assurance, and INVESTMENT ASSOCIATION, No. 3, Pall-mall East, LONDON.

Established A.D. 1844.

Empowered by Special Act of Parliament.

Parties desirous of investing Money are requested to examine the Plan of this Institution, by which a high rate of Interest may be obtained with perfect security.

The Interest is payable in January and July, at the Head Office in London; and may also be received at the various Branches, or through Country Bankers, without delay or expense.

PETER MORRISON, Managing Director.

Prospectuses and Forms for opening Accounts sent free on application.

## Family Endowment Life Assurance AND ANNUITY SOCIETY.

12, CHATHAM PLACE, BLACKFRIARS, LONDON.

ESTABLISHED 1835.

CAPITAL, £500,000.

DIRECTORS.

William Butterworth Bayley, Esq., Chairman.

John Fuller, Esq., Deputy-Chairman.

Lewis Burroughs, Esq.

Robert Bruce Chichester, Esq.

Major Henderson.

Charles Henry Latouche, Esq.

Edward Lee, Esq.

Colonel Onseley.

Major Turner.

Joshua Walker, Esq.

An Annual Bonus is allowed to parties who have made Five Annual Payments on Policies taken out on the Profit Scale. That for the current year is 20 per cent. in reduction of the Premium.

REDEMPTIONS AND ANNUITIES GRANTED AS USUAL.

INDIA BRANCH.

The extensive Assurance Business of the Agra and United Service Bank has been transferred to this Office, and the Society has Branch Establishments or Agencies at Calcutta, Madras, Bombay, Agra, and Hong Kong.

JOHN CAZENOVE, Secretary.

## London Necropolis Company.—It is

intended to OPEN the CEMETERY on the 13th November, and this Company will undertake Funerals on and after that date.

A train, conveying Funerals and Mourners only, will start from the Westminster-road Station daily at 11:30 A.M.

Forty-eight hours' notice of any intended Funeral must be given at the office of the Company, 2, Lancaster-place, Waterloo-bridge, where full particulars of the general arrangements may be obtained.

The Charges are:—

First Class Single Grave in perpetuity, including conveyance of	£2 10 0
Coffin to Woking, Funeral Service, and Interment	1 0 0
Second Class, ditto ditto	1 0 0

This Company has also contracted with eminent and responsible Undertakers and Statuaries, so that the Public may either employ their own Undertaker or Statuary, or by one payment obtain all the requirements of a Funeral.

A detailed Tariff may be obtained on application, either in person or by letter.

By Order,

RICHARD CHURCHILL, Sec.

## W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible: also to his MEDICINAL EXTRACTS, prepared from the fresh plants (*Hyoscyamus Niger*, *Conium Maculatum*, *Atropa*, *Belladonna*, *Cotyledon Umbilicus*, &c.) also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alternative), Liq. Parietarie (diuretic), and Liq. Belz (prepared from the *Egle Marmelos*, or Indian Bacl), for Dysentery and Diarrhoea.

W. T. has a large supply of INDIAN BARK on hand.

2, Edward's-street, Portman-square.

## Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.

Impassioned Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

Taraxacum (Davenport's) Liqueur, or Fluid Extract, prepared by Spontaneous Impassation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

## Mathey Caylus' Gluten Capsules

contain the purest Copaliba, either simple or combined with Citrate of Iron, Ratanhy, Cubeba, &c.; acknowledged by the London and Paris Hospitals; also by the Lock Hospital; M. Lesueur, chef de Travaux Chimiques à l'Académie de Médecine; Drs. Ricord, Cullerier, &c., who have granted written attestations, to be the best prepared Medicine for the cure of certain diseases.

Extract of a Letter from Dr. Cullerier:—

"I cannot induce you too much to extend the use of your preparations; by so doing you will render a valuable service to the therapeutic of blennorrhagie affections."

"I am, &c.,

"CULLERIER,

"Chirurgien de l'Hôpital de Lourcine."

Sold in Bottles, at 2s. 9d. and 4s. 6d., sealed and stamped with the Government stamp, bearing the name of the Patente. To be had wholesale and retail of Robert King, French and English Pharmaceutical Chemist, 21, Prince-street, Hanover-square; and all respectable Chemists in the United Kingdom.—Country agents required.

## DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN  
ISLES, NORWAY,

AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

PRESCRIBED BY EMINENT MEDICAL MEN AS

*The most effectual Remedy for Consumption, Bronchitis, Asthma, Gout, Rheumatism, some Diseases of the Skin, Rickets, Infantile Wasting, General Debility, and all Scrofulous Affections.*

## PURE AND UNADULTERATED.

THE great difficulty of obtaining genuine and good Cod-liver Oil has long prevented a just appreciation of its acknowledged remedial virtues, and precluded many suffering invalids from realizing the beneficial effects of this truly valuable Medicine.

Dr. de Jongh's Light-brown Cod-liver Oil is of the best kind and finest quality, being extracted from the liver of the Dorso—*Gadus Callarias*, a species of Cod-fish caught at the Great Fishery of the Loffoden Isles—by a process yielding a much larger proportion of iodine, phosphate of lime, volatile acid, the elements of the bile, and other essential principles, than the Pale Oils manufactured in England and Newfoundland, which, by their mode of preparation, are deprived in a great measure of their active elements.

The well-merited celebrity of Dr. de Jongh's Oil is attested by its extensive use in France, Germany, Holland, Belgium, and Italy, by numerous spontaneous testimonials from eminent members of the Faculty and scientific Chemists of European reputation, and since its recent introduction into this country, by the marked confidence, as well as great success, with which it has been prescribed by Medical Practitioners.

### TESTIMONIAL FROM

The late **JONATHAN PEREIRA, M.D., F.R.S.E., F.L.S.,** Professor at the University of London, Author of "*The Elements of Materia Medica and Therapeutics*," &c. &c.

"MY DEAR SIR,—I was very glad to find from you, when I had the pleasure of seeing you in London, that you were interested commercially in Cod-liver Oil. It was fitting that the Author of the best analysis and investigations into the properties of this Oil should himself be the Purveyor of this important Medicine.

"I feel, however, some diffidence in venturing to fulfil your request by giving you my opinion of the quality of the Oil of which you gave me a sample, because I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this Medicine as yourself, whom I regard as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of responding to your application. The Oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer Oil can be procured.

"With my best wishes for your success, believe me, my dear Sir, to be very faithfully yours,

(Signed)

"JONATHAN PEREIRA.

"Finsbury-square, London, April 16th, 1851.

"To Dr. de Jongh."

Extract from "**THE LANCET**," July 29th, 1854.

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de Jongh gives the preference to the Light-brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. In the preference of the light-brown over the pale Oil we fully concur.

"We have carefully tested a specimen of the Light-brown Cod-liver Oil, prepared for medical use under the direction of Dr. de Jongh, and obtained from the wholesale agents, Messrs. Ansar, Harford, and Co., 77, Strand. We find it to be genuine, and rich in iodine and the elements of bile."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S stamp and signature, by

## ANSAR, HARFORD, AND CO.,

77, STRAND, LONDON,

Sole Consignees and Agents for the United Kingdom and British Possessions, and may be obtained from respectable Chemists and Druggists in Town and Country, at the following prices:—

HALF-PINTS ... 2s. 6d. | PINTS ... 4s. 9d. | QUARTS ... 9s.

### IMPERIAL MEASURE.

\*\* Hospitals and other Charitable Institutions requiring large quantities may be supplied on considerably reduced terms.

## Three Lectures

ON THE

## SPINAL SYSTEM AND ITS DISEASES.

Delivered at the Chatham-street School of Medicine,  
Manchester.

By MARSHALL HALL, M.D., F.R.S. L. &amp; E.,

FOREIGN ASSOCIATE OF THE IMPERIAL ACADEMY OF MEDICINE OF PARIS, ETC.

## LECTURE II.

THE PATHOLOGY AND MODES OF DEATH IN DISEASES  
OF THE SPINAL SYSTEM.

GENTLEMEN,—As I stated at the close of my former lecture, I now proceed to bring before you the Pathology—the *living* Pathology,—the Physiology,—of the Diseases of the Spinal System.

Already I have said that the spinal system is the source and seat of the *Class of Convulsive Diseases*. Amongst these, *Infantile Convulsion*, *Puerperal Convulsion*, but especially *Epilepsy*, take the chief rank.

Epilepsy has received a variety of designations, such as *morbus sacer*, *morbus Hercules*, expressive of its formidable character. It has long been regarded as the *opprobrium medicorum*. Even Esquirol, in his excellent work, "*Les Maladies Mentales*," expresses himself in regard to it in the following terms:—

"Les symptômes de l'épilepsie sont tellement extraordinaires, tellement au-dessus de toute explication physiologique; les causes de cette maladie sont tellement inconnues, que," &c.

I am almost afraid, after making these statements, to say what are my own views of this formidable malady, the result of my own labours. And yet I may not withhold the truth. I will therefore frankly tell you that I regard this *opprobrium medicorum* as removed for ever. I think no disease is better understood, in its physiology or pathology, since the detection and application of THE SPINAL SYSTEM, than — EPILEPSY! It consists, in fact, of Direct, or Reflex Action, and dire Effects!

I am not blind to the many obscure points in the pathology of this and the other formidable diseases of this class. But in what department of medicine is there not much still left for the physician to discover? It is in their comparison with other diseases that I regard the inexplicable epilepsy as no longer inexplicable.

I must commence my explanation by drawing your attention to three most important physiological facts:—

If we puncture or lacerate, or otherwise injure the cerebrum or cerebellum, or the cerebral nerves of special sense, in every possible manner, we observe *no results*, *no phenomena*, no expression of pain, no excited movements.

The cerebral system in all its parts is, in this respect, *inexcitable*.

But if we touch any part of the spinal system, and especially the spinal centre, with the point of a needle, ever so slightly, there are immediately excited muscular movements, spasm, convulsion.

The spinal system is, in all its parts—*excitor*, *excito-motor*. These important facts constitute the foundation of all our knowledge of the diseases of the nervous system, and are the very source of all *diagnosis* in regard to them.

For the same facts, as is proved by clinical observation, hold in regard to the human subject.

By experiment and by observation, then, we are led to these conclusions:

No lesion of the cerebral system, limited to the cerebrum, can be attended by spasm or convulsion.

No structural lesion of the spinal system, short of destruction, can occur *without* exciting spasm or convulsion.

If, in affections of the cerebral system, we observe spasm or convulsion, it is because it is *not* limited, in itself or in its effects, to the cerebral system. Thus, congestion of the centre of the cerebral system may, as in hanging, become extended to that of the spinal system, and then spasm or convulsion supervenes.

Or affections of the spinal centre may consist in gently applied *pressure*, not in lesion of tissue, and then paralysis, and not spasm or convulsion, will be observed. Or it may consist in sudden or violent *shock*, or utter destruction, and then, I need scarcely say, that paralysis, and not spasm or convulsion,

No. 1629.

will occur. All this we have seen demonstrated by experiment; all this you will see hereafter in your observation in the clinical, and especially the surgical, ward.

What a means of *diagnosis*, then, have we obtained by these simple physiological facts! How has physiology become our guide in practice!

I have thus explained to you, gentlemen, how disease of the cerebral centre may, by pressure downwards, affect the spinal centre. But another question arises: How does a disease of the spinal system, as a pure convulsive malady, affect the cerebral?—for such is the frequent event, as we observe in epilepsy.

Observe what occurs in the most *marked* cases of this dire malady. The head becomes fixed, or there is torticollis, by the action of the *muscles of the Neck*,—*trachelismus*; the jugular and other veins of the neck are compressed; the capillary system of the neck, the face, the intra-cranial structures congested; the veins start, the arteries throb; the *cerebral* centre becomes implicated. *All is intelligible! All is explained!*

Affection of the centre of the cerebral system is extended to that of the spinal system—the medulla oblongata—by downward pressure: affections of the spinal system are extended to the cerebrum, by *trachelismus*!

That all this is so, is demonstrable. That it is *always* so, is, perhaps, what I ought not, however disposed to do so, to assert. And, gentlemen, does it not constitute a beautiful specimen of the *physiology of disease*? But such is the whole of our recent views of epilepsy and of the *Class* of convulsive diseases, as observed in the clinical ward, to which I must now recur.

And first, pray observe with me an experiment or two.

I have removed the cerebral centre in this frog. Its spinal system is still most lively and energetic. I take and rub the toe between my thumb and finger; you observe the almost convulsive movements produced: I now touch the upper part of the spinal centre with this needle: the animal is thrown into the most violent convulsions!

Gentlemen, these experiments are *types* of disease; they are the types of epilepsy and other convulsive diseases.

The *first* is the type of *ex-centric* epilepsy;

The *second* is the type of *centric* epilepsy.

For the first was induced by an excitant applied to a part of the spinal system at a distance from its centre; the second to that centre itself.

So it is in epilepsy; so it is in convulsive diseases generally, in the human subject! Do not these simple and illustrative facts interest you? They are of the deepest interest.

Do you not now perceive *how* dentition, and gastric and enteric and uterine irritation, may excite spasm or convulsion, even epilepsy? And do you not now perceive that *ex-centric* epilepsy is no more an *opprobrium medicorum* than infantile or puerperal convulsion; for that it is equally intelligible?

You see again the violent convulsion which I excite by again touching the spinal centre in this frog by this needle.

Such is the dire state of things in centric epilepsy, whether this be of organic origin, or have become organic in its course; whether it be congenital, on one hand, or inveterate on the other.

The cases of epilepsy which occur in private practice are, for the most part, of the former or *ex-centric* kind, and *curable*, however, for many reasons, difficult of cure. The cases which we see in the lunatic asylum, and especially in the workhouse, are generally centric, and—must I not add?—too generally incurable.

Allow me to draw your attention to this *Table*. It has cost me much labour; but it contains in a page, a volume. You will find it in THE LANCET, July 20, 1850, vol. ii. p. 77. Procure it, or copy it, and study it well. For, allow me to say, I know of no such specimen of this most interesting pathology. The *chain* of events in epilepsy and other convulsive diseases, is pursued in it, *link by link*. The *causes* are arranged in this first column, the principles and modes of treatment in this last; the *rationale*, the various stages, forms, and complications in the intermediate ones. It would occupy us too long were I to enter into its details. I have only time for a rapid sketch.

The *ex-centric* causes act on *eisodic* nerves, thence on the spinal centre, and thence along *exodic* nerves, on the various muscles. Of these, few, many, or all may be affected, and the malady may be the very slightest or the very direst. Amongst the rest—I was about to say, chief amongst the rest—are the muscles of the *Neck* and of the *Larynx*.

By the contraction of the muscles of the neck the veins of the neck are compressed, as I have already noticed; and the extra-cranial and intra-cranial tissues and organs become

affected with venous congestion and all its consequences. Nay, I am disposed to say that, in every case in which there is such venous congestion of the neck, face, eyes, brain, it arises from this trachelismus, latent or evident. I do not wish you, however, to adopt this opinion without examination; but rather to subject it to a most careful investigation for yourselves.

By the contraction of the muscles of the larynx in laryngismus, this vital inlet to the respiration, combined, as it usually is, with *breath-struggles*, I believe the direst form of epilepsy, with its direst effects, as coma, mania, dementia, &c., to be produced.

I do not say that these effects may *not* arise in cases in which there is only trachelismus and no laryngismus; but I am convinced that they are *chiefly* the effects of laryngismus; and hence they have subsided in cases in which the laryngismus has been disarmed by tracheotomy, as I shall have to state at length in my next lecture.

And now, gentlemen, you perceive in what sense epilepsy may be regarded as a cerebral disease. Cerebral in its very *origin* it can never be. It may be intra-cranial in its origin, because within the cranium there are many tissues, as the membranes, from which eisdic nerves arise, many eisdic nerves, the fifth especially, pursuing there a part of their course; and the medulla oblongata,—all which may be excited by the presence of an exostosis, a tumour, a variety of diseases. But I repeat that no disease of the cerebral centre, limited to that centre in itself and its effects, does or can produce epilepsy. Yet every day we read in medical writings of affections of the cerebrum inducing epilepsy. Shall I give you an example of this? For once I will relinquish the gravity of my subject, and present you with a specimen of modern pathology, so called:—“*I hold* (!) that the peculiar features of an epileptic seizure are owing to the gradual accumulation of morbid material in the blood until it reaches such an amount that it operates on the *brain* (!) in, as it were, an *explosive* (!) manner. In other words, the influence of this morbid matter, when in sufficient quantity, excites a highly-polarized (!) state of the brain,” &c. &c. &c.

If such feebleness existed alone, I would not add another word. But I am constrained to add that this feebleness is associated in the author whom I have quoted with at least an equal degree of malignity, and in him assuredly the *odium medicum* is not extinct.

Exciting causes: the Spinal system; the Neck; the encephalon; such are the links of this chain of pathology. There remains another to which I must now draw your especial attention: it is—the medulla oblongata, with its *pneumogastric nerve*.

I have already adverted to laryngismus as giving to epilepsy, and convulsions generally, its most formidable character. This form of laryngismus is *spasmodic* or *convulsive*, excited through the spinal system.

But there is another form of laryngismus. After a severe epileptic convulsion, the patient is left in a state of *coma*, or, as it may be termed, of *simple apoplexy*. This condition may prove fatal. The respiration becomes stertorous—that is, there is laryngismus. But this laryngismus is very different from that formerly described: it is less complete, but more persistent; it is, indeed, permanent; some one said, in rather familiar phrase, “The patient snores his life away.” This laryngismus is *not*, like the former, spasmodic, but paralytic. It is owing to compression or congestion—an apoplectic state—of the medulla oblongata, and *paralysis* of the pneumogastric nerve, in which every branch, as well as the recurrent laryngeal, is implicated.

Apoplexy of the medulla oblongata; paralysis of the pneumogastric nerve! Gentlemen, did you ever hear of these expressions before? If, then, I *demonstrate* these things to you, you will not have assembled here and have listened to me in vain.

Legallois—the illustrious Legallois—divided the pneumogastric above the origin of the recurrent. The larynx became partially closed. The breathing was stertorous. In a word, every phenomenon was obscured which I am about to describe to you as occurring in the coma or simple apoplexy observed after a severe epileptic seizure.

And what do we observe? We observe paralytic laryngismus, impeded respiration, augmented apoplexy; we also observe—or, rather, I have observed—a *diffused bronchial rattle*, the effect of *paralysis* of the bronchial and pulmonary branches of the pneumogastric!

Here a most interesting phenomenon presents itself. The cerebrum is not essential to life. How then does apoplexy, simple, cerebral apoplexy, destroy life? It does not do so. Apoplexy only destroys life when, by its congestion by downward

pressure, it implicates the medulla oblongata and its pneumogastric nerve. It is by the apoplexy of this medulla and the paralysis of this nerve, that life is, in effect, destroyed!

Generally the patient dies of paralytic laryngismus, or of laryngeal asphyxia. From this danger he is rescued by early tracheotomy.

But if tracheotomy be performed, but performed too tardily, the patient, however saved from laryngeal asphyxia, dies of bronchial asphyxia!

But I am anticipating the subject of the lecture of to-morrow.

There are other branches of the pneumogastric nerve—the cardiac and the gastric. The heart and the stomach participate in the paralysis of the general pneumogastric.

The observant physician will observe palpitation as a symptom in some cases of epilepsy. This is explained by excitement of the cardiac branches of the pneumogastric.

In other cases, there are hiccup, eructation, acidity of the stomach; the effects of excitement of the gastric branches of this composite nerve.

As in these cases there is morbid action in the heart and stomach, so in deep epileptic coma there is failure of the powers of these organs.

The pneumogastric nerve is not more involved in epilepsy than in other convulsive diseases. All the phenomena just described as observed in the former, are again met with in the latter, only, of course, modified by the exciting causes, and the conditions of age and sex.

In infants there is the same or similar action of the muscles of the neck, and of the larynx and respiration. In puerperal convulsions the symptoms are identically those of epilepsy.

There is a form of epilepsy which I have not yet noticed. It is the *epilepsia syncopalis*. The patient, instead of turning purple, turns pale and ghastly. Sometimes this syncope is fatal!

So it is in the laryngismus stridulus of infants. The little patient not unfrequently dies suddenly—too suddenly to be the effect of asphyxia. The case is cardiac, syncopal.

Both these cases are affections [*shock?*] produced through the medium of the pneumogastric nerve.

But, gentlemen, you remember that I spoke, in my lecture of yesterday, of a lower medulla oblongata, and of a lower analogue of the pneumogastric. These, too, are influenced by the convulsive seizure.

The laryngismus stridulus is frequently excited by enteric irritation. This is also frequently attended by fret of the bladder.

Epilepsy is frequently induced by enteric and uterine irritation, and is sometimes attended by involuntary evacuations of the bladder, rectum, &c.

The urine is frequently morbid in both cases.

There is something in all this *analogous* to the modes of action of the medulla oblongata and the pneumogastric nerve.

It is obvious that both these portions of the nervous system form one. Both are liable to be affected in one and the same convulsive seizure.

Perhaps the lower portion of this system is most clearly isolated in what relates to *Obstetrics*. To excite the cervix uteri is frequently to excite abortion. To excite the cervix uteri during parturition is to excite the uterine efforts. But to excite the cervix uteri during parturition is, also, frequently to excite a puerperal convulsion! These are facts familiar to every experienced practitioner. They are *proofs* that “a meddling midwifery is bad.”

Other facts of the same kind are constantly elicited in practice: to excite the rectum, by the pressure of the fingers backwards, excites uterine action; and it is well known that the excitement of the internal surface of the uterus by the hand, introduced in certain forms of hæmorrhage from inertia, excites the uterus to energetic contraction.

All this is accomplished through the lower medulla and its analogue of the pneumogastric.

I think that a subject very inscrutable hitherto will receive elucidation from these studies—that of sterility, inertia of the uterus, &c. &c.

The influence of the nerves and passions, with their course of action, their seat and their destination, their physiological and their pathological relations, forms also a most interesting subject for inquiry—a subject, however, to which I can only slightly allude on this occasion.

One point I wish to notice, in conclusion. I have, I trust, in unravelling the mystery of epilepsy, removed one of the *opprobria medicorum*. I hope, in my lecture to-morrow, to rescue this malady from the domain of *empiricism*, whether within or without the ranks of our profession.

## OBSERVATIONS

ON THE

GANGLIA AND NERVES OF THE  
UTERUS.

By ROBERT LEE, M.D., F.R.S.,

FELLOW OF THE ROYAL COLLEGE OF PHYSICIANS, LONDON; PHYSICIAN TO  
THE BRITISH LYING-IN HOSPITAL, AND OBSTETRIC PHYSICIAN TO ST.  
GEORGE'S HOSPITAL.

(Continued from p. 352.)

On the 5th of June, 1841, Mr. Lawrence, then a member of the Council and Committee of Physiology of the Royal Society, carefully examined all my dissections of the ganglia and nerves of the unimpregnated and gravid uterus. He thought the series of preparations most interesting and important, and recommended me to send a paper, "On the Nervous Ganglia of the Uterus," to the Royal Society. One preparation, Mr. Lawrence said, might have left him in doubt respecting the structures which I had discovered, but the series had produced the most complete conviction on his mind, that they were ganglia and nerves of the uterus, and could be nothing else. The microscope, he observed, is not required to discover them, they are better seen with the naked eye than with any magnifier.

Dr. Roget, then secretary of the Royal Society, after examining my dissections, and comparing them with Professor Tiedemann's plates, urged me in the strongest terms to comply with the request of Mr. Lawrence. I did so, and the paper, "On the Nervous Ganglia of the Uterus," with two engravings, was published in the "Philosophical Transactions."

The following is the description which I gave in this paper of the ganglia and nerves of the uterus, vagina, bladder, and rectum:—

"In a communication to this Society, which was read on the 12th of December, 1839, I described four great plexuses under the peritonæum of the gravid uterus, which had an extensive connexion with the hypogastric and spermatic nerves. From their form, colour, and general distribution, and their resemblance to ganglionic plexuses of nerves, and from their branches actually coalescing with those of the hypogastric and spermatic nerves, I was induced to believe, on first discovering them, that they were nervous ganglionic plexuses, and constituted the special nervous system of the uterus.

"Subsequent dissections of the unimpregnated uterus, and of the gravid uterus in the third, fourth, sixth, seventh, and ninth months of pregnancy, have enabled me not only to confirm the accuracy of my former observations, but to discover the important fact, that there are many large ganglia on the uterine nerves, and on those of the vagina and bladder, which enlarge with the coats, bloodvessels, nerves, and absorbents of the uterus during pregnancy, and which return after parturition to their original condition before conception takes place.

"The uterus and its appendages are wholly supplied with nerves from the great sympathetic and sacral nerves. At the bifurcation of the aorta, the right and left cords of the great sympathetic nerve unite upon the anterior part of the aorta, and form the aortic plexus. This plexus divides into the right and left hypogastric nerves, which soon subdivide into a number of branches to form the right and left hypogastric plexuses. Each of these plexuses, having the trunk of the hypogastric nerve continued through its centre, after giving off branches to the ureter, peritonæum, rectum, and trunks of the uterine bloodvessels, descends to the side of the cervix, and there terminates in a great ganglion, which, from its situation and relations, may be called the hypogastric ganglion, or utero-cervical ganglion.

"This ganglion is situated by the side of the neck of the uterus, behind the ureter, where it is passing to the bladder. In the unimpregnated state, it is usually of an irregular, triangular, or oblong shape, with several lobes or processes projecting from it, where the nerves enter, or are given off from it. In the long diameter, it usually measures from half an inch to three quarters of an inch, varying in dimensions with the size of the nerves with which it is connected. The hypogastric ganglion always consists of cineritious and white matter like other ganglia, and grey and white nerves issue from it, which proceed to the rectum, bladder, uterus, and vagina. It is covered with the trunks of the vaginal and vesical arteries and veins, and the ganglion has an artery of considerable size, which enters it near the centre, and divides into branches, which accompany the nerves given off from its inner surface, and from its anterior and inferior borders. The

hypogastric nerve, after separating into a plexus, enters its upper edge, and branches from the third and other sacral nerves, its posterior border, and the whole of its outer surface. None of the branches of the sacral nerves pass over the ganglion to the bladder, though some of them enter its anterior edge where the vesical nerves are given off.

"From the inner and posterior surface of each hypogastric ganglion, numerous large nerves are given off, which go backward to anastomose with the hæmorrhoidal nerves, which accompany the arteries to the rectum, and pass with them between the muscular fasciculi of the organ. An extensive connexion is thus established between the two hypogastric ganglia and the nerves of the rectum, and many large, broad nerves pass off from the posterior and inferior part of these ganglia, to ramify on the sides of the vagina, and between the vagina and rectum.

"From the inferior border of each hypogastric ganglion several fasciculi of small nerves are sent off, which pass down on the sides of the vagina, and enter several large flat ganglia about midway between the os uteri and ostium vaginae. From these vaginal ganglia, innumerable filaments of nerves, on which small ganglia are formed, extend downwards to the sphincter, where they are lost in a white dense membranous expansion, from which they cannot be separated without laceration. From this great web of ganglia and nerves on the sides of the vagina, by which it is completely covered, numerous branches are sent to the sides of the bladder, which enter it around the ureter. All these nerves of the vagina are accompanied with arteries, and they often form complete rings of nerve around the trunks of the great veins.

"From the anterior margin of each hypogastric ganglion, large white and grey nerves are sent off, some of which pass on the outside, and others on the inside of the ureter, and these branches meet in front of the ureter in a ganglion, which may be termed the *middle* vesical ganglion. There are other two ganglia formed on these nerves one between the uterus and ureter, and the other between the ureter and vagina. These may be called the internal and external vesical ganglia. The ureter is thus enclosed within a great ring of nerve, which resembles the oesophageal ganglion in some of the invertebrata. The trunks of the uterine artery and vein are likewise encircled by a great collar of nervous matter, between which and the hypogastric ganglion several large and some small branches pass.

"The internal vesical ganglion, which usually has a flattened or long bulbous shape, is formed entirely upon the nerves which pass from the hypogastric plexus and ganglion, and run between the uterus and the ureter. It has an artery which passes through its centre. It first gives off a large branch to the ring of nerve or ganglion which surrounds the uterine bloodvessels; it then sends branches to the anterior part of the cervix uteri, and afterwards a great number of small filaments to the muscular coat of the bladder behind, where it is in contact with the uterus. The internal vesical ganglion then sends forward a large branch which terminates in the middle vesical ganglion.

"This ganglion sends off a great number of large nerves to the bladder. Some of these accompany the arteries, and can be seen ramifying with them upon the whole of the superior part of the organ, even to the fundus. Filaments of these nerves, scarcely visible to the naked eye, are seen ramifying upon the bundles of muscular fibres, occasionally forming loops, and enclosing them, or passing down between them to the strata of fibres below. Some of the smaller branches of the middle vesical ganglion do not accompany the arteries, but are distributed at once to the parts of the bladder around the ureter.

"The external vesical ganglion is formed entirely upon the nerves which proceed from the hypogastric ganglion, and pass on the outside of the ureter. This is a small thin ganglion, the branches of which are sent immediately into the muscular coat of the bladder. It usually sends down a long branch to anastomose with the nerves and ganglia situated on the side of the vagina.

"From the inner surface of each hypogastric ganglion, numerous small, white, soft nerves pass to the uterus, some of which ramify upon the muscular coat about the cervix, and others spread out under the peritonæum, to coalesce with the great ganglia and plexuses situated on the posterior and anterior surfaces of the organ. Large branches also go off from the inner surface of the hypogastric ganglion to the nerves surrounding the bloodvessels of the uterus, which they accompany in all their ramifications throughout its muscular coat. Other branches of nerves pass down from the ganglion between the vagina and bladder. Soon after conception, the bloodvessels of the nervous ganglia and plexuses now described enlarge, and the ganglia and plexuses themselves expand with

the uterus. The long diameter of the hypogastric ganglion at the end of the ninth month measures about an inch and a half.

"I have published a full description, with illustrations, of the great ganglionic nerves surrounding and accompanying the bloodvessels, and of the ganglia and plexuses, situated on the body of the uterus.\* The appearances presented in the fourth month of pregnancy by the hypogastric ganglia, and the ganglia and nerves of the rectum, bladder, vagina, and uterus, and also the great plexuses of nerves situated on the anterior surface of the uterus, are seen in the plates which accompany this paper."

On the 16th of June, 1842, at the request of Mr. Lawrence, I presented another communication to the Royal Society, entitled "Appendix to a Paper on the Nervous Ganglia of the Uterus, with a farther Account of the Nervous Structures of that Organ," which was likewise published, with an engraving, in the "Philosophical Transactions." Mr. Lawrence was the referee on both these papers, and on his recommendation to the council they were published in the "Transactions" of the Royal Society.

The following is the descriptive part of this paper. Fig. 5, (which will appear in our next number,) represents the appearances described:—

"I continued the investigation of this subject during the whole of 1840 and 1841, and discovered the great nervous ganglia at the neck of the uterus, a description of which is contained in the last volume of the "Philosophical Transactions." But these ganglia, which exceed in size the semilunar ganglia of the great sympathetic, constitute only a small portion of the nervous system of the human uterus. I propose now briefly to describe other nervous structures, of far greater size, as displayed in the dissection of a gravid uterus at the end of the ninth month of pregnancy.

"In this preparation the great sympathetic nerve sends numerous branches from both its cords to the trunk of the inferior mesenteric artery, which forms a great plexus around it. These nerves accompany all the ramifications of the artery, but the greater number proceed with the hæmorrhoidal artery to the rectum. The two cords of the great sympathetic, after giving off these branches to the inferior mesenteric artery, pass down before the aorta, nearly two inches below its bifurcation, where they are united by several fine nervous filaments. But the cords continue distinct, and soon separating, each passes down behind the hypogastric bloodvessels to the side of the neck of the uterus, and there terminates in the corresponding hypogastric or utero-cervical ganglion. The left cord of the great sympathetic, or, as it is usually called, the hypogastric nerve, enlarges greatly as it approaches the hypogastric ganglion. This ganglion is nearly two inches in breadth, and covers a great part of the cervix uteri. It appears to consist of six or seven smaller ganglia, which are united together by nervous cords. Each of these ganglia is a thick, solid, nervous mass, of an orange-white colour, inclined to brown. Arteries which have been injected pass through these smaller ganglia, and accompany the various nervous filaments which proceed from them. Into the whole outer surface of the left hypogastric ganglion, numerous branches from the third sacral nerve enter; and behind there is a great connexion formed between the ganglion and the branches of the left hæmorrhoidal nerve. The vaginal nerves arise from the inferior margin of the ganglion, and the vesical form its anterior border. Some of these nerves pass on the outside of the ureter to enter the middle vesical ganglion, and others pass on the inner surface of the ureter to the anterior part of the neck of the uterus.

"From the superior and anterior parts of the left hypogastric ganglion, a plexus of nerves, accompanied by an injected tortuous artery, proceeds upward along the whole body of the uterus, near the left side, to the trunk of the left spermatic vein, and there terminates in a dense, reddish-brown coloured mass, consisting of fibres firmly interlaced together, and which has all the characters of a true nervous ganglion. From its vicinity to the principal spermatic artery and vein, which it partly surrounds, and the ligament of the ovary, it may be called the *left spermatic ganglion*. Between this ganglion and the left hypogastric ganglion an artery extends, which is closely embraced by a plexus of nerves, and a direct nervous communication is thus established between these remote ganglia. The nerves adhered so firmly to the artery through its whole course, that before they were separated they presented the appearance of two white lines on its sides, with filaments crossing over the vessel. From these nerves, extending between the left hypogastric and spermatic ganglion, branches with arteries are given off in their whole course to the *sub-peritoneal ganglia and plexuses* on the posterior surface

of the uterus, and also branches to the plexuses on the anterior surface. On approaching the spermatic ganglion, these nerves with their artery pass under or between the branches of the *left sub-peritoneal plexuses*, and frequently communicate with them by fine nervous filaments. The artery can be readily traced through the substance of the spermatic ganglion, but the nerves which accompany it from the hypogastric ganglion immediately disappear on entering the mass. Numerous large branches of nerves from the left sub-peritoneal plexus likewise terminate in the left spermatic ganglion, but some of them pass under it, and proceed to the round ligament; and others are continued upwards, gradually diminishing in size as they approach the renal plexus along the spermatic bloodvessels. From the upper border of this ganglion, large flat nerves proceed to ramify on the fundus uteri, and pass with the vessels into the muscular coat. The trunk of the spermatic vein and artery is almost completely surrounded with this ganglion, as the trunks of the uterine and vaginal arteries and veins are enclosed within rings of nerve connected with the hypogastric ganglion.

"In this dissection there are nervous structures displayed on the anterior and posterior surfaces of the uterus of still greater magnitude. These, from their situation, may be called the *sub-peritoneal ganglia and plexuses* of the uterus.

"Over the middle of the lower part of the body of the uterus behind, immediately beneath the peritoneum, is situated the posterior sub-peritoneal ganglion, which is considerably larger than the left hypogastric ganglion. It presents the appearance of a layer of dense structure, composed of fibres strongly interlaced together, having a yellowish-brown colour. It adheres firmly to the peritoneum, but between its lower surface and the muscular coat of the uterus there is interposed a thick, soft layer of cellular substance, through which filaments of nerves and branches of considerable size pass to the muscular coat of the uterus. The middle part of the ganglion is more than two lines in thickness, but it becomes everywhere thinner towards the circumference, and particularly at the inferior border, where it sends off many nerves to the back part of the vagina. From its left lower and lateral part, it sends off two layers of broad nerves, one of which adheres to the peritoneum, and the other closely invests the muscular coat and bloodvessels of the uterus. Between these layers there is placed a very thick mass of soft cellular membrane, through which innumerable branches of nerves pass between these layers, the hypogastric ganglion, and the plexus of nerves with the injected artery extending between the hypogastric and spermatic ganglion. Many of the superficial nerves pass down under the peritoneum, and terminate in the upper border of the left hypogastric ganglion, and upon these superficial nerves there is formed another ganglion of considerable size, between which and the hypogastric nerve numerous branches of soft nerves extend. This ganglion, formed on the nerves under the peritoneum, near the edge of the uterus, is thick and solid, and consists of a yellowish-brown substance, with white nervous filaments interlaced, and arteries of considerable size passing through it. From its lower border large nerves extend to the upper edge of the hypogastric ganglion, and innumerable soft nerves enter the whole inner surface of the hypogastric ganglion, which take their origin from the lower part of the great sub-peritoneal ganglion. The upper part of this ganglion becomes firmly adherent both to the peritoneum and muscular coat of the uterus, which it covers as high as the fundus. Large, broad nervous plexuses, superficial and deep, extend from the upper portion of the sub-peritoneal ganglion across the body of the uterus to the spermatic ganglion, and bloodvessels, and the round ligament, around which they form a sheath of nerves.

"In an elaborate drawing by Mr. Joseph Perry, all the ganglia and plexuses on the left side of the uterus now described, have been represented with the greatest fidelity."

"As the arteries and veins on the right side of the uterus are only partially injected, the nerves extending between the hypogastric and spermatic ganglia have not been so minutely traced. But that there is a similar nervous chain connecting these great ganglia of the fundus and cervix, and the sub-peritoneal ganglia and plexuses, does not admit of doubt, and has been clearly demonstrated by other dissections at an earlier period of pregnancy.

"Over the middle of the anterior and lower part of the body of the uterus there is situated a nervous and muscular mass, of great extent, and similar in structure to the sub-peritoneal ganglia described on the posterior surface. It adheres to the peritoneum firmly, but on being divided longitudinally, it is also observed to be separated from the muscular coat of the uterus by a soft stratum of cellular membrane. From the

\* The Anatomy of the Nerves of the Uterus. London, 1844. Fol.

lower part of this *anterior sub-peritoneal ganglion*, nerves are bent down to the cervix uteri and vagina, and numerous branches pass off on both sides to the hypogastric ganglia. Superficial and deep plexuses of nerves are likewise sent off from its superior lateral borders, which proceed across the uterus, sending branches into the muscular coat, and uniting with all the ganglionic plexuses on the posterior surface. The appearances presented by the *anterior sub-peritoneal ganglia* and plexuses in the fourth month of pregnancy, have been displayed in the second engraving which illustrated the paper 'On the Nervous Ganglia of the Uterus.' At that period, the ganglion seemed nothing but a thin nervous and vascular membrane, imbedded in soft cellular substance, through which the delicate nervous filaments, accompanied with arteries, proceeded to the superior angles of the uterus. On comparing this dissection with that now described, it is impossible to avoid being struck with the enormous development of these nervous structures during the four latter months of pregnancy, or to resist the conclusion that these are formed for the purpose of supplying the uterus with that nervous power which it requires during labour.

"These dissections prove that the human uterus possesses a great system of nerves, which enlarges with the coats, blood-vessels, and absorbents during pregnancy, and which returns after parturition to its condition before conception takes place. It is chiefly by the influence of these nerves that the uterus performs the varied functions of menstruation, conception, and parturition, and it is solely by their means that the whole fabric of the nervous system sympathizes with the different morbid affections of the uterus. If these nerves of the uterus could not be demonstrated, its physiology and pathology would be completely inexplicable.

(To be continued.)

## ON AUSTRALIAN OPHTHALMIA.

By GARRETT BUTLER, Esq., M.R.C.S.L.

I DESIRE to lay before the notice of the junior members of the profession who intend practising in our Australian colonies the following observations on the above disease. While residing in the colony of Victoria, I had frequent opportunities of observing the affection, as well as the treatment usually adopted for its cure. The disease differs materially from anything to be met with in practice in this country, and practitioners generally follow the treatment usually recommended for acute conjunctivitis occurring at home. Australian ophthalmia is, in my opinion, essentially a disease resulting from debility. Amongst the young and delicate, the toil-worn, and those least injured to the climate, the affection appears in its worst and most painful character.

The immediate cause of the disease is relaxation and debility of the vessels of the conjunctiva. The remote causes will be found in the sand carried from the interior by the furious hot winds, in a disordered state of the primæ viæ, excessive fatigue, and bad living. The symptoms at first closely resemble those of ordinary conjunctivitis, with the exception of the inflammatory fever which usually accompanies the latter disease. The patient at first complains of "weakness in the eye;" there is intolerance of light, and great vascularity of the conjunctiva, with a gritty, sandy sensation in the eye. After a few hours, sometimes a day or two, the discharge so characteristic of the disease makes its appearance. At first it is a thin, muco-purulent secretion, becoming rapidly thicker, and ultimately of surprising hardness. In some cases I have removed pieces from the eye of almost cartilaginous consistency. Its formation is wonderfully rapid and profuse, and is the cause, by its pressure acting like a foreign body in the eye, of all the sufferings the patient undergoes. There is also considerable supra-orbital pain, especially at night, when all the symptoms are aggravated. The patient passes sleepless nights, and the general health usually suffers in consequence. In the treatment, the state of the bowels must not be overlooked; their functions I have found best restored by a mild mercurial purge. The topical treatment which I have found most beneficial is diametrically opposite to that of conjunctivitis. Instead of the local abstraction of blood, (sometimes constitutional,) low diet, purgatives, &c., which some adopt in the colony as means of cure, I always begin by using a solution of from four to six grains of nitrate of silver to the ounce. This checks the discharge at once, and with it all the symptoms rapidly subside. After the application of the collyrium, it is advisable to cover the eyes with a light, cold bread poultice, and to smear the eyelids at bed-time with cerat cetacei. The

patient should be confined to a cool, shady (not dark) room, and be allowed a nutritious diet. Under this treatment the most aggravated cases will often be cured in two or three days. Occasionally some debility and relaxation of the vessels will continue for a time, when it will be necessary to use the sulphate of zinc with vinum opii.

Australian ophthalmia is seldom followed by bad results. In neglected or badly-treated cases, I have seen opacities of the cornea, nebulae, and pterygium follow. I never knew it to occasion ulcers or sloughing of the cornea, and the deeper textures of the eye are, I believe, never engaged.

I trust that the above remarks from one who has devoted much time and pains to the study and treatment of the disease will be of some use to our medical brethren who intend to practise in the Australian colonies, and through them be the means of alleviating the sufferings of our friends and countrymen in the far-off land.

London, October, 1854.

## A Mirror OF THE PRACTICE OF MEDICINE AND SURGERY IN THE HOSPITALS OF LONDON.

Nulla est alia pro certo noscendi via, nisi quam plurimas et morborum et dissectionum historias, tam aliorum proprias, collectas habere et inter se comparare.—MORGAGNI. *De Sed. et Caus. Morb.* lib. 14. Proœmium.

### CASES OF EXTERNAL INCISION FOR STRICTURE OF THE URETHRA.

KING'S COLLEGE HOSPITAL ..... MR. FERGUSSON.  
ST. MARY'S ..... MR. HENRY LEE.  
" ..... MR. COULSON.

In what state are the therapeutics of stricture at the present day? Have the able men who have devoted their energies to elucidate the pathology of the disease, and endeavoured to find remedial means, succeeded in placing the treatment upon a firm and satisfactory basis? Have patients now a better chance than a century ago, to be relieved from the inconvenience, suffering, and perils of aggravated stricture? Have the rewards which have been bestowed upon successful competitors by learned bodies or benevolent individuals, both in this country and abroad, led to commensurate improvements in the branch of surgery under consideration?

It would be doing injustice to the present generation of surgeons to answer these questions in the negative; and when the observer looks round in our vast nosocomial establishments, he may convince himself that successful applications are being made of the methods which have, in modern times, been devised. Nor is it improbable, on the other hand, that much good is done in private practice, where cases seldom assume the aggravated characters which are frequently seen in the wards of our hospitals.

It is especially against the severe forms that the greatest therapeutical ingenuity has been displayed, and it would appear that surgeons are agreed that the only means of overcoming permanent and unyielding obstacles to the flow of urine, or to the introduction of instruments, is to destroy the substance forming the impediment. But here we find opinions diverging in various directions, from this central point of consentaneous action. Some destroy, by means of different caustics; others use the cutting instrument, and divide the coarctation either within the canal, or through the skin of the perineum. Is there to be but one rule, or do all the methods deserve application, in appropriate cases? Can we safely exclude any of these means of destruction? Or do any of them present risks of a more serious nature than the complaint itself?

These questions are not easily answered, for the supporters of the different methods bring both cases and good arguments in support of their views. But some approach might be made to the solution of the problem by coming to an understanding

as to the nature of the cases which *really* and *truly* do require the extreme measures which we have just named; for if a rule could be laid down as to the circumstances which render the destruction of the offending substance necessary, it would only remain for the surgeon to choose the operation which, with a fair prospect of success, offers the least amount of danger. This rule, however, does not exist; for you hear, on one side, that the knife should be rigidly withheld when the smallest instrument can pass; and, on the other, that in certain cases gradual dilatation is perfectly useless, as the tissues are so retractile that the advantage gained is very soon lost again.

Now, it must be granted that there are inequalities of the urethral canal of an extremely resilient nature, the fibrous element, of which these rugosities are composed, having assumed some of the elasticity of the yellow fibrous tissue. But pressure has nevertheless the power of making the prominences recede, not simply by mechanical compression, but also by causing a certain amount of absorption. If instruments could be borne in the urethra for a long time, there would hardly be any stricture which could resist the treatment by pressure; but we must not leave catheters for a protracted period in the canal, for, by this measure, we make the patient run serious risks. In the place of prolonged pressure, advantages might perhaps be expected from considerable and somewhat sudden dilatation, by means of catheters of gradually higher numbers, gliding upon a guiding staff, as is done with Mr. Wakley's instruments; or by a separation of branches, as practised with Mr. Holt's catheter.

Nor should the practitioner lose sight of the good results which may sometimes be obtained by using bougies of fractional ascending sizes. These are hardly ever seen in this country, but are very common in France, where there are thirty-six numbers between our 1 and 12. But with some surgeons dilatation is an insufficient measure; and where there is a tendency to relapse, where the stricture seems to return again and again, they see no other means, though an instrument can still be passed, than to lay the urethra open from the perineum, and allow the canal to re-form upon an instrument left in it for a more or less prolonged period.

In the face of a number of successful cases which have been published, it would hardly be possible to deny the occasional good results of this practice; still, we must be allowed to state that we have known of three or four cases where death has followed the operation; and as dilatation, though less promptly efficacious, cannot endanger life, we may perhaps be excused for still pausing between the bougie and the knife.

But we will suppose, for a moment, that the urine is discharged *guttatim*, and that no instrument whatever can be passed. What is to be done in such a case when there is no actual retention at hand? Cut from without, and run the risk of not finding the urethra? or cut from within with one of the numerous kinds of instruments so well described in Mr. Thompson's late prize essay "On Stricture," or else use the nitrate of silver or the potassa fusa?

The latter method is open to objections on theoretical grounds, as well observed in a clinical lecture by Mr. Henry Lee, to which we shall have to draw attention; for, burning, as we all know, is mostly followed by retraction of the parts, on cicatrization taking place: thus, we have before us, in using caustics, the dread of making matters worse.

Cutting through the perineum without a guide is very hazardous, (though we shall see by Mr. Lee's operation, described below, that the difficulty may be overcome,) and no resource is therefore left but to divide from within. If we continue to suppose that no instrument can be passed, we have to make a choice amongst the cutting catheters which have been proposed, from Mr. Stafford's, down to the one, for which M. Reybard, a French surgeon, has lately obtained the Argenteuil prize of £480. Every one knows Stafford's instrument, we may perhaps subjoin a description of Reybard's, which has not as yet been popularized in this country. We should premise, however, that in the case we have supposed, M. Reybard would first *scarify* to obtain a route for his urethrotome.

In order to appreciate the value of the therapeutical means advocated by M. Reybard, it is indispensable to look at the author's notions as to the *cause* of some kinds of strictures. He considers, with most writers, that *gonorrhœa* is the most common cause of stricture, and thinks that the narrowing of the canal is due to an *abnormal* or *transformed* tissue, and not to the simple thickening or induration of the parietes of the urethra. This abnormal tissue presents properties analogous to the texture of cicatrices, and may, in very chronic cases, assume fibrous and fibro-cartilaginous characters. This tissue, according to the author, occupies, almost exclusively, the internal or connected aspect of the mucous membrane of the

urethra; the membrane is *not* thereby thickened, and may even be rendered thinner. The stricture is thus, not formed by the projection of the tissue of new formation into the *cavity* of the canal, but by the retraction and shortening suffered by a circular portion of the parietes on the affected point.

The author therefore regards coarctations as presenting an *invariable* structure; and thinks that the different kinds of narrowing are merely varieties of the same affection. It follows, from this theory, that it is impossible to restore to the tissues forming the stricture the normal and primary properties of the urethral parietes, as these tissues, being new and abnormal, have never been possessed of such properties. Hence strictures, always according to M. Reybard, are cured by the different means which *tend* to re-establish the integrity of the membrane.

By clinical studies and experiments, the author has found this new tissue endowed with two principal peculiarities: viz., *retractility* and *elasticity*. Thus, by retractility, the tissue always tends, though slowly, to an incessant shrinking; hence strictures return, as bad as ever, after dilatation; which latter is rendered possible by the elasticity of the tissue. Upon these data M. Reybard has founded his therapeutics; and he tried, in his earlier attempts, what he calls *scarification*, or what might more properly be styled *coarctotomy*. This consisted, as published by the author in 1833, in numerous incisions, combined with dilatation.

This method proved, however, ineffectual, and, after fifteen years' pathological investigations, he gave the preference to *urethrotomy*. Scarification is now employed by the author only as a palliative measure, but without dilatation, and with *fibrous* and *non-dilatable* strictures of old or feeble subjects, with whom urethrotomy might be dangerous.

This latter operation consists in making, from the cavity of the urethra, an incision, which includes, besides the narrowed portion, the *whole thickness* of the parietes of that canal. The bleeding surfaces which result from this incision must be kept apart from each other, so that they may cicatrize independently. The new surface which then forms becoming combined with the remains of the circumference of the urethral parietes, widens the diameter of the canal, or at least produces, in the point operated upon, a new canal, the calibre of which remains *permanent*.

The idea of this method occurred to the author by examining the mode of cicatrization of the experimentally-made longitudinal wounds of the urethra of animals. He found that when these wounds are prevented from uniting, the result is a smooth, thin, non-retractile cicatrix, which, by becoming *added* to the parietes of the urethra, *increases* their extent.

Before performing urethrotomy, it is important to prepare the patient, and dilate the stricture, so that the latter may allow the urethrotome to pass. When the dilatation is too slow, or too painful, it should be preceded by *scarification*, as we stated above.

The urethrotome consists of a sheath, split along its whole extent; and this sheath contains a blade, which the operator exposes with ease by a simple and ingenious mechanism under the control of a central rod. The urethra is thus divided from *behind forwards*.

Whatever be the shape of the stricture, the incision should always be made laterally, because the parietes have in that region less thickness, and since the bulbous arteries, situated inferiorly, are thus avoided. The incision should penetrate the whole thickness of the membrane, to the depth of about two lines, and extend about two inches in length. The longer the incision, the easier it will be to keep the margins of the wound apart.

M. Reybard, after the incision, introduces a two-branched dilator into the urethra, or one filled with mercury, to keep the lips of the wound apart; but, as the instrument might cause irritation, it is not *left* in the urethra, and should only remain for a few minutes every day, this operation being repeated daily for about twenty-five or thirty days, the lapse of time necessary for the cicatrization of the wound.

A cicatrix is thus formed, not only along the margins of the wound, but on the fundus of the latter; that is to say, on the intervals resulting from the separation of the edges. As to hemorrhage, (there is always a flow of blood for four or five days after the operation, which becomes afterwards serous and sero-purulent;) that is to say, an alarming loss of blood, it has been noted ten times in thirty-two cases (rather a large proportion.) But in nine cases, the hemorrhage ceased spontaneously, and in one by means of compression.

The symptomatic fever is not in general high; infiltration of urine has not happened; but one death (the patient was epileptic) has been noted out of thirty-two cases. Right

persons operated upon by M. Reybard were seen several years after the urethrotomy, and had remained well.

M. Robert, from whose able report we have extracted the preceding particulars, considers that this operation has *solved the problem of the radical cure of stricture*; and he states, in praise of the method, that men like Mr. Syme, Mr. Coulson, and others, have obtained the same results by a somewhat different mode of proceeding.

Thus, if we mistake not, there exists some analogy between Reybard's and Syme's operations; both divide the parietes of the urethra, and dilate the wound subsequently, the Edinburgh professor superradding, however, the division of several layers of soft parts. At all events, it does not appear that either M. Reybard or Mr. Syme consider that their respective operations should be limited to any portion of the urethra, and they would probably have recourse to it even were the narrowing situated at a short distance from the glans.

We are strongly reminded of this circumstance, a few days ago, while following Mr. Stanley in his wards at St. Bartholomew's Hospital. One of his patients, a young man about twenty-six years of age, has been troubled with stricture for several years, and now passes his urine in drops. Several attempts have been made since his admission a few weeks ago, to pass an instrument, but to no purpose; the obstruction is situated about three inches from the meatus, and is to all appearance insurmountable. We would just state, *en passant*, that this patient had gonorrhœa for seven months, about three years ago, and that he used no injections whatever. Thus it is apparent from this case, as from many others, that it is the inflammation of the canal, as stated by Ricord, and not the infections, which cause stricture.

What is to be done in such a case? What would Mr. Syme or M. Reybard do? they both require a patent urethra; how do they manage when no instrument can be passed? As to Mr. Syme, we are all aware that he does not admit such a thing as an impassable stricture; but actual facts will convince many surgeons, to their great regret, that coarctations will present themselves which resist all attempts at the passing of an instrument.

We admit, however, that, with the assistance of the two auxiliary measures to which we are going to allude, no stricture is impassable. The first of these auxiliaries consists of *time, opiates, antiphlogistic means, and gentle pressure with the end of the instrument* against the obstacle. The second is *violence*—viz., forcing the catheter through the soft parts offering resistance in the urethral canal.

As to the first of these helps, we are strongly reminded of a case, some time ago under the care of Mr. Lloyd, at St. Bartholomew's Hospital. The patient called at the hospital with almost complete retention, at the hour of Mr. Lloyd's visit. The latter had the man laid on a wooden table in the surgeon's consulting-room, and tried to pass a catheter of moderate size. The instrument was arrested about the membranous portion of the urethra; and, by the courtesy of Mr. Lloyd, we were able to convince ourselves of the powerful resistance offered to the instrument, which resistance was certainly more than what is called spasmodic. For full half an hour were the gentle efforts continued, whilst the patient's attention was frequently diverted. We confess that the time seemed to creep very slowly; but at last, without opium, bleeding, the warm bath, or any other means but gentle pressure against the strictured portion of the urethra, the instrument passed into the bladder, to the great satisfaction of all present.

As to the second way of rendering the stricture patent, we beg to quote a few words which we heard Mr. Fergusson speak in the theatre of King's College Hospital, now several years ago.

"The question about impermeable stricture is an idle one; for there is certainly no impassable stricture for the surgeon who is determined to force through it. It is unfortunate that eminent teachers should claim more dexterity than they really possess; for by their full acquaintance with the anatomy of the part they, in some degree, by a sleight of hand, appear to pass the instrument easily into the bladder, whilst they are really forcing their way through a canal the relative anatomy of which is very familiar to them. He (Mr. Fergusson) had long had the idea that the seeming dexterity was nothing but actual violence. In the present instance [a case of external perineal incision of the urethra] he had thought it right to force the passage, and introduce the director, and he might, if so disposed, have told the pupils that he had succeeded in his endeavours by dint of perseverance and dexterity."

"So much for violence. Now, to return to M. Reybard: it would appear that in a case like Mr. Stanley's he would begin, as we stated above, by scarifying, and thus pave the way to the

use of his urethrotome. This is exactly what Mr. Stanley intends to do; but he fully expects that Stafford's instrument and subsequent dilatation, without any further use of the knife, will conquer the difficulties in the way of normal micturition.

Now, out of this case of Mr. Stanley's, the question arises, whether the wound would lay the foundation of a fistulous opening, if the stricture were divided through the integuments of the penis. This fear would certainly be legitimate, but we cannot speak of our own experience on the subject, and are not even sure whether Mr. Syme divides strictures by the external incision so near the glans, and what may have been the result of this practice, always supposing it has been had recourse to. We must say that we have some apprehension about the matter, founded on a case we saw some years ago at St. Mary's Hospital.

The patient was under the care of Mr. Haynes Walton, and was suffering from two or three tumours along the course of the urethra, as a consequence of gonorrhœa. It is probable that inflammation had taken place in the sub-mucous tissue of the canal, which inflammation had been followed by abscess, well circumscribed by fibrinous effusion. Some matter had been discharged, but the tumours had persisted for years, and were allowing of a slight escape of urine. Mr. Walton excised these tumours, with which a certain amount of urethral tissue was of course involved; but complete cicatrization did not take place, and the patient was discharged with fistulous openings.

Might not the same course of events be repeated, in a case like Mr. Stanley's, if an external incision were tried? We do not mean to answer the question positively, as the analogy is not quite complete.

This leads us, however, to consider whether it is satisfactorily ascertained that wounds made in the perineum, for the external incision of the urethra, do *always*, or at least *generally*, heal up without leaving a fistulous opening. Data are rather wanting on this head, but we may refer our readers to a former "Mirror," (THE LANCET, vol. i. 1853, p. 58,) where they will find a case in which the patient came under the care of Mr. Gay, at the Royal Free Hospital, after having some time previously submitted to external perineal incision for stricture. The state of the man is thus described in the number of this journal just alluded to:—

"Henry A—, aged fifty years, a bulky man, with a pale, pasty face, and anxious countenance, was admitted, May 10th, 1852, under the care of Mr. Gay, with a fistula in perineo, the result of abscess and stricture. The fistula was of long standing, connected with an operation previously performed, and whenever the patient evacuated the bladder, a considerable quantity of urine passed through the abnormal opening. Mr. Gay succeeded in closing the fistula by the twisted suture, and the patient was eventually discharged with a small aperture in the perineum, through which no urine was, however, passing." We added the following remarks on concluding the relation of this case:—

"This patient will probably be seen again in some of our charitable institutions, as his proneness to vesical derangement seems very strongly marked. As we stated above, the case cannot be looked upon as finished, and it must be owned, with reference to perineal section upon a staff passed into the bladder, that the man was decidedly an unfavourable subject for the operation."

Three cases, in which the external incision for stricture has been performed in hospitals, have lately come under our cognizance, and as this operation is by no means frequently performed, we shall lay the facts before our readers.

(To be continued.)

## Medical Societies.

### ROYAL MEDICAL & CHIRURGICAL SOCIETY.

TUESDAY, NOVEMBER 14TH, 1854.

JAMES COPLAND, M.D., F.R.S., PRESIDENT.

THE first meeting for the session was held this evening. There was a very full attendance of members and visitors. The following gentlemen were elected fellows of the Society:—Archibald Billing, M.D.; Peter Hincks Bird, Esq.; Frederick Collins, M.D.; Booth Eddison, Esq.; Alfred Haviland, Esq.; Edward Smith, M.D.; Benjamin Travers, jun., Esq.

A case was afterwards read by Mr. CRITCHETT, of congenital

cataract successfully treated by operation; and a case by Mr. HENRY THOMPSON, of hernia, complicated by the presence of a non-descended testicle in the canal. A discussion followed on each of these cases. A report will appear in the next LANCET.

## HARVEIAN SOCIETY.

MR. COULSON, PRESIDENT.

THURSDAY, NOVEMBER 2ND, 1854.

THE first meeting of the session was held this evening; there was a very full audience. As is usual on the opening night, the PRESIDENT delivered an inaugural address. He said:—

"Gentlemen,—The laws of our Society prescribe to the President the duty of addressing you, at the commencement of every session, on the objects of the Society, and the best methods of accomplishing them. The institution of this custom, like that of the Society itself, is founded upon a keen insight into the nature and wants of the medical profession. It is very possible that, after the labours consequent upon practice were terminated for the day, we might be tempted to take advantage of our meetings in the evening as a means of relaxation and friendly intercourse, and forget the great objects which have brought us together. I think, therefore, that the object of the law which renders it incumbent upon your President, to the best of his ability, to address you at the commencement of each session, on the proper objects of the Society, is a good one. But I have said that the institution of the Society (and, I might have added, of all societies of this kind) is founded on a similar insight into the nature and wants of our profession. If we stand in need of the agency of such societies to give us strength as men, we are no less in need of them as members of the medical profession. Not only our own individual weakness imposes upon us the necessity of meeting together in friendly union, but the very peculiarities of the profession to which we have devoted ourselves render it equally imperative. No other profession depends so much upon the assistance which it may receive from the operation of societies as ours, and it will be worth while to inquire into the reason of this. We do not hear of active lawyers feeling it incumbent upon them to hold meetings for the purpose of enlarging their acquaintance with the principles and practice of law, or of extending its operation. And the same holds with respect to other professions. The difference seems to me to be this: in no other profession is the connexion between science and art so necessary to be kept in mind as in our own; practice so absorbs the faculties of the medical man that he is ever in danger of drifting away from scientific principles. We find, therefore, that in all countries where medical men have endeavoured to elevate medicine into a science, medical societies have been more numerous and far more flourishing than any other institutions of a similar nature. This may be accounted for in the following manner: The leading men in our profession, in proportion as they become more skillful, incur the danger of losing sight of general laws. Our skill mainly depends upon the opportunities offered to us of practice. *Ceteris paribus*, he will be the best practical physician or surgeon who is most constantly occupied. But in this very occupation there is danger. While we are so constantly engaged upon particulars, we lose sight of the necessity of generalization. We keep so close to the beaten path that we have no idea, too often, of the map of the country. This is the danger that is ever presenting itself to the medical man, a danger, be it remembered, that increases with time. The more phenomena we see, the less, very frequently, are we able to soar to the conception of general laws. The time that we expend in the collection of materials is so great, that we have not any left for philosophizing upon them. The larger our practice, the more, by that very fact, are we deprived of the leisure which is required in order that we should make a proper use of it. We are so much of workmen that we have some difficulties to struggle against when we wish to become philosophers. This is a difficulty, however, which is inherent in the very nature of our profession, and it is one which may be met most appropriately by the institution of societies. We meet here to throw all our experience into one common stock, and to endeavour to trace the hidden laws which underlie the phenomena which our experience has brought before us. While we are at work in the day we observe only; when we bring the results of our observations here in the evening, we are enabled to philosophize. We begin to war from the region of fact to that of principles; and unless we do this we shall

make but small advances in the very science which we profess. But to do this properly we must associate ourselves with others; for no man's experience, however great, can supply him with the whole of what is necessary for a complete induction. The great philosopher who gives his name to our Society observes, in his dedication to his immortal work, "True philosophers, who are only eager for truth and knowledge, never regard themselves as already so thoroughly informed, but that they welcome further information, from whomsoever, and from whencever, it may come; nor are they so narrow-minded as to imagine any of the arts or sciences transmitted to us by the ancients in such a state of forwardness or completeness that nothing is left for the industry and ingenuity of others; very many, on the contrary, maintain that all we know is infinitely less than all that still remains to be known. Nevertheless, philosophers do not pin their faith to other persons' precepts, in such wise that they lose their liberty and cease to give credence to the conclusions of their proper senses."

Harvey, we see, recognised the value of the intercommunication of thought between classes of scientific men, and he gave a proof of his recognition of the value of societies by his magnificent donation to the College of Physicians. He saw clearly enough that the collision of thought produced sparks, from which the lamp of science might be lighted; and our experience must teach us the same lesson. Not only are most men's experience deficient in extent, but suspicious in quality; not only can no single man collect all the facts, but the mirror in which they are seen is coloured and distorted. A fact is not the same thing to one observer as it is to another. The powers of perception vary in different individuals; two persons look at the same fact, perhaps from different points of view, and consequently receive two different impressions. Induction is difficult, then, in medical science, not only on account of the impossibility of the observer collecting a sufficient number of phenomena, but on account of the idiosyncrasies of the observer himself. We always have been, and always shall be, under the influence of the idols or spectres which Bacon has delineated in such a masterly manner. The spectres of the tribe (*idola tribus*) still exercise their baneful influence in distorting our judgment, by causes which arise from the very defects of the human mind: the spectres of the den (*idola speciei*) still operate, by causing us to measure the laws of the universe by our individual standards: the spectres of the market-place (*idola fori*) still disturb our judgment, by the misconceptions which arise from our intercourse with each other: the spectres of the theatre (*idola theatri*) still trouble, by raising philosophical dogmas into general laws, by making us consider the world of imagination as the only true world. A Society like the present is the most efficient check upon the dangers to which we are exposed from this source. We can never flatter ourselves that the bye-path we have chosen is the high road, when we see so many persons travelling towards the goal in so many different directions.

You will agree with me, then, that a Society like this is not only useful to ourselves, but of benefit to the science of which we are students. We assist each other, and, in so far as we do this, we become benefactors to the world. In reference to what I have just said relative to the necessity, not only of a large experience, but of a multiplied experience—not only of a multitude of facts, but of a multitude of observers, to establish the principles of medical science, it may be instructive to consider the state of medical opinion with respect to the pestilence which has been lately raging amongst us, and even now is lingering here, "loath to depart." Many distinguished and laborious members of our profession have devoted a large portion of their time and energies to the investigation of the cause, essential nature, and treatment of cholera. Each of these has had a large number of cases brought before him; each has brought to the consideration of these cases the resources of a mind well stored with the knowledge of medical science in its present state; each has conscientiously exercised the whole powers of his mind upon the consideration of the phenomena before him. Nevertheless, it is but too well known to all of you, how divergent are the theories which attempt to account for cholera—how various are the modes of treatment adopted. This arises, not only from the want of a sufficiently extended experience—not only from the peculiar colouring with which each man, by nature or education, unconsciously covers the objects of his observation—but also from the want of that instinctive prescience which exists in the mind of every great discoverer. It is not merely phenomena that are required, it is a deep certainty that these phenomena are all sprouts from the same tree, and a craving to get at the knowledge of the nature of the tree. Kepler, with all his facts before him, was tormented by the presence, felt, but not seen, of a law which

would explain all these facts, and rested not until he tore away the thread of facts which enveloped the principle, and published to the world his "three laws." Newton, with all Kepler's knowledge imprinted on his mind, with a larger experience, derived from his own observation, was not content until he dived deep down into the ocean of facts, and brought up the great law of gravitation. These examples, and those of our great medical discoveries, must be ever present to our minds, inciting us to look upon experience, however necessary, as the mere guiding-posts to a true philosophy. All these separate observations on cholera may have their use. A philosophical observer will gain something, not only from the truth that is contained in the deductions from them, but from their errors. Let us, however, when we speak of the pestilence, remember, that although medicine has not done much to discover or to remove the cause, it has been of incalculable use in moderating the effects. No one who is acquainted with the results of hospital or private practice in this direction, will deny that increased experience has brought with it the knowledge of various methods of alleviating pain, and of arresting symptoms which formerly were the precursors of death. There can be no doubt, also, that the sanitary measures which have been adopted, and which the profession have recommended for years past, have in many instances prevented the outbreak, or diminished the violence, of the disease. It is to the medical profession mainly that the adoption of sanitary measures by the Government and local authorities is due. The labours of many of you in this direction have been of incalculable use to the public, and you may congratulate yourselves that you have laboured in the right way, even if you have not finished your work. If we ever arrive at the ultimate cause of cholera, each observer who has contributed one fact necessary to the induction may be consoled that he has been useful in the great achievement, although he may bear away but a fractional portion of the glory. I trust that the position of our place of meeting will be found in future to be even of greater advantage to the progress of our Society than it has hitherto been; I mean, in consequence of the neighbourhood of St. Mary's Hospital, and the recent establishment of its school. A large hospital furnishes incalculable opportunities for the due prosecution of our studies, and at St. Mary's the medical staff—if I may allude to a body of which I am myself a member—is composed of men some of whom have an European reputation. There is every probability that the active labours of that staff in the field of operation opened to them will not be without its influence on our meetings. It is, however, gentlemen, mainly dependent upon yourselves to elevate the character of the Harveian Society. Unless we individually work for the good of the institution, all the advantages which centuries of study and research have placed within our reach, will be practically of no benefit to this institution. If each person will make it a matter of duty to bring before the notice of the Society, at its periodical meetings, the results of his observations on the cases before him, and the facts which presented themselves to him, we shall assuredly prosper, and the Society will vindicate to itself the propriety of dignifying itself with the great name of the discoverer of the circulation. It will be a disgrace to us who have associated ourselves with the name of Harvey, if we flag in pursuing our course along the road which led him to immortal honour. In proportion as our resources are greater than those in the possession of the physicians and surgeons of the time of Harvey, our responsibility is increased. Any one who reads his graphic and philosophical account of the manner in which he proceeded to the discovery of the circulation, and the methods he adopted in carrying on his researches into the nature of generation, will be struck with the fact, that had Harvey possessed those common appliances which are now in the possession of most medical men, he would have been saved hours and days of anxious labour. What would Harvey have done had he had the microscope, such as it is with the modern improvements, to assist him in his operations? What might we not have expected from this most acute of observers, had the tremendous world, to which the microscope alone could introduce him, been laid open before him? If he did so much with imperfect tools, what would he have effected with tools of a power of which imagination itself would scarcely have dared to dream the extent? Harvey did the work of a giant with the armour of a dwarf; let us guard ourselves against the imputation of having armour fitted to the limbs of giants, but being no more able than dwarfs to make use of it. With the vast increase of power which modern discoveries have placed in our hands, our responsibility increases. If we have such vast facilities for doing good compared with those which were the property of our ancestors, we shall basely neglect our duty if we do not

know how to use them. I have already alluded to the microscope as having laid open nature in her inmost recesses. It is our business to strive that the knowledge thus given to us shall not have been given in vain. Chloroform is another of those new elements of strength which have added to our power. Making some necessary deductions from the indiscriminate praise which was at first lavished upon its properties as an anæsthetic agent, still there are few of us who have not had experience of its wonderful effects in sparing our patient the action of pain, and smoothing away many difficulties which we ourselves might experience in the course of our operations. There are a few cases where its application might be injudicious, but these form but a small proportion of those in which its agency is of the greatest possible benefit. It is of the utmost importance that the operation of chloroform should be carefully watched, and the members of the Harveian Society should make a point of communicating here the results of investigations on this subject. If I were to go over the long list of the increased forces which medical men possess now compared to those which were in the possession of their predecessors, I should be merely repeating what has been said before, and should be wearisome without being instructive. It may be advisable, however, to glance at one or two of the advances which have been made during the last year. It cannot be said that many startling changes have taken place; and the proper way of estimating our progress would be to take account of that gradual increase in the powers of the united profession which increased knowledge, closer co-operation, and a deeper sense of our responsibilities, have produced. We may have made no very brilliant discoveries, but if we compare the tone of the profession with that which existed thirty years ago, I think it must be admitted that there has been a great advance, and there is a gradual annual progress in this. It must, I think, be confessed that, as a profession, we become annually more earnest in our endeavours to seek for scientific solutions of the problems we have to solve. We are less bigoted and exclusive. We are more willing to share the results of our experience with others. We are less disposed to lock up our knowledge in secret corners, and let no one have access to it. In addition to this, I firmly believe that we are more filled with a solemn feeling of the great duties we owe to Him who gave us our powers, and to His creatures for whose use they were granted. If a profession like ours, numbering its members by thousands, makes a slow but sure progress of this nature, we may be certain that its capabilities for good are wonderfully increased. It will act with augmented force upon the world, and the results will be sensible in a large diminution of suffering and disease. Although, however, we may have to look to the growth of strength in the whole profession, more than to the development of any particular department of its operations, for the proof of our improvements, there have been still several instances of discovery which show that agencies are at work similar to those which produced the grand results in the history of medicine and surgery. There are a few other improvements which may be worth mentioning as having their value in increasing the general stock of professional knowledge. I may allude to the production of local anæsthesia. This we must acknowledge is a point of first-rate importance. To produce insensibility to pain without depriving the patient of consciousness would be the very triumph of medical science. It would be premature to pronounce upon the merits of the invention at present, but we know that, amongst other instances, local anæsthesia has been produced in cases of cancer of the uterus, by an ingenious instrument for projecting chloroform or ether upon the part, and favouring rapid evaporation. I may also mention that, during the last year, the cure of small aneurisms, nevi, and erectile tumours, by means of the concentrated solution of the perchloride of iron, has been repeatedly effected. The same solution is now much used as a styptic to bleeding surfaces, and generally succeeds in arresting hæmorrhage in a very short time. M. Chassaignac, of Paris, has made known to the surgical world a case which shows that, after all, spina bifida is not an incurable malformation, for he succeeded in obtaining the closure of the sac and the recovery of the child, by injections of iodine. I may add that M. Bonnet, of Lyons, continues to use the same injections into the cavity of chronic abscesses, and even into the peritoneal cavity, with a certain amount of success. I need not, however, occupy your time with accounts of scientific discoveries, with which you must be as well acquainted as myself. I allude to them simply to show that we are not standing still. It is enough for us to see, in the intervals between the pulsations of scientific discovery, that science still lives and is active. This gives us the certain hope that science will still animate our profession; that we may look forward to

discoveries as great as those which have made the glory of the illustrious heroes of invention. It is for us singly, gentlemen, if we cannot obtain the high distinction of connecting our names with any grand incident in medical discovery, to work diligently to prepare the road, and the materials for those who can. We can all dig materials out of the quarry, if we cannot construct the edifice ourselves. It behoves all of us, then, to work diligently in our individual paths, and to throw whatever observations we make into a common stock for the benefit of the profession and mankind. The Harveian Society is intended to help you in this latter purpose. Each member who wishes to see the Society prosper should not neglect to keep records of the cases under his charge. The principal symptoms should be noted, the effects of peculiar treatment should be described, and the salient points, both in the manifestations of the disease and the result of treatment, laid before the Society as matters of consideration. If this were to be done conscientiously and religiously by all of us, such a body of facts would be brought forward by different observers as would materially assist the practice of the art, and ultimately, it may be hoped, lead to the establishment of general principles. "There is no way," says Harvey, in a letter to Vlackveld, "more calculated to advance the proper practice of medicine, than to give our minds to the discovery of the usual law of nature by the careful investigation of the rarer forms of disease." This is precisely the object we propose to ourselves in the Harveian Society. The careful investigations of the rarer forms of disease is much more possible when entrusted to a hundred investigators than to one or two. The very error that may have led one clever man astray, and set him wandering far from the road which leads to truth, without any possibility of his ever reaching the goal, may have been detected immediately by another observer. We save labour at the same time that we are able to produce more general results. These are the considerations which I would urge upon the members of the Society. While we work together we cannot fail to work usefully. If we shut ourselves up from all sympathy and co-operation, our selfishness will meet with its due reward.

On the motion of Dr. RAMSBOTHAM, seconded by Dr. JOHN GRAY, a vote of thanks was proposed to the President, and carried by acclamation.

Mr. COULSON briefly acknowledged the compliment, and the meeting adjourned until Thursday, the 16th inst.

## EPIDEMIOLOGICAL SOCIETY.

DR. BAERINGTON, PRESIDENT.

MONDAY, NOVEMBER 6TH, 1854.

DR. BAERINGTON commenced his address by congratulating those members of the Society who were present upon their once more meeting together, notwithstanding the danger to which they had all been more or less exposed, both as medical men and as members of the community, during the prevalence of the late fatal epidemic. At the same time he had to express his great grief at the loss which the Society had sustained by the death of the late Dr. Roupell, who had been carried off by cholera since their last meeting. The President then alluded to the fact that now, instead of as formerly having to hold their general meetings in the rooms belonging to the Medico-Chirurgical Society, and their council meetings at the private residences of individual members, they had been enabled to provide the room in which they then were for their general meetings, and a smaller adjoining room for their council meetings. A repository had also been provided for the books belonging to the Society, a measure which would be productive of great benefit, by promoting the circulation of works relating to Epidemic Disease. Remarking upon the necessity of the careful and accurate collection of all the important facts having relation to epidemic cholera, the President observed that we had no difficulty in tracing as definite a line of effects produced as in the plainest example of poisoning, but that it was the nature of the cause producing these symptoms at which we wish to arrive. A great step would be made in this inquiry could we define any circumstances or sets of circumstances under which cholera could not exist. It had been found in many instances that, on persons being removed from certain localities, cholera was stayed, whilst certain localities appeared to predispose large numbers to be attacked at the same time. Many of these cases had been observed, but there had been no such collection of them as would allow of any important deductions being drawn as to the causes of such variations. But little appeared to have been done by way of testing the power of various prophylactic measures. In

large institutions there would be no great difficulty, during the prevalence of an epidemic, of trying many different means of prevention at the same time, in various divisions of such buildings; and by experiments of this kind it was possible that we might be able to effect much good. Not even with regard to house-to-house visitation and the advantages of the early treatment of diarrhoea to checking cholera, had there been a sufficient amount of evidence collected to warrant a final and definite conclusion upon the point. The President also directed attention to the interesting point of the influence of the causes of cholera upon persons who were not attacked by the disease itself, an influence which was shown to exist, to some extent at least, by the greater susceptibility of most persons at these times to the effects of purgatives, &c. Then with regard to treatment, there was no lack of suggestions, but, excepting in particular instances, there was much difficulty in carrying out particular lines of treatment in such a way as fairly to test their advantages. The President, after alluding to the papers which had been read, and to the labours of the special committee, strongly urged the necessity of the Society publishing the papers read before it, and suggested that it might be easily managed, by each member subscribing for one or more copies of the proposed volume, at the same time expressing his willingness to put his own name down for ten copies. Having made some observations upon the constitution of the late and of the present Board of Health, the President sat down amidst loud cheering.

The SECRETARY having read his report,

Dr. RICHARDSON made some observations in relation to some remarks which had fallen from the President with regard to the practice pursued in olden times, of lighting large bonfires in infected districts. From the researches into the historical part of the subject, which he had made in conjunction with Dr. Moffat, he had ascertained that this measure had in different cases appeared to have produced very opposite results, which he thought might be owing to the causes of the epidemic being within or without the place where the fires were used, as their only action could be in producing a draught of air from surrounding parts to those in which they were lit.

Dr. J. BIRD moved a vote of thanks to the President for the great interest and zeal he had displayed in promoting the objects of the Society. He referred to the testimony of the late Dr. M'Kenzie, with regard to the necessity of checking the premonitory diarrhoea, as well as to the influence of a close confined atmosphere in promoting the spread of the disease.

Mr. ROGERS, seconding the vote of thanks to the President, bore testimony to the efficacy of the house-to-house visitation in the district of the parish of St. Anne's placed under his care.

The vote of thanks having been put, and carried—

Dr. SNOW read some statistics, which tended to prove that Mr. Rogers was mistaken in attributing the sudden decrease of cholera in the parish of St. Anne's to the steps taken by the authorities to ensure the prompt treatment of premonitory symptoms, the decline of the epidemic having commenced before those measures were adopted.

Mr. HUNT read a paper by Mr. Bennett, Medical Officer to St. Giles's parish, showing the influence which the sanitary measures adopted in that parish had had upon the progress of cholera since the first outbreak of the disease in London. Mr. Bennett considered that diarrhoea had no necessary connexion with cholera, excepting as a predisposing cause. That the outbreak of the disease might, or might not, be preceded by certain symptoms; which, however, were only to be looked upon as manifestations of the action of a peculiar poison previously introduced into the system. He thought the non-contagiousness of the disease to be proved by the fact, that although every case of cholera which applied was admitted into St. Giles's workhouse, none of the previous inmates caught the disease.

Dr. HEADLAM GREENHOW thought that house-to-house visitation had never been fairly tried, having generally been adopted too late; but in places in which he had seen it tried, it appeared to him to have produced great effect in causing a decline of the disease. To prove the efficacy of early treatment, he mentioned the case of two workhouses, situated in the heart of an infected district, in one of which no case of cholera, and in the other only two, had occurred, owing to the strict measures which had been adopted for the treatment of premonitory symptoms. In one of them, St. Mary's, Newington, Mr. Lownes, the medical officer, had adopted the system of posting persons at the doors of the water-closets, who reported the names of all who visited them more than once during the half day. By this means, they had discovered 260 cases of diarrhoea,

in which no application had been made for medicine, in spite of notices posted all over the house.

Dr. HECTOR GAVIN also bore witness to the efficacy of house-to-house visitation, and considered that there was as much necessity for treating cases early in this disease as in any other. He related some statistics of the disease, which had fallen under his observation whilst holding his appointment at the General Post-office; and dwelt upon the necessity of ascertaining the relation of other diseases, such as influenza, &c., to cholera.

Dr. BARLOW dissented from the assertions which had been so freely made, to the effect that cholera might, in every case, be prevented by checking pre-existing diarrhoea, remarking upon the fact that, in a large proportion of cases, the attack came on quite suddenly, and that in nearly one-half the attack took place between the hours of four and seven A.M., the persons attacked having, in a majority of instances, partaken of a hearty supper. In regard to the question of contagion, he related the case of a citizen who left town for a healthy locality in the country, and was speedily attacked by cholera. The person who nursed him was attacked likewise; and being removed to another house, two members of the family into which she was received were in the same manner seized by the disease, which then seemed to stop.

The PRESIDENT having returned thanks for the vote which had been passed, the meeting adjourned.

## WESTERN MEDICAL AND SURGICAL SOCIETY OF LONDON.

DR. BARCLAY, Vice-President, in the Chair.

FRIDAY, NOVEMBER 3RD, 1854.

DR. CAHILL read a paper on

### SOME CASES OF TYPHOID FEVER.

The author first narrated three cases of this form of fever, in each of which the early diagnosis was obscured by the prominence assumed by one set of symptoms: in one, the patient seemed suffering under an attack of phthisis, which view was confirmed by his previous history and the chest symptoms; in another, the brain was the organ most disturbed; whilst in the third, the abdominal tenderness, diarrhoea, and tympanitis, caused the case to assume the appearance of enteric inflammation. The subsequent course of the disease, however, and the appearance of the rose-coloured spots peculiar to this form of continued fever, soon established the true nature of the disease. He then alluded to the confusion that existed in the nomenclature of the disease, arising from the different views which were entertained by the profession as to its exact nature and its relation to typhus, some considering it as symptomatic of abdominal lesion, whilst others viewed it as a specific disease, and distinct from typhus or maculated fever. With respect to the treatment, the author stated that all our efforts should be based upon the endeavour to uphold nature while she was working out the cure, due care being had to the modifications, normal and abnormal, that may arise during the course of the disease. The principal remedies insisted upon were, in addition to the usual adjuvants of ventilation and cleanliness, nourishment, when it could be digested, and stimulants, when they could be borne. All medicines, especially stimulants, should be cautiously administered, and much good is often derived from the administration of opium. With respect to mercury, he stated that it should never be given to cure the fever, (which is impossible,) but to alter and amend the secretions; but if administered for its specific action, it would be found to be injurious in more ways than one,—first, by producing bilious diarrhoea, and thereby exhaustion; and, later in the disease, by causing the absorption of the lymph thrown out by the serous membrane where perforation threatened, thus taking away the means nature had prepared for the prevention of greater evils. In alluding to the comparative efficacy of remedies in typhus and typhoid fever, he stated that wine was better borne, and indeed required, in the latter form, as was opium; this latter drug often inducing fatal coma in the insomnia of typhus. Tartar-emetic and opium, introduced into practice by Dr. Graves, is found to be very useful in many cases of continued fever, especially in those forms of the disease where the symptoms resemble those of delirium tremens, and occur in constitutions which have been injured by inebriety. The distinctive characters of typhus and typhoid fever were then sketched. In the typhoid variety the duration of the disease is twenty-eight days, as a rule; the diarrhoea and

abdominal symptoms are always present, and occur generally about the tenth or twelfth day; the pulmonary system is seldom affected; rose-coloured spots are observed all over the abdomen, distinct and well marked; the bladder and rectum are seldom beyond the control of the patient; the disease does not terminate by crisis; ulceration of the bowel is an ordinary accident; epistaxis is borne without fatal sinking. In typhus, on the contrary, the duration is generally twenty-one days; diarrhoea rarely occurs; there is much prostration; the pulmonary system is generally affected to a great degree; the eruption is characterized by macule; the bladder and rectum act involuntarily; it is generally terminated by crisis, that by perspiration being generally fatal; loss of blood by epistaxis is generally followed by rapid sinking; ulceration of the bowel is a rare accident. Before concluding, he alluded to the epidemic of relapsing fever in Ireland in 1823-26, which Dr. Graves regarded as a mild form of yellow fever, from the prevalence of hepatic symptoms. In 1834-35 a similar type occurred, and in both the peculiarity of the disease consisted in the unusual length of the fever, it running on uninterruptedly for thirty or thirty-three days, and then remitting and again recurring. In these cases the remission must be considered as a part of the disease, and viewing it in this way the treatment by quinine was found very successful. It was very contagious and very fatal.

Some variety of opinion was expressed by some members of the Society as to the distinctive characters of typhoid fever, and its claim to be considered as a disease *sui generis*.

Dr. MURPHY, in connexion with some remarks, alluded to the occurrence of continued fever in connexion with fetid vapours. He narrated a case bearing on the point, in which two persons, exposed to unhealthy vapours rising from putrefaction, suffered from a severe attack of continued fever, no possible source of contagion existing at the time in the locality.

This view of the origin of some cases of fever was agreed to by the CHAIRMAN, who, however, differed from the author of the paper, in considering that no exact duration could be given to either typhus or typhoid, and that consequently no correct diagnosis between them could be gained in this respect.

On November 17th, Dr. PETTIGREW was announced to read a paper "On Tumours, their Nature and Treatment."

## Reviews and Notices of Books.

*Transactions of the Pathological Society of London. Vol. V. Including the Report of the Proceedings for the Session 1853-54. pp. 371.*

(Continued from page 391.)

### THIRTY specimens of

#### *Disease, &c., of the Organs of Digestion*

are described. Mr. J. SALTER is the author of three interesting contributions, profusely illustrated, in reference to the teeth: one showing erratic vascular canals in the teeth; another, vascular tumours connected with the dental periosteum; and a third, specimens of epulis. Dr. HANDELD JONES has supplied the following eight articles:—Four communications, with illustrations, on disease of the stomach and its mucous membrane; a case of abnormal development of the solitary glands, in a patient, aged eleven, who died suddenly with obscure symptoms; and a series of five cases, illustrative of local jaundice of the liver, or of abnormal pigment-production in that organ, in connexion with jaundice, from which he draws the following inferences: "First. That interference with the out-flow of bile into the intestine causes dilatation chiefly of the gall-bladder and larger ducts, and not at all of the smaller. Second. That this arrest of the bile-flow tends to produce local or general jaundice of the liver itself, but does not do so necessarily, at least for some time. Third. That local jaundice of the liver—that occurring in spots and general jaundice, such as occurs in acute yellow atrophy affecting the whole organ—may be produced without any such obstruction. Fourth. That very considerable accumulation of yellow pigment in the hepatic cells may be chiefly, if not entirely, dependent on vascular congestion, long protracted, the exuding hæmatis

undergoing changes in the liver similar to those which are seen when it exudes in other parts. Fifth. That from the comparatively small number of the coloured spots, and their often wide separation in cases of local hepatic jaundice, there seems reason to conclude that derangement of the action of the ultimate ducts is materially concerned in their production." The author also described a case of diseased intestine in typhoid fever, in which there were many ulcers in the lower portion of the small and in the large intestines, in the solitary and agminated glands; and he raised the question, whether in that disease the deposit is restricted to the solitary glands, or is not often an ordinary deposit of exudation matter in the mucous membrane, just as a variolous pustule forms in the substance of the skin?

Mr. E. PYE SMITH exhibited a specimen of *medullary cancer* in a tumour at the pylorus of a robust, fat man, aged sixty-three, very anemic, and with feeble digestion, which was unaccompanied by pain or tenderness, vomiting or purging; also a *biliary calculus*, four inches and a half by two inches and a quarter, of the shape and size of the gall-bladder, which had passed by ulceration into the intestine, and had produced inflammation and fatal obstruction in the jejunum. He also presented, for Mr. Ewen, two cases, one of *medullary cancer and ulceration of the stomach*, and another of *simple chronic ulceration of the stomach*, with two large perforations, four inches and a half by one inch, in the lower curvature, closed up by adhesions to the liver and spleen.

Dr. QUAIN was the medium of communication of two cases: one for Dr. Bucknill, of *fatal perforation of the stomach* in an insane man, aged twenty-two, from the presence of a large quantity of cocoa-nut fibre in the stomach; and another for Dr. Armitage, of *lobulated liver* in a child, nearly four years old. The latter patient had not had jaundice, but was afflicted with disease of the kidney, accompanied by anasarca and erysipelas, and died from peritonitis.

Mr. HOLT presented a rare instance of *pendulous fatty tumour* or tumours attached to the epiglottis, and hanging loosely in the pharynx and oesophagus, which interfered with the closure of the glottis. It had existed for many years, and had occasionally been protruded from the mouth by laughing or vomiting, producing impending suffocation. It was returned, and the patient, by swallowing slowly, could take his food for a long period with comparative ease and comfort. He died suddenly. The size of the tumour is not stated, but from the drawing we may infer that the mass was nearly five inches in length.

Dr. HARE has described a case of *cancer of the omentum* in a plasterer, aged sixty-six years; Mr. Pollock, one of *cellular and granular deposit in the liver, kidney, and peritonæum, in a case of typhus*; Dr. Septimus Gibbon, one of *cirrhotic liver* in a house-painter, aged twenty-two, with great ascites, and without jaundice; Mr. Simon and Mr. R. R. Robinson, cases of *biliary calculi*, discharged in both cases through an opening at or near the umbilicus. Mr. Simon had seen other similar cases at St. Thomas's Hospital, and described the steps of the discharge to be—first, the passage of the calculi from the gall-bladder by ulceration; secondly, their inclusion in an ulcer-like cyst; thirdly, the cohesion of this with the parietes; and, fourthly, the perforation of these investments. Dr. Ogle also described a case of *biliary calculus*, having a mass of calculi in an abscess of the liver, which opened by ulceration into the duodenum and common bile-duct; the patient dying suddenly from dropsy of the pericardium.

Dr. HABERSHON communicated a case of *Asiatic cholera*, in which there was great enlargement of the aggregate and solitary glands of the intestine; and Mr. Shaw, one of *rupture of the ilium* from a contusion of a reducible hernia by a blow over the truss, in which it was perceived that a knuckle of the intestine had descended; and Mr. N. Ward, a similar case from a kick in a direct inguinal hernia of long standing.

Mr. Gay described an interesting case of *extreme constipation*, one in which nothing had passed from the bowel during a space of three months. The boy continued in good health, but the bowels became greatly distended and resisting, and a rupture was evident through the linea alba. All purgative remedies had failed to produce any effect, and it was only by the application of a bandage to support the palsied descending colon, and the employment of warm water enemata for half an hour at a time that faecal matter, much resembling cinders, was dislodged. Lastly, Mr. T. J. Ashton exhibited an *imperforate rectum and anus* without a recognisable depression to indicate the position of the outlet.

(To be continued.)

*Das Klima von Italien und seine Heilwirkungen, bei Lungen-schwindsucht*, von Dr. T. H. BURGESS. Aus dem Englischen übersetzt und unter Berücksichtigung der für Lungen-schwindsüchtige geeigneten Aufenthaltsorte in Deutschland mit Zusätzen versehen, von Dr. R. HAGEN. Leipzig, 1854.

We have much pleasure in noticing this volume, which is a German translation, with notes, of Dr. Burgess's excellent monograph "On the Climate of Italy." The best test of the value of a work, or of its utility, is the fact of its being translated into foreign languages. We are therefore gratified to find that our own favourable opinion, expressed when the work first appeared, is corroborated in so flattering a manner in Germany.

*Principles of Comparative Physiology.* By W. B. CARPENTER, M.D. Fourth edition, 8vo, pp. 770.

It is unnecessary, in noticing the fourth edition of Dr. Carpenter's standard work, to do more than state that it comprises all that is known on the subject of Comparative Physiology up to the present time.

*Maclise's Surgical Anatomy.* Parts V. and VI. Churchill.

THIS splendid work maintains its claims to the high reputation which it has achieved. The fifth and sixth Parts contain the whole subject of aneurism of the carotid and upper extremity, the surgical dissection of the parts of the facial median line, and the surgical anatomy of the abdomen, showing the relative condition of organs in a state of health and disease.

## THE BOARD OF HEALTH AND THE HERTFORD NEW SEWER.

To the Editor of THE LANCET.

SIR,—Having read, in a late number of THE LANCET, a statement to the effect that a new sewer at Hertford is to be drained into the New River, not having a taste for such beverage, and entertaining some fear of its probable consequences upon the health of persons using the New River supply, I took the liberty of drawing the attention of the President of the Board of Health to the statement.

My note has received the prompt attention of Sir B. Hall, and I have received a letter from T. Taylor, Esq., secretary to the Board of Health, enclosing a copy of a letter from the New River Office, with information that the statement in question "is entirely without foundation."

By giving publicity to this information, you may relieve the fears of many persons on this side of London.

I remain, Sir, your obedient servant,

Upper Holloway, November, 1854.

W. B. KESTEVEN.

**EASTERN DISPENSARY, BATH.**—The whole of the offices in the medical staff of this Institution having become vacant, first, by the resignation of Dr. Blackmore, Dr. Trull, Mr. Bush, Mr. Stockwell, and Mr. Tayler, and subsequently by the resignation of Dr. Tunstall, a special general meeting of the governors and subscribers was held on the 13th of November. The five gentlemen first mentioned having expressed their willingness to resume their former positions, were, by a large majority, re-elected, and Dr. J. Maule Sutton was elected in place of Dr. Tunstall.

## THE LANCET.

LONDON: SATURDAY, NOVEMBER 18, 1854.

OUR armies and fleets abroad, and ourselves at home, have to contend against the same enemy. Cholera and fever pursue our forces by land and sea in distant countries: the same scourges invade and desolate our homes. The bulletins and despatches which record the fortunes of our soldiers and sailors in their contest against the Russians, are well nigh silent as regards their struggles against the pestilence. At home we keep an accurate account of our losses: a weekly bulletin, detailing the ravages committed by our internal foes, is issued by the Registrar-General; these weekly lists are regularly posted up, and at the end of every quarter we are presented with the results. Abroad, every man killed and wounded by the sword or the projectiles of the Russians is mentioned by name in the reports of the Commander of the Forces: but those who fall beneath the not less formidable arm of pestilence perish undistinguished: their names may indeed be learned by revising the muster-rolls of the regiments or ships to which they belonged, but they are not deemed worthy of being inscribed on the same death-rolls which announce to the world the names of those whose memory is to be honoured and whose loss is to be deplored. And yet why should they not be? Is his death who is stricken down in the camp with pestilence so much less glorious or less to be regretted than his who falls before the cannon of the enemy as to be undeserving of notice? If it be not a debt due to the fame of those who thus perish, that the manner of their death should be recorded, is it not at least reasonable to hope, from an accurate register and publication of the causes of death, similar advantages to those which flow from the published registers of the causes of death at home?

In the public inquiry into the organization of the medical department, and the means relied upon to maintain the health of our forces,—which must necessarily, for the honour of the medical staff, the exculpation of the authorities of the War-Office and of Lord RAGLAN, and the satisfaction of the public mind, take place,—a fundamental point will be the causes of mortality. We shall expect to be informed of the numbers of men who have died from the ordinary casualties of battle, and of those who have died from sickness. It will be all-important to know what forms of sickness have proved fatal, and in what proportions. It is a matter of more than scientific curiosity to determine the balance between the deaths from wounds and those from disease. It deeply concerns not only our soldiers and sailors, but every Englishman, to learn whether our Generals have duly estimated and provided against both the allied enemies, Russia and the Pestilence; whether their skill and their resources have not been too exclusively directed against the first, with indifference or supineness neglecting the latter. We leave it to others to question or to prove that all the resources of science, of skill, and of daring, have been employed to the uttermost in bringing our artillery to bear upon the Russians. There has been enough of noble courage to achieve the conquest of the world; whatever opinion may be formed of the generalship displayed. But we may be permitted to call for evidence to show that the resources of Medicine and of Hygiene have been exhausted in order to preserve our own men from the havoc

of pestilence. The burthen of proving both these points rests entirely upon the authorities of the War-Office and the Commanders of the Forces. It is in their case, in their power, and therefore under their responsibility, both the purely military duty of effectually wielding the forces under their command to the discomfiture of the opposing armies, and the subsidiary duty of protecting the lives of our countrymen with which success in the field is so intimately linked. It has been made abundantly manifest, by the events and calamities of the campaign, that there is no such thing in our war-system as an independent, responsible medical department. There are, indeed, medical officers attached to each regiment and ship; it is true that these officers may be classed together in the Army and Navy Lists under the designation of a Medical Department; but what we distinctly deny is the existence of any such organization and central guidance of these officers as can be said to give them the force of united and intelligent action. As individuals they may be, and we doubt not are, good men; but there their utility ends.

We disclaim all intention to criticise the strategical conduct of our generals; we will therefore only cite the remarkable observation a French general is said to have uttered on witnessing the madly gallant and forlorn charge against the overwhelming forces of LIPRANDI by a small band of cavalry under Lord CARDIGAN: "*C'est très magnifique, mais ce n'est pas la guerre!*" May we not in like manner criticise the equally reckless or ignorant indifference to the means of preserving life and health displayed in the foolish neglect of the aid of Medicine, and affirm—"It is very admirable, this prodigality of life, but it is not science, not true strategy, not policy, and not humanity?"

When we shall have obtained full information as to the diseases and other causes which have occasioned, not the decimation,—for that fractional proportion is altogether inadequate to express the extent of mortality,—but the loss of nearly one-half of our men, then the inquiry may be extended to the means of obviating similar catastrophes in future. We shall naturally seek, in the first place, for a careful comparison of the mortality of our own forces, and of that of our allies, the French. We shall learn to what extent they have been exempt from sources of disease and suffering to which our men have been exposed. We shall learn, from the consideration of the difference of circumstances, and the difference of administrative and medical care, to what extent sickness—which some of our generals regard as the visitation of Providence, or the inseparable attendant upon a campaign—may be averted by superior vigilance and science.

Not to anticipate the conclusions of an inquiry, which we again affirm to be inevitable, we may, without fear of error, conjecture that our friends have, by their greater foresight and more able administration of their medical department, saved the health, the lives, and the limbs of many men, under circumstances which we, on our own part, had taken no effective measures to provide for. It will not be the least beneficial result of our alliance, that we shall be enabled, by the contrast between the sanitary arrangements of the two armies, to draw useful lessons of improvement. We shall learn the inestimable value of the principle of erecting the medical department of an army into a distinct and responsible power; of placing all the personnel and matériel of our sanitary department under the informing guidance of an intelligent head; of making the medical department self-dependent and self-

sufficient; of freeing it from the inconvenience of being constantly checked and impeded in its action by the necessity of relying upon other departments for the supply of the most common wants: we shall become conscious of the importance of the services that medical science can contribute to great undertakings which depend for their execution upon the skilful disposition of great masses of men.

Of the evils, the losses, the waste of men and money, attendant upon the present want of system, we have already had experience enough. We can only regret that that sad experience is not yet concluded. We fear we have still to witness the sacrifice of many brave men, through a dogged persistence in our chaotic proceedings, under which efficiency is impossible, and responsibility is lost. We have still to deplore much unnecessary suffering from the clashing and counter-actions of this bureau and that bureau, each interfering with the other, and the thing to be done not done. We have still to witness the unhappy results of rendering the medical staff of our army powerless for good; of abandoning the health of our troops to accident; of engaging in a series of sanguinary conflicts in a hostile country, having deliberately left ambulances and surgical stores hundreds of miles behind; of sending on the wounded, not to the spot where the surgical stores were left, but to new hospitals, unprovided with surgeons or surgical appliances; of allowing the Commander of the Forces in the East to usurp the natural functions of an officer of health, and to dispose of all sanitary resources; of leaving to a daily newspaper the self-imposed duty of raising money and superintending the distribution of medical comforts to the sick; and of allowing the Secretary-at-War to improvise a new order of medical attendants composed of pilgrim Lady BOUNTIFULS, and despatching them, whether the surgeons in charge want them or not, can manage them or not, upon special duty as nurses, or we know not what, in the hospitals.

We have still to witness all this, and much more; and then, the inquiry; and then, let us hope, the reform.

It is a remarkable fact, that the most ancient of the ruins of Rome, and the only remains left of the handiwork of her kings, is the great sewer of the Imperial city, the *cloaca maxima*. Two thousand years ago, TARQUINIUS PRISCUS drained the low grounds about the forum, carrying the outlets of his *cloacæ* into the Tiber. His chief drain, however, was afterwards found to be so imperfect as to cause the enormous conduit we have mentioned to be constructed by his son, TARQUINIUS SUPERBUS. This great sewer, with which the smaller *cloacæ* communicated, served not only to cleanse the city, but acted as a drain to the *Velabrum* and the *Circus Maximus*, through which it passed, its tunnel being so large, according to LIVY, that a waggon-load of hay could pass along it, and barges float upon its stream. The *cloaca maxima* discharged itself into the Tiber at the *pulchrum litus*, and now, though choked up nearly to its top by the artificial elevation of the surface of modern Rome, still serves, we believe, as the common sewer of the city after the lapse of 2000 years! The drainage of the streets of Rome has been the admiration of past times as well as of our own; LIVY speaks of it as a work so vast that his own age had not been able to equal it; and PLINY, recording the repair of the great conduit in the time of AUGUSTUS, (afterwards added to by AGRIPPA,) denominates it the *opus omnium maximum*. The maintenance of the Roman *cloacæ* was at first the business of

the censors, then of the *ædiles*, until finally the emperors created officers, called *curatores cloacarum*. The only system of sewerage which can compete with that of Rome is the sewerage of our own city, and though boasting no such size of conduit-tunnel (even in the now-arched Fleet ditch) as the great *cloaca*, can pride itself of an inestimable advantage which that of the Romans did not possess, viz., systematic communication with the houses by lateral drains. Nevertheless, as to the real extent of *house-drainage* possessed by the ancients, we think we have little certain information, and are by no means willing to maintain its restriction to that very limited extent some writers have been disposed to. It was restricted enough, no doubt, and in comparison with that of London may be said scarcely to have existed at all; still, from what has been observed (according to MARZONI) in the excavated ruins of Pompeii, it appears not improbable, to say the least, that the *house-drainage* of the S P Q R was not quite so bad as frequently has been asserted. London, however, is pre-eminent in domestic sewerage, or at any rate in the recognition of the propriety of the principle, and its extensive practical adoption. We are unable to indicate exactly the total extent of sewers in the metropolitan districts, but some idea may be formed of it when we state that, in the Holborn and Finsbury districts together, there are perhaps more than 100 miles of main covered subway; and in addition to which above twenty miles of smaller sewers, to carry off the surface-water from the streets and roads, and 300 miles of drains leading from houses to the main sewers. A return made by the officers of the Westminster Division shows that, between 1807 and 1834, there had been built within the "Ranelagh Level" 2692 feet of open, and 6886 feet of covered sewers, making a total length of 9578 feet, at the cost of the Commissioners; while the length made during the same period by private persons was 91,906 feet. Now, supposing this extensive system carried out to a yet further extent through the metropolis, how is it, may it not be asked, that we are nevertheless constantly, and seemingly with justice, making complaints about the matter, that boards of health and sanitary commissioners tell such terrible and disgusting tales, and the assumption is arrived at that predisposition to, and extensive propagation of, many febrile or zymotic diseases are to be ascribed to the accumulation of filth and excrement about our streets and dwellings, and its consequent production of an overhanging pall or lethal atmosphere of miasmatic matter? In chief explanation of

\* The following illustrations are afforded by last month's "Weekly Returns" of the Registrar-General:—

"At 12, East-place, West-square, on 29th of July, an ostler, aged forty-two years, 'diarrhoea, (six days;) cholera maligna, (fourteen hours.)' Mr. Goldsborough, the medical attendant, writes as follows:—'The stench arising from a drain situated at the back of the premises was so horrible as to make me feel sick on entering the house. A drain runs beneath the floor of the next house, occupied by a workman in the common sewers, and he describes the stench arising from it sometimes as being very bad. There is also at the bottom of East-place a common drain, stagnant, choked with filth, imperfectly covered by a few loose boards. So poisonous was the stench that I have felt unwell ever since.'

"At 6, Richard-street, on 5th of August, the wife of a rope-maker, aged thirty-three years, 'premonitory diarrhoea, (twenty-four hours;) cholera, (eighty hours.)' Mr. Orton, the medical attendant, states:—'The drainage is filthy, the contents of the water-closet being nearly on a level with the floor, &c. Two children died last week at No. 4 in this street, from cholera.'

"At 1, Jacob-street, on 14th of August, the son of a labourer, aged eleven months, 'diarrhoea, (some days;) cholera, (three days,) fever.' 'This small house (says Mr. Martin) is crowded with lodgers, several of whom are sick, the cellar is half full of water and soil from adjoining privies, which can be seen through the broken floor of the room inhabited by the parents of the deceased child; the stench emitted was fearful at night, when the door was closed on the seven souls who lived in the room.'

"At 1, Retreat-place, High-hill-ferry, Upper Clapton, on 24th of August, the wife of a gardener, aged fifty-four years, 'developed cholera, (ten hours.)' The Registrar reports:—'The fact of seven deaths having taken place in one week at High-hill-ferry proves that something is radically wrong, as regards the sanitary state of the place. There is an open ditch running from the top of the hill to the bottom, and washing with its filthy substance the side walls of some of the houses, and passing close in front of others, so that I am not surprised at the cholera having taken up its abode there. This is not the first time that I have taken notice of this nuisance.'

the difficulty, it must be remembered, first, that such is the immense extent and meandering ramifications of inhabited houses, and the almost fearfully dense and constantly-increasing population of London, (we use the term widely,) that the drainage, however excellent as far as it goes, (and truly great in extent it is,) is yet far inadequate to the necessities of the Babylon we live in. Secondly, that from want of funds—for sewer-making is the most expensive of all undertakings\*—many of the most closely-built and densely-inhabited (with the dirtiest and poorest people) districts are either quite undrained, imperfectly so, or have the works connecting the houses to the sewers, or the smaller sewers to the main conduits, choked up, or in such a state of ruin as to be nothing but longitudinal and often open cesspools, whose contents ooze up around the dwellings and through the very floors of the habitations.† Thirdly, the want of uniformity in the law in different divisions, the absence of unity of action and plan in surrounding districts, together with the frequent attempts of the house proprietors to avoid expense or immediate outlay in connecting their property with the street sewers, form formidable obstacles to the amelioration of the present system.‡ Fourthly and lastly, another great evil is that, just like the Romans of old, we discharge all our filth into the river that runs through our city, but, unlike them in this respect, we pump it back into the tanks and cisterns of our houses. In this latter practice, we say, we are far behind the custom of the "Eternal City." The Roman aqueducts of MARTIUS and CLAUDIAN, which stretch their long and broken lines of lofty arches over the south of the Campagna, shattered and fallen as they are, still speak to us of the past

and mighty grandeur of Rome. The first brought water to the city from more than sixty miles' distance, and at one period of the history of the "Seven-hilled Queen," no less than twenty aqueducts brought so many different streams of water across the wide plain or Campagna where she stood. What a contrast to ourselves!

"The sewers of London run into the Thames and the sea, from which a part of the water-supply is derived. The water which the inhabitants of London have but the repulsive alternative to discuss in words or to use in fact, is, however, baled from the ditches only, by the wretched inhabitants of such parts as Jacob's Island."

Again:—

"We have been informed, for instance, on good authority, that in a warm summer, the New River water, as delivered in London, sometimes contains spawn floating in it, and has a fishy smell, which is objected to by bathers; but this matter and all animalculæ visible to the naked eye may be detained by sand-filtration, and the nuisance in this instance is to be ascribed to the omission of that practice.† It is true that attempts have been made by some recent Acts to remedy an evil, against which it might be thought it would, to use an old proverb, be 'No sooner said than done.'"

"To warn any class of men," says the "Report" before alluded to, "against the use of unclean excremental water, even filtered, may appear useless. But it is now known that it enters into the supply of some of the principal cities of Europe, and contaminates the *eau sucrée* of Paris, as well as the house-water of London. The disagreeable, revolting nature of this truth has probably been a cause of its suppression, and the consequent perpetuation of an insufferable nuisance."

What progress we are making in removal of the evil may be gleaned from the following extract from a pamphlet (dated June, 1854,) by Mr. BURCH:—

"Nothing will be done this session, and the people of more than half London will be drinking water tainted not only with the ordinary sewage discharged into the river Lea, but apparently also with the poisonous excretions of Cholera patients. The New River Company have obtained a Bill for diverting the sewage of Hertford, which of course 'tells' very well. But the effect is merely to divert the sewage from their upper to their own lower source of supply, and the supply of the East London Company."

In the absence of any specific information on the subject, it is difficult even to conjecture to what extent illegal practice is carried on in this country. It would appear, however, from letters lately published in this journal, that in some districts, at least, the number of persons so offending is perfectly alarming. One gentleman alone has stated that he is prepared to lay before a competent committee the names of thirty of these imposters, all practising in one town. Whether or no a more than usual number are congregated in this particular locality, matters little to the general question; for it is notorious that there is scarcely a qualified practitioner in any district of the kingdom whose practice is not interfered with by knaves and charlatans, falsely calling themselves surgeons or physicians. Even in a pecuniary point of view such a state of things is sadly disheartening to those honourable members of the profession who, after much labour, study, and expense, have qualified themselves for the practice of medicine. But it is even a more serious matter when viewed in relation to its influence on the respectability of the profession at large. It is this class of men who, in various ways, bring obloquy upon that calling to which they falsely pretend to belong. These are the persons who figure at our police-courts and at the bar of the Old Bailey; these are the persons who cannot by possibility

\* The 31,000 feet of new sewers made in the Holborn and Finsbury district between 1822 and 1831, cost more than £23,000. The elongation of the great Fleet sewer from Holborn to Kentish Town, in 1828, cost £46,682, the extent being 16,000 feet.

† In one position, a brick sewer, five feet high by three feet wide, will be constructed, at about £2 10s. per lineal yard, whilst in a similar situation there will be laid down an earthenware tube, one foot three inches in diameter, at an expense of 8s. or 10s. per lineal yard. There must be something positively wrong in such discrepancy of practice as this. . . . If the cheaper sewer performs its functions more or even as perfectly, then is the achievement so much the more worthy; but if it does not perform so well, then the innovation becomes an injury."—*Vide Robinson on the Drainage of Towns*, p. 8.

‡ "In the sub-district of Haggerstone West, at 23, Dunston-street, on the 4th of August, a milk-seller, aged thirty-one years, died of 'small-pox, (thirteen days.)' This was a most malignant case. On and adjoining the premises are overflowing cesspools; no drainage. Streets almost under water, to the disgrace of the Commissioners of Sewers, who have been applied to again and again without effect."

"At 23, Bethnal-green-road, on the 13th of August, the wife of a confectioner, aged thirty-four years, 'diarrhoea, (twenty-four hours), malignant cholera (three days), consecutive fever, (two days.)' Mr. Rolph, her medical attendant, writes:—'This case occurred in the high or main street of this parish, which contains above 90,000 inhabitants, as was shown by the last census. It has no sewer in the main street, (although rates are regularly exacted for this purpose;) and at the rear of the house in which deceased died is a graveyard, which has received for interment upwards of 57,000 persons. In the year 1849, the number of burials which took place in the churchyard amounted to above 1200. Such a state of sanitary affairs is without a parallel in the metropolis.'

"At 32, White's-grounds, on the 22nd of August, the son of a labourer, aged three years, 'cholera, (five days), congestion of brain.' The Registrar, after recording twenty-two deaths from cholera, says:—'These two deaths from cholera have occurred within a few days in White's-grounds. Several of the houses are in a filthy, dilapidated state, the drains and privies belonging to Nos. 31, 32, and 33 are in a shocking plight. The soil from the privy at the back of No. 31 is actually above the surface. Places such as these must be very prejudicial to health. I have certified the state to the Guardians of the Poor, who will immediately take proceedings for the removal of the nuisance, and the cleansing of the houses. The Commissioners of Sewers have recently covered in an open sewer at the back of these houses, and also done extensive works in the vicinity, but the good resulting from such works is not for the moment available, inasmuch as the owners of property have not been compelled to connect the drains of their houses with such sewers.'

"The householders in Wellington-street, mostly shopkeepers, complain bitterly. They have paid sewers' rates for four years, and yet have to empty all their slops into the gutter, which, as in the case of New-street, is so faulty that stagnant slush is constantly seen in pools along the entire street."—*Registrar-General's Returns for August, 1854.*

† A remarkable case was mentioned to the Committee on the Health of Towns in which a new sewer, nearly a mile and a half long, had been made in the parish of Camberwell, on the urgent application of the inhabitants, and yet only one application had been made for a private drain in the whole distance.—*Penny Cyclopædia*, vol. xxi, p. 317.—See also our previous remarks on the drainage of the Woolwich marshes, ante p. 130.

\* Report on the Mortality of Cholera in England, 1848-49, p. lxxviii. London. 1852.

† Report by the Government Commission on the Supply of Water to the Metropolis, p. 16. London. 1851.

have any sympathy with honourable men, and therefore batten upon the injuries they inflict upon respectable members of the profession. It has been shown that there is nothing too low or too base to which they will not resort to effect their end. Almost every post brings us some complaint against these enemies to our calling. Praters about "the honour and dignity of the profession" would do well to direct their attention to this evil. Instead of sowing dissension, and engendering heart-burnings amongst honourable and respectable men, let them render real service to the cause of their brethren, by organizing for the purpose of obtaining some means of punishment for the harpies that fasten their talons with so deadly a grasp upon the medical body. You may raise the standard of education; you may make the entrance to the portals of legitimate practice more difficult; you may institute societies for raising the scientific character of medicine; but these benefits, great as they would be, would fail to effect their full amount of good, so long as the evil under consideration is allowed to remain. It would perhaps be vain to expect a cordial co-operation in the work of exterminating this evil from many of those who have power and influence in the profession. They may, to a certain extent, be beyond the reach of its baneful effects. It is that numerous class of gentlemen who are engaged in general practice on whom the injury is chiefly inflicted. Ask any young practitioner, and, indeed, it may be said any old one, what are the greatest evils with which he has to contend? and in ninety-nine cases out of a hundred the answer will be, that he is immolated by the prescribing chemist on the one side, and the quack upon the other. There must come a time when this state of things will cease to exist. It would be well, in the mean time, that practitioners in every district of the kingdom collected evidence upon the subject, in order that it might be made available when the proper opportunity for using it arrives.

## SANITARY STATE OF THE METROPOLITAN POPULATION.

To the Editor of THE LANCET.

SIR,—Acting upon the suggestion contained in Dr. Webster's letter, (*vide* THE LANCET, October 7th,) "that our stock of accurate information regarding the late sanitary condition of the metropolitan population may be augmented," I send the following statistics, obtained from the register of cases at the Bloomsbury Dispensary during the prevalence of the cholera, as compared with the corresponding period of 1853:—

- "1. From August 1st to October 31st, 1853, the number of cases of all kinds admitted was 931.
- "2. From August 1st to October 31st, 1854, the number of cases of all kinds admitted was 2080.
- "3. From August 1st to October 31st, 1854, the number of cases of cholera and choleraic diarrhoea admitted was 530.
- "4. From August 1st to October 31st, 1853, the number of deaths from all causes was 24, being 2·57 per cent. of the total number of cases admitted.
- "5. From August 1st to October 31st, 1854, the number of deaths from all causes was 31, being 1·49 per cent. of the total number of cases admitted.
- "6. From August 1st to October 31st, 1854, the number of deaths from cholera and choleraic diarrhoea was 3, being '56 per cent. of the patients admitted suffering from those complaints, or rather more than 1 in 200.

"Bloomsbury Dispensary, Nov. 1854."

"T. CHAPLIN,  
Resident Medical Officer.

From this statement, it appears that there is one point of discrepancy between the statistics of St. James's and Blooms-

bury—namely, that fewer patients were attended at the former, whilst more than double the number were attended at the latter dispensary during the choleraic period. But the point of agreement is of most importance—namely, "that other diseases then prevalent appear to have been less frequent, and also showed a milder type, and that cholera and choleraic diarrhoea seemed to supersede most other maladies, and that early debility was the ordinary characteristic of disease." It was observed that boils and carbuncles, erythema, and erysipelas ceased, or nearly ceased, on the outbreak of cholera in this district.

In respect to the sanitary condition of this locality, a very marked improvement has been effected by the liberality of the Duke of Bedford in the construction of deep and capacious sewers through some of the narrowest streets and most densely populated neighbourhoods. To this cause, in all probability, has been owing, in a great measure, the mildness of the epidemic, and its comparative non-fatality.

Of sanitary regulations and improvements, it may be asserted—and our statistics bear out the assertion—that, although the epidemic was not averted by these means, yet that it was greatly divested of its fatal character.

Whatever tends to increase the healthy condition of the people, increases in the direct ratio the power of resisting the force of an epidemic; and, on the contrary, whatever tends to weaken the health or exhaust the strength of the constitution, favours the destructive force of the epidemic. In this way an explanation may be afforded of the greater fatality of the epidemic in insalubrious districts in the metropolis; amongst our troops at Varna; on board our ships in a state of inaction, both in the Baltic and in the Black Sea, and in the Crimea after the battle of the Alma.

I remain, Sir, &c.,

ISAAC PIDDUCK, M.D.,  
Montague-street, Nov. 1854. Physician to the Bloomsbury Dispensary.

## THE COLLEGE OF SURGEONS AND THE PUBLIC MEDICAL SERVICE.

To the Editor of THE LANCET.

SIR,—I think the surgeons of England will be astounded by the intelligence conveyed in your leading article of last week, as to the admission of surgeons for the public service. Is it impossible to bring the Council of our College to a sense of their duty? They have laboured but too efficiently for fourteen years to the degradation of the profession; can they not be restrained, now that they abdicate all efforts to maintain the rank of the surgeons of our fleet and army, and aid in crushing them by the damning servility of their present step? From them it has gone forth that the surgeons of England, members of the College, are not equal to the ordinary emergencies of their calling. If the education and examination for the membership is so inadequate, why do they lower it? By what logic do they reconcile it with their consciences that, in order to pander to the obstinacy of the red-tapists, they are going to fill the most important offices which surgeons can be called to with men of education yet inferior to their present members? Their duties will be to tend the wounded heroes of our land—to save lives of value to the State beyond my skill to reckon; they will have to fight disease, and defend from the results of injury; but not in well-found hospitals, with time to choose the method, to seek support or advice from others or from books, to select the best of instruments and appliances specially constructed for each case, and then to operate with the aid of practised dressers, trained and skilled assistants. Far from it. These men will, many of them, at every turn see life ebbing from the brave and valued upon the full current of the wounded artery; and, from the treasures stored up in the brain, with little time for recollection, none for consultation, without skilled assistants, and possessing only instruments of general, not special, adaptation, will have to fight the second fight of every battle-day—saving those lives which the enemy's efforts have endangered. I am indeed prepared most solemnly to assert that a two and a half years' student of the highest capabilities is not fit for service in the field. For the greater part of his time, say two years, he has not engaged in practical studies at all, and if for six months he has frequented wards of hospitals and operative theatres, he has had no opportunity yet of training his hand even so as to be an effective dresser.

Whig expediency has already worked ruin in our public councils; let it not be permitted to ruin our sacred art. Let the Council of the College remember their oaths as surgeons, if not as councilmen, to do nothing to the discredit of our calling! Let them now manfully impose their skilled opinion

upon the skillless authorities, and, refusing to admit to their membership unqualified boys, demand the removal of the impediments which bar the service of the State to every man of high and honourable feeling.—I am, Sir, your obedient servant,  
Nov. 1854. ONE WHO HAS SEEN FOREIGN SURGERY.

## THE REVIEW OF THE WORK OF DR. HASTINGS.

To the Editor of THE LANCET.

SIR,—I cannot but think your reviewer has borne harshly and unfairly upon Dr. Hastings in the recent review of his work in THE LANCET, and has expressed an unwarranted contempt for the tendency of some minds to search after mere remedies, as a means of advancing medicine. It is to the empirical method, (I do not use the word in its bad or mean sense,) and not to the study of doctrine or theory, that we owe the use of mercury and bark. The greatest English physician, Sydenham, set up the empirical search for remedies as one of the very highest things which could occupy the attention of the practitioner. Nor does this sentiment and its results belong merely to former times. We of the present day must refer the use of hydrocyanic acid, (a medicine certainly as dangerous as oxalic acid,) creosote, the use of ether as an anæsthetic by Morton, the great discovery of the use of chloroform, cod-liver oil, &c., to empirical sources. They certainly did not flow from the study of doctrine or theory. The late Dr. Williams spent much of his time at St. Thomas's Hospital in mere experimentation in remedies, and to this we owe the use of the iodide of potassium, almost as a specific, in pericarditis. At the present time Dr. Simpson, of Edinburgh, is engaged in a trial of the salts of nickel, cerium, and other metals, from which he expects, and believes he has already realized, great advantages. It may be mortifying to admit that many of our great resources in physic have arisen, not so much from patient thought and theory, as from bold experiment, and from hints taken from popular practices, but I think all must admit that the fact is so.

I cannot join with the contempt of your reviewer for the use of naphtha in the early stages of consumption. Since the publication of the book of Dr. Hastings upon the subject, the tendency of all our knowledge has been to show that highly carburetted substances, including cod-liver oil, are those most effectual in the treatment and prevention of consumption. It does not appear, then, that Dr. Hastings made a mere guess when he advocated the use of naphtha. It is now known that in some cold countries the inhabitants ward off consumption by the free use of animal oils; in others, by the use of spirits. It has been found, too, that drunkards, though they get other diseases, are comparatively free from pulmonary consumption. Naphtha is still used by many, and will probably always be used, in the treatment of phthisis.

Dr. Hastings may be wrong in his recommendation of the oxalic and fluoric acids, but he may be right; and I have certainly seen a case in which his treatment was of remarkable efficacy in the arrest of undoubted phthisis. I should hope, sir, that you would at least give Dr. Hastings the opportunity of publishing in your pages any cases in which the new remedies advocated by him have been found useful. We certainly ought not to check any honest attempts to enlarge the *armamentarium medicum*, for as yet we have derived very little comparative benefit from the vast advances of chemistry in the knowledge of organic and inorganic substances.

I remain, Sir, your obedient servant,

Nov. 1854.

M.D.

P.S. I enclose my name as a guarantee of my good faith.

Should Dr. Hastings forward to us any reports of cases, showing the results of his treatment, we shall publish them without hesitation. The doctor may be assured that we have no personal feeling on the subject of his work or his practice.—  
Ed. L.

## UNQUALIFIED PRACTITIONERS.

To the Editor of THE LANCET.

SIR,—Now that the subject of illegal practice is on the tapis, I wish much to mention my case:—

An individual, without any qualification, is practising in my neighbourhood, having two of the best clubs in the place, and several very excellent patients, and I blush to add that qualified medical men meet him in consultation. If these gentlemen were asked why they meet him? they would answer—“Poor fellow! he has a large family to keep, and what can one

do. It seems unkind not to do so,” &c. So in this way they suffer one of their own fraternity to be robbed right and left out of false pity for this person, who unhesitatingly places “Sergeon” on his door, and assumes a title he has no more right to than the pen I now hold. I say false pity, because I feel certain that the little smattering of knowledge he obtains by their prescriptions can but prove a curse to him who daily lives with the fear of prosecution over his head, and I should think a curse to those who employ him, from his want of decision and knowledge in the treatment of diseases. If I am wrong in this my judgment, for what purpose are we forced to expend so much time and money by apprenticeship and years in London, attending the hospital medical and surgical practice, lectures, dissecting, &c., and finally obliged to pass one or two severe ordeals before we are allowed to gain our own living? To speak in the mildest language, it is most unfair. It may be asked—Why do I not stop such proceedings? I can only say that if I were to do so, I should raise such a nest of hornets about my head, that it would be more bearable to give up my practice and retire elsewhere. The person in question would be looked upon as a martyr, and I as a tyrant, who had turned a man, his wife, and family out of doors, and perhaps into the workhouse, to gratify my avarice, or something of that sort.

Are there no members of the profession sufficiently rich, independent, and spirited to give a decided opinion upon this momentous question?—with perseverance enough to weed out these tares? We have men who will labour during their lives for the benefit of mankind in general; surely there are some who have the time and the energy to become good soldiers in the cause of their sadly abused profession, and who will work patiently until they have placed their supreme science on that pedestal where it should stand amongst the noblest and the best, not contaminated and associated, as it too often is, with illegal practitioners, midwives, and nurses.

Knowing the deep interest you always evince in the welfare and honour of our calling,—I am, Sir, yours very truly,

November, 1854.

M.R.C.S.E. & L.A.C.

P.S.—Could not a Society be formed (with the sanction and authority of the Examining Boards) to prosecute persons practising without a diploma of some sort? The funds to be raised by every gentleman giving, on passing his examination either at the College or Hall, one guinea over and above his diploma fee for the purposes of this Medical and Surgical Protection Society.

## DR. AYRE'S TREATMENT OF CHOLERA BY CALOMEL.

To the Editor of THE LANCET.

SIR,—Should the following letter be deemed worthy of a place in the pages of your far-famed, widely-circulated, and re-published LANCET, please insert it.

I am, Sir, your obliged and obedient servant,

Hamilton, Canada West, Oct. 1854.

W. CRAIGIE.

[TO DR. AYRE, OF HULL.]

DEAR SIR,—Having, in our visitation of cholera in July and August last, tried your plan of treating that formidable disease, I feel it my duty to report to you the results. In only eleven cases could I succeed in getting the treatment fairly and honestly carried out, from the difficulty of getting proper attendants for the sick during the panic. Of these eleven cases, eight recovered from the stage of collapse, but one of them died on the sixth day after, from consecutive congestive fever. In all the cases, collapse had fairly set in before the treatment was begun, and in two of the cases (both of which recovered) was so far advanced as to leave very little hope of recovery. The treatment consisted in giving a two-grain calomel pill every ten minutes, with a tablespoonful of cold or iced water to wash it down. A bit of ice was allowed to dissolve in the mouth in the intervals, if it could be got, and was required to relieve the thirst. Mustard was in most cases applied to the stomach and bowels, or fomentations with turpentine; and warmth by bottles or sacs of hot water to the body and extremities. Nothing else was allowed till reaction was fairly established; but when reaction commenced—when the pulse could be felt, and the breath became warm—the pill was given only every fifteen or twenty minutes.

The largest quantity of calomel taken was, in one case, 200 grains in twenty-four hours, and, in another, 160 grains in sixteen hours. In the former case, the medicine was continued three or four hours longer than necessary; but neither in this nor in any other case of recovery did salivation result from the medicine, nor any other effect than reaction and change of the

character of the stools from rice-water to dark, often black, discharges.

It was very different with the premonitory diarrhoea, for which I tried calomel and opium, two grains of the former to one of the latter. This was successful; but salivation frequently occurred when only four or five doses of the medicine had been taken.

Sulphuric acid, with and without laudanum, was also tried, with very uncertain results. In some cases, it speedily checked the diarrhoea; in others, it seemed to have no effect; and I was unable to judge by the symptoms when it was likely to succeed, and when to fail. What I found most certain and most effectual in checking the diarrhoea, and of course preventing the cholera, was a mixture of laudanum, tincture of rhubarb, and ammonia; but even this was not always successful.

During the prevalence of the cholera, there was a strong tendency to bowel complaint. A moderate dose of castor oil, without or with twenty or twenty-five drops of laudanum, or a teaspoonful of salts—even a seidlitz powder—would produce hypercatharsis, and end in cholera. I also observed many anomalous cases: for instance, a patient was apparently recovering from an attack of *bilious* diarrhoea, when collapse suddenly set in, and death in from four to six hours, the discharges both from the stomach and bowels being *bilious* to the last. Would you call this Asiatic cholera? Again: a patient would have a violent fit of vomiting, followed by one very copious faeculent discharge from the bowels, and be so prostrated as to die in four or five days, there being no collapse, no subsequent vomiting, and very little bowel complaint. I saw four such cases. What were they?

In two of the three fatal cases referred to, I am quite certain the treatment was fairly carried out as long as the patients could swallow. One of them was the last case I saw. A young woman was affected with diarrhoea in the morning. Vomiting and cramps came on at three P.M., with collapse. Treatment commenced in half an hour after. Death at nine P.M. In a great number of cases where the treatment was only continued till symptoms of reaction occurred, and then abandoned, relapse followed; and though the treatment was resumed, death followed. I particularly recollect two cases of this kind, where I feel confident recovery would have resulted had the treatment not been intermitted, in the one case for nearly three, and in the other for four, hours. It is not prudent or safe to relax the treatment till bilious discharges are produced.

Consecutive fever occurred in four of the eight cases of recovery from collapse; two of these were very severe; one of them fatal.

The result of my experience has produced the greatest confidence in your plan of treatment, and the profession, as well as humanity, owes you a debt of gratitude for suggesting the most successful mode of treatment yet proposed.

I have the honour to be, most respectfully, dear Sir,

Your very obedient servant,

W. CRAIGIE.

## THE WAR.

**HEALTH OF THE TROOPS BEFORE SEBASTOPOL.**—The French Minister of War has received the following letter from Dr. Michel Levy, chief physician to the army in the East:—

Under Sebastopol, October 27th.

"M. le Maréchal.—The siege is proceeding with vigour. The daily number of wounded, however, is not considerable. It varies from 16 to 22, and the killed from 6 to 8. From the opening of the siege to the 23rd of October the total number of wounded, including cases of mere contusions and slight wounds, which constitute the majority, amounts to 718, and that of killed to 98. On the 25th, 320 sick were embarked for Constantinople, and there remain at present 1008 sick in the ambulances. Of these 137 only are wounded. Thus the duties of the medical department are more arduous under the fire of the batteries of Sebastopol than those of the surgical department. I visited in detail all the sick, and have ascertained 1st, that one-third only are seriously ill; 2ndly, that the other two-thirds are in a debilitated state, but certain of recovery. The General-in-Chief has ordered measures necessary to improve as much as possible the position of our sick. The Turkish wounded are attended in our ambulances. I visit as often as possible the ambulance in the trenches. It is placed under the care of the different surgeons of the army ambulances, who relieve each other daily. This service, which is not without danger, is a post of honour, and a practical school of military surgery. Our wounded, and those

who have undergone operations continue to furnish a remarkable proportion of cures, thanks to the care taken of them and the skill of their operators, the most distinguished of whom are Messrs. Scrive, Thomas, Marmy, Gœury, Secourgeon, Perier, Bourguillon, Colmant, &c. No army ever received medical and surgical assistance more prompt, more methodical, more complete, or more assiduous. Under the walls of Sebastopol and at Constantinople we have a number of talented practitioners vying with each other in skill for the benefit of our sick and wounded. The ambulances, installed on the tableland above Sebastopol, amid the roaring of the artillery, exhibit, by their regularity and excellent organization, the best specimens of those temporary establishments. Not a single case of cholera or lock-jaw had manifested itself of late amongst the wounded. The internal diseases are chiefly diarrhoea, dysentery, devoid of intensity, light intermitting fevers, and gastric fevers, some of which are accompanied by cerebral congestion. The cold of the nights produced a few cases of bronchitis. The fleet reckons between 500 and 600 scorbutic patients, of whom the most seriously attacked have been landed. The army is completely free from that affection, and the daily distribution of fresh bread, and the very frequent distribution of fresh meat, preclude the possibility of its manifestation. The morale of the army is also a protection against it. Notwithstanding the toils attending the duties in the trenches and certain privations, the soldiers continue in high spirits. The General-in-Chief is constantly amongst them, seeing after their wants, and the certainty of an approaching triumph is another element of hygienic preservation."

**THE STAFF-SURGEONS IN THE ARMY.**—A new dress has just been decided upon for staff-surgeons. It will consist of a tunic or frock, similar in shape to the new line dress, with a slight display of gold lace. The facings and cuffs are covered with black velvet, turned up with lace. The dress trousers are black, with a stripe of gold cord; the undress of the similar colour, but with a small scarlet cloth stripe. The cocked hat will be retained, with a small green plume. The regimental medical officers' uniform will be almost similar to the foregoing, save in regard to the facings and cuffs, which will be regulated in regard to the shade and pattern used by each corps. An addition will be made to the foregoing in the shape of pouch, &c.

Dr. HALL has returned from Scutari, and has resumed his duties as principal medical officer of the army before Sebastopol. The medical staff is represented as being inadequate to the present wants, owing to the number of deaths that have occurred in the medical department from cholera.

**APOTHECARIES FOR THE FORCES IN THE EAST.**—The following warrant has been issued:—

"Victoria R.—Whereas it has been represented to us that great benefit will result from re-establishing the rank of Apothecary to the Forces, our will and pleasure is that apothecaries to the forces shall form part of the regular establishment of the army, and that they shall rank as lieutenants, according to the dates of their commissions, for the first 15 years of their service, and after that time as captains, but as juniors of that rank.

"The pay of an apothecary to the forces shall be:—Upon first appointment, 9s. a day; after 5 years' service, 10s. 6d. a day; after 10 years' service, 12s. a day; after 15 years' service, 13s. 6d. a day; after 20 years' service, 15s. a day; after 25 years' service, 16s. 16d. a day; after 30 years' service, 18s. a day. He will receive an allowance for a servant, and for lodging and fuel, if not provided with quarters, and forage for one horse, if kept.

"The rate of half-pay of an apothecary to the forces shall be, after 10 years' service, 5s. a day; after 15 years' service, 6s. a day; after 20 years' service, 7s. a day; after 25 years' service, 8s. a day; after 30 years' service, 9s. a day.

"But no apothecary to the forces shall be entitled to claim retirement after any period of service under 30 years' duration, upon the ground of ill-health contracted in the service, unless such unfitness for service shall be supported by medical certificates satisfactory to our Secretary-at-War.

"Every apothecary to the forces who shall have served upon full pay for 30 years and upwards, shall have the right to retire upon half-pay, provided that the Secretary-at-War shall be satisfied with the manner in which such apothecary shall have performed his duty.

"Given at our Court at St. James's, this 23rd day of October, 1854, in the 18th year of our reign.

"By her Majesty's command,  
SIDNEY HERBERT."

**THE WOUNDED FRENCH AFTER THE BATTLE OF THE ALMA.**—The medical periodicals in France give the following figures respecting the French wounded after the battle of the Alma:—The number of wounded sent from the Crimea was 1064. At the present time, there are at the Pera Hospital 500 men; at the Dolma Baktché Hospital, 352; at Kanditjé Hospital, 116; at Ramis-Tchifick Hospital, 5; and at Maltepe Hospital, 7 men. There are also, at the Convalescent House of Dahoud Pacha, 75 men, who had left the wards soon after their admission. Amongst these wounded were 182 Russians. On the 9th of October, the number of deaths was within 50—viz., less than 1 in 19 patients. Out of 90 amputations, there have been but 11 deaths. Out of the 28 amputations performed on the field of battle, the subjects of which were conveyed to Constantinople, 6 only have died. The Russians resist the sequelæ of operations better than the French. Some fears were at one time experienced respecting the effect which would be produced by a certain number of cholera patients who were sent to the above-named hospitals from the Crimea; but these men were placed under tents by order of Dr. Levy, the director-general of the medical service, and the disease happily did not spread. Such isolation of cholera patients had already been tried at Varna, and found to answer completely.

### Medical News.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, November 9th, 1854.

DODD, HENRY ALLNUTT, North Stoke, Oxon.

HAFFENDEN, DALTON ADOLPHUS, Hanwell.

RICHARDSON, BENJAMIN, Glusdale, Whitby, Yorkshire.

**QUEEN'S COLLEGE, CORK—MEDICAL FACULTY.**—The Medical Faculty was opened on the 2nd inst., by the Dean, Dr. Fleming. The lecture-room was densely crowded, and the proportion of students appeared to be larger than on any similar occasion.

**UNIVERSITY COLLEGE, LONDON.**—The first session of the council for the current academical year was held on Saturday, the 4th inst. The Liston clinical gold medal, for surgical cases, was awarded to Mr. John Zachariah Lawrence. The Fellowes clinical medals, for medical cases, were obtained—the gold by Mr. Stephen Nesfield, the silver by Dr. Frederick G. Clarkson.

**REWARDS TO MEDICAL PRACTITIONERS FOR SERVICES DURING THE CHOLERA.**—The Treasurer of Guy's Hospital has presented to Mr. Henry Wakefield, Junr., of Russell-square, a complete set of the "Guy's Hospital Reports," as "a small acknowledgment of his services in the Hospital during the late prevalence of cholera." And at a meeting of the Governors, held last week, Captain Shepherd, Deputy-Chairman of the East India Company, offered to Mr. H. Wakefield an Assistant-Surgeoncy in the Company's service, as a further mark of his own and the Governors' appreciation of his zeal and exertions on the same occasion.—Aylesford, a small village on the banks of the Medway, about two miles and a half from Maidstone, was the seat of cholera to a fearful extent during the late epidemic. The principal inhabitants, anxious to testify their appreciation of the unremitting attention and kindness evinced by Mr. J. W. Barnes, the resident surgeon of the village, towards the poor during the scourge, have generously subscribed and presented him with a purse of £35.—The Guardians of the Brentford Union, at their weekly meeting on Wednesday last, voluntarily voted to each of their medical officers a relative amount of remuneration for their extra duties during the late prevalence of cholera. This is at least one step in the right direction in recognising the services of a class of men so notoriously underpaid, and whose duties have become so much identified with all matters pertaining to the health of the community. The Brentford Board is presided over by John May, Esq., of Twickenham, a gentleman of liberal mind, and a staunch friend to the profession.

**SALARIES OF IRISH POOR-LAW MEDICAL OFFICERS.**—At the last weekly meeting of the Limerick Board of Guardians, Sir Richard de Burgho, Bart., in the chair, a letter from the Poor-law Commissioners was read, in which the Commissioners affirmed the salaries of the medical officers of the Union,—that of Dr. Brodie at £100 a year, and Dr. M'Mahon at £90, with rations.—*Irish paper.*

**ELECTION OF A MASTER OF THE DUBLIN LYING-IN HOSPITAL.**—The appointment of a fitting master to the Lying-in Hospital of Dublin is a matter of deep interest and importance to those engaged in obstetric practice in every part of the world. The present improved state of obstetric science and practice is largely owing to the ample facts which several able and industrious masters of that institution have collected, methodized, and published. It is therefore with unfeigned gratification that we announce the election of Dr. M'Clintock to that office. The admirable work Dr. M'Clintock published, in conjunction with Dr. Hardy, containing the fruits of their observations during three years' service as assistant-masters, constitutes the most unimpeachable proof of his fitness for the higher office of master, and is, at the same time, the surest pledge of further and even more valuable accessions to science. We congratulate, not so much Dr. M'Clintock, who has only achieved that to which his merit entitles him, but the profession, which, already his debtor, looks to him with confidence for still greater advances in knowledge.

**LORD PALMERSTON AND THE REMOVAL OF NUISANCES.**—Dr. Waller Lewis has been commissioned by the Secretary of State for the Home Department to inquire into the laws of foreign countries for the regulation of noxious trades and occupations, and to report on the effects of these employments on the health of the artisans.

**HOMŒOPATHS IN TROUBLE.**—At Marseilles, the Inspectors of Pharmacies have seized, in homœopathic establishments, certain medicines prepared according to Hahnemann's directions; and the matter is to be brought before the Courts, as the inspectors contend that homœopathic chemists do not comply with several articles contained in the regulations according to which pharmaceutical matters in France are settled.

**THE ROYAL SEA-BATHING INFIRMARY, MARGATE.**—Efforts are now being made for establishing this noble institution upon a broader and more efficient basis, by retaining eighty patients until the 1st day of January. This establishment, which is essentially national, and receives its inmates from all parts of the kingdom, is especially devoted to the treatment of scrofulous and analogous diseases, which, by concurrent medical testimony, can only be successfully treated under the favourable conditions attendant on a sea-side residence.

**MUNICIPAL ELECTION AT INVERNESS.**—Two members of our profession have just been elected members of the Town Council of Inverness—Dr. Forbes and Dr. J. G. Mackenzie. The former gentleman, who was re-elected, had not offered himself as a candidate until shortly prior to the election, when he was pressed by many of the electors to become a candidate, which he did, but made no canvas. The *Inverness Courier* congratulates the burgh on the results of the recent election.

**HIGH-SHERIFF OF CARDIGANSHIRE.**—We were much pleased to notice, in the *London Gazette* of the 11th inst., that John Propert, Esq., has been nominated high-sheriff of his native county.

**MEDICAL HONOUR.**—The Governor-General of India has been pleased to appoint Dr. Robert Muir to the charge of the 1st Assam Light Infantry. An Irish journal, in commenting on this appointment, says:—"This office has been conferred by Lord Dalhousie as not only due to the merits of this promising young medical officer, who has been but a short time in the Company's service, but also as a tribute of respect to the memory of his father, the accomplished writer, 'Delta.'"

**THE NEW COMMISSION OF SEWERS.**—Dr. Augustus Sayer, of 25, Upper Seymour-street, Bryanstone-square, who for many years past has distinguished himself by his indefatigable zeal for the sanitary welfare of the parish of Marylebone, of which he is a vestryman, has been elected a commissioner to represent the borough of Marylebone at the New Representative Commission of Sewers that is to be appointed in the course of a few days in place of the old and defunct body.

**THE PATRIOTIC FUND AT MARYLEBONE.**—Drs. Watson, Burrows, and Augustus Sayer have been appointed members of the committee, amongst whom are the Right Hon. Lord Portman, Lord Wodehouse, Lord Rokeby, Sir James Hamilton, Bart., Sir B. Hall, Bart., M.P., the Hon. Baron Platt, and other noblemen and gentlemen residents of the wealthy parish of Marylebone, for collecting money on behalf of the Patriotic Fund in that district. The subscriptions already, in less than a fortnight, amount to £2000.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, NOVEMBER 11TH.**—Last week the total number of deaths registered in London was 1160. In the ten corresponding weeks of the years 1844-53 the average number was 1011, and if this is raised in proportion to increase of population it becomes 1112. From a comparison of the results it appears that the mortality is now not much in excess of the usual amount, but it exceeds in a more important degree the point to which the usual mortality, in an improved condition of London, might be reduced. Cholera, which was fatal in the two previous weeks in 66 and 31 cases, was fatal last week in 23. In the same weeks diarrhoea numbered 46, 33, and 35 deaths. Nine of the deaths from cholera occurred on the north side of the river, the remaining 14 on the south side; 3 of which are returned in the sub-district of St. Paul's, Deptford, 4 in the district of Lambeth. Scarletina has for some weeks predominated amongst zymotic diseases. In the first week of October the deaths referred to it rose to upwards of a hundred; since that time it has fluctuated near the same point, but its tendency has not been to decrease. Last week the births of 839 boys and 727 girls, in all 1566 children, were registered in London.

### Obituary.

**DR. JAMES REID.**—This physician, whose premature death was recorded in the last number of THE LANCET to have occurred on the 5th instant, after a short illness, at the age of fifty-one, was a native of Scotland, and educated at the University of Edinburgh, where he received the degree of Doctor in Medicine. Like numbers of his ambitious countrymen, Dr. Reid migrated southward, to obtain further professional knowledge, and to push his fortune, as many others had done previously, in the great metropolis. He became in 1824 a licentiate of the Apothecaries Company, and in April, 1825, was likewise admitted a member of the College of Surgeons. Soon afterwards, the young surgeon commenced as a general practitioner, in Charlotte-street, Bloomsbury, where he resided during several years, early making himself known for his urbanity, and the attention he paid to those patients who requested medical or surgical assistance. Having remained during several years in Charlotte-street, Mr. Reid removed afterwards to Bloomsbury-square. In this legal locality his reputation increased so much, that he resolved to renounce general business, and to practise especially as an accoucheur. Accordingly the hitherto surgeon-apothecary became, in 1841, a member of the Royal College of Physicians, and M. having been then replaced by D. on his door-plate, Dr. Reid now took full rank amongst the profession as a physician. Prosperity rewarded the perseverance and uniform good conduct of the newly laureated professional brother, during the subsequent seven years he spent in that district of London, which was facetiously called by the late Wilson Croker, a "terra incognita." Following the example of numerous predecessors, Dr. Reid migrated westward, in 1848, when he pitched his tent in Brook-street, which every one knows is ventilated by the aristocratic atmosphere of Grosvenor-square. Being there zealously patronized by several influential members of his own fraternity, and always assiduously attending to those who were placed under his care, professional engagements so augmented that, at the period of Dr. Reid's decease, he had every prospect of being soon a fashionable and much employed physician-accoucheur. But inexorable fate decreed otherwise; since Death stepped forward and ruthlessly cut short the successful career of a worthy individual who, till very recently, had ample reason to anticipate increased professional repute, with its attendant golden remuneration. Analogous to his late metropolitan confrères, Drs. Roupell, Rowland, and Golding Bird, who had each shortly before "gone to that bourne from whence no traveller ever returns," Dr. Reid died as it were in the prime of life, and when it may be said all four had begun to reap, if not actually receiving, the well-earned and ample fruits of their previous labours. Although neither a high intellectual genius, nor profound, it may be truly stated, Dr. Reid had been both a diligent student and possessed a well-stored practical mind, which his various valuable communications to different medical periodicals fully testify. Besides these productions, his "Manual of Midwifery," and the "Treatise on Infantile Laryngismus," evidently show he was an observant and judicious practitioner. His two papers on "Puerperal Mania," and the "Jacksonian Prize Essay on Bronchocoele," likewise merit commendation. To sum up the character of this departed and altogether very estimable

physician, the biographer may justly assert Dr. Reid was an amiable, excellent person, much beloved by patients, and generally esteemed in the profession; consequently his early demise is deeply regretted by relatives and a large circle of friends. He married, rather early in life, Miss Lloyd, a native of one of the midland counties, who still survives with six children; the eldest son being a student of law, intended for the bar, whilst the second has just entered his late parent's profession. Amongst the appointments held by the lamented deceased, two were both responsible and remunerative. One an Examiner in Midwifery to the College of Surgeons; the other being a directorship of the Medical and Clerical Insurance Company. As in other professions, of the army and navy, even when fighting before Sebastopol, no sooner does any fellow combatant drop, than a host of candidates immediately start up to fill all vacancies, whether created by accident, bullet, or disease. This result has supervened in the present contingency, seeing both the above offices have already become objects of very earnest solicitation. Before, however, closing this brief notice of the late respected Dr. Reid, it may be interesting to mention that the malady which caused his dissolution appears to have been of inconsiderable duration, as the deceased had returned home, only slightly indisposed, early in last October, after making on the continent a short excursion of pleasure. Bilious symptoms first supervened, which were followed by an attack of jaundice, with something like ague. The liver latterly seemed seriously diseased, being attended with considerable swelling in the region of that viscus, which, on dissection after death, contained hydatids.

We are sorry to have to record the death of HENRY BECKWITH, Esq., assistant-surgeon in the 49th regiment, now stationed before Sebastopol. He died of cholera, after a few hours' illness, on the 17th of October, having been in good health (although he had gone through great fatigue) up to the previous day, when he was attacked with this fatal disease. He prosecuted his medical studies for several years in the city of York under Mr. William Anderson, and was a distinguished and esteemed student of the York Hospital and the York School of Medicine. During this time, he was well known to, and much noticed by, the principal families of York and the neighbourhood, not only for his gentlemanly and pleasing manners, but as being the eldest son of the late highly-respected Rev. — Beckwith, of Collingham, one of the vicars-choral of York Cathedral. Had his life been spared, there is every probability that, from his superior abilities, he would have been raised to a high post in the medical staff of the army.

Dr. CHARLES FORBES, H.E.I.C.S., on the 21st of August, at Rawul Pindee, Bengal.

At Oldham, on the 7th inst., ROBERT GRUNDY, Esq., M.R.C.S.E. and L.A.C., son of the late William Grundy, Esq., of Hoolebank, St. Helen's, Lancashire.

On the 9th inst., at Woodhill, Cork, Ireland, STEPHEN FAGAN, M.D., of Albion-street, Hyde-park-square, London. The deceased gentleman was an A.M., M.B., 1824, and M.D., 1852, of Trinity College, Dublin.

On the 13th of September, at Umballa, East India, GEORGE TAYLOR FOGARTY, Esq., surgeon of the 7th Bengal Native Infantry, third son of the late John Edward Fogarty, of Drogheda, Ireland.

On the 7th inst., aged eighty-three, JONATHAN WHITE, Esq., Surgeon, Leeds. The deceased gentleman had not been in practice for some years past.

### BOOKS RECEIVED FOR REVIEW.

- Dr. Mayne's Expository Lexicon. Parts II. and III.
- Dra. Jones and Sieveking's Manual of Pathological Anatomy. What to Observe at the Bedside.
- Mr. H. Lee's Pathological and Surgical Essays.
- Dr. C. R. Fresenius's System of Instruction of Quantitative Chemical Analysis. Edited by Mr. J. Lloyd Bullock. Second Edition.
- Professor Plattner and Dr. Muspratt on the Use of the Blowpipe.
- Dr. E. Watson on the Topical Medication of the Larynx.

- The American Journal of Insanity.
- Dublin Hospital Gazette.
- Dr. W. Mackenzie on the Diseases of the Eye.

## TO CORRESPONDENTS.

**An Inhabitant of the Adelphi.**—The matter has been placed before the President of the Board of Health. Our correspondent states that "night and day filth carts are passing to the Thames at the Adelphi, for the purpose of discharging the scum collected in the neighbourhood, the effluvia arising from the organic matter being abominable." It is, indeed, most disgraceful that such a nuisance should be permitted to be carried on in one of the most central parts of the metropolis, and certainly one of the most densely populated. A meeting of the Inhabitants should take place, and the grievance brought before Lord Palmerston, who, no doubt, would cause the nuisance to be stopped. The filth should be immediately carried away from the metropolis.

**Funchal.**—The misconception that the words "slanderous climatorial insinuations," in the review of Mr. Bloxam's book on "Madeira" in our last number, could be intended to reflect upon Drs. Burgess and Mason, is as strange as unfounded. It seems to us almost superfluous to say that the paragraph bears no other construction than that Drs. Burgess and Mason had done, what they have a perfect right, and no doubt good reasons, to do—namely, expressed an unfavourable opinion of the climate of Madeira as adapted to invalids.

The conclusion of Mr. Edwards' paper is unavoidably postponed.

## YELLOW FEVER ON BOARD THE "MEDA."

**A West Indian.**—The following are the extracts referred to. The success of the treatment seems to warrant the resort to it on all opportunities:—

"From the few deaths which took place on board the *Medea*—only four—out of about sixty cases of yellow fever treated by Dr. Laird, there can be no doubt entertained as to the great success of this young surgeon's mode of treatment, which principally consists of small doses of spirits of tartaric, (about fifteen drops for a dose), given, combined in the form of mixture, with sweet spirits of nitre, camphor emulsion, and some aromatic tincture, which he gives in doses of a teaspoonful in half a wineglass of water every three or four hours, till a complete remission of the fever is effected. As soon as this favourable state takes place, he gives small doses of quinine twice or thrice a day, while at the same time he supports the patient's strength with light nourishing food, and a moderate allowance of wine. His adjuvant remedies are castor oil, (with a dose of which he always begins the treatment,) occasional doses of blue pill, evaporating lotions, sinapisms, cupping, blisters, &c.

"Dr. Laird, who has had much experience in the treatment of the diseases of warm climates, believes yellow fever to be the effect of a virulent æriiform poison, which, being received into the system in sufficient quantity, excites fever, and then speedily corrupting the blood, results in black vomit, and other forms of fatal hemorrhage.

"On the other hand, he considers that turpentine, from its certain action on the skin and kidneys, without increasing the febrile excitement, enables the system to throw off the poison, while as an antiseptic this remedy appears to correct the diseased state of the blood, and as a styptic to prevent, or, in the latter stage, to restrain passive hemorrhage.

"As a further inducement to medical men to give this mode of treatment a fair trial, I have also learned, and it is worth recording, that Medical Inspector Dr. Gilbert King, R.N., who has the credit of first using small doses of turpentine in the treatment of yellow fever, did so most successfully during the severe epidemic in Bermuda in 1843. Dr. Laird, it appears, was then attached to this gentleman's staff, and on that occasion there were about 900 cases of fever treated in a somewhat similar manner to that which has been practised again with so much success on board the *Medea*."

**Frederika's** "Hints to the Professional Body at Large" are inadmissible. The paper is left with the publisher.

**Mr. H.** is thanked for the information, which will be used at the proper time.

**An Irish Militia Surgeon.**—The 19th section of the Militia Pay Act clearly states that the militia surgeon is not entitled to half-pay or a pension. This is a gross injustice, and an effort must be made to find a remedy.

## OBSERVATIONS ON CHOLERA.

To the Editor of THE LANCET.

SIR,—Whatever may be the nature or origin of the specific morbid poison, which is generally admitted to constitute the exciting cause of cholera, a highly-damaged state of the functions of the alimentary canal, accompanied by great prostration of strength, coldness of the extremities, and of the general surface of the skin, a feeble and almost imperceptible pulse, are amongst its early and most prominent symptoms. All those measures, therefore, which have a tendency to further depress the vital powers or to weaken the patient must necessarily diminish the chances of recovery, and increase the danger of a fatal termination. As the cause of the disease has hitherto eluded the cognizance of our senses, so likewise have we failed in discovering an antidote or a specific remedy for it, and the utmost we can achieve is to combat its effects, and endeavour to assist nature to bear up under its injurious influence. The principal indications of treatment are—Firstly, to allay the irritation, and arrest the inordinate secretion of the stomach and bowels, and—Secondly, to restore the circulation and natural temperature of the skin, and to support the strength of the system. In order to attain the first object, opium, in combination with aromatics, should be administered more or less frequently, according to the urgency or severity of the symptoms, whilst brandy-and-water in moderate quantities, with nutritious food in a liquid form, such as beef-tea, arrow-root, sago, &c., are best adapted to bring about the latter. I have found the following simple formula almost invariably and speedily efficacious in putting a stop to the vomiting, purging, and cramps, and in restoring animal heat in cases of English cholera and diarrhoea, and I would earnestly recommend its being given a fair trial in the more formidable (the Asiatic) form of the disease:—Powder for opium confection, (P. L.) ten grains; mercury with chalk, three grains, to be made into a powder, to be taken (by an adult) every one, two, or three hours, as long as the characteristic symptoms of cholera continue.

I remain, Sir, your obedient servant,

Benton Benger, White, Oct., 1854.

WILLIAM LUTON.

**Mr. Joshua Waddington, (Margate.)**—There is much force in the arguments used for keeping the Royal Sea Bathing Infirmary open all the year round. Mr. Waddington observes:—

"Let the infirmary be kept open the whole year through, and the cures I am certain will be greatly multiplied; for I state it as the result of my experience, that a continuous residence is absolutely necessary. In the name of common sense, is it possible that a weak constitution can be changed in a few weeks, or even months? In the name of humanity, what can be more cruel than at the end of the infirmary season to turn out those unfortunate sufferers who may have just commenced to improve in health? It is a refinement upon that cruelty to treat them in the same way from season to season, until death steps in and relieves them from the torture of being tantalized with recovery. Hitherto this playing at battle-door with the patients used to commence in May, and end in October. Now, however,—a circumstance on which I sincerely congratulate you,—the period for keeping open the infirmary is extended, for eighty patients, to the 1st of January, a sure proof that the prejudices commonly entertained against a sea-side residence during the winter are fast fading away. The truth is, we can do more good in the winter than in the summer, for this season: the atmosphere by the sea-side is in summer cooler, and in winter two degrees warmer than that of places inland; and, a matter of far greater importance in regard to the cure of scrofula, it is also much dryer. The atmosphere of Margate, compared with that of London, has, according to De Luc's hygrometer, the advantage of five degrees in dryness."

**A. B.**—It must be shown, if an action is brought against a person for practising as an apothecary without a license, that he did so for gain. Practising as an accoucheur has not been hitherto regarded as an infringement of the Apothecaries' Act.

**A. P.** must forward us his name and address, in confidence. Our correspondent shall then receive a private note.

**Widdowson.**—A certificate of having served five years in the "manner of an apprentice" is occasionally received by the authorities, in lieu of indentures of apprenticeship.

## TREATMENT OF CHOLERA BY ACIDS.

To the Editor of THE LANCET.

SIR,—I observe in THE LANCET of the 28th ult. I am made the subject of criticism by "R. W.," of Caius College, Cambridge. He accuses me of "pretending originality" respecting the treatment of Asiatic cholera by acids in 1831 or 1832, whereas "R. W." affirms he has discovered the fountain-head in one Dionysius Fontanonius, a Frenchman, who wrote 250 years ago, and in some nameless Englishman of about the same date. Well, Sir, those same ancient authors must have been born before their time, have been too knowing for the age in which they lived, thus to have foreseen and to have prescribed a cure for an epidemic (Asiatic cholera) which did not afflict mankind until some two hundred years after the period in which they flourished. "R. W.," of Caius College, appears to have been aware of a real remedy projected 250 years ago. Why, then, has he never brought it forward, and urged it upon the public, any time within the last twenty or thirty years, during which the Asiatic cholera has been devastating mankind? Did he never hear of one who, having one talent given him, wrapped it in a napkin, and made no use of it, and of what became of him? Why, Sir, if this sort of criticism is to prevail, I ask who upon earth can lay claim to originality in anything? Cannot "R. W." come forward on any occasion, and swear that there is "nothing new under the sun"? No modern inventor was, I wot, contented successfully against musty old books, scoured together and fumbled over by antiquarian R. W.'s of the cloisters of Caius College, Cambridge. Of course, "R. W." (I wish he would give us his name at length) has never read my pamphlet (but that is of no importance to some people; they can write a criticism all the same) on the "Treatment of Asiatic Cholera by Acids," or he would have perceived that I do not claim an entire originality in the matter; but that I did what "R. W." would not, or could not, or did not care to do, endeavoured to bring into general notice, and to give prominence and effect to a mode of treatment which has proved to be of great importance. But of this enough.

I have read in your pages recently much about the treatment of Asiatic cholera, but cannot say that I feel greatly satisfied thereby. I propose to prepare a short paper, embodying succinctly my views, especially on the medical treatment of that disease, which I trust you will deem of sufficient importance to lay before your readers in the columns of THE LANCET.

I am, Sir, yours truly,

GEO. BODINGTON.

November, 1854.

**A Student.**—Application should be made to Dr. Andrew Smith, Medical Superintendent of the Army.

**Mr. MacNab, (Inverness.)**—It appears the answer has been sent to the wrong party. Our correspondent shall receive a private note.

The communication of Mr. J. F. Watson, relative to the late case of the Rev. Mr. Holmes at the Heigham Hall Asylum, arrived too late for insertion in the present number. It shall appear next week.

**X., (London Hospital.)**—One guinea per diem would be a fair remuneration.

**N.** In the next LANCET.

**ERRATUM.**—In the list of licentiates of Midwifery, inserted in THE LANCET last week, the date of Mr. Nowell's diploma should have been "1851," not "1854."

COMMUNICATIONS, LETTERS, &c., have been received from—Dr. Marshall Hall; Dr. R. Dundas Thomson; Mr. William Anderson, (York); Mr. William Thorn; A. P.; Enquirer; Dr. Fleming; Dr. Waller Lewis; M.R.C.S.E. and L.A.C.; Mr. Allwork; Mr. F. W. Watkins; The Eastern Dispensary, Bath; Mr. Mackinnon, (42nd Royal Highlanders, the Crimea); Dr. Huddock; Dr. Mackinlay, (Isleworth); Mr. Alaskill; A. B. C.; Dr. MacNab; Dr. Henry Hancox, (Brynmawr, Breconshire); X.; An Old Subscriber; Mr. Allison; Mr. J. Orr, (Liverpool, with enclosure); Mr. J. Nicholls; Mr. R. S. Francis, (Boughton, with enclosure); Mr. W. Caruthers, (Halton, with enclosure); Mr. W. Keith, (with enclosure); Mr. G. Nunn; Mr. B. McClelland, (with enclosure); Mr. T. W. Ransom, (with enclosure); Dr. Settle, (Hendley, with enclosure); Mr. John Bell, (with enclosure); Funchal; N.; A West Indian; Frederika; An Inhabitant of the Adelphi; Medicus; Mr. Joshua Waddington, (Margate); A Subscriber to the Eastern Dispensary, Bath; A. B.; Mr. H.; A Student; Mr. J. P. Watson; Mr. G. Bodington; &c. &c.

**Hooper's Invalid Water Cushions and Mattresses, or Beds, for Bed-sores,** whether threatened with Sloughing, or in which Sloughing has actually taken place.—Fractures, Diseased Joints, Ulcerated Cartilages, Paralysis, Spinal Affections, Renal Diseases, Inflammation of the Bowels, Spasms, Lassitude, Typhoid and other Fevers, Gout and Rheumatic Affections, Cancer, Ovarian Dropsy, Coldness of the Stomach and Feet, Consumptive, and all Bed-ridden Patients. Mr. HOOPER has succeeded in obtaining Waterproof Sheetting (Bed-Protectors) at a Great Reduction in Price, Free from Smell, and not affected by Temperature, Urine, Acids, or Alkalies; and, MAY BE WASHED AS FAMILY LINEN. Also—

## IMPROVED URINALS, AND ELASTIC BED PANS, OR RECEPTACLES,

INDIA-RUBBER, ENEMA, and DOUCHE, answering equally for either purpose, and may be carried in the Pocket.

For Hospitals and other Institutions a Discount is allowed. Their advantages over the costly and cumbersome Water Beds have been published in the Medical Journals, and they are particularly applicable for Paralytic and Lunatic Patients.

"I HAVE in several instances employed Mr. Hooper's Water Cushions and Mattresses; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water-Bed."

"JONN. PEREIRA, M.D.,

"Physician to the London Hospital.

"Finsbury-square,

"February 27, 1852."

"SIR,  
"Your Water Cushions and Mattresses answer most admirably; indeed, they are invaluable. They have been in use here for eighteen months."

"Jan. 1854."

"R. L. WILLIAMS, M.D., Visit. Phys.

"North Wales Lunatic Asylum.

INVALID CUSHION,  
FOR GENERAL PURPOSES.

CUSHION MORE ESPECIALLY USEFUL FOR SLOUGHING  
OVER THE SACRUM.

CIRCULAR CUSHION, FOR SITTING ON.

MATTRESS OF AN INTERMEDIATE SIZE.

FULL-LENGTH INVALID MATTRESS OR BED.

Being greatly preferable to the original costly and cumbersome Water Bed. The above are simply to be placed on an ordinary Bedstead.

## HOOPER'S SPIRAL SUPPORTERS.

[The Figures 1, 2, 3, &c., show the points at which measures should be taken in circumference.]

KNEE CAP.

SPIRAL SUPPORTER.

ABDOMINAL SUPPORTER.

ANKLE SOCK.

STOCKING.

HOOPER, 7, PALL MALL EAST, AND 55, GROSVENOR STREET, LONDON.

## Army and Navy Surgeons can be

supplied with the best SURGICAL INSTRUMENTS cheaper than any other house in the trade, at PRATT'S, 420, Oxford-street. Travelling Urinals, from 12s.; Brass Enema Syringes in Case, 7s. 6d.; Elastic Stockings, 5s.; Case of Amputating Instruments, £3 15s.; Pocket Case, 30s.; Tooth Instruments, from 25s.

PRATT, Surgical Instrument Maker, 420, Oxford-street.

## Henry Bigg, 9, St. Thomas's-street,

Borough, Surgical Instrument-maker to Guy's and St. Thomas's Hospitals, begs to call the attention of the Medical Profession to the following valuable instruments, made from designs and suggestions kindly given by the Gentlemen whose names are attached—viz, Mr. Le Gros Clark's Talipes Instrument; Mr. Bransby Cooper's Ovarian Trocar; Mr. Cock's Recto-Vesical Trocar; Mr. Cooper Forster's Ear Speculum; Mr. Hilton's Speculum Ani; Dr. Lever's Midwifery Instruments; Mr. Solly's Elastic Catheter, with Caigut Director. These Instruments being constructed on the premises secure their excellence and perfect finish.

9, St. Thomas's-street, Borough, London.

## Dr. Lever's Improved Elastic Utero-

ABDOMINAL BELT being constructed by Mr. H. Bigg, 29, Leicester-square, under the immediate suggestion of Dr. Lever, will be found to combine every advantage possible to obtain. It upholds the parietes of the abdomen, secures support to the uterus, and admits of the elastic force immediately above the pubes being increased by the patient after the Belt is applied.

To be had only of Mr. H. BIGG, 29, Leicester-square.

## Spinal Curvature.—Mr. H. Bigg, 29,

Leicester-square, particularly invites the attention of the Faculty to two new and distinct forms of SPINAL APPARATUS he has recently invented. The principle on which they are constructed, thoroughly supplants the "brute force" of the screw, yielding instead an elastic power analogous to muscular motion; it also encourages respiration, admits of the spine being moved in any direction, and possesses a weight so trifling as hardly to be felt by the wearer.—PATENTED.

To be had only of the Patentee, 29, Leicester-square.

## Treatment of Club Feet, Spinal

CURVATURE, &c., WITHOUT THE EMPLOYMENT OF THE SCREW.—MR. H. BIGG, 29, Leicester-square, begs to invite the attention of the Faculty to an entirely new principle he has discovered for constructing the various apparatus for deformities of the feet and spine.

"The living structures do not with impunity tolerate the brute force of the screw." "In any case in which the force of the screw is employed, unless for a very brief period, excoriation, sloughing, intolerable pain in the parts compressed will inevitably result." "Dr. LITTLE, on 'Deformities,' pp. 34, 35.

Mr. H. Bigg has recently invented four distinct forms of Orthopaedic Instruments for Talipes Varus, T. Valgus, T. Equinus, Lateral Curvature, &c., in all of which the principle of muscular elasticity is simulated and the "brute force" of the screw ignored.—PATENTED.

29, LEICESTER-SQUARE.

## Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1.

FIG. 2.

FIG. 1. BELT AND AIR-PAD FOR PROLAPUS UTERI OR ANI.—Mr. Bourjeaud begs to state that the apparatus here figured has been found extremely useful in cases of prolapsus uteri or ani, and with patients, especially females, who require support for the perineum. The compressing agent is a scotchcotton bag, filled with air; it is in the diagram hanging loose in front of the patient, and is fixed in its place by the strips of elastic tissue, the free extremity of which is seen. The latter is fixed to the lower and posterior margin of the belt, and by the elasticity of the bag and straps sufficient compression is made, and not the slightest uneasiness is experienced. This is a most valuable adjunct to surgical and obstetrical practice, and is highly appreciated by the most eminent members of the profession.

FIG. 2. This is a most useful belt, called the ABDOMINAL SUPPORTER. It is made of varying strength, to suit the peculiarities of patients, and is most useful during gestation or after parturition, to forestall the uncomfortable state called pendulous abdomen. During gestation, it relieves the veins from the pressure of the distended womb, and thus prevents swelling of the legs; and after the birth of the child it is most valuable to those ladies who are anxious for the look of their waists. This belt is most useful in cases of dropsy, especially when ovarian, as the pressure may be increased so as to conduce, in favourable cases, to the absorption of the fluid. Mr. Bourjeaud cannot too strongly recommend this belt to corpulent people; they will find it a real comfort.

## The Respirator,—The assumption of

the name of Respirator for various discreditable and defective imitations of MR. JEFFREYS' Instruments, the value of which in medical practice has given a wide reputation to the name, can only mislead unwary persons not acting under professional advice.

City Office for the Respirator, 25, Bucklersbury; West-end Depot, 25, Holles-street, Oxford-street, London. In London and all Towns, the principal Chemists and Surgical Instrument Makers are Agents for Mr. Jeffreys' Respirators.

## M. Pillischer's Newly-Constructed

STUDENT'S MICROSCOPE, which, for solidity, portability, and reasonable price, surpasses any Microscope hitherto made by any English or Continental maker. The Student's Microscope, with coarse and fine adjustments, single mirror, one eye-piece, a one-inch and one-quarter-inch French achromatic object-glasses of best quality, the whole packed in mahogany case, 7in. by 6in., £5 10s.; or with M. Pillischer's own-made, 1in. of 16 degs. angular aperture, and 1in. of 60 degs., £7.

The above stand with lever stage, extra eye-piece, double mirrors, animalcule cage, &c., £8; or with Pillischer's glasses, £9 10s.

A list of prices will be sent free on application to M. Pillischer, 88, New Bond-street.

TO THE SURGICAL AND MEDICAL PROFESSION.

## W. F. Dürroch, late Smith, begs to

inform the Profession, that he continues to MANUFACTURE SURGICAL INSTRUMENTS of every description, and that he has attained the highest reputation by the approval and patronage of the most eminent practitioners and lecturers for the improvements made in various articles. Gentlemen favouring him with their orders may rely on having their instruments finished in the best and most modern style. Surgical and Medical Instruments made to drawings, and kept in repair. Established 1798. No. 2, New-street, St. Thomas's-street, (near the Hospital,) in Southwark.

Superior dissecting instruments and equally moderate in price, well worth the inspection of the student.

SPECULUM ANI, made by W. Dürroch, for John Hilton, Esq., may be had at a moderate price.

## Surgical Instruments, and every

Implement necessary for Surgeons and Druggists, can be had (warranted best quality and moderate prices), Retail as well as Wholesale, from the Manufacturer, JAMES ARNOLD, 35, WEST SMITHFIELD, St. Bartholomew's Hospital, London.

## Every excellence which the

Surgeon can require—viz., Lightness, Durability, Strength, and Economy—is realized by HUXLEY'S SURGICAL STOCKINGS, KNEE-CAPS, ANKLETS, &c.

H. and Co. have much pleasure in informing the Profession that they have perfected an ABDOMINAL BELT of new construction, which, acting diagonally, is not liable to displacement; its weight is only four ounces. Price 18s. Diagrams and particulars forwarded by post. Every kind of Surgical Stocking made. Spiral Stockings at a great reduction. Measure required for Stockings: Circumference at A, B, C, D, and E; length from A to D, and D to E.

HUXLEY and CO., 8, Old Cavendish-street, late 5, Vere-street, Oxford-street.

## ELECTRICITY

FOR NERVOUS, FUNCTIONAL, AND RHEUMATIC DISEASES.

MEINIG'S New and Greatly Improved GALVANIC ELECTRO-GENERATOR, for supplying vito-functional energy to any organ in want of the same, and to the system generally, may now be had at the Establishments, 103, Leadenhall-street, and at 213A, PICCADILLY. All wet and metallic contact with the Body is entirely obviated; it acts with water alone, without acid, the action lasts more than twenty-four hours after each damping, and can be renewed and regulated without undressing, the Generator, enclosed in an envelope, being carried in the pocket or suspended from the neck.

THE EXTRAORDINARY CURATIVE VIRTUES OF THESE MILD CURRENTS OF ELECTRICITY ARE NOW FULLY ESTABLISHED BY EXPERIENCE. The Prospectus (to be had gratis, or by post for two stamps) contains the names of more than 600 persons cured within the last eighteen months, and this remedy is now adopted in nearly all the Hospitals, and by the most eminent practitioners. Sold at 5s. and upwards, according to power, at C. MEINIG'S, 103, Leadenhall-street, and 213A, PICCADILLY.

N.B.—In the first stages of CARCINOMA the continuous current from the colon to the abdomen has been found eminently successful in checking the further progress of the disease.

POCKET-BATTERIES for Medical Practice on the same principle. (Intensity of 120 cells within the space of a small pocket-book.) 103, LEADENHALL-STREET and 213A, PICCADILLY (near Regent-circus) Prospectus gratis, or by post for two stamps.

**Medical Galvanic Coil, complete, at**  
27s. 6d. Powerful ELECTRO-GALVANIC MACHINES for Medical purposes, of very superior finish, with Battery and Conductor, complete, at 27s. 6d., at C. BAKER'S Surgical, Optical, and Philosophical Instrument Warehouse, 244, High Holborn.

**New Spinal Support.—Fr. G. Ernst,**  
Lamb's Conduit-street, Foundling Hospital, begs to draw the attention of the Faculty to his recently-invented SPINAL APPARATUS, which, after some months of trial, has proved superior to any of the various kinds hitherto used, and produced the most satisfactory results. This appliance, being self-adjusting, free bodily motion is permitted; thus, while equal and necessary support is given to the wearer, all injurious or painful pressure is avoided, and a great amount of comfort and benefit consequently yielded. It can be modified so as to suit any FORM OF SPINAL DEFLECTION; its weight is comparatively trifling, and from its capacities for nice adaptation elicits no observation when on the body.

To be had only of the Inventor, 48, Lamb's Conduit-street.

TO THE MEDICAL PROFESSION.

**Fr. G. Ernst, Anatomical Machinist**  
and MANUFACTURER of SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF of BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam Exner (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &c.

**The Eye Douche, for applying Lotion**  
to or bathing the Eye, is self-acting, simple, and portable. The immediate relief obtained from its use particularly recommends it to the notice of all who are much engaged in reading, writing, or designing; it has been employed with the most favourable results by patients under the care of Haynes Walton, Esq., Surgeon to the Central London Ophthalmic Hospital. Price 20s.; carriage paid to any railway station.

Manufactured by WILLIAM T. COOPER, 26, Oxford-street, London.

**COOPER'S LAVEMENT APPARATUS** is the most perfect ever invented; the possibility of air entering the bowels is prevented, and the labour of pumping is avoided; being constructed entirely of metal, without valves, it cannot become out of order, which renders it particularly suitable for use in the country or in foreign climates. Price 35s. Enema Apparatus from 10s.; Superior Reservoir Apparatus from 27s.—Each instrument in mahogany box with lock and key.

Manufactured by WILLIAM T. COOPER, 26, Oxford-street, London.

**THE CORK RESPIRATOR** is the lightest cheapest, and most efficacious ever produced; allows free respiration, and from being easily applied and removed, is specially adapted for the use of Invalids, or Ladies attending evening meetings or places of amusement. Price 3s., free by post.

Wholesale only of WILLIAM T. COOPER, 26, Oxford-street, London.

Illustrated Catalogues free by post.

**Purification of Linen.—Prevention of**  
Disease.—J. BOILESSVE, 55, King William-street, City, London, solicits the attention of the nobility and gentry to his CALORIFERE, for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

From his Grace the DUKE OF BEDFORD, Woburn Abbey, Sept. 24th, 1853.  
SIR,—His Grace the Duke of Bedford has desired me to say, his Grace has received your letter inquiring about the Calorifere (drying machine) put up in the Laundry at Woburn Abbey in May, 1852, by Mr. Boilessve. In answer to that inquiry, I have to state, that nothing can exceed it in effect and economy. I sent to the Laundry for the man who has the management of it, and he says, that they can dry off the linen in much less time than they could with the old stove, without dust or dirt of any kind in the Laundry. They can obtain any degree of heat they wish for, and that at a great saving of fuel.

I am, Sir, your obedient servant,

J. Boilessve, Esq.

J. PALFREMAN, House Steward.

**Warming and Ventilating, by Hot**  
AIR, CHURCHES, HOSPITALS, TOWN HALLS, and other PUBLIC BUILDINGS.—J. BOILESSVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

Highfield, Berkhamstead, Herts., January 24th, 1854.

SIR,—I read some time ago in your valuable paper, an article advocating the need in this climate of warming dwellings with some simple apparatus, giving ventilation, combined with the healthiest temperature, at a great saving of fuel. I am very glad to give you the result of my experience of a new kind of stove, named "Calorifere," erected some months ago at this residence by Mr. J. Boilessve, London; it answers its purpose perfectly; the house and every room to which the ventilation is adapted, is kept at an agreeable temperature, with an utter absence of the oppressive atmosphere usually experienced by all other methods of warming dwellings; that I have seen several persons, some of them highly scientific, who have examined the apparatus and have expressed themselves satisfied, and consider it a most perfect application of warm air and ventilation combined. The cost of warming the house and conservatory attached, has been Eightpence per twenty-four hours, during the late cold weather, and the trouble of attendance is very little. The economy of fuel will cause this stove to be generally adopted. I have no doubt, more especially as the charge for coals is constantly on the increase. The stove in operation should be seen to be appreciated, and I can add, from my experience of its effects during this winter, that it is invaluable for any invalid in so variable a climate as ours, and no one can be aware of the comfort until it is tried.

I am, Sir, yours obediently, a Subscriber,

The Editor of the Times.

E. W. FARMER.

**Mr. Edwin Osborne, of 24, Savile-**  
ROW, LONDON, the Sole Licencee and Maker of PALMER'S PATENT LEG, adapts this beautiful substitute to every form of amputation; and having had great experience in its manufacture, feels confident of giving comfort and satisfaction to those persons who may favour him with their patronage. References given, (if required.)

**Water Filter for the Pocket, with**  
DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.  
J. SOLOMON, Wholesale Optician, and Photographic Depot, 22, Red Lion-square.

**Infants' New Feeding Bottles.—These**  
celebrated Nursing Bottles, the best Artificial Mother ever invented, enabling the most delicate infant to feed from its birth with the greatest comfort and ease, are adapted to milk, biscuits, and all kinds of food. The Nipple, of novel material, is elastic, soft, durable, very cleanly, and so beautiful in appearance of nature, that no infant ever refuses it.—BENJAMIN ELAM, 198, Oxford-street.—7s. 6d.—Each is stamped with my name and address.

**Purify Sick Rooms, and give comfort**  
to Patients and perfect Safety to Attendants.—The most offensive atmosphere is instantaneously purified, and the air impregnated with refreshing fragrance, by SAUNDERS' ANTI-MEPHITIC FLUID, prepared by J. T. Saunders, Perfumer, 315a, Oxford-street, Regent-circus. Sold by all Druggists and Perfumers. Price 1s.

**Poultices superseded by the use of**  
MARKWICK'S PATENT SPONGEO PILINE.

As a substitute for common poultices and fomentations, the superiority of this article is unquestionable. It is strongly recommended by the most eminent of the Faculty for its cleanliness, economy, lightness, and general efficacy, and is now used in several of the hospitals. Also Markwick's Patent Piline, for Cholera-Belts, Rheumatism, Chest Protectors, Respirators, Lumbago, &c.

Sold, retail, by Chemists and Druggists, and wholesale only by  
GEORGE TRIMBEY, 41, Queen-street, Chancery.

**Aërated Waters of sufficient and**  
uniform strength. BLAKE, SANDFORD, and BLAKE, 47, Piccadilly, having given great attention to the manufacture of Mineral Waters, and feeling it important that medical men should be assured of the quantity of Alkali contained in each kind, beg to submit the following list of their preparations:—

Potash Water, 18 grains of the Bicarbonate in each bottle. Citrate of Potash, (a new and valuable auxiliary in Gout and Rheumatic affections,) 30 grains; Soda, 15 grains; Magnesia, 12 grains, and Ammonia, 10 grains.  
B. S. & B. would especially recommend their Seltzer and Vichy Waters; the latter now bottled in half-pints as well as pints.

BLAKE, SANDFORD, and BLAKE, 47, Piccadilly.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

**Important Saving, by Pre-payment,**  
in the PURCHASE of

NEW WHITE MOULDED VIALS.

APSPLEY PELLATT and CO. submit the following PRICES of VIALS, for PRE-PAYMENT only:—

1 oz., 1 oz., and 1 1/2 oz. per Gross, 6s.	
2 oz. " 7s.	
3 oz. " 8s.	
4 oz. " 10s.	
6 oz. " 15s.	
8 oz. " 18s.	
4 1/2 oz. graduated in 3 doses 12s. 6d.	

In quantities of not less than Six Gross, assorted to suit the convenience of the purchaser, delivered to carriers in London. No charge for Package. Breakage at risk of Purchaser.

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,

APSPLEY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

**Patent Perambulators.**

C. BURTON, Inventor, Patentee, and Sole Manufacturer to Her Majesty by appointment.

The distinguished patronage, the flattering encomiums, and the increasing demand, are sufficient proofs of the utility and excellence of these fashionable, safe, and elegant Carriages for adults, children, and invalids, propelled from behind by the slightest effort. Country and Shipping orders. Illustrated Circulars.

OFFICE, 487, NEW OXFORD-STREET.

Also, C. BURTON'S PATENT PERAMBULATOR FOR THE MILLION. Price Two Guineas.

CAUTION.—To avoid unprincipled and dangerous imitations, look for Burton's Label on each Carriage.

**GOLD CHAINS AND JEWELLERY.**

**Watherston and Brogden, Wholesale Manufacturing Goldsmiths and JEWELLERS,** beg to announce to the Nobility, Gentry, and Public in general, that in obedience to the numerous calls made upon them since the Great Exhibition, where they were awarded a Prize Medal, they have resolved to throw open their Manufactory to the Public at Manufacturers' prices, a closer connexion than has hitherto existed between the real worker in the precious metals and the Public being obviously an advantage to both parties. Gold is capable of being alloyed to any extent, and therefore, in order to protect the Public in the article of Chains, Watherston and Brogden will make the Mint price of 77s. 10½d. per oz. for British standard the basis of all their operations, and making their profit on the workmanship alone, will charge the bullion in their Chains at its intrinsic value, undertaking to re-purchase it at any time at the same price: thus—15 carat gold will be charged and will realize 53s. 1d. per oz.; 18 carat gold will be charged and will realize 63s. 8½d. per oz.; 22 carat gold will be charged the Mint price of 77s. 10½d. The price for workmanship will be charged according to the intricacy or simplicity of the pattern: for example—a Chain weighing 2 oz. of 15 carat gold is worth, at 53s. 1d. per oz., £5 6s. 2d. intrinsic value; supposing the workmanship to be £2, total £7 6s. 2d. By this arrangement the purchaser will see at a glance the proportion charged for labour compared with the bullion in a Gold Chain, and, being always able to realize the one, will have only to decide on the value of the other. An extensive assortment of Jewellery, all made at their Manufactory, 16, HENRIETTA STREET, COVENT GARDEN. (Established 1798.)

**Gas Horse-Singeing Lamps.—The**

Nobility and Gentry are informed that SINGEING LAMPS, embracing the most recent improvements, with flexible Hoses of any length, may be obtained at M. SALT and SON'S, Surgical Instrument Manufacturers and Cutlers to the Queen, Bull-street, Birmingham.

**The Arctic Expeditions.—The whole**

of the Ships of the various expeditions which have wintered in the Ice, including those of Sir John Franklin and Captain Collinson, have been warmed by SYLVESTER'S HOT AIR APPARATUS.—For prospectus and prices, apply to SYLVESTER and CO., Engineers and Manufacturers of Heating Apparatus, 96, Great Russell-street, Bloomsbury, London.

**Royal Polytechnic Gas Fire.—**

BACHHOFFNER and DEFRIES'S PATENT.—The Public is respectfully informed that arrangements have now been made for the supply of this unique and beautiful mode of Warming Private Houses, Shops, Public Buildings, &c. Smoke, dust, ashes, and accidents from fire are effectually prevented by its use, while it presents all the comfort and appearance of an open coal fire, securing, at the same time, perfect ventilation. To be seen in action at DEFRIES'S Office, 145, Regent-street, London.

**Ten Thousand Stoves.—The Tenth**

Thousand of the PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, and CO., 46, King William-street, London-bridge, and may be obtained of most ironmongers. The Improved Patent Ventilating Stove, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded, post free.

**Metal Bed-Pan,**

Price 6s.—Acknowledged to be the most convenient in form, and much more durable than any now in use.

To be had of the Manufacturer, J. LAWRENCE, 20, Great Charlotte-street, Blackfriars; of Messrs. Gale, Baker, Warde, and Oldfield, Bouverie-street, Fleet-street; and of Messrs. Leadbitter and Hollon, York. Orders from the Country must be accompanied by a Remittance.

**Metcalf and Co's New Pattern**

TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfumery for the toilet.—At METCALFE, BINGLEY, and CO'S only establishment, 130 and 131, Oxford-street, second and third doors west from Holles-street. Metcalf's Alkaline Tooth Powder, 2s. per box.

**Ford's Eureka Coloured Shirting is**

now ready, in 200 different patterns. Specimens in varied colours sent post free on receipt of six stamps.

FORD'S COLOURED EUREKA SHIRTS, Six for 27s. FORD'S WHITE EUREKA'S, best quality, Six for 40s.; second quality, Six for 31s.; if washed ready for use, 2s. extra.

CAUTION.—Ford's Eureka Shirts are stamped "38, POULTRY, LONDON," without which none are genuine.

\* Catalogues with particulars post free.  
RICHARD FORD, 39, POULTRY, LONDON.

**Funeral Extortion avoided, by Exe-**

cutors and bereaved Relatives of deceased Noblemen, Gentlemen, Tradesmen, and others, sending in the first instance to SHILLIBEER'S OFFICE, CITY ROAD, near Finsbury-square, or to 12, NORTH STREET, QUADRANT, BRIGHTON, instead of employing their Upholsterer, or the nearest Undertaker, who, not possessing the needful requirements, resort to the Funeral Furnishers, to hire them, and consequently inflict twofold profits.

Shillibeer's Establishment combines under one charge, to any scale of pomp and humility desired.

Funerals of every class, and the most varied description of conveyances, old and new styles, and first-rate equipments, at charges so moderate as to defy competition. Catholic Fittings from Paris. No extra charge within ten miles. A Nobleman's Funeral, Thirty Guineas; Gentleman's, from Ten Guineas; Tradesman's, £8; Artisan's, £4 and upwards.

Originated in 1842.

AT THE CRYSTAL PALACE.

**"The Duobus," a cheap close Carriage**

for a "Country Practice," having all the comfort and convenience of a Brougham, with the weight of an ordinary Gig. Price £42. This Carriage can be seen at the new Crystal Palace, and sketches and particulars obtained on application to T. B. Starey, Coachmaker, Nottingham.

**Improved Invalid Cot Carriages—**

the greatest luxury and comfort ever introduced for removing invalids, being fitted up with the patent noiseless wheels. These carriages may be engaged, on moderate terms, for any Journey, upon application to H. and J. READING, coachbuilders, 14, Riding House-lane, Cavendish-square.—N.B. A good assortment of new and second-hand carriages for sale or hire.

**The 16s. Trousers reduced to 14s.—**

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

**R. T. Pigram, Practical Tailor, and**

Inventor of the Indicator of the Human Figure, whereby a perfect fit is secured, respectfully invites the attention of the public to his mode of art, since none can doubt the importance of an easy and exact adjustment of wearing apparel. Superior Trousers at 17s. 6d. per pair.

R. T. PIGRAM, 61, Lamb's Conduit-street, Foundling Hospital.

**To Professional Men and others.—**

The Oxford Mixed Doeskin Trousers, price 21s. The Striated Cloth Vest, price 10s. 6d. Stock for choice, or to measure.

S. BATTAM, Coat and Trousers Maker, 180, Tottenham-court-road, four doors south of Schoolbred and Co's.

Patterns of the material and Directions for Measuring sent free per post.

**Overcoats, Capes, &c., at W. Berdoo's,**

96, New Bond-street, and 69, Cornhill, one of the largest stocks in London. Superior garments at reduced charges. Shooting Jackets. Berdoo's well-known Light Overcoat, for all seasons, (price 45s.) Ladies' Cloaks, Mantles, Habits, &c., all made thoroughly impervious to rain, without obstructing free ventilation, and without extra charge; or made to order at a day's notice.

**Assistant-Surgeons.—Gentlemen**

receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at

L. PHILLIPS, 28, WEST STRAND, LONDON,

the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, and every necessary information, may be obtained on application.

THE SYDENHAM TROUSERS.

SAMUEL BROTHERS' Stock of OVERCOATS for the present Season is worthy of your inspection.

**Soyer's Aromatic Mustard. — "M.**

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration." — **THE LANCET.**

Sole Agents: Messrs. COHEN and BLACKWELL, 21, Soho-square, London.

**To Invalids and those desirous of**

**PRESERVING HEALTH.**—The Sanitary Commission instituted by **THE LANCET** having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to **EDMONDS and CO.'S HOMEOPATHIC COCOA.**

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

**Cocoa of the finest quality, prepared**

in the best possible manner.—Our **PURE GRANULATED COCOA** was pronounced by the Analytical Chemists employed by **THE LANCET**, in their memorable researches into the Adulterations of the Food of the People, to be free from any admixture whatever. The Invalid, and Cocoa-drinkers in general, are requested to make trial of it. In pound packets, 1s. each. Arrow-root, genuine as imported, at 4d. per lb., 6d. per lb., 8d. per lb., 1s. per lb., 1s. 4d. per lb., and the very finest Bermuda in the Kingdom, 1s. 8d. per lb.; 7 lbs. of that at 8d. per lb., or any higher quality, packed in tin canisters, without extra charge. Good Ceylon Coffee, 1s. per lb.; Java Coffee, a rich and useful article, 1s. 4d. per lb. Good Congou Tea, 3s. per lb.; very excellent ditto, 3s. 4d. Orders to the amount of 40s., for any of the above articles, covering a remittance for amount of same, forwarded, carriage free, to the nearest railway station.

HANDFORD & DAVIES, 61, High Holborn.

**DOMESTIC ECONOMY****H. Sparrow and Co. beg to announce**

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.

Fine Souchong, 3s. 4d., 3s. 8d., and 4s.

Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 8d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, **HENRY SPARROW and CO.,** Wholesale Dealers in Tea, 372, Oxford-street, London.

**Pure as well as Fine Tea.—**

Tea, when pure, is well-known to produce a most wholesome beverage; the impolicy of allowing it to be coloured by the Chinese is fully set forth by the Analytical Sanitary Commissioners, in **THE LANCET**, and also in *The Times*, (October 8th, 1852.) The fact, therefore, is now familiar to most, that artificial colour is used to give the Spring crop and the spent Autumn gathering the same appearance. If this practice were discontinued, a twofold benefit would arise; first, the fine qualities would have all the fragrance and strength unimpaired; and, secondly, the inferior faded leaves could not then be passed off as good, causing the flat, insipid infusion, so frequently the subject of complaint. The uncoloured Tea imported from China, by **HORNIMAN and Co.,** London, is perfectly pure; the Green, from the absence of the usual artificial colouring, is of a natural olive hue. The Black, and also the Green, are exclusively of the Spring product from young and vigorous plants, which yield not only more strength, but the full degree of fragrance which FINE Tea, when purely natural, and seasonably selected, alone possesses; ONE TRIAL induces a continued preference. The prices are reduced:—

Finest Congou, 3s. 8d. Finest Lapang Souchong, 4s. and 4s. 8d.

Fine and Pure Green, 3s. 8d., 4s., and 4s. 8d.

**HORNIMAN and CO.,** Wormwood-street, London, Importers of the most approved Teas in general use, but free from the objectionable artificial colour on the surface.

Agents in London, **PURSELL**, 80, Cornhill; and **ELPHINSTON**, 227, Regent-street, and 366, Oxford-street.

Sold by authorized Firms in all Towns, in 1 lb., ½ lb., and ¼ lb. packages only.

**Pure Country Bread, supplied every**

Day by Train by **G. BILLINGS**, of Sawbridgeworth, Herts.

Sawbridgeworth, Herts, 1852.

George Billings begs respectfully to call the attention of the Public to the subjoined Testimonial (vide **THE LANCET**, March 26th, 1852) as to the pure and unadulterated nature of Bread made by him.

Having been earnestly solicited by numerous parties in London to introduce it to the public, he has appointed as his agents:—**MR. DAVID BILLINGS**, 7, Ivy-place, Hoxton; **MR. HOLLOWAY**, 18, Liverpool-street, Bishopsgate.

N.B.—All Bread supplied to the London public is stamped,—"**G. BILLINGS**, Sawbridgeworth."

London Hospital, March 17th, 1852.

I have made a careful analysis of the Bread manufactured by **MR. GEORGE BILLINGS**, Sawbridgeworth, Herts, and I find that it is perfectly free from everything of a deleterious nature; besides which it is of good colour and light texture, is pleasant to the taste, entirely free from acidity, easy of digestion, and apparently well suited to the wants of the dyspeptic.

**HENRY LETHEBY, M.D.,**

Professor of Chemistry, &c., in the London Hospital.

18, Upper Seymour-street, Portman-square,

November 4th, 1853.

Having submitted to careful analysis a loaf of bread, manufactured by **MR. GEORGE BILLINGS**, of Sawbridgeworth, Herts, and placed in my hands for that purpose by **MR. D. BILLINGS**, of Ivy-place, Hoxton, I find the bread to be well made, free from acidity and all deleterious matter, and accordingly well adapted for the sustenance both of invalids and of persons in health.

**ANDREW URS, M.D., F.R.S., Analytical Chemist.**

\* \* \* Orders by post punctually attended to.

**Recherché Wines.—Sherry: A very**

fine Sherry, (Amontillado and Montilla,) Brown and Pale, for Cash, at 48s. per dozen; 42s. per quart; 24s. per hoghead; 28s. per butt.

PORT.—Very fine old dry Wine (Vintages 1827, 1830, 1832, 1833), lately imported: from the Wood at 48s., 54s., 63s., and 68s. per dozen.

First Class Champagne, (Ay, Arize, Pierry, Verzenay, and Sillery,) Sparkling and Still Moselle, Sparkling, Still, and Red Hocks, and Bordeaux Wines, at very moderate prices.

These Wines are patronized and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples and List of Prices forwarded on application.

**H. H. HAMMICK**, Importer, 11, Pall-mall, London, opposite the "Travellers' Club."

**Allsopp's Pale Ale in Bottle, as**

supplied to the **CRYSTAL PALACE**; also in casks of 18 gallons Recommended by **BARON LIEBIG**.

Address, **HARRINGTON PARKER and CO.**, 5½, Pall-Mall, London.

**Pale India Ale and Stout, 4s. 6d.**

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts. Delivered free within four miles of London, and carriage free to all railway stations in England at 6d. per dozen extra.

**WOOD & WATSON**, 16, Clement's-lane, City.

**Allsopp's Pale Ale.—Medical gentle-**

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring **ALLSOPP'S PALE ALE** in its genuine state, in either cask or bottle, by addressing their orders to **NATHANIEL EASTTY**, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hoffmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in **THE LANCET**, Saturday, May 15, 1852, No. 20, Vol. 1st, upon **ALLSOPP & SONS**, EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of **NATHANIEL EASTTY**, 132, Upper Thames-street, London.

**Teeth.—Mr. Alfred Jones, of Gros-**

venor-street, has recently completed a new and important improvement in the construction of **ARTIFICIAL TEETH**. The superiority of their appearance, and the unerring accuracy with which they are fitted to the mouth, without wires, springs, or ligatures, and the lightness of their construction, gives greater facility in mastication and freedom to the speech, and imparts a more youthful appearance to the countenance than has hitherto been attained; they support any teeth that may be loose, and have been tested by many of the first medical men, the nobility, and gentry, from whom he has received the most flattering acknowledgments of success. Supplied only by **MR. ALFRED JONES**, Surgeon-Dentist to Her Royal Highness the Duchess of Gloucester, her late Royal Highness the Princess Augusta, and his late Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street, Grosvenor-square.—At home from Eleven until Five.

**Sheppey Union.—Medical Officer**

wanted.—The Guardians of the Sheppey Union are desirous of receiving applications from Medical Practitioners, qualified according to Article 168 of the General Consolidated Order of the Poor-Law Commissioners, and desirous of being appointed (subject to the approval of the Poor-Law Board) **MEDICAL OFFICER** of the Eastchurch District of the Sheppey Union, with a yearly salary of £75; and of the Workhouse with a yearly salary of £25. The gentleman elected will be appointed Public Vaccinator to his districts, and will be required to reside in the village of Eastchurch, or within three miles thereof. Applications, with testimonials, addressed to the Guardians of the Sheppey Union, to be sent to the Clerk before Tuesday, the 21st of November, 1854.

By Order of the Board,  
**ROBERT EDWARDS, Clerk.**

Sheerness, November 9th, 1854.

**Bucks General Infirmary.—House-**

**SURGEON.**—A Vacancy having occurred in the office of House-Surgeon, Gentlemen intending to become Candidates for the Appointment are requested to forward their Testimonials of character and qualification to me on or before Monday, the 27th inst. Salary, with board and residence, £55 per annum, with an annual increase of £5, to £70. It is required that Candidates be Members of the Royal College of Surgeons of London, Dublin, or Edinburgh, and Licentiates of the Apothecaries' Company, London. A Gentleman who has been a Dressing-Pupil will be preferred. The Election will take place on the 6th day of December next.

Aylesbury, November 6th, 1854.

**HENRY HETWARD, Secretary.**

**Leicester Infirmary and Fever House.**

A Vacancy having occurred in the Office of **HOUSE SURGEON** and **APOTHECARY** to this Institution by the resignation of **MR. BULLOCK**, any person qualified and desirous of offering himself as a Candidate is requested to send his testimonials, directed to the Secretary, eight days prior to the Election, which will take place at a Special General Board, to be held at the County Assembly Rooms, on Wednesday, the 13th December next, at Twelve o'clock at noon. The Salary has hitherto been £130 per annum, but it is recommended to the next Annual Board to fix it as follows: £120 for the first year, rising at the rate of £10 per annum until the fourth year, when it will be £150 per annum, with Board, Lodging, and Washing, provided by the Institution. The Candidate must be a Member of the College of Surgeons of London, Edinburgh, or Dublin, also a Licentiate of the Apothecaries' Company of London, and have attained the age of twenty-three years.

By order,  
**WILLIAM JACKSON, Secretary.**

Infirmary Board-room, Nov. 7, 1854.

**Royal Institution of Great Britain,**  
Albemarle-street.—Candidates for the FULLERIAN PROFESSORSHIP OF PHYSIOLOGY are requested to apply in writing to the Secretary R.I. on or before Saturday, June 2nd, 1885.

JOHN BARLOW, M.A., Sec. R.I.

**Mr. G. Hind, F.R.C.S., resumed his**  
DEMONSTRATIONS on the morning of the 16th of September, at the usual hour.  
Class-room, 29, Newman-street, Oxford-street. Private residence, 9, South-crescent, Bedford-square.

**University of London, &c.—A First**  
CLASS B.A. and M.D. prepares Gentlemen, privately or in class, for the Matriculation, Medical, and Arts Examinations, the Fellowship Examinations, &c. Full MS. and printed notes forwarded. One Vacancy for a PRIVATE PUPIL, who may be Apprenticed.—Address A. Z., Ferriman's, 49, Albany-street, Regent's-park.

**King's College, London.—Practical**  
DEMONSTRATIONS ON THE URINE, by LIONEL BEALE, M.B., Professor of Physiology. Gentlemen desirous of attending the Course, which will commence on Friday, Dec. 1st, are requested to leave their names at the Secretary's office, or at Dr. Beale's Pathological Laboratory, in Carey-street. These Demonstrations take place on Monday and Friday evenings, from Eight to Half-past Ten. Fee, £2 2s.

**Islington Dispensary.—Notice is**  
hereby given, that a General Meeting of Governors will be held at the Dispensary on Tuesday, the 25th of November, at Half-past Eight P.M. precisely, to Elect a SURGEON to that Institution. Candidates for the Office must be Members of the Royal College of Surgeons, and not Practitioners of Midwifery or Pharmacy. They must exhibit their qualifications to the Medical Committee at the Dispensary on Saturday, the 25th of November, at Seven P.M. precisely.

Geo. Wm. Brady, Hon. Sec.

**A Resident Surgeon and Apothecary**  
is required for the WESTERN GENERAL DISPENSARY, New-road, St. Marylebone. Candidates must be Members of the Royal College of Surgeons of England, Edinburgh, or Dublin, and Licentiates of the Apothecaries' Company to practise in London, and are required to attend (with their qualifications and testimonials) a Meeting of the Board of Directors on Monday evening, November 27th inst., at Eight o'clock, when the Election will take place.—Further particulars may be obtained at the Dispensary.  
Nov. 13th, 1884. By Order, J. MARTIN, Sec.

**Western General Dispensary, New-**  
ROAD, ST. MARYLEBONE.—Notice is hereby given, that a Special Meeting of the Governors of this Institution will be held at the Dispensary House, on Monday, the 18th of December next, for the purpose of Electing a Physician, in the room of Dr. McIntyre, resigned. The Ballot will be opened at Two, and closed at Five o'clock.—Candidates must be Fellows or Licentiates of the Royal College of Physicians of London, and are required to forward their qualifications and testimonials, addressed to the Secretary, on or before Monday, Dec. 11th.  
Nov. 13th, 1884. By Order, J. MARTIN, Sec.

**St. Mary's Hospital.—A fourth**  
RESIDENT MEDICAL OFFICER, duly qualified, will be recommended to the Weekly Board for Election, whose duty will be to attend the Lying-in Patients of the Maternity Department, at their own residences, and such other duties in the Maternity Ward as shall be defined by the Medical Committee. The Officer will be required to sleep in the neighbourhood, and to have his board at the Board-room table. Salary, £50 per annum. Gentlemen desiring the above office are requested to send their applications, with testimonials, to the Secretary, from whom further particulars may be obtained, on or before Wednesday, the 20th instant.  
Board-room, Nov. 10th, 1884. ROBERT J. NEWMAN, Secretary.

**Hampshire County Hospital, Win-**  
chester.—There is a vacancy for a PHYSICIAN to this Hospital, in consequence of the resignation of Dr. Wood. Candidates must be legally qualified to practise as physicians in England, and must send in their applications to the Committee before Wednesday, the 22nd of November.  
JOHN L. JARDINE, House-Surgeon.

**Wanted, a House-Surgeon to the**  
CARDIFF INFIRMARY. He must be a Member of the College of Surgeons of London, Edinburgh, or Dublin, and a Licentiate of Apothecaries' Hall, London. Salary, £100 per annum, with apartments in the house, coals, and candles. Testimonials and applications to be addressed to the Committee of the Glamorganshire and Monmouthshire Infirmary, care of Mr. Granger, at the Cardiff Infirmary. The Election will take place on Thursday, 4th day of January, 1885.

**The Lying-in Hospital, Rutland-**  
SQUARE, DUBLIN.—This Hospital, the largest of the kind in the British dominions, contains 140 beds, 15 of which are appropriated to the Diseases of Females: 2800 women are annually delivered in the Institution by the Pupils, under the superintendence of the Resident Medical Officers.  
There is a Museum and Library for the use of the Students, and comfortable accommodation for Intern Pupils.  
The Master's Lectures are recognised by all the Medical Licensing Bodies. The Pupils of this Hospital are privileged to attend the Institution for Diseases of Children, Filt-street; and the Cow-pock Institution, Sackville-street.  
Terms of attendance for six months:—Intern Pupils, Twenty Guinea; Extern Pupils, Ten Guinea.  
Applications to be made to the Master, Dr. McCLECKROCK at the Hospital.

TO THE PROFESSION.

**Mr. Bowmer, M.R.C.S. Eng., 50,**  
LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.  
Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.  
Assistants wishing to secure engagements may register their names, &c., personally, or by letter.  
Attendance from 11 till 4.

MEDICAL.

**Wanted, by a General Practitioner**  
within thirty miles of London, an ASSISTANT, with one or both of the legal qualifications.—Apply to Messrs. Westwoods and Hopkins, Wholesale Druggists, 18, Newgate-street, or, by letter, to T. S., Post-office, Little Waltham, near Chelmsford, Essex.

**A Surgeon in South Staffordshire**  
requires the assistance of a Gentleman (to reside in the house) to Visit, Dispense, and attend an ordinary case of Midwifery. Legal qualifications necessary. References as to moral character and professional ability will be required.—Apply, by letter, post-paid, to W. T., Post-office, Wednesbury, Staffordshire.

**Wanted Immediately, by a General**  
Practitioner in North Staffordshire, a Visiting and Dispensing ASSISTANT of good moral character, capable of attending the various branches of the profession. Must be a good horseman. A liberal salary given.—Apply by letter, inclosing testimonials, to X. Y. X., care of Mr. Arthur Tomkinson, Stationer, Tunstall.

**A Gentleman wishes for an Assist-**  
ANTSHIP, in a Practice that is quite private and select, where moderate Dispensing and Book-keeping, and occasional Visiting, or attendance in a Labour in the absence of the Principal, might be required. The Advertiser is upwards of thirty years of age, has been a student of King's College, London, and has also been an Assistant at one post during eight years.—Address, B. A., Stoke, Suffolk, near Colchester.

**Medical Practice, Kent.—In a village**  
a few miles distant from a fashionable Watering-place, suitable to a Gentleman disposed to receive a few Nervous Patients. There are nine acres of land attached, and large garden, with good stabling, &c. The property, which is freehold, can be purchased or taken at a rental, and the furniture, carriage, horses, &c. at a valuation. Three Cottages belonging to the estate are also to be sold. The Practice is small, but capable of much improvement.—Address, M.R.C.S., Post-office, Tunbridge Wells.

TO INCIPENT BOTANISTS, MEDICAL STUDENTS, &c.

**For Disposal, a Fasciculus of**  
INDIGENOUS MEDICINAL PLANTS, carefully prepared, scientifically named, and systematically arranged. Price 10s. 6d.  
A Collection of 800 BRITISH FLOWERING PLANTS. Price 2s.  
An elegant Fasciculus of BRITISH FERNS. Price 10s. 6d.  
A Fasciculus of 80 BRITISH MOSESSES. Price 8s.  
William Forggitt, Market-place, Thirsk.

**Wanted.—A Medical Officer for the**  
Achill District in the county of Mayo. Salary, £50 per annum.—Apply to John Can, Secretary, Achill, Newport, Co. Mayo.

**A Gentleman who has had con-**  
siderable experience in Dispensing, and the Minor Operations in Surgery, is desirous of obtaining a Situation as DISPENSER to some Public Institution. The highest testimonials can be given.—Address P. R., Western General Dispensary, New-road, London.

**Ulverstone Union.—Appointment of**  
MEDICAL OFFICER and VACCINATOR for the Carmel District.—Notice is hereby given, that the Guardians of the Poor of the Ulverstone Union will, at their Meeting to be held at the Board-room in the Union Work-house, in Ulverstone, on Thursday, the 30th day of November, 1884, at half-past one o'clock in the afternoon (in consequence of the resignation of the late Medical Officer), appoint a MEDICAL OFFICER AND VACCINATOR for the Carmel District, comprising the townships of Allthwaite Lower, Allthwaite Upper, Broughton East, Carmel Fell, Holker Lower, Holker Upper, and Staveley, in the said Union. The duties of Medical Officer are those contained in the Consolidated Order of the Poor-Law Commissioners, dated the 24th day of July, 1847, regulating the duties of Officers. The salary of Medical Officer to be at the rate of £50 per annum, exclusive of all Surgical and Midwifery fees referred to in the said Order, and all Vaccination fees. The duties as Public Vaccinator are those laid down by the Poor-Law Commissioners, and the regulations of the Guardians founded thereon. The remuneration as Vaccinator to be, for each successfully vaccinated case, 1s. 6d. when the operation is performed within two miles, and 2s. 6d. beyond that distance from his residence. It will be necessary that the officer elected reside in the District, and that he possess one of the four double medical qualifications prescribed by the said Order of the Poor-Law Commissioners above referred to; particulars of which, and of the other duties of Medical Officer and Vaccinator, may be seen on application to the Clerk. Offers of service, with testimonials of qualification, must be delivered to the Clerk, (free of expense,) at the Clerk's Office, in the Union Work-house, on or before Wednesday, the 29th day of November, 1884. The average yearly amount of extra Medical fees is about £4, and Vaccination fees about £5, which latter, in consequence of the Compulsory Vaccination Act, will be greatly increased. The appointment will, in the first instance, be made from the day of appointment until the 25th of March next, when the then Medical Officer will be eligible for re-election, and, in all probability, will be continued.  
By order of the Board of Guardians,  
JOHN SOUTER, Secy, Acting Clerk.

Board-room, November 9th, 1884.

# Messrs. Lane and Lara, MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC ASYLUM REGISTRARS.

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.  
Office hours from 12 till 4.

## One Hundred and Fifty Pounds Cash

will be taken for an increasing and highly-respectable GENERAL PRACTICE of £300 per annum, with an agreeable Residence at a low rent. Total expenses under £1 a week. Population exceeds 30,000, with only fifteen Medical Men in active practice. This is offered solely on account of ill-health.

Apply to Messrs. LANE and LARA, 14, John-street, Adelphi.

## Medical Patent.—Partnership.—To

be sold, price £500 each, FOUR-SIXTEENTHS of a Valuable PATENT in daily use by the Profession. A preference given to a Medical Man, to whom the undertaking would be perfectly legitimate. Fifteen per cent. per annum will be guaranteed as a minimum return, but as, during the nine months it has been worked, a profit at the rate of twenty-four has been realized, most lucrative results may reasonably be anticipated.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

## Receipts last year, £1250. Price

£1000, one year's Partnership Introduction to the best GENERAL PRACTICE in a large and influential eastern district of the Metropolis; lowest Midwifery Fee, £1 1s. The double qualification indispensable.

Apply to Messrs. LANE and LARA, 14, John-street, Adelphi.

## Out-door Assistant. — Wanted, a

Member of either of the Colleges of Surgeons, or a L.A.C., to Visit and Dispense occasionally.—Apply, by letter, stating qualifications, to Alpha, care of Mr. Fowler, High-street, Kidderminster.

## Medical Assistant.—A Surgeon in

the Midland Counties is in want of an ASSISTANT to Dispense, keep the Books, Visit, and attend Midwifery occasionally.—Address Medicus, Post-office, Waltham, Melton Mowbray.

## A Qualified Assistant is required to

take part generally in the routine duties of a Practice, where there is an Assisting Dispenser.—Address, giving references, age, and qualification, to Robert F. Woollett, Newport, Monmouthshire.

## A Student accustomed to Dispensing

is desirous of making an Engagement to DISPENSE for a few hours in the latter part of the afternoon or evening.—Address J. F., Porter's Lodge, Middlesex Hospital.

## Medical Partnership.—An Edin-

burgh M.D. and Surgeon desires to meet with a SHARE of a PRACTICE in a populous district. The Advertiser has had much experience in Midwifery and General Practice.—Address, M.D., 63, Bury New-road, Manchester.

## Medical.—An Old-established and

respectable Practice to be Disposed of, in a populous and most fashionable watering-place on the East Coast. Any party wishing to retire from a Town Practice, would be well suited at a moderate premium.—Apply, by letter, to Medicus, at Mr. W. Taylor's, 100, Leadenhall-street, London.

## The Friends of a Young Gentleman,

aged nineteen years, of deficient intellect, are desirous of placing him with a Medical Man in the country. His habits are perfectly quiet and inoffensive. The great object is a comfortable home, for which ample remuneration will be offered.—Address, Medicus, at Mr. Murphy's, Bookseller, New Brentford, Middlesex.

TO SURGEONS AND CHEMISTS.

## The Proprietor going to Sebastopol,

offers, at half the original cost, an elegantly-fitted SHOP, well stocked; convenient house of nine rooms, with garden; snug Surgery, and where a good Retail and large Practice are certain.—Address, Medicus, Mr. Woods, 30, Felix-terrace, Islington.

MEDICAL.

## A General Country Practice, re-

aligning upwards of £800, in a large and populous neighbourhood, is for Immediate Disposal, in consequence of the sudden death of the late Practitioner.—Apply to Thos. Hunt, Esq., Surgeon, Alfred-place, Bedford-square, London; or by letter to C. S., Post-office, West Bromwich, Staffordshire.

## To the Medical Profession.—To be

Disposed of immediately, by private treaty, at Northwich, Cheshire, in consequence of the decease of the Proprietor, the Stock, Surgical Instruments, Pictures, &c., of a Surgeon, together with a large Collection of Valuable Surgical Books, if required. Any Gentleman wishing to Commence Business will find this well worthy his attention, the late proprietor having had an extensive Practice for the last eleven years.—For particulars, and to treat for the same, apply to Mrs. Weston, Northwich; or to Mr. Thompson, Chemist, 13, Church-street, Liverpool.

TO SURGEONS AND CHEMISTS.

## For Disposal, the Lease and Shop

Fittings of a HOUSE in an excellent situation near Portland-place, wherein an extensive practice and retail have been conducted for many years.—Apply to Mr. ORRIDGE, 30, Bucklersbury, Cheapside.

## Three Hundred Pounds Per Annum.

—The succession to a highly respectable PRACTICE, in a beautiful neighbourhood in one of the Northern Counties, is to be disposed of for £180.—Apply to Mr. ORRIDGE, 30, Bucklersbury, Cheapside.

MEDICAL.

## A Country Practice of twenty-five

years' standing is for Disposal, producing about £300 per annum. £100 will be required for the Purchase. The situation in a very desirable part of the Midland Counties. There are several small appointments.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

TO SURGEONS.

## A Practice recently commenced, and

already returning after the rate of £200 per annum, with a well-finished Open Surgery, producing cash business of £3 weekly, is for Sale through the illness of the Practitioner. The situation is in one of the large and rapidly extending villages in the immediate neighbourhood of London.—Apply to Mr. ORRIDGE, 30, Bucklersbury, Cheapside.

## Purchase Required.—A Gentleman

thirty-five years of age, married, and able to command means for an extensive Practice, wishes to meet with a favourable opportunity near London, where the income, either singly or in Partnership, would not be less than £300 to £1000 yearly. References to be exchanged.—Apply to Mr. ORRIDGE, 30, Bucklersbury, London.

## Purchase Required. — A Gentleman

twenty-eight years of age wishes to Purchase a PRACTICE of about £1000 per annum, with two years' Partnership introduction.—Apply to Mr. ORRIDGE, 30, Bucklersbury, London.

## Purchase Required.—A Gentleman

twenty-six years of age, wishes to invest £300 in a PARTNERSHIP in some eligible town in the South of England.—Apply to Mr. ORRIDGE, 30, Bucklersbury, Cheapside.

TO SURGEONS.

## The Lease of a Corner House with

private door in the main road, and handsome double-fronted Surgery at the side street (substantially furnished) is Transferable under peculiar circumstances upon very easy terms.—Apply to Mr. ORRIDGE, 30, Bucklersbury, Cheapside.

MEDICAL.

## To be Disposed of, an Old-established

PRACTICE, within a few miles of the city of York.—For further particulars address to X. Z., care of Mr. John Sparr, Druggist, Goodramgate, York.

## Medical Practice for Disposal.—A

Gentleman retiring from Practice wishes to Dispose of the same, to which a Twelvemonth's Introduction would be given. Receipts from £900 to £1000 per annum, without Retail, Union, or Club Practices. The command of £800 will be indispensable.—Apply (personally, if convenient) to H. C. Merryweather, Esq., 72, Euston-square.

## Medical Practice to be Disposed of.

—A General Practitioner, residing in the immediate neighbourhood of a large and fashionable Watering-place in South Devon, being about to retire, has the opportunity of introducing any party of gentlemanly address, with good testimonials, to a highly-respectable and increasing Connexion.—For particulars, and to treat for an Introduction, apply to Charles Bayly, Esq., Solicitor, Torquay.

MEDICAL.

## A Medical Man, fully qualified, and

married, desires to meet with a Gentleman who, from ill-health or any other cause, may wish to be relieved of the onerous and more fatiguing duties of his profession. As very little money can be given, a small share only of the proceeds will be expected. The most unremitting attention will be given. No objection to conduct a branch Practice. Age forty, and accustomed to an extensive country Practice. The highest references can be offered.—Address, M. A., 1, Lamb's Conduit-place, Holborn.

## A Gentleman wishes to obtain a

Situation for his Coachman as Out-door SERVANT. The man can be recommended in the strongest possible terms for sobriety, honesty, and civility, and the care he takes of his horses. He is about twenty-five years of age, and married: knows London thoroughly well. Upwards of one year's unexceptionable character.—Address, post-paid, A. Z., THE LANCET Office, 423, Strand.

PRINTED BY THOMAS CHOWAT SAVILL, at his Printing Office, No. 4, Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the county of Middlesex; and published for the Editor by GEORGE GUTHRIE, of No. 423, Strand, in the Parish of St. Martin-in-the-Fields, Westminster, in the said county, at No. 423, Strand, aforesaid; and sold by all Booksellers and News-vendors in Great Britain and Ireland and the Colonies.—Saturday, November 18, 1864.

LONDON:

JOHN CHURCHILL, NEW BURLINGTON STREET.  
No. 1630.

**MEDICAL HANDBOOKS**

PUBLISHED BY MR. S. HIGHLEY.

**Mr. S. Highley's Publications may**

be seen and obtained of his English Agents:—Mr. Graham, Oxford; Messrs. Macmillan and Co., Cambridge; Messrs. Simms and Denham, Manchester; Mr. J. H. Bellby, Birmingham; Deighton and Loughton, Liverpool; Mr. C. Heald Thomas, Gloucester; Fletcher and Alexander, Norwich; Mr. Leng, Hull; Messrs. Sutherland and Knox, Edinburgh; Mr. Hadden, Glasgow; Mr. J. A. Wilson, Aberdeen; Messrs. Hodges and Smith, Dublin; and Gentlemen remote from Towns may procure any work contained in this Catalogue by forwarding a Post-office Order for the Price specified. All works above 6s. in price will be sent Carriage Free to any part of Great Britain and Ireland.

**A PRACTICAL TREATISE ON THE DISEASES PECULIAR TO WOMEN.** Illustrated by Cases derived from Hospital and Private Practice. By SAMUEL ASHWELL, M.D., late Obstetric Physician and Lecturer to Guy's Hospital. Third Edition. 8vo, 12s. 6d.

"There are few medical works which have reached a third edition in so short a period of time as that of which we have now to announce the publication. This is not merely due to the reputation of the author as an obstetric physician, but to the practical character of the work itself."—MEDICAL GAZETTE.

**A MICROSCOPIC EXAMINATION OF THE WATER SUPPLIED TO THE INHABITANTS OF LONDON AND SUBURBAN DISTRICTS.** By ARTHUR HILL HASSALL, M.B., F.R.S. 8vo, Coloured Plates, 2s. 6d.

**SCHACHT ON THE MICROSCOPE** in its Special Application to Vegetable Anatomy and Physiology. Edited, with the Co-operation of the Author, by FREDERICK CURREY, Esq. Second Edition, considerably Enlarged. Numerous Woodcuts. [In the Press.]

"The demand for a Second English Edition enables the Author and Translator to bring the subject up to the present day, and thus place it in advance of Dr. Schacht's original Work."

"We congratulate the publisher on having presented a valuable little work in so easily accessible a form, which, like many attempts at popular scientific expositions, is neither deficient in accuracy nor superficial in information."—DUBLIN MEDICAL QUARTERLY REVIEW.

**FLORA METROPOLITANA;** or, Botanical Rambles within Thirty Miles of London. Furnishing a List of those Plants that have been found on the different Heaths, Woods, Commons, &c., surrounding the Metropolis; chiefly from actual Observation and the latest Authorities. With a SUPPLEMENT, containing their Time of Flowering, Colour of the Flower, and Heights in Feet of the principal Localities; together with an Index of the English Names. Also a List of the LAND and FRESH-WATER SHELLS found round London. By DANIEL COOPER, F.R.C.S.E., &c. Post 8vo, price 6s.

Catalogues of each sort of Labels are published separately, and will be sent per post on application.

## The Pen Superseded.

The most elegant, easy, economical, and best method of MARKING LINEN, Silk, Books, &c., without the ink spreading or fading, is with the INCORRODIBLE ARGENTINE PLATES. No Preparation required. Any person can use them with the greatest facility. Name-plate, any style, 2s. 6d.; Initials, ditto, 1s. 6d.; Numbers, per set, 2s. 6d.; Crest, 5s. Sent, post free, with directions, on receipt of stamps or post order.

FREDK. WHITEMAN, Inventor and Sole Maker, 19, Little Queen-street, Holborn.

## Army and Navy Surgeons can be

supplied with the best SURGICAL INSTRUMENTS cheaper than any other house in the trade, at PRATT'S, 420, Oxford-street. Travelling Urinals, from 12s.; Brass Enema Syringe in Case, 7s. 6d.; Elastic Stockings, 5s.; Case of Amputating Instruments, £3 15s.; Pocket Case, 30s.; Tooth Instruments, from 25s.

PRATT, Surgical Instrument Maker, 420, Oxford-street.

## Patent Perambulators.

C. BURTON, Inventor, Patentee, and Sole Manufacturer to Her Majesty by appointment.

The distinguished patronage, the flattering encomiums, and the increasing demand, are sufficient proofs of the utility and excellence of these fashionable, safe, and elegant Carriages for adults, children, and invalids, propelled from behind by the slightest effort. Country and Shipping orders. Illustrated Circulars.

OFFICE, 497, NEW OXFORD-STREET.

Also, C. BURTON'S PATENT PERAMBULATOR FOR THE MILLION. Price Two Guineas.

CAUTION.—To avoid unprincipled and dangerous imitations, look for Burton's Label on each Carriage.

## Aërated Waters of sufficient and

uniform strength. BLAKE, SANDFORD, and BLAKE, 47, Piccadilly, having given great attention to the manufacture of Mineral Waters, and feeling it important that medical men should be assured of the quantity of Alkali contained in each kind, beg to submit the following list of their preparations:—

Potash Water, 18 grains of the Bicarbonate in each bottle; Citrate of Potash, (a new and valuable auxiliary in Gout and Rheumatic affections,) 30 grains; Soda, 15 grains; Magnesia, 12 grains, and Ammonia, 10 grains.

B. S. & B. would especially recommend their Seltzer and Vichy Waters; the latter now bottled in half-pints as well as pints.

BLAKE, SANDFORD, and BLAKE, 47, Piccadilly.

## Drug Price Currents forwarded free

of Postage, on application, by Messrs. HEWLETT and GODDARD, Wholesale Druggists, 6, Arthur-street West, Upper Thames-street, near London Bridge, removed from Hatten-garden; containing the ready Cash Prices for Drugs and Pharmaceutical Preparations of the purest quality. Messrs. H. and G. solicit the attention of the Medical Profession resident in the Provinces, Infirmary Committees, Dispensaries, &c. &c., to the advantages attendant upon the above Price Current.

## W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible: also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyocyanum Nigra, Conium Maculatum, Atropia, Belladonna, Cytodendron Umbilicis, &c.) also to his Liq. Taraxac, Liq. Galli Aparinis (a valuable alterative), Liq. Parietaria (diuretic), and Liq. Beis (prepared from the (Egle Marmelos, or Indian Bael), for Dysentery and Diarrhoea.

W. T. has a large supply of INDIAN BAEI on hand.

2, Edward-street, Portman-square.

## Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1864.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.

Insipissated Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

Taraxacum (Davenport's) Liquor, or Fluid Extract, prepared by Spontaneous Insipissation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

## Mathey Caylus' Gluten Capsules

contain the purest Copiba, either simple or combined with Citrate of Iron, Ratanhy, Cubebs, &c.; acknowledged by the London and Paris Hospitals; also by the Lock Hospital; M. Lecœur, chef de Travaux Chimiques à l'Académie de Médecine; Drs. Ricord, Cullerier, &c., who have granted written attestations, to be the best prepared Medicine for the cure of certain diseases.

Extract of a Letter from Dr. Cullerier:—

"I cannot induce you too much to extend the use of your preparations; by so doing you will render a valuable service to the therapeutic of hemorrhagic affections."

"I am, &c.,

"CULLERIER, "Chirurgien de l'Hôpital de Lourcine."

Sold in Bottles, at 2s. 6d. and 4s. 6d., sealed and stamped with the Government stamp, bearing the name of the Patentee. To be had wholesale and retail of Robert King, French and English Pharmaceutical Chemist, 31, Princes-street, Hanover-square; and all respectable Chemists in the United Kingdom.—Country agents required.

## Hooper's Juice of Taraxacum,

Insipissated by dry air, can be obtained in the following forms:—

The EXTRACT; dose, a tea-spoonful.

The FLUID EXTRACT; dose, a dessert-spoonful.

The LIQUOR, with CORTICAL ESSENCE of SARSAPARILLA; dose, a dessert-spoonful.

With Seltzer Water, either of these preparations forms a pleasant draught, and with which their effects are greatly augmented.

"For emaciated constitutions, I know of no medicine equal to Hooper's Taraxacum and Sarsaparilla."—Dr. JOHNSON.

For Affections of the Liver, Kidneys, Jaundice, Indigestion, Cutaneous Affections, and Constipation, these preparations have long been prescribed by the most eminent of the Faculty with the best results. The above Extracts of Taraxacum, when mixed with water, produce a milky appearance, similar to the juice in its fresh state.

"So valuable a preparation as your Taraxacum can need no recommendation from me; still I feel bound to say its beneficial effects have surpassed my most sanguine expectations. My mother, who is in her 78th year, and who through the greater part of her life has been a martyr to liver complaint, appears to have had ten years added to her life by a three months' use of it."

"I remain, yours truly,

"ARTHUR LEAPINGWELL.

"To Mr. Hooper, 7, Pall-mall East."

"Haydon Vearage, Slendrod.

BRIGHTON SELTZER WATER, 4s. per doz. Other facetious Mineral Waters, at a reduction of 25 per cent.

HOOPER, Operative Chemist, 55, Grosvenor-street, and 7, Pall Mall East, London. Laboratory, Great Scotland-yard.

## New Equitable Assurance Company,

(Incorporated by Act of Parliament, 7 and 8 Vict. cap. 110.)

CHIEF OFFICES—440, STRAND, LONDON.

BRANCH OFFICES.—SAVINGS BANK, WORCESTER.

CAPITAL, £100,000.

G. PEACHEY, MANUFACTORY AND WAREHOUSE, 73, BISHOPSGATE-STREET WITHIN, LONDON.

## DR. DE JONGH'S

## LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN

ISLES, NORWAY,

AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

PRESCRIBED BY EMINENT MEDICAL MEN AS

*The most effectual Remedy for Consumption, Bronchitis, Asthma, Gout, Rheumatism, some Diseases of the Skin, Rickets, Infantile Wasting, General Debility, and all Scrofulous Affections.*

## PURE AND UNADULTERATED.

THE great difficulty of obtaining genuine and good Cod-liver Oil has long prevented a just appreciation of its acknowledged remedial virtues, and precluded many suffering invalids from realizing the beneficial effects of this truly valuable Medicine.

Dr. de Jongh's Light-brown Cod-liver Oil is of the best kind and finest quality, being extracted from the liver of the Dorse—*Gadus Callarias*, a species of Cod-fish caught at the Great Fishery of the Loffoden Isles—by a process yielding a much larger proportion of iodine, phosphate of lime, volatile acid, the elements of the bile, and other essential principles, than the Pale Oils manufactured in England and Newfoundland, which, by their mode of preparation, are deprived in a great measure of their active elements.

The well-merited celebrity of Dr. de Jongh's Oil is attested by its extensive use in France, Germany, Holland, Belgium, and Italy, by numerous spontaneous testimonials from eminent members of the Faculty and scientific Chemists of European reputation, and since its recent introduction into this country, by the marked confidence, as well as great success, with which it has been prescribed by Medical Practitioners.

### TESTIMONIAL FROM

The late **JONATHAN PEREIRA, M.D., F.R.S.E., F.L.S.**, Professor at the University of London, Author of "The Elements of Materia Medica and Therapeutics," &c. &c.

"MY DEAR SIR,—I was very glad to find from you, when I had the pleasure of seeing you in London, that you were interested commercially in Cod-liver Oil. It was fitting that the Author of the best analysis and investigations into the properties of this Oil should himself be the Purveyor of this important Medicine.

"I feel, however, some diffidence in venturing to fulfil your request by giving you my opinion of the quality of the Oil of which you gave me a sample, because I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this Medicine as yourself, whom I regard as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of responding to your application. The Oil which you gave me was of the very finest quality; whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer Oil can be procured.

"With my best wishes for your success, believe me, my dear Sir, to be very faithfully yours,

(Signed)

**JONATHAN PEREIRA.**

Finabury-square, London, April 16th, 1861.

"To Dr. de Jongh."

Extract from "THE LANCET," July 29th, 1864.

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de Jongh gives the preference to the Light-brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. In the preference of the light-brown over the pale Oil we fully concur.

"We have carefully tested a specimen of the Light-brown Cod-liver Oil, prepared for medical use under the direction of Dr. de Jongh, and obtained from the wholesale agents, Messrs. Ansar, Harford, and Co., 77, Strand. We find it to be genuine, and rich in iodine and the elements of bile."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH's stamp and signature, by

## LETT SOMIAN LECTURES

## On Surgery.

DELIVERED BEFORE THE FELLOWS OF THE  
MEDICAL SOCIETY OF LONDON,

DURING THE SESSION 1853-54.

By JOHN BISHOP, Esq., F.R.S.

## LECTURE II.

## DISEASES OF THE BONES.

*On necrosis. Organic changes of the bones in this disease. Their origin hypothetical; mode of formation of the new, and of the throwing off of the dead bone. Necessity for the removal of the dead bone by surgical aid discussed. On exostosis, osteophytes, and soft tumours of bones. Difficulties of their diagnosis.*

In my last lecture I pointed out that the strength and elasticity of bones depend on the proportions existing between their organic and inorganic constituents, and that when they are in a state of elasticity they are capable of resuming their normal figure, after being distorted by any force applied to them; but that when they are inelastic they remain distorted, and cannot recover their primitive form as long as they continue in that condition.

In the present lecture it is my intention to submit to your consideration the subject of some of the organic diseases of bone, including those of inflammation, necrosis, and exostosis.

*Inflammation of Bone.*

The bones, like all other tissues of the human body, are liable to inflammation. They possess a very low degree of sensibility in their normal state; but when inflamed they become exquisitely sensible. The causes of osteitis are numerous; it may be the result of external injuries, or of internal constitutional derangement. It is sometimes secondary, and the consequence of an inflammatory condition of the periosteum and surrounding soft tissues. The inflammation is sometimes of an acute, and sometimes of a chronic type; which states are determined by the nature of the circumstance by which it is produced. Amongst the most frequent of the external causes to which we may ascribe the inflammation of bones, are mechanical injuries, such as falls or blows; also sudden, or prolonged and excessive states of heat and cold. Sometimes the inflammation attacks the outer layer of the bone, and is then combined with periostitis; at other times it affects the inner surface, and is then combined with an inflamed state of the medullary membrane, or it may affect the whole thickness of the bone at the same time. The products of an inflamed bone are in many states different from those of the softer tissues. In a moderate degree of inflammation of the external portion of a bone, the product consists of a gelatinous, dark-red exudation, which changes its colour to a reddish white, and finally becomes a pure white. Whilst these changes in colour are taking place, the gelatinous exudation, which coagulates like the white of an egg, is metamorphosed into soft flexible cartilage, and finally consolidates into reddish-white succulent bone. In this way the portion of the bone affected becomes covered, either with a thin porous film, or a thicker layer resembling velvet in its texture. The periosteum is swollen, and loosely connected with the exudation. When the exudation is in a more advanced stage, it becomes organized, and unites, forming the outer layer of the bone, to which the periosteum becomes firmly attached. When the internal lamina of a long bone is attacked with inflammation, the secretion is lodged on the internal surface of the medullary tube, or on the spongy substance, and consequently the medullary tube becomes contracted, and the spongy substance acquires greater solidity. Sometimes the exudation is deposited on the wall of the Haversian canals, and the bone becomes indurated. Independently of these products, there are others which are the results of inflammatory conditions of the bones. Some of these products become organized in different ways: some change into osseous structures, which differ from the texture and composition of healthy bone; others acquire a fibroid or cellular tissue.

These abnormal products are attended with an expansion of the bone, the amount of which depends on the quantity of matter secreted, and many of the cases of expansion of texture

No. 1630,

and increase of volume are due to these products of inflammation of the bones.

When the bone is affected with acute inflammation, the product is either of a fibrinous or of a purulent character, which varies in degree of fluidity in proportion to the greater or less quantity of serum which is contained in the effusion. It is also frequently tinged with blood, or with a brown or green-tinted sanies. In these acute forms of inflamed bone the periosteum is loosened from the bone by the fluid thrown off beneath it, and it then becomes distended into a fluctuating sac. The exudation is chiefly deposited in the cancellous structure, but some of it finds its way into the Haversian canals of the compact tissue. The surface of the bone becomes rough and eroded from the destructive solvent power of the effusion. The walls of the Haversian canals are similarly affected, and the cancellous structure shows more clearly the destructive nature of the effusion; the network becomes dull and opaque, and its membrane may be easily torn. This is a formidable condition of inflammation of bone, and may lead to the absorption of the purulent secretion into the system, and thus destroy life, or, if it take a more favourable turn, it may end in the death or necrosis of the bone.

When the spongy substance is the seat of inflammation, the pus thrown off is sometimes enclosed within the walls of the compact bone. This form of internal abscess of the bones often occurs in the shafts of the femur and tibia, and has been described by Sir Benjamin Brodie, Mr. Arnott, and Mr. Mayo. This abscess is generally attended with considerable and lasting pain, and often produces enlargement of the bone, accompanied with great constitutional irritation. The modern treatment of these interosseous abscesses is due to Sir Benjamin Brodie, and consists in first making a crucial incision through the soft parts, and then perforating the bone with a middle sized trephine, penetrating through the compact into the cancellous structure; the membrane surrounding the abscess is then perforated to allow the pus to escape; the cavity is afterwards filled up by means of healthy granulations. The seat of these abscesses is almost always in the head or in the lower part of the tibia. It is known that the matter will remain many years without producing any necrosis of the bone, in consequence of the membrane by which it is surrounded protecting the bone from its effects. The diagnosis of the precise seat and nature of the collections of matter in bone is a subject of considerable difficulty, and it requires great tact to determine its pressure and locality; but the enlargement of the bone, and the persistence of pain in its internal part during a series of years, are the most prominent symptoms for our guidance in the treatment. But notwithstanding the difficulty of forming a correct diagnosis of the actual presence and special seat of an abscess in many of the bones, it is, nevertheless, very unwise to make experimental explorations and perforations in them, in order to obtain that knowledge, from the liability of these attempts to produce inflammation of the bone and sloughing of the soft parts—evils which are too serious in their consequences to warrant such proceedings without the most mature consideration. When the suppuration of the external laminated surface of a bone is confined to a small spot, the inflamed part of the bone exudes a product which is susceptible of ossification. It will be easily understood, from what has been said respecting inflammation of the bones, that various states or stages of inflammation are accompanied by variations in the nature of the product. The product also varies in different states of the same system, or in different constitutions. The treatment of inflammatory states of bone is conducted on the same general principles as those of the inflammatory conditions of the soft parts, except that active local depletory measures do not produce the same amount of beneficial effect so rapidly as may be accomplished in those tissues which are more accessible to local remedial agents. The interposition of the more highly vascular soft tissues tends to prevent the application of remedies immediately to the bone, and it is often only after the long-continued use of counter-irritants, applied on the adjacent soft parts, that chronic forms of inflammation of the bone subside.

In the acute forms of osteitis, active depletory measures must be early had recourse to, in consequence of the rapid changes the osseous tissues undergo while passing into the suppurative process. These measures may be aided by either warm fomentations or cold lotions, according as the nature of the case indicates. Mr. Stanley recommends mercurial ointment to be applied to the surrounding soft parts, and he states that the iodide of potassium, in doses of three grains, repeated three times a day, never fails to assist in the removal of inflammation of bone. It is obvious that absolute rest must be enjoined, and if the seat of the mischief is in the vertebral column, the

recumbent position is indispensable. It would be superfluous to detain the Society by minute details of special cases, as on the present occasion it is only necessary to lay down general principles. Although bones die, and are thrown off by the vital energies of the system, particle by particle, as is the case in caries, the disease is essentially different from the complete death or mortification of large segments of bone, as happens in the disease included under the term necrosis.

In caries, the circulation of the blood, modified by the disease, is still going on; but in complete necrosis of bone, the circulation is entirely suspended. Whatever tends to interrupt the free circulation of the blood in bone, tends either to the atrophy or to the death of the part, as in the softer tissues of the body. From these conditions it is that we find that necrosis generally attacks those osseous tissues which are endowed with the least vascularity, and therefore the compact portions of bone are much more liable to this disease than the cancellous or spongy structures. It is apparently for this reason that the shafts of the cylindrical bones become affected, while the softer tissues at each end remain free. Indeed, we may state, in general terms, as an axiom, that the liability of a bone to spontaneous attacks of necrosis is inversely proportional to its normal vascularity. In corroboration of this view Kolliker\* remarks, that "there can be no doubt that the fluids which the plasmatic vascular system of the bones receives from the bloodvessels, probably modified by the influence of the nucleus which is retained in every lacuna, are most indispensably requisite for the maintenance of the bone; for we see that when the supply of blood is impeded by the destruction of the periosteum of the medulla, by ligature of the vessels of the limb, or by the obliteration of the periosteum, necrosis of the bone certainly ensues." But independently of the causes already assigned, there are many others which may be enumerated tending to produce the death of bone: for example, if the bone receives a severe shock, or is crushed, or subjected to extremes of heat or cold. Necrosis may also be the result of internal constitutional causes, such as scrofula, syphilis, gout, and scurvy. In the organic changes which take place in the bone, it is found that, while in caries the earthy salts are diminished, in necrosis it is the organic matter that disappears.

#### NECROSIS.

*Proportions of Inorganic and Organic Matter found in several cases in the Phalanges.*

	II.
Inorganic	60.77
Organic	39.23
	III.
Inorganic	67.43
Organic	32.67

There are not any bones in the whole skeleton that are not liable to be affected with necrosis. The whole of a bone may be affected, but this is not a common occurrence; for we generally find a segment only, of greater or less magnitude, involved; sometimes the outer lamellated portion is necrosed; in other cases the diploetic tissues. When the internal portion of a bone is affected, it is often confined to that portion of the bone; but sometimes the disease penetrates to unequal depths, and may even extend nearly through the lamellae.

Experience has shown us that the least vascular portions of the bones are the most liable to be affected with this disease; we accordingly find that the shafts of the long bones, such as the tibia, the femur, the humerus, the radius, the ulna, and also the bones of the skull, all belong to the cycle of bones which possess a very low degree of vascularity. It is a disease that most frequently attacks young people, and more especially those of a scrofulous constitution, but it may occur at any period of life. The vascular spongy tissues which are the least liable to necrosis are, for the same reason, those most liable to be affected with caries.

When a portion of a bone becomes necrosed, it sets up an active state of inflammation in the healthy bone lying in contact with it; the inflammation goes on to suppuration, which is kept up until the dead bone is removed, either by the process set up by the system, or by surgical manipulation. But when the disease is left to the natural powers of the constitution to remove it, the exhaustion consequent on the profuse suppuration induced is often so great as to destroy the patient. The inflammatory state of the bone sets up an inflammation of the

surrounding integuments, which ulcerate, and one or more sinuses are formed through which the matter thrown off by the bone passes, including scales and particles of the sequestrum. The suppurative process is then the means provided by nature to separate the dead from the healthy bone, and to throw off the sequestrum.

It is easy to distinguish the dead from the healthy bone by its bleached, dull-looking, and discoloured appearance; but until a complete separation between them has taken place, it is difficult to determine very accurately their boundaries, in consequence of the blending of the colours of the dead and healthy bone with each other. According to Rokitsansky—

"Around the dead bone, wherever it is in contact with the healthy bone, the latter undergoes a gradual expansion or rarefaction of its tissue by the enlargement of the Haversian canals; it assumes a rosy tint, and becomes succulent; the lamellated tissue gradually acquires an areolar structure, becomes more and more rarefied, and at length disappears altogether, and its place is occupied by the substitution of a red, soft, spongy substance. This change is effected by the inflammation which has been set up giving rise to suppuration and granulations. The bony tissue is dissolved by the matter secreted in the Haversian canals, while the granulations which are produced at the same time fill up the enlarged canals. The result of these processes is the production of a furrow which encircles the margin of the dead bone; this furrow is gradually filled up with granulations from the healthy bone as far as the surface of the dead bone, thus filling up the space which separates the living and the dead structure."

From this we see that the production of purulent matter for the removal of the dead bone, and the granulating process for the formation of the new bone, are being carried on at the same time; and Rokitsansky is of opinion that these views of the processes are much more rational than those which assume that inflammation and absorption are employed simultaneously. Sometimes the granulations from the healthy bone will perforate the sequestrum where its segments are thinnest; and where this takes place in several points they may completely surround the dead bone, and fix it so as to delay its removal. The perforations are supposed to be effected by the corrosive quality of the matter acting on the tissue. This view seems strengthened by the fact, that independently of the irregularities on the surface of the sequestrum that give rise to the unequal thickness of the dead bone, the side that opposes the surface of the suppurating tissue appears rough and worm-eaten, and is discoloured, and often black. These views, which accord with the state in which the tissues present themselves in this disease, are nevertheless hypothetical, and require further investigation.

When necrosis takes place on the surface of the bone, the inflammation leads to an exudation which subsequently ossifies on its surface, immediately beneath the periosteum; and as these processes of inflammation and exudation extend inwards, they involve the whole thickness of the bone, and finally reach to the medullary canal, or to the spongy or diploetic tissue. The deposition of the new bone takes place in the internal part of the bone beneath the lamellae, as well as on the surface of the bone. The exudation which takes place on the surface of the bone is sometimes very considerable, and the deposit goes on and enlarges the bone until it has acquired a considerable dimension. The suppression of the exudation depends in a great measure on the time occupied in the removal of the dead bone; so that it is obvious that the sooner the latter is accomplished, either by nature or art, the less will be the waste of the system. The granulations uniting with the cicatrix of the soft parts being thinner than the surrounding bone, a depressed scar is generally presented, lying in the hollow formed by the surrounding parts. The degree of depression of the scar depends on the thickness of the surrounding bone. In the reproduction of the new bone, the first deposit appears to take place around the Haversian canals in circular, radiating discs; at least this is the view taken by Professor Quekett.

It is a remarkable provision of nature, that the muscles, after remaining for some time connected with the dead bone, by passing through the openings in the new, gradually become detached from the necrosed part, and insert themselves in the new. When the necrosed bone is internal, the new osseous matter is exuded from the internal surface beneath the periosteum, the membrane adhering firmly to the inflamed soft parts surrounding the bone. When the internal necrosis occupies only a portion of the shaft of one of the long bones, the rest of the medullary canal becomes filled up with new bone. Sometimes the new encloses the dead bone, and forms a shell, which consists of two layers, one of old, and the other of newly-formed bone, lined with periosteum. This case is

\* Manual of Human Histology, p. 381.

termed the sequestral capsule. This capsule is perforated by openings varying in size and number, which lead into the cavities of the sequestral capsule, either obliquely or directly. The openings are either of an oval or of a rounded form, and about the size of a bean or pea. Most of the openings communicate with abscesses in the soft parts, which open externally, either directly or by fistulous canals, taking a tortuous course, and opening at a distance from the aperture in the bone. When the fistulous openings are connected with the necrosis that has extended from within outwards, and penetrated the external laminae of the bone where no new bone has yet been deposited, the openings are lined with granulations, which are continuous with the inner membrane of the sequestral capsule. The pus continues to be poured out as long as the dead bone remains, but it ceases when the entire removal of the sequestrum is accomplished. The existence of osseous granules in the pus is a sure means of ascertaining whether the disease of the bone is, or is not, going on. The process of ossification then succeeds, and the medullary tube is filled with a solid cylinder of bone. After the lapse of some time, a gradual enlargement of the Haversian canals of the newly-formed bone takes place; the canals change their organic structure, and instead of being osseous, become of a cellular structure, which is supposed to perform, though imperfectly, the functions of a medullary canal. When the process of regeneration has been completed, the bone is composed of the internal cylinder of new bone, surrounded by a case of the old bone, and an external layer exuded beneath the periosteum. For some time there is a well-marked boundary between the old and the external layer of new bone, but ultimately this becomes undistinguishable.

The surface of the newly-formed bone is at first rough and thickened; but after some time, the layers become more consolidated and dense, and of a more uniform and smooth texture. It sometimes happens, however, that the bone retains its rough aspect during life, and continues to be dense, and of a high specific gravity. When the whole thickness of a bone is affected, the exudation in the production of new bone takes place both from the external surface, and also from the medullary canal of the healthy bone. After the removal of the sequestrum, the growths from the two ends unite before the bone has attained its original length, and a shortening of the limb is the result. Sometimes the union of the ends is imperfect, and a kind of false joint is formed. It very rarely happens that necrosis affects an entire bone; and this is very important, in consequence of the new being formed by the section of the old bone which has escaped the ravages of the disease. It is supposed, however, by Rokitsansky, "that the periosteum and other surrounding soft parts, and even the newly-formed vascular tissues, are capable of producing an exudation which will become bone." This view seems to be borne out by the fact, that in a few cases recorded of spontaneous necrosis of the entire bones, new bones to supply their place have been reproduced. In experiments made by Heine on some of the lower animals, it was found that after the entire removal of a bone, a new one was reproduced spontaneously.

In persons of an unhealthy and scrofulous habit, the inflammatory process which succeeds necrosis may assume an unhealthy character, and instead of being accompanied with healthy granulations, may give rise to an ichorous discharge; and the process may degenerate into ulceration and caries of the bone. Another form of necrosis sometimes occurs, consisting of a gangrenous ulceration of the spongy bones. In these forms the bone becomes soft and brittle, and betrays a very disordered state of the constitution.

It must be obvious, that as there is a very considerable drain on the system in necrosis, occasioned by the profuse discharge for the purpose of throwing off the dead bone, and in the formation of the new, the system should be well supplied with nourishing diet; and with regard to the local treatment, the early extraction of the dead bone is desirable, and appropriate dressings should be applied to the ulcerated surfaces of the soft parts. These are subjects concerning which there is no ambiguity, nor is there anything which appears to call for either illustration or special attention; but from the nature of the processes which have been described, it must be obvious that the earlier the complete removal of the dead bone can be safely effected, the sooner the patient will be convalescent.

(To be continued.)

SIR JOHN SPENCER LOGIN.—This gentleman, who accompanies his Highness the Maharajah Duleep Singh to this country as Medical Superintendent, received the honour of knighthood from her Majesty on the 14th inst.

ON THE

## POWER OF IRON IN EXPELLING MORBID POISONS FROM THE SYSTEM.

By WILLIAM THORN, M.D.

I WILL not pretend to give a scientific explanation of the way in which the citrate of iron acted upon the blood in the two cases I am about briefly to narrate, but that the effect was distinctly due to the iron there can be no doubt, because it was given alone, simply dissolved in cinnamon-water; no purgatives were even resorted to, indeed I seldom find them necessary where the citrate of iron is administered, for it is a preparation that never constipates, as far as I have seen.

About three months since, I was called to see the Rev. Mr. S—, an eloquent, overworked young clergyman, twenty-seven years old, tall, thin, of a dark complexion, and a bilious temperament. He had just returned from Ramsgate, having gone there for the recovery of his health; while there he had suffered most severely from enteritis and hepatitis. The prescriptions showed that he had been taking calomel and iodide of potassium with but slight benefit, for I found him most completely shattered in mind and emaciated in body, more like one in the last stage of phthisis than anything else. He was much jaundiced; the tongue was furred; the pulse weak, frequent, and small; the appetite bad; palpitation upon the slightest exertion; and a dread of going to sleep, in consequence of the disturbance that was produced by frightful dreams. Having examined the condition of the various visceral organs, and having ascertained that no organic disease existed, I came to the conclusion that the disorder of the liver was functional, that it was in a state of torpor, why I could not say, and that the rest of the symptoms were those of debility only. From this view I did not like to continue the calomel, and I felt afraid to give quinine, because of its congestive action upon the liver. I therefore thought that the best plan would be to give a metallic tonic to remove the anæmic symptoms. The rest of the case is told in a few words. In about fourteen days after I had given the iron, I was sent for in a great hurry to see my patient, the message being that he had an attack of cholera. Upon arriving, I found that he had passed quantities of slate-coloured fæces in a liquid state, of about the consistence of thin gruel. I said, this action is critical, the liver is clearing itself out. This discharge continued for three or four days, five or six times each day, and then spontaneously ceased. I merely, during its continuance, ordered good nourishing diet, and left nature to do the rest. From that time my patient steadily recovered, taking iron and quinine only. I am pleased to say that he has become clear in his complexion, comparatively speaking fat, and in all respects well. It may here be stated that should it be objected that the slate-coloured evacuations passed were simply matters coloured by the iron, I am sure that this was not the case, because there was none of the characteristic black appearance of iron in the fæces, until at least another fortnight afterwards. I believe all the first doses of iron were absorbed and used in making new, or at least in renovating the old, blood-globules, for I have frequently noticed, that while the patient really requires the exhibition of iron, there is no indication of it in the stools, until the constitution no longer needs it, unless, indeed, it is given in a larger dose than the system can take up, when, of course, the surplus must come away from the first.

In the second case the effect of iron was still more striking, because the expulsion of the morbid poison was by a different channel. Mr. N—, aged about thirty-eight, middle size, rather stout, pale countenance, and of a bilious temperament. Went abroad, about eighteen months since, to see relations, from whom, for family reasons, he had been long estranged. He did not meet with a friendly reception, and he grieved much on account of it; but he says that he remembers but little, until he found that he had lain for three weeks at an hotel in Königsberg, in a state of fever and insensibility. He came to England as quickly as possible, and resumed his usual duties, which were of an intellectual and arduous nature, but he did not recover his health; he got much thinner; he was wearied by the slightest exertion; he was always taking cold; and was considered by himself and his friends to be gradually getting worse. Having tried a long course of homœopathic sugar-plums without the least benefit, he sent for me. I gave him full doses of citrate of iron for about a month, and at the end of that time he had two large carbuncular boils, one at the back of the neck, and the other on his left arm. These

remained open, discharging freely for about a fortnight, during which time he took freely of port wine and generous diet. He then made a trip to Paris, and returned quite well, again stout, his health and vigour being completely renewed.

The only comment I would make upon the two cases thus hurriedly and imperfectly recorded, is my opinion, that the iron, by renewing the red globules of the blood, enabled the vital powers to throw out, by critical discharges, the morbid matters which had been deteriorating and debilitating the constitution of each patient for months before, and that it is by an analogous action that we must attribute the benefit derived from the free exhibition of iron in cases of scrofulous disease.

Harrow-road, Paddington, November, 1844.

## ON CRETINISM AND IDIOTISM.

By JOHN TATAM BANKS, M.D.

ON a recent tour through Switzerland I was induced to visit the Hospice of the Abendberg. Many motives prompted me to do so, especially the desire to see a little patient (the child of a lady residing in England) now staying there, and also to judge for myself of the advantages and benefits arising from this institution.

Most of the readers of *THE LANCET* are perhaps aware that the hospital on the Abendberg was opened in 1840 by a benevolent physician, Dr. Guggenbühl, for the reception of patients afflicted with cretinism—a numerous class of human beings hitherto too much neglected, and suffered to live and die like the lower animals. In Switzerland alone there are, I believe, 20,000 persons afflicted, to a greater or less extent, with this fearful malady—a malady presenting the greatest mental imbecility, combined frequently with the greatest bodily degeneracy—a melancholy spectacle, the description of which is painful, the sight dreadful.

The fact that goitre and that cretinism in men and also in animals, occur in the lower confined grounds, and in narrow damp valleys, where the due circulation of air is interrupted, and that at 3000 English feet above the sea these diseases in Switzerland are seldom found, led Dr. Guggenbühl to build his hospital on the Abendberg 3500 feet above the sea level. A more favourable and beautiful spot could scarcely be selected amidst the chain of the Bernese Alps. It is well exposed to the sun, on the southern slope of the mountain, and to the dry, pure, bracing air, but sheltered from severe cold winds. The views from it are exceedingly grand.

Dr. Guggenbühl appeared to take great pleasure in showing us over his establishment, and in explaining his system. He presented to our examination many of the pitiable objects whom his unwearied exertions are striving to raise from helpless idiotism to mental intelligence.

As Dr. Guggenbühl considers cretinism as the consequence of an enfeebled physical condition,—in other words, the effect of an abnormal or diseased state of the bodily organs,—his treatment consists in improving the general strength, thereby developing and strengthening the different organs of the system, and thus bringing all the functions of the body into a healthier state, amongst the rest that of the brain, and so to rouse the mental faculties into more vigorous action to admit of moral training and judicious instruction.

In addition to the natural advantages of an elevated situation, where the mountain air, peculiarly beneficial from its strong electric properties, can be freely breathed, (remote from the noxious influences of the lower grounds and valleys,) physical, medical, and moral treatment are assiduously observed.

Gymnastic exercises in the open air, the cultivation of little gardens, and the occasional use of baths, electricity, and frictions are carefully attended to.

The medical treatment of course varies according to the indications of the disease. In some the skin is much affected; in others the glandular system; in others the nervous. Many are rickety, and I saw two or three children with their bones so soft that their limbs could be easily bent. Many are atrophied, and numbers hydrocephalic.

From the conversation I had with Dr. Guggenbühl, I entertain no doubt that the remedies best calculated to correct disordered, and to promote healthy actions of the system are well selected, and judiciously prescribed.

Great attention is paid to regulate the propensities, to improve the manners and habits, and to awaken the affections of these unfortunate beings, and, from the reports, we have

reason to believe with much success; and that not only in numerous instances has the infirm and torpid frame being strengthened, but intelligence kindled in the once dormant mind of the degraded cretin. In this generous effort "to restore to its higher condition the ruined tenement of the idiot's frame,"—enabling him to join in the amenities of social life,—the persevering and self-denying founder of the Hospice on the Abendberg devotes his life and property.

Unquestionably, in many cases the peculiar conformation of the brain bids defiance to any improvement in the mental manifestations; but experience has shown that in numerous instances the imperfect senses of the once-neglected idiot may, by training and education, be strengthened and developed.

The aid of the benevolent is alone wanting to remove the chain which binds the idiot's mind, and rescue him from his bondage, in this our own beloved country, as well as in the poor cretin's Alpine home.

Hougham Lodge, near Dover, Kent, November, 1854.

## ON THE

## TREATMENT OF CHOLERAIC DIARRHŒA BY OLIVE OIL.

By C. RODNEY HUXLEY, Esq., M.R.C.S.

FOR several weeks past I have read many opinions on the treatment of cholera published in *THE LANCET*, all of which have been opposed to the simple means employed in distant parts, and in my own practice, which have effectually and invariably checked the premonitory symptoms in this fearful malady—viz., half-ounce doses of olive oil, given every three hours till the diarrhœa ceases. When surgeon to the British Seamen's Hospital at Lisbon, I had frequent opportunities of testing this invaluable medicine in the most stubborn cases of diarrhœa, and in no instance have I known it fail.

I was induced to adopt this treatment, hearing from an influential merchant in Lisbon of two alarming cases of cholera, both sufferers personally known to my informant, who rapidly recovered by the simple use of olive oil taken as described. And so surely will it yet be learnt that the remarkable escape of the Jews in seasons of cholera, is attributable to the frequent use of this oil. The fact is so notorious that I am surprised the subject has been past over as little more than the result of accident.

I will not enter into the philosophy or physiology of this treatment, more than by reference to its invariable effect upon the mucous membrane of the alimentary canal, which is to allay its universal irritation. In this respect, I look upon olive oil as a specific, for it has never failed to check the excess of mucous secretion, so constant a symptom in the first stages of cholera. My conviction is, if you can succeed in soothing the irritation, you check the disorder, and neither cramp nor other fearful symptoms will follow. The danger of the blood ceasing to circulate, owing to the waste of its fluid ingredient, is no longer anticipated, and the patient is soon pronounced out of danger.

In conclusion, permit me to state that my only object in soliciting insertion of these remarks in *THE LANCET*, is the conviction, and no less hope, that the treatment by olive oil in cholera will receive, as it merits, an universal test.

Groombridge, Nov. 1854.

## A CASE OF DEATH FROM THE ABSORPTION OF "WASHING SODA" (BICARBONATE OF SODA.)

By HENRY HANCOX, M.D.

NOT being aware of any case having been recorded of the injurious effects of "washing-soda" upon the tissues of the human body, when absorbed into the system, I submit the following case to the readers of your widely-circulated journal, should you consider it worthy of a place.

I was called to attend Mary A—, aged forty-eight years, a washerwoman, of spare habit of body, on the 3rd inst, when she gave the following history of her case:—A little more than a fortnight from the above date she received a small cut from a penknife, on the outer side of the little finger of her right hand; being merely a small scratch no notice was taken of it: she shortly after commenced to wash some linen in water containing "washing soda." The day following great pain was experienced in the part that had been cut by the penknife, and swelling soon after made its appearance, which induced her to

apply a hot bread poultice to the finger and hand, which she continued to do until it began to put on a serious aspect, when I was summoned to attend her. The hand, fore-arm, and arm, are very much swelled, hard, and inflamed, the under part of the arm being of a bright scarlet colour; complains of great pain, which she describes of a burning character; the glands of the axilla are enlarged; intense pain in the head; tongue furred, and very dry; great thirst; pulse quick and full; skin dry; bowels have not been acted on for three days. She was bled to sixteen ounces, and the following mixture ordered, and two grains of calomel with each dose of the medicine. Sulphate of magnesia, one ounce; infusion of senna, eight ounces; make into a mixture, and take two large spoonful every other hour. Cold applications to be applied to the inflamed part.

4th. - Patient this morning seems somewhat relieved from the burning pain which she experienced yesterday; pulse not so quick; thirst still great; the bowels have been well acted upon by the medicine; she states the cold applications give her more ease than the poultices formerly used; the blood drawn from the arm yesterday is cupped and buffed; will not bear further depletion; ordered a saline mixture.

5th.—Armi still remains hard, and very much swollen; no quaginess or fluctuation can be detected in any part; the tongue remains furred, and the thirst still continues; pulse quick, but small; she seems to be in a sinking state; medicine to be discontinued; ordered her to take a little port wine occasionally during the day; she began to sink rapidly, and breathed her last at five o'clock the following morning.

*Remarks.*—This case is interesting, as it shows the pernicious and fatal manner in which “washing soda” (soda bicarbonas) acts upon the human body, when continued to be applied to a recently cut surface. How or in what way it produces its poisonous effects upon the blood is a mystery that I am unable to solve. I have seen a case where the finger has been amputated in consequence of disease in the joint, which was caused by washing linen in water containing this substance, and I have no doubt that many of my professional brethren have met with similar cases.

## CASES OF EXTERNAL INCISION FOR STRICTURE OF THE URETHRA.

KING'S COLLEGE HOSPITAL .....	MR. FERGUSSON.
"MARY'S" .....	MR. HENRY LEE.
ST. MARY'S .....	MR. COULSON.

(Concluded from p. 417.)

**KING'S COLLEGE HOSPITAL.**

## TREATMENT OF STRICTURE OF THE URETHRA BY THE EXTERNAL INCISION.

(Under the care of Mr. FERGUSSON.)

THIS patient is a man of fair complexion, above twenty-six years of age, and has had stricture of the urethra for the last eight years. The affection has caused along the canal that amount of mischief and disorganization which is so characteristic of coarctation. About eight years previous to his admission into this hospital, he suffered from retention, which proved so obstinate that M. Delagarde, of Exeter, punctured the bladder above the pubis. The catheter at that period was only left three days in the canal; and as the natural outlet probably became tolerably pervious again, the wound was allowed to heal. The cicatrix is now clearly visible: it is circular, the size of a fourpenny-piece, and presents a rugose, starry appearance.

In spite of the occasional use of instruments, the urethra, some

time after this, was felt to have been narrowed in two places: one a few inches from the meatus, and the other towards the membranous portion of the urethra. The canal now gave way, abscesses formed, and after the pus was discharged, fistulous tracts and openings yielded a passage to the urine each time micturition took place. In the summer of 1854 the man was admitted into this hospital in a weakly state, and the treatment by dilatation was systematically pursued for several months with a certain degree of advantage. But the fistulous openings showed no tendency to close.

Owing to the patient's weakly state, Mr. Fergusson did not wish to resort, at that period, to any operative measures; but when the man returned to the hospital, (Sept. 1854,) Mr. Fergusson resolved to treat the stricture by the external incision, and freely to lay open the sinuses, so as to afford the patient a good chance of regaining the integrity of the canal.

On the 14th of October the patient was brought into the theatre, and when examined was found to present several fistulous openings about the scrotum, one of which was close to the peno-scrotal angle. When the man had been fully narcotized by chloroform, he was tied up, as for the operation of lithotomy, and a silver catheter, of about No. 4 size, was introduced into the urethra, and glided easily into the bladder. Mr. Fergusson now made the usual incision exactly along the raphe of the perineum, and having reached the instrument, carried the knife upwards and downwards for about the distance of one inch and a half. The urethra having thus been freely laid open, the scalpel was carried along the different fistulous tracts, which were all largely incised. This measure caused the escape of a certain amount of urine along with the blood. The silver catheter was now withdrawn, and an elastic one of a large size introduced.

The hæmorrhage was very inconsiderable, and when the patient was removed, Mr. Fergusson stated that the present case was one of no common interest, as the numerous fistulæ with which the patient was affected had resisted various kinds of treatment; he had suffered several attacks of retention of urine, for one of which the bladder had been punctured over the pubis. It had been evident, through the operation, that a pretty large instrument could pass; but it was doubtful whether it had run the right course, for there existed a pouch towards the prostate gland. He (Mr. Fergusson) had been very careful to avoid this large sinus, so as to secure the correct division of the strictured portion of the urethra. By laying open the fistulous tracts, the urine lying in them (which is very liable to cause calcareous deposits) was freely evacuated, and as the instrument was to be left in the urethra, there was every likelihood that the wounds made in the scrotum, in different directions, would lead to an eventual cicatrization of the parts. In fact, it was all-important to this patient that the abnormal communications between the scrotum and urethra should be closed up, as for a long time he had passed all his urine from the scrotum.

The patient progressed pretty favourably after this operation, and the elastic catheter (No. 10) which had been passed into the bladder, was left for eleven days, when it was found somewhat incrustated with calcareous deposits.

One month after the operation the perineal wound had not yet completely cicatrized, and the urine passed through it, as well as through an aperture situated at the root of the scrotum. At this period, it appeared as if urine had again irritated some portion of the perineum, as pain and heat were felt towards the anal region, the usual forerunners of a purulent collection.

This patient is evidently one of those who try all the ingenuity of the surgeon, and upon whom the value of such operations as the external incision may fairly be tested. The case, according to the views generally entertained, should do well, for the sinuses were freely incised, the urethra largely divided, and the instrument left in the bladder for eleven days, a period of time nearly sufficient for complete cicatrization and re-formation of the canal.

One circumstance should, however, be taken into account—viz., the broken health of this patient, which must materially interfere with the work of repair, upon which the success of this operation mainly depends. The latter may emphatically be called Mr. Syme's, as there was no difficulty in passing the silver catheter, and the operative proceeding was conducted exactly as directed by the originator of the operation. Would Reybard's have offered some chance of success? We think not; for, in a canal so deeply affected, the *internal* incision, and the possible unconcern with respect to the sinuses, might have been inadequate to lead to a favourable issue.\* Mr. Fergusson had, of course, no trouble in finding the urethra, as a tolerably sized instrument was placed in the canal. Can the same operation be performed when no instrument will pass?

\* Since the above was written, the patient has died of purulent deposit,

It would appear, from Mr. Lee's case, which stands next on our list, that such is the case, and we proceed to enter into a few particulars.

Before doing so, however, we would just state that Mr. Fergusson had, a short time ago, an opportunity of presenting to the pupils a seafaring man upon whom he had performed

#### EXCISION OF THE ELBOW-JOINT

two years previously.\* He said that there were few cases in England like the one now before the pupils, and that the man enjoyed now a fair amount of motion in the elbow-joint, after having had all the bones of the articulation consolidated in consequence of a fall from a mast. In fact, the elbow had been ankylosed in a very awkward position, and the arm was useless.

In that state the patient had applied to various hospitals, as also to a bone-setter, (who twice disturbed the ankylosed surfaces.) When the man came before Mr. Fergusson, the latter thought the only way of dealing with this stiff joint was to follow the method of Mr. Barton, of America, who had cut out a wedge-shaped piece from the front of the tibia, and created, in some degree, a new joint below the ankylosed knee. Mr. Mackenzie had applied the same method to the elbow, and he (Mr. Fergusson) had thought that this operation was the surest means of giving some mobility to the stiff elbow-joint of this patient.

He accordingly had cut out a large portion of the end of the ulna, radius, and humerus, and the amount of bone taken away was rather considerable, as there had been much hypertrophy of bone, or rather formation of new osseous tissue. The operation was, in fact, a re-section of an ankylosed joint. The subsequent treatment was simple, and the patient had left the hospital with the wounds cicatrized, and some motion in the joint. Now, two years after the operation, the mobility of the arm was considerably increased, and it was satisfactory to have a living proof of the great amount of benefit which may be obtained by the adoption of decisive measures in cases of this kind. The patient had been reported to be dead, but he stood here to prove the contrary.

#### STRICTURE OF THE URETHRA OF TWENTY YEARS' STANDING; EXTERNAL INCISION WITHOUT GUIDE.

(By Mr. HENRY LEE.)

THIS patient is a hair weaver, about forty years of age, of a thin, sickly look, and observed the first symptom of stricture twenty years before his present admission. At that period retention of urine suddenly came on, when a personal friend of the patient, seeing the state he was in, shaped a piece of *whale-bone* from an *umbrella* into the form of a bougie, and passed it up the urethra. Immediately after the operation, the urine flowed copiously.

The patient now remained well for three or four years, when symptoms of stricture again presented themselves, but not to such a degree as to cause him much inconvenience, the use of the catheter being, however, now and then required.

Four years before his admission here, the distress from the stricture became suddenly so great as to induce Mr. Guthrie, under whose care he then was, to divide the stricture with Stafford's instrument. After this operation, the patient passed his urine freely, for a short time, but soon the stricture returned, and he has been suffering from it more or less up to his admission. When first seen in the hospital, September 14th, 1854, there was pain in the lower part of the abdomen, and across the loins, and the bladder could be distinctly felt, through the parietes of the abdomen, to be hard and full. There was total inability to pass urine, which fluid only came in drops. The endeavours to introduce a catheter, both without and within the hospital, having proved useless, Mr. Lee had the patient brought into the theatre, passed down an instrument as far as the obstacle, and with no better guide than the end of the catheter, freely divided the urethra. When this perineal section was accomplished, No. 6 catheter was introduced into the bladder, and there retained for five days.

The urine a few days afterwards passed both through the wound and the urethra, and the patient after remaining several weeks in the hospital is on the point of being discharged. The wound is all but healed, and scarcely any urine escapes through the perineum.

Mr. LEE, in a clinical lecture on this case, after giving a sketch of its principal features, and having pointed out the different kinds of unpleasant consequences following stricture, and the various methods which have been devised for the cure of coarctation, said—

"The plan of dividing stricture by instruments passed down the urethra has been variously modified; sometimes an instrument of the shape of a trocar has been made to protrude from the end of a catheter, so as to perforate the stricture; sometimes the instrument used has been made in the shape of a lancet, and sometimes a long very thin knife has been passed down to the stricture upon a director. Another plan has lately been adopted in France where an instrument could be introduced into the bladder. The instrument used resembles in construction a lithotrite, but the blades are capable of being separated from each other to the extent of about a quarter of an inch. The instrument is then introduced, and the blades suddenly separated, so as forcibly to tear open the stricture.

Now all these plans have the disadvantage, besides that of endangering the vitality of a portion of the mucous membrane of the canal, of not providing an escape for any portion of urine which may flow from the urethra through the opening which they make. Under these circumstances it has been proposed to make an incision in the perineum, and to divide the stricture from without. This plan, of which I now propose to speak, has at least the advantage, when properly performed, of being free from the dangers arising from making false passages, extravasation of urine, and purulent deposits.

The cases for which this operation has been recommended are of three kinds:—

1. Where the stricture presents an extreme degree of irritability, and resents, by violent local and constitutional disturbance, any efforts to produce dilatation.

2. Cases in which the stricture, when dilated, rapidly contracts again.

3. Cases in which, after the dilatation of the passage, micturition is nevertheless painful, difficult, and uncertain.

To these three classes we may add a fourth, not admitted by some surgeons—namely, cases in which no instrument can be passed into the bladder.

For these affections a free incision of the contracted part of the urethra has been maintained to be the proper mode of treatment, and to be in fact required.

The mode of performing this operation, as described by Mr. Syme, is as follows:—

A grooved director is first introduced through the stricture, where this can be done, (and Mr. Syme is of opinion that, with care and attention, there is no stricture through which an instrument may not be made to pass.) The patient then being placed upon his back, at the edge of the table, with his legs bent, as in the operation for lithotomy, an incision, about one inch and a half in length, is made exactly in the raphe of the perineum. The whole of the thickened, indurated, and contracted texture is then divided upon the director, to the extent of an inch or two, or more if necessary. A No. 8 silver catheter is then passed into the bladder, and allowed to remain there for at least two, and not more than three days.

Great stress is laid upon the fact of the incision being made exactly in the middle line of the perineum, in order to avoid the artery of the bulb which lies by the side of the canal.

The only sources of danger alleged to exist are, hemorrhage and extravasation of urine. But if the knife is kept exactly in the median line, the only vessels that are likely to bleed are, the smallest branches of the superficial perineal artery, and the cells of the corpus spongiosum; the bleeding from these may be checked, should it be desirable, by placing a piece of folded lint between the edges of the wound, and applying the slightest degree of pressure for a few hours.

The liability to extravasation of urine after this operation, I will presently consider, reserving it for separate remarks, as I conceive the liability or otherwise to its occurrence forms the grand distinction as to this operation being admissible or not.

After the operation of perineal section, the catheter is tied in the bladder, and the patient put to bed. At the end of forty-eight hours the catheter may be removed. A full sized bougie should be introduced once a week for three or four weeks, and then at more distant intervals, according to circumstances.

Now this operation, as I have described it, appears a very simple affair, and if this were all, there is little doubt which is to be preferred, the pain and inconvenience, (to say nothing of the danger of a stricture) or the simple operation of dividing a portion of the urethra on a grooved director. But, unfortunately, the operation has not been found to be one of such a very simple nature in its consequences, even where an instrument could be got into the bladder, much less in cases where no staff could be passed.

Mr. Syme, of Edinburgh, asserts that he has performed this operation a great number of times, without any ill effects, excepting only some consequent symptoms of nervous irritation. But in other hands the most serious mischief has often super-

\* An account of this case will be found in a former "Mirror." (THE LANCET, vol. II, 1853, p. 518.)

vened. Patients have been attacked with a shivering fit the day after the operation: there has been a quick, irritable condition of the pulse, accompanied perhaps by profuse perspiration, and want of sleep. These symptoms have continued, the patient's tongue becoming brown and coated, and, in a certain number of cases, the patient has died. On a post mortem examination, some purulent infiltration has generally been found about the neck of the bladder, or some secondary inflammation in other parts.

Now how are we to account for such different results in the practice of various surgeons of equal skill? I believe that something like a solution may be arrived at by an attentive consideration of the description which Mr. Syme has given of his operation.

In the way in which he performs it, the only fascia concerned, as he says, is that which lies immediately under the integuments. In other words, he divides only the skin, superficial fascia, and the urethra. Now it is clear from this description, that all the strictures which he has operated upon have been situated anterior to the membranous portion of the urethra; for had he operated upon any stricture in the membranous portion of the canal, even though situated quite at its anterior part, he must have been in danger of wounding the deep perineal fascia as well as the superficial. Hence, then, arises a practical distinction of the utmost importance. When a stricture is situated in the bulb of the urethra, it may be divided from without, and any urine which escapes from the passage is sure to pass out at the external wound. But the circumstances are different when the knife, in passing along the grooved director or sound, perforates the deep perineal fascia, and wounds the urethra as it passes through this part. The urine which escapes from the passage may then lodge in the wound made in the deep perineal fascia, and a drop or two may become infiltrated behind this dense structure. It will then give rise to inflammation, and having no means of escape, will produce violent constitutional irritation. When once inflammation is established in the cellular tissue of this part, its products will permeate the areolar tissue, and may thus propagate the inflammation to the outside of the bladder, and to the cellular tissue within the pelvis, thus giving rise to the abscesses and the purulent infiltration which I have mentioned.

But where the incision is confined to the superficial fascia, and to the bulb of the urethra, there is, as I have said, very little danger of any of these accidents occurring; and by choosing his cases, (as it were,) and confining himself to those in which the stricture is situated anterior to the membranous part of the urethra, Mr. Syme has met with the success to which I have alluded.

Hence there appear to be two classes of cases: those in which the stricture is situated in that part of the urethra corresponding to the corpus spongiosum, and those in which the stricture is at the anterior part of the membranous portion of the urethra. In the former situation, as far as our present evidence goes, the stricture may be divided with comparative impunity; in the latter, most severe and even fatal symptoms have followed.

But practically, it will be asked, how are we to know that a stricture is confined to the bulb of the urethra, or to any part in front of this? Where an instrument can be introduced, the point may be made out in this way, and Mr. Syme never operates unless he is able first to introduce an instrument into the bladder.

In the case to which I have drawn your attention, I was led to believe that I might with impunity divide the stricture, from the circumstance of Mr. Guthrie having divided it by internal incision before, without any ill effects. This proved to me, either that the stricture was confined to the bulb of the urethra, or, if situated farther back, that the surrounding parts were so consolidated by inflammation as to preclude the danger which might arise from infiltration of urine."

We now pass to the third case on our list, in which the operation was performed according to Mr. Syme's method, with some improvement, possibly, towards the latter part of the proceeding.

#### ST. MARY'S HOSPITAL.

##### EXTERNAL DIVISION IN STRICTURE OF THE URETHRA.

(Performed by Mr. COULSON.)

RICHARD S—, aged forty-four years, was admitted, September 16th, 1854, with severe stricture. His stream of urine was very small, being compelled to pass it every hour or oftener in the day, and at night came away involuntarily. The latter fluid was alkaline, and loaded with thick ropy mucus. In addition to his local symptoms, the patient had a cough, to which he had been subject for some time past.

His countenance was pale and anxious; his flesh and strength much reduced. He had been suffering from stricture for many years past, and an attack of retention having come on, he applied at this hospital.

No. 2 catheter was then passed with much difficulty, and the urine drawn off. After a short stay in the hospital, his general health improved considerably, and dilatation has been repeatedly tried, but no instrument, however small, after the first week, could be got into the bladder. The stricture was situated at the bulb, and on pressing the perineum, it felt like a hard cartilaginous ring; and from repeated attempts at dilatation, a false passage just in front of the stricture had been made.

In consequence of the character, extent, and duration of the stricture, Mr. Coulson proposed external division as the course most likely to afford the patient relief.

October 11th. — After considerable difficulty, Mr. Syme's smallest grooved staff was passed through the stricture, and the contracted part divided upon it.

Mr. Coulson commenced his incision in the median line, terminating it half an inch in front of the anus, the incision being nearly two inches in length. The staff was soon reached, and the knife passed along it, from behind forward, cutting through a gristly, unyielding substance, of which the stricture was composed. A straight grooved director was then passed under the staff into the bladder. The staff was withdrawn, and a No. 8 catheter introduced without difficulty.

The catheter was now firmly fixed by tapes, and the patient removed to bed. During the operation, which occupied less than two minutes, Mr. Coulson kept the thumb and forefingers of the left hand on either side of the raphe, so that the incision could not deviate from the central line, a point to which he attached much importance.

Before the staff was withdrawn, Mr. Coulson passed, as stated above, a grooved director from the external wound into the bladder, which instrument served as a guide to the introduction of the catheter. This latter plan may be of essential service in obviating any difficulty which might arise in reaching the distal extremity of the urethra.

The elastic catheter, thus introduced with the aid of the director, was retained fifty-four hours, and then withdrawn. It was introduced again at the end of a fortnight, since which it has been passed twice a week.

The patient's general health has considerably improved, he passes urine in a good stream, and a No. 10 catheter can be introduced into the bladder without the least difficulty.

This was clearly a case in which dilatation could not any further have been tried with any chance of success. The hardness and extent of the stricture, the difficulty of getting even the smallest instrument through it, and the existence of the false passage, would have been insuperable difficulties in the way of this plan of treatment.

In concluding the relation of this case, and of the series, we would just remark, that the more we see of stricture of the urethra and its disastrous consequences, the more we are inclined to hail those operative measures which, brought forward by men of experience, hold out a prospect of giving relief to a class of patients whose sufferings are very great. Let not, however, the profession be exclusive; let us examine with impartiality the remedial means which are proposed, and, as there is considerable variety in the cases brought before surgeons, they should be acquainted with the different lines of practice which have been proposed. We shall not add a word to the remarks we made last week respecting the merits of the internal or external incision; and shall only express the hope that the treatment of stricture may be conducted with all the vigour and decision which are imperatively called for in so annoying and dangerous an affection.

That stricture of the urethra is really an affection which eventually puts the patient's life in great peril, is well known to every member of the profession; we shall, however, merely, by way of illustration, adduce two aggravated cases, in which the fatal consequences could not be averted by the best efforts of the surgeon. The details were drawn up by Mr. Holmes, surgical registrar to the hospital; and the post-mortem examinations made by Dr. Ogle and Mr. Gray, conservators of the museum.

#### ST. GEORGE'S HOSPITAL.

##### ENLARGEMENT OF THE PROSTATE GLAND; BLADDER DILATED, HYPERTROPHIED, AND SACCULATED; PERFORATION OF THE ENLARGED PROSTATE BY THE CATHETER.

(Under the care of Mr. TATUM.)

JOHN S—, aged seventy-seven, was admitted May 9th, 1854. This old man when admitted was in a state of senile

dementia, and could give no idea of the previous history of his case. It seemed, however, that he was at that time labouring under retention of urine, which from his age was judged to depend upon enlargement of the prostate gland; and this supposition was confirmed on examination of the urethra with a prostatic catheter. The instrument passed down to the region of the prostate without experiencing any obstacle, and then, after some difficulty, was made to reach the bladder. No peculiar sensation was experienced in doing this, and it was not known at that time that the catheter had passed through the substance of the gland.

Two days afterwards, however, considerably more difficulty was experienced, and a good deal of force had to be applied; the instrument was thus introduced into the bladder, and in its passage the resistance of a solid substance was distinctly felt.

After the first use of the catheter, the instrument was employed regularly morning and evening, the urine drawn off being abundant in quantity, very offensive, and intimately mixed with a large proportion of blood diffused through the mass of urine.

No further symptoms occurred worthy of note; the delirium was persistent, and occasionally rather violent; but this ceased as the patient's strength gradually failed, and he died eight days after his admission.

*Post-mortem examination, twenty-nine hours after death, made by Mr. GRAY.*—All the organs of the thorax and abdomen were healthy, except the kidneys, whose pelves and infundibula were dilated, and their lining membrane highly vascular, and filled with purulent urine. The cortical and medullary portions of the organs were softened, and in many places disseminated with irregular collections of pus. The bladder was much dilated, its walls somewhat hypertrophied and fasciculated, and it contained about a pint of bloody semi-purulent urine. There was also a large clot in the bladder, of the size of a hen's egg. On its posterior wall a large circular orifice was observed, leading into an irregularly-shaped pouch, formed by the protruded mucous membrane. The prostate gland was enormously enlarged, not only the lateral, but also the central lobe, the latter projecting for some distance into the bladder at its neck. An orifice was seen at the back part of this lobe which led directly into the prostatic portion of the urethra; this had been made during life by the passage of a catheter through it. The remaining portion of the urethra was healthy.

**STRICTURE OF THE URETHRA; FALSE PASSAGE; ABSCESS IN THE PROSTATE GLAND; DEATH; NECROPSY.**

(Under the care of Mr. CUTLER.)

**MARK B—**, aged forty-four years, was admitted May 24th, 1854. He was received in the hospital in consequence of difficulty of passing urine, owing to stricture of the urethra.

On examination with the instrument, a narrowing of the canal was discovered at the anterior part of the urethra, through which a catheter (No. 1) was with difficulty introduced. Besides this stricture there was another, somewhat less tight, a little in front of the prostate gland. No particular difficulty was experienced in passing this stricture; but whenever the instrument was introduced, a feeling was experienced as though the point was passing over a rough surface. On every occasion on which the catheter was used (which was done daily) the urine was drawn off, this proving that the bladder had been reached; nor was considerable bleeding caused by catheterism on any occasion. The patient had, however, a slight rigor once after the passage of the instrument, but this went off without any further symptoms, and for the few days before his death the catheter was worn in the bladder.

On the evening of the sixth day after admission, the man had another rigor, and the instrument was accordingly withdrawn; the rigor recurred more severely during the night, but nothing was observed to justify alarm for his life till a very short time before his death, when (on the seventh day) he was seized with great faintness; the surface of the body and face turned blue and livid, and the pulse was imperceptible. Stimulants were administered, but they were unavailing; the man never rallied, though there was no appearance of coma, nor was there any spasm of the glottis. He died in about an hour from the first seizure, and was not known to have had any fits before.

*Post-mortem examination, twenty-three hours after death.*—The body was well-formed, and in good condition, there being a good deal of fat in the sub-cutaneous cellular tissue. Cranium: The membranes of the brain were healthy, except the dura mater, which was more intimately adherent to the

calvarium than usual. The substance of the brain was soft, and rather more vascular than natural; the fornix and septum lucidum were also soft, and the ventricles very large; base of brain healthy. No pathological changes of importance were found in the thorax or abdomen. Pelvis: There was a stricture of the urethra, about two inches from the orifice, the lining membrane at this point of the canal being thickened and dense in texture; a second stricture was found in the anterior part of the membranous portion of the urethra. Between the two, a portion of the lining membrane was covered with lymph for about the extent of a sixpence. Beyond the second stricture was a false passage leading about two inches beneath the lining membrane in a direction backwards, towards the neck of the bladder. In the right lobe of the prostate gland was an abscess, surrounded by much ecchymosed blood, the prostatic ducts were dilated, and the bladder hypertrophied.

## Medical Societies.

### ROYAL MEDICAL & CHIRURGICAL SOCIETY.

TUESDAY, NOVEMBER 14TH, 1854.

JAMES COPLAND, M.D., F.R.S., PRESIDENT.

A COMMUNICATION was read, entitled,

A CASE OF SUCCESSFUL OPERATION FOR CONGENITAL CAPSULAR CATARACT ON A FEMALE, AGED TWENTY-TWO, WHO HAD BEEN BLIND FROM BIRTH.

BY G. CRITCHETT, ESQ.,  
SURGEON TO THE ROYAL OPHTHALMIC HOSPITAL.

Jane S—, aged twenty-two, was brought to the Royal Ophthalmic Hospital in the spring of 1849, suffering from cataract in both eyes, with slight internal strabismus, and considerable involuntary rolling and oscillation of the globes from side to side. The corneae were bright; the anterior chambers large; pupils small and irregular, and filled with an opaque white substance; perception of light was good. She had frequently been operated on before. Mr. Critchett first succeeded in detaching the adherent iris from the capsules by the usual needle operation, the puncture being made through the cornea. By a second proceeding, he made a small opening through the sclerotics, and dragged the capsule from the sphere of vision by means of a hook in one eye, and fine forceps in the other. Then to remedy the oscillatory movement, which prevented the impression of any object distinctly upon the retina, he divided, first the internal and then the external recti muscles. The sight is now improving, and by education she is slowly beginning to make some valuable use of her newly-acquired sense.

Mr. FERGUSSON observed that it was not often that papers referring to operations on the eye came before the Society, and he therefore would put a question to the author on a subject which he thought of importance, and which had not been referred to in the valuable paper before them. Was chloroform used in the present case, and if so, with what effect? He (Mr. Fergusson) should expect that agent to be of great service in controlling the muscular movements of the eye in cases requiring operation.

Mr. CRITCHETT replied that, in the operation narrated in the paper, chloroform (at that time seldom used) was not employed. He did not think, however, that it was so important an agent in these as in many other operations, because the muscular movements of the eye could be entirely controlled, and the globe fixed by the speculum and other mechanical means. Regarding the use of chloroform generally, it had been of late occasionally used in the Ophthalmic Hospital in cases of extraction, such cases being selected for its employment in which there was fear of irritability and spasm coming on, and forcing out the lens. Mr. Bowman, who had first employed the agent, and himself, had reason to think it of great value. Its tendency to produce sickness was an objection to its employment in operations on the eye, but if it were given on an empty stomach this was not likely to take place. Even in cases in which sickness had occurred, no ill effects followed, in consequence of the lids being fixed down by strapping, and the globe of the eye collapsed from the operation. In cases also of artificial pupil in children he had employed it with much advantage.

Mr. DIXON had never used chloroform in cases of extraction. Mr. Critchett had stated that he had never seen any ill-effects

from the vomiting following its administration, but there was another evil which might sometimes result from its use: this was nausea, squeamishness, and loss of appetite, which might last for twenty-four hours. In very old persons it was highly necessary, in addition to keeping the eye at rest, to support the strength by nourishment. If food could not be taken in consequence of nausea, support could not be administered, and the operation would prove unsuccessful from the wound failing to heal by the first intention. He thought that great caution should be exercised in using chloroform in these cases.

Mr. HOLMES COOTE had seen chloroform administered in three cases of extraction; in one instance both eyes being affected with cataract. The chloroform was given to the extent of complete insensibility, yet no ill effect followed in either case. It was undoubtedly a beneficial agent, but required to be used with circumspection.

Mr. HALE THOMSON had employed chloroform in very many cases, but regarded it as less useful in operations on the eye than in most other operations. Indeed, in such cases he had never seen any benefit result from its employment. The case before the Society was one of much interest, and it was really astonishing that the organ existed at all after the performance of so many operations upon it. He had himself, some years since, operated upon a boy of fourteen years of age, for congenital cataract, and though the operation was perfectly successful, it was twelve months before the eye was sufficiently educated to properly appreciate the nature of objects coming before it. In Mr. Critchett's case, as the sight was not perfectly restored, he (Mr. Thomson) thought the perfect sense of the organ would never be attained. He objected to the division of the recti muscles for the purpose of steadying the eye, for he had noticed deterioration of sight constantly follow operations for strabismus. He also objected to the mode of detaching the lens by an incision through the cornea, and considered that this might be more easily and readily effected by making the cut through the sclerotic, behind the cornea.

Mr. CRITCHETT was still of opinion that the operation through the cornea was the best, and in this he was supported by most of the authorities on eye operations. He did not think that the number of operations which had been performed interfered with the ultimate result, for it must be remembered that many of the most successful cases were those in which seven or eight operations were performed, a small portion only of the lens being removed after each operation. The division of the muscles in the case before them was no doubt an experiment, but he had to choose between the constant movements of the ball, and any bad results which might follow the operation. As he had never seen any harm, but in all cases immediate or gradual improvement of sight follow the operation for strabismus, it was a sufficient answer to Mr. Thomson's objection. In the present instance, he did not believe any ill effects followed the operation.

A paper was then read, entitled,

ON INGUINAL TUMOUR, ASSOCIATED WITH SYMPTOMS OF STRANGULATED HERNIA, AND ABSENCE OF THE TESTICLE ON THE AFFECTED SIDE.

BY HENRY THOMPSON, ESQ., F.R.C.S., M.R.

The following case often presents itself to the surgeon:—A man, subject to swelling in one of the groins, finds it suddenly increased in size after physical exertion. The tumour becomes tender, and the abdomen is painful on pressure. On examination, the testicle is found to be wanting on the affected side. The author believes that sufficient attention has not been paid to the symptoms accompanying this form of disease, and rendering its diagnosis from hernia not always easy. He also describes the effect which a congenital arrest of the testicle in the inguinal region would have in complicating the operation for hernia combined with this defect. He proceeds to the relation of a case under his care in the Marylebone Infirmary. A man, aged fifty-five, was brought to this institution, labouring under symptoms of strangulated hernia. The symptoms were so severe as to justify immediate operation, the taxis having already been unsuccessfully employed. The deficiency of the testicle in the corresponding side of the scrotum was noticed on examination. The hernial sac having been opened, two loops of small intestine, of deep chocolate colour, were seen turning upwards over the tendon of the external oblique, much the same as in a femoral hernia; beneath them lay an atrophied testicle and spermatic cord at lower angle of the opening. The stricture was divided, the intestine was returned, and the testicle left in the canal. On the third day after the operation the bowels opened freely and natural, but the patient died shortly after of peritonitis. The loops of intestine (ilium)

were seen, upon examination after death, lying in the abdominal cavity, (which contained some pus,) of deep brown colour, and mortified in those parts which corresponded with the stricture. The author concluded with some remarks, showing the importance of early operation even in doubtful cases.

THE PRESIDENT did not think there was any difficulty in coming to the conclusion that in this case there was strangulated hernia of the intestines.

Mr. SPENCER WELLS supported a remark made by Mr. Thompson, as to the propriety of making an exploratory incision in cases where a strangulated hernia was suspected to exist; and narrated a case in which he had performed the operation a few days before upon a patient of Dr. Browning Smith's, of Notting-hill. An old gentleman suffered from obstinate vomiting, supposed to depend upon gouty irritation of the stomach; and one consequence of this vomiting was a tumour in the left inguinal region, which had existed thirty-six hours when Mr. Wells saw the patient. It was not thought to exercise any very marked influence upon the state of the patient, and doubts were expressed as to its nature; but Mr. Wells made an exploratory incision, and exposed a knuckle of intestine very tightly strangulated, which could not be reduced without opening the sac and dividing its neck. This was done, but the vomiting proceeded unchecked, and the patient died forty hours afterwards. On post-mortem examination, it was found that the gut had been completely reduced. It was slightly inflamed, but there were no signs of peritonitis, nor any hemorrhage, so that the hernia had been quite secondary to the gastric affection. It was obvious, however, that it could not have been left justifiably without relieving the strangulation.

Mr. FERGUSSON remarked that one reason why writers on surgery had omitted to specially notice such cases as that before the Society, was in consequence of their diagnosis being so clear and distinct that such reference was unnecessary. He had operated in many such cases, and had found no difficulty in determining the nature of the cases. The chief value of the paper, however, was its inculcation of the necessity of not delaying operative procedure too long in tumours of this description. In fatal cases of hernia the surgeon generally found after death that an earlier resort to the knife would have been better both for the patient and the credit of surgery. He was quite sure that we ought not to delay making an exploratory incision in these cases earlier than was now the custom, more particularly as chloroform could be now employed. If after the administration of that agent the swelling could not be reduced, then we should be justified in making an incision as if we were about to operate for strangulation. In ninety-nine cases out of a hundred, the surgeon, he believed, would find the tumour to be hernia. With respect to the danger of the operation for hernia, he believed that this was nothing in comparison with that of the disease. The incision was not dangerous, not six out of a hundred died from the operation itself. Inflammation might arise, the intestine might be injured, the obturator or epigastric arteries be wounded; but these effects were rare and trivial compared with the effects of the strangulation on the intestine. If the surgeon had a doubt on his mind respecting the nature of the tumour, he should never hesitate to make an incision, which would remove the difficulty, and probably save life. When death occurred in cases of strangulated hernia, it was the disease, and not the operation, which killed; life being lost from the want of decision in the surgeon who sees the case.

## MEDICAL SOCIETY OF LONDON.

MR. HEADLAND, PRESIDENT.

SATURDAY, NOVEMBER 11TH, 1854.

DR. WINN related

### A CASE OF DIFFICULT LABOUR,

which he believed to be perfectly singular. In August last he was requested to see, in consultation with Mr. Bedingfield, a young woman who had been in labour four days. She was in the seventh month of her second pregnancy. He (Dr. Winn) discovered that the labour had been interrupted, not from want of power or room in the pelvis, but in consequence of a very singular membranous band, which had prevented the os uteri from dilating. It was half an inch in width, and was stretched immediately across the os uteri. It was only adherent at its extremities, which were attached to the angles formed by the junction of the vagina to the uterus. Dr. Winn hooked

his finger over the band, drew it down, and divided it with a bistoury. Immediately after its division, the os uteri began to dilate, and the labour was speedily terminated. A fortnight after delivery, scarcely a vestige of the membrane could be felt; only a small root of the band could be detected anteriorly. It appeared, on inquiry, that this patient had met with a very unusual accident when eight years of age. Whilst standing on a bellows placed on a chair, and attempting to reach something, the chair slipped, and she fell with great force; the nose of the bellows, which happened to be nearly red hot, penetrating the vagina to some extent. Tumefaction, with a discharge of blood, lasted for some time, but she was able to leave her bed in a few days. The nose of the bellows measured about half an inch in diameter. It was right, Dr. Winn thought, to state that her first pregnancy, which terminated at the fifth month, was not attended by any difficulty. Dr. Winn said he was desirous of obtaining the sense of the meeting, as to whether the singular growth was congenital, or the effect of the accident in childhood.

#### CO-EXISTENCE OF TWO SPECIFIC DISEASES.

MR. ROGERS HARRISON mentioned a case in which measles supervened on an attack of gonorrhoea, which was being treated by copaiba. The eruption went through the usual course, and the discharge ceased. This case, he thought, was in contradiction to the axiom that two distinct diseases would not go on in the system at the same time.

MR. MILTON remarked that two diseases might go on in the system at the same time, such as gonorrhoea and measles, the one being local, the other constitutional. Hunter's axiom referred to two constitutional diseases.

MR. DENDY observed that Hunter's remark was to the effect that two diseases could not go on in the same part, nor in the same system, at the same time: one, however, might keep the other in abeyance. A constitutional disease like measles, might cure a local one like gonorrhoea. He related the case of a child who, whilst suffering under a severe attack of whooping-cough and bronchitis, was seized with cholera. The chest affection was completely arrested during the cholera, but returned immediately on the disappearance of that disease.

MR. HARRISON remarked, that in his case the original disease did not return.

#### ANEURISM OF THE AORTA, WITHOUT SYMPTOMS.

MR. MILTON exhibited a preparation, consisting of the aorta of a man who had died suddenly from rupture of an aneurism through its entire extent. There had been no symptoms, except those of dyspepsia, before death, and the patient had been admitted into the police force, three months before, in apparent health.

MR. HIRD read a paper

#### ON CERTAIN FUNCTIONAL DISORDERS OF THE NERVOUS SYSTEM, PARTICULARLY OF THE SPINAL CORD, WHICH SIMULATE ORGANIC DISEASE.

He alluded to the frequency of local pain along the course of some of the cerebro-spinal nerves, which, so far as the present state of pathological knowledge can determine, do not depend on discoverable structural changes. When the spinal cord, or a part of it, is the apparent seat of this affection, Mr. Hird was of opinion that the blood, and not the nerve-matter, is in most cases the source of the disordered action. He drew attention to the fact of deranged nervous actions being produced by the introduction of various preparations of the materia medica, and of certain animal poisons into the circulation; and also to cases of renal coma, as a consequence of the non-elimination of deleterious agents from the blood, by the kidneys. The experiments of Dr. E. B. Ségurd were thought by him to strengthen this view, as, by the injection of red blood, he had reproduced local life in both nerves and muscles, both in animals and decapitated men, even after cadaveric rigidity had taken place. The continued supply of healthy red blood to the vascular structure of the nervous centres, he looked upon as equally essential for the generation of a sufficient nervous force for the performance of healthy functions, as the acid solution is to the plates of a galvanic battery for the generation of the galvanic force; and considered that a deteriorated condition of the blood, which does not afford to the nervous centres the stimulus for healthy action, is the cause of these disorders of their functions. As a contrast to morbid polarity of the cord, he instanced the physiological polarity which takes place in the male frog during the season of copulation. The class of patients in which hyperæsthesia of the spinal cord most frequently occurs, is the delicate æmemic female, in whom the uterine functions are at fault. In a very small proportion of cases a little vascular engorgement

may exist, which may justify the cautious employment of depletion or counter-irritation. The main object in the treatment Mr. Hird considered to be the restoration of the deteriorated blood to the healthy standard, and the re-establishment of suppressed or diminished secretions from the uterine, gastro-hepatic, and renal organs. In many cases the use of steel acts almost as a specific, and the cod-liver oil may be advantageously administered at the same time. The cold douche, and local applications of belladonna, &c., are also useful as auxiliaries to steel, fresh air, and nutritious diet. The cases in which slight congestion exists, and which are generally those following some sudden manifest exciting cause, the cupping glasses, or a few leeches, are very beneficial; but as the mobility of the nervous system is evidently increased by even slight depletion, this treatment should be restricted to those special cases which are exceptions to the general rule. The continued use of anti-spasmodic and stimulating medicines Mr. Hird objected to, as producing injurious results on the nervous system of delicate females.

THE PRESIDENT, if not in the chair, would have made some remarks, with the view of showing that the conditions to which the paper referred were not always easy of removal by tonics and iron.

MR. HUNT, after making some observations on the importance of a correct diagnosis in cases of neuralgic disease, related an instance in which a lady was sent to the sea-side with what was supposed to be incipient hip-joint disease. She was ordered to be leeches and blistered. These means were applied, with an aggravation of the symptoms, which were simply tenderness and pain, most severe, but superficial. Mr. Hunt now saw the case, and finding the lady pale and sallow, with the catamenia regular, but pale, and that she had suffered much mental anxiety, ordered her exercise and iron. She rapidly recovered under this plan of treatment.

DR. MACKENZIE would divide the discussion of what was called "spinal irritation" into four heads. First. Did it exist? He thought that it did was shown by the symptoms of tenderness, &c., which presented themselves in those cases without organic lesion. Second. What did it depend on? It was a functional disorder, but of what kind we did not know. Third. What are the constitutional and other states which produced it? The most common were mental affections; next, irritation of the peripheral extremities of the nerves communicating with the spinal system, and poisoned states of the blood, such as obtained in rheumatism, &c. Fourth. How were we to effect a cure? We must remove the cause. The mental affection, where it existed, must be removed by change, &c., and we must follow up by the cold douche; so in the other cases the primary disease or state must be first overcome. As in all these cases the patients were usually æmemic, it was necessary to sustain the general health.

DR. THEOPHILUS THOMPSON had been pleased to observe that the author of the paper had abandoned a proposition with which he started, to show that "spinal irritation" resulted from toxæmia. He questioned if this was correct, or whether it could be shown that in any number of cases it depended on a poisoned condition of the blood. With respect to the treatment of these cases, he thought that the anti-depletive method had been too exclusively advocated, and that though most instances of the affection might require iron and support, in some cases depletion was necessary. He related a case of hysterical vomiting, in which a variety of tonics, iron, &c., had been employed without effect. Some tenderness was found to exist in the spinal column, to this part leeches and blisters were applied, with immediate relief to the vomiting. Similar effects might arise from too little or too large a quantity of blood. He then referred to some cases of injury to the spine, giving rise to various nervous symptoms, which were removed by local depletion after iron had failed: and he mentioned a case of voracious appetite, following concussion of the spine from a fall from a stage-coach, producing, as he thought, the same condition as that of exhaustion previous to death.

DR. WARD had found, in cases of toxæmia attended by local symptoms, the leeches applied to the affected part died.

MR. DENDY, with reference to the diagnosis of the cases under discussion, remarked that, when the disorder was neuralgic, the sudden touch of the finger on the skin of the affected part would produce intense pain, whilst, by gradual manipulation, great pressure might be exerted with little or no suffering. He agreed with Dr. Thompson respecting bloodletting, and saw nothing contradictory in the employment of local depletion, at the same time that we were supporting the system generally.

DR. HARE said, that in this affection every case must be investigated *per se*, and the precise cause of the symptoms determined. When the affection occurred in females, between

puberty and the climacteric period, in eight out of nine cases it depended on irritation of the vagina and uterus, accompanied by leucorrhœa. The use of sedatives, with astringent lotions for the leucorrhœa, was one of the chief indications of cure. These cases were often accompanied by anemia, and iron was then of service. In serious organic disease, such as stone in the bladder, he did not think the "spinal irritation" so complete, nor the superficial tenderness so marked. He referred to Dr. Griffin's work "On Spinal Irritation" as the best treatise on the subject.

Dr. WILLSHIRE remarked, that fuller acquiescence would, he thought, have been given to the whole of the author's views if the particular condition of the blood which had been dwelt upon had been regarded as one of *spanæmia*, rather than of *toxæmia*. The blood, there could be no doubt, was frequently greatly impoverished, but could not (in his opinion) be said to be charged with, or affected by, any special poison, he therefore assumed Mr. Hird had meant to imply a different state of blood to that which the term he had made use of would really necessitate. If, however, the author of the paper maintained that the distinction in question had been drawn, and had used the term *toxæmia* advisedly, he must be at issue with the teaching of the paper. Again, he must believe that without attention being paid to the removal of the psychological causes of many strange nervous affections of women, the most ably directed tonic treatment by drugs would often not be of very much avail.

Dr. T. THOMPSON explained that he did not deny that there was a poisoned condition of the blood in some diseases, but not in the cases of "spinal irritation" to which he had referred, as local remedies had effected a cure.

Dr. Sisson considered that a large proportion of cases of "spinal irritation" were dependent on great mental distress and anxiety. Treatment, in the first instance, should point to this. After the mind was stimulated, iron to stimulate the blood, and the local application of belladonna, were of service. He related some cases to show the effect of mental emotion in producing nervous affections, and strongly objected to the term "spinal irritability," as failing to convey the meaning intended.

Dr. KMD remarked that of course the symptoms complained of did not result from affection of the spinal cord itself, but were the effect of reflex action on the ganglia external to the spine. He knew Dr. Griffin, who had lamented to him the difficulty of finding a better word; but he had lived before the time of Marshall Hall, or he would probably have found a better name.

Dr. O'CONNOR fully agreed with Dr. Hare in his estimate of Dr. Griffin, of Limerick. The theory of Dr. Marshall Hall was at once a key to all the affections involving the spinal cord; but it was evident that views similar to those put forth by Dr. Marshall Hall, of an independent spinal system, were entertained by Dr. Griffin; for in his chapter on the "Pathology of Fits in Infants," depending on dental irritation, Dr. Griffin assigns to the spinal cord a distinct reflex function, independent of any cerebral agency. Dr. O'Connor agreed with Dr. Thompson, that many forms of disease disturbing the functions of the spinal cord required the abstraction of blood and counter-irritation, but in a guarded and limited manner, and related cases that fell under his own observation, demanding for their cure that plan of treatment. He differed from the author in limiting those affections involving the functions of the spinal cord to females, and related cases of spasm of the glottis in males, depending on gastric and intestinal irritation. Dr. O'Connor had no doubt that abnormal conditions of the blood excited deranged functions of the spinal cord, and gave the history of a case, recently under his care, of a gentleman who had suffered for some time before from an intermittent paraplegic state, which was completely removed by the elimination of lithic acid, the patient having been previously subject to attacks of gout.

Mr. HIRD, in reply, remarked that he did not think any of the speakers differed much in opinion with him. He agreed in the main with what had been said, but thought the cases requiring depletion were very rare. His remarks had applied not to *toxæmia*, but to a degenerated condition of the blood, and the remedies he had recommended were to improve this state.

SATURDAY, NOVEMBER 18TH, 1854.

#### OBSTRUCTION AND PERFORATION OF THE COLON.

Dr. RICHARDSON exhibited a preparation taken from a gentleman, aged twenty-two, who had been the subject of habitual constipation from boyhood, and to relieve which he had resorted

constantly to purgatives. A few days since, after four days' constipation, he was suddenly prostrated, was seized with sickness, but not of a fecal character, with coldness and shivering. There was a tumour in the groin, which was found to be not hernia. It could be reduced by pressure. He died, and on examination the colon was found obstructed near the cæcum, which was loaded with feculent matter. The intestine was attached strongly to the parietes of the abdomen; the feces had escaped from a perforated opening, and distributed themselves between the muscles of the abdomen so equally, that no particular swelling was observable, except in the groin as above mentioned, which was found to arise from this cause.

Dr. BRINTON remarked that the history of the case, the suddenness of the attack, the not remarkably distended condition of the intestine, and the post-mortem appearances, all showed, he thought, that this case was one of death from perforation rather than from obstruction. Like cases, however, of perforation from obstruction, the cæcum was the part which gave way.

The PRESIDENT said that it might be a question whether death arose from peritonitis consequent upon the escape of fecal matter into the abdominal cavity, or between the layers of the muscles.

Dr. RICHARDSON replied that there was no escape of matter into the peritoneum.

Mr. I. B. BROWN suggested that an artificial anus, made at the point of swelling in the groin, might have been of service.

Dr. RICHARDSON said that there had been no idea of the presence of fecal matter between the muscles, in consequence of the swelling from that cause having been so even and general. The swelling in the groin had been punctured, and only flatus escaped.

#### ARSENIC IN SPASMODIC ASTHMA.

Dr. BAMFFYLDRE DANIELL related the case of a lady, forty-five years of age, who had long been the subject of severe attacks of spasmodic asthma, attended at one time with occasional attacks of bronchitis. The latter, however, had been removed by travelling and treatment. She now awoke with the asthma every morning, or four or five times a week. Belladonna, of all the remedies employed, seemed to afford her the most relief. On examining the chest, the left lung at its superior and posterior portion was found to be emphysematous. She was greatly debilitated, the intercostal muscles being scarcely able to act. The liquor arsenicalis was administered three times a day, in doses of three drops, with the most marked benefit, the asthmatic attacks being arrested, and the general health very much improved.

Dr. O'CONNOR remarked that the case detailed was similar to cases recorded by Dr. Griffin, which depended on some functional derangement of the spinal cord. He thought that quinine or iron would have acted as beneficially as arsenic in this case.

Dr. MACKENZIE had some years since employed arsenic in small doses in cases of whooping-cough, hay fever, and spasmodic asthma, with the best results, when these affections were unaccompanied by inflammation. He had been induced to try this remedy from observing the state of the mucous membrane in the class of cases mentioned.

In answer to questions, Dr. DANIELL remarked that in his case the catamenia had been irregular for years, and had now probably ceased. There was no skin disease, nor mark of periodicity in his case.

Dr. HUGHES WILLSHIRE read a paper on

#### THE CACHECTIC CONDITION IN CHILDREN.

The twofold aspect under which the term "cachexia" is usually regarded was first commented upon—viz., as a disease in itself, in virtue of its own special potency, as indicated by the terms of *general cachexia*, *infantile marasmus*, *tubercles*, *atrophia*, &c.; and as a secondary affection, dependent upon or associated with some primary diseased condition in the shape of various but well-defined acute and chronic maladies. While it might be true that the older pathologists went too far in viewing the cachectic condition too constantly as *the disease*; it was not the less so that modern writers on infantile disorders had shown too great a desire to always reduce it to some local lesion, and neglect such evidence as proves that a general state of the economy, to be called the "cachectic," exists often prior to any specialized or local disturbance, and under whose influence various inflammatory affections, congestions, dropsies, gangrenes, exudations, and deposits ensue, marked by peculiarities of character and of progress, bestowed by the general condition of the economy alluded to. Such was the case as regarded the catarrhal, diptheritic, scorbutic, &c., diathetic states or forces;

and it also came within the bounds of legitimate inquiry to ask whether the "cachexias" known as the syphilitic, scrofulous, saturnine, &c., may not have a common bond between them, and identical with that cachexia following no diathetic malady or empoisonment of the blood. In the former cachexias a dyscrasic speciality was always superadded, (as the terms of the proposition implied,) whilst as regarded the latter, it *might be*, but such must not necessarily be, the case. The relations of the cachectic condition in the child were then discussed under the following heads:—First, in connexion with deficient alimentation and defective hygiene; secondly, as associated with certain diathetic maladies; thirdly, as connected with, not only several *chronic*, but certain *acute*, more or less localized lesions or disorders. These topics being considered, the reflex influence which the "cachectic condition" itself has in impressing a peculiarity of type, &c., upon local inflammatory and other diseases arising in a system under its sway was then adverted to. From what had been stated, it was not improbable the author might be accused of having mixed up two great forms of systemic debilitation undoubtedly distinct in their nature and associations. It might even be urged against him that he had thrown into one the several cachexias associated with several different specific diseases, dyscrasias, or diathetic states, such as syphilis, tuberculosis, rachitis, &c.,—that which follows defective alimentation and hygiene, and that consequent upon severe structural changes of the gastro-intestinal mucous surface. Of course, in answer, he would reply that, except as regards *degree*, he believed the *fundamental cachexia* was much the same in all, and that the point where a difference existed was in a *superaddition* to the cachexia rather than in the cachexia itself. Particular reasons for this opinion were then given, after which the author proceeded to inquire as to what constituted the most fundamental change in the economy that we could arrive at, as connected with, if not genetic of, the cachectic state. In most instances it would be found that where a condition of *spanamia* existed, there was defibrinization of the blood, a diminution of its red corpuscular element, and frequently an increase of the blood's alkalinity. The latter did not occur, it must be admitted, in the cachectic state associated with scorbutic manifestations, even if the salts of potash were not diminished. Still the late inquiries of Messrs. Paget, Bennett, (Hughes,) Wharton Jones, &c., and illustrations deducible from comparative physiology and the diseases of adult life, might be brought forward in support of the views now asserted; at least, so their author was of opinion. Of course, a more profound analysis might be attempted—viz., what is (it might be asked) the peculiarity which thus so absolutely necessitates this impoverished condition of the blood? This is the most difficult inquiry of all, because the more extreme generalization. But even this must be undertaken, and though most imperfectly, as the author admitted, the present paper had offered its aid.

A discussion of some length ensued, in which Mr. Ross, Dr. Brinton, Dr. Andrew Clark, Mr. Power, Dr. Webster, Dr. Chowne, Dr. Daniell, and Mr. Hinton took part.

## PHYSIOLOGICAL SOCIETY.

MONDAY, NOVEMBER 13TH, 1854.

MR. I. B. BROWN, V.P., in the Chair.

THE meeting was well attended.

THE PRESIDENT made a few introductory remarks. He spoke of the importance of physiological knowledge in relation to the progress of medicine, and earnestly recommended the labours of this section of the Society to the attention of the fellows. There were all the elements in the Society for forming an energetic and highly valuable section devoted to physiological investigations, and the industry of the members might soon make these meetings as large and important as the meetings of the Pathological and Epidemiological Societies. It perhaps required time for the fellows of the Society to be made aware of the fact that these meetings took place monthly, and were open to all fellows of the Society.

DR. CRISP exhibited coloured drawings of the viscera of a large alligator, taken by measurement, and then read the following communication—

### ON THE MALPIGHIAN BODIES OF THE SPLEEN OF THE ALLIGATOR AND CROCODILE, AND ON THE WEIGHT OF THE SPLEEN AS COMPARED WITH THE BODY IN THESE ANIMALS.

Nearly all the writers on the spleen that I am acquainted with deny the existence of Malpighian bodies in fish and reptiles—

an error that a more extended examination of the vertebrate animals would readily have corrected. These bodies are very distinct in some of the cartilaginous fishes, and in many reptiles; but in none that I have examined are they so large as in the alligators and crocodiles. The preparations on the table, from the spleen of an alligator and of a crocodile, are sufficient evidence of this, although when recently taken from the body they were more apparent. The specimen, however, in which they have been subjected to the action of dilute nitric acid displays them better. They are about the size of these bodies in the sheep and other of the ruminants; they measured, when fresh, about the twenty-fourth of an inch in diameter. Another error of more importance respecting the spleen is the assertion of every writer that I know of, "That the spleen decreases in size as we descend in the scale of vertebrate animals"—a mistake that can only have originated in that common source of error, the lazy system of taking for granted that which previous writers have stated as correct, and of not investigating for ourselves. It is from this cause that the English works on physiology, and the articles in our Cyclopædia, (copied mostly from Continental writers,) are crammed with mistakes, the question too often being, "Where does the information come from?"—not "*Is it true?*" From a recent work "On the Spleen," with which one of the reviewers was so charmed that he broke forth into a soliloquy on Truth, I extract the following passage:—"Reptilia.—As we descend in the scale of the vertebrate series, the function of the spleen appears to be considerably reduced in importance, as shown by the extreme diminution of its size—a diminution more marked than in any other of the vertebrata." But let us test the correctness of this descending scale by the class of animals in question. I have examined ten of these—four crocodiles and six alligators, varying in weight from a few ounces to two hundredweight. All were inspected soon after death, and in seven, the bodies and viscera were carefully weighed by myself, and the alimentary canal measured. In the three larger specimens the weight of the body only was guessed at. In all, the stomach contained stones; and in one, large pine-knots, partly digested. The relative weight of the body and of the spleen in the ten specimens was as follows:—Crocodiles,  $\frac{1}{100}$ ,  $\frac{1}{100}$ ,  $\frac{1}{100}$ ; a large specimen, the body not weighed, about  $\frac{1}{100}$ ; alligators,  $\frac{1}{100}$ ,  $\frac{1}{100}$ ,  $\frac{1}{100}$ ,  $\frac{1}{100}$ ; two large ones, the bodies not weighed, about  $\frac{1}{100}$  and  $\frac{1}{100}$ . If the above proportions are compared with those of some orders of birds, the alligator's spleen will be found to be relatively much heavier; and when the weight of the tegumentary covering (possessing but little vascularity) in these Saurians is considered, the proportion is greatly increased. It may be remarked, too, that some of the animals above mentioned had not fed for several months. If we investigate this descensive scale still further, and examine a lower grade of the vertebrata—viz., fishes, we find a much greater proof of its erroneousness than in the reptiles.

DR. RICHARDSON read a paper

### ON THE PRESENCE OR ABSENCE OF BLOOD IN THE ARTERIES AFTER DEATH.

He commenced by alluding to the fact, that the emptiness of the arterial system after death had attracted the attention of the earliest anatomists, and had probably given rise to the idea that the arteries were channels for conveying æreal spirits—an idea which had impeded the labours of all anatomists up to the time of Harvey. The cause of the emptiness of the arteries had in modern times given rise to numerous physiological discussions; but the common opinion of late had been that a contractile power in the arteries caused them to empty themselves. To this opinion there were two objections—1. That granting the arteries to possess a muscular contractile power, it is not easy to see how that power can be exerted when all the other muscles of the body are relaxed, as they are during and immediately after the act of death. 2. The arteries were not always left empty, which they would be if this contraction were the cause of their emptiness. The arteries were found in three conditions after death—1. Charged with blood, like the veins. 2. Absolutely empty. 3. Containing cords of coagulated blood with no surrounding serum. In answer to the question, What is the cause of these varying conditions? Dr. Richardson said that the answer he believed had been given long since by the discoverer of the circulation of the blood. They were connected with certain relative states of the respiration and circulation in the act of dying. The following was the Harveian explanation as given in the 9th chapter of the treatise "On the Motions of the Heart and Blood":—"And now the cause is manifest, wherefore in our dissections we usually find so large a quantity of blood in the veins, so little in the arteries; wherefore there

is so much in the right ventricle, so little in the left—circumstances which led the ancients to suppose that the arteries, as their name applies, contained nothing but spirits during the life of an animal. The true cause of the difference is this, that as there is no passage to the arteries, save through the lungs and heart, when an animal has ceased to breathe and the lungs to move, the blood in the pulmonary artery is prevented from passing into the pulmonary veins, and from thence into the left ventricle of the heart, just as we have already seen the same transit prevented in the fœtus by the want of movement in the lungs, and the alternate opening and shutting of their minute orifices and invisible pores. But the heart not ceasing to act at the same precise moment as the lungs, but surviving them, and continuing to pulsate for a time, the left ventricle and arteries go on distributing their blood to the body at large, and sending it into the veins; receiving none from the lungs, however, they are soon exhausted, and left as it were empty." In support of this reading of the subject under consideration, Dr. Richardson now adduced various experiments and observations of his own. He had watched the process of dying in men and in animals on numerous occasions during the past two years, and had observed that whenever the act of dying was at all prolonged, the cessation of the heart's beat prior to the cessation of respiration was followed by fulness of the arteries after death; and, *vice versa*, that the cessation of the respiration prior to the cessation of the heart's beat was followed by emptiness of the arterial trunks. To this general rule there were a few exceptions, however. Thus the arteries may be left empty after death from hæmorrhage, although the respiration may have outlived the heart. In cases of death from failure of the right side of the heart, or from obstruction there, the arteries may again be empty, though respiration continued longer than the circulation. In cases of obstruction in the left side of the heart, again, the arteries may be full, though the heart may have outlived the circulation; while in sudden death, where the heart and lungs ceased to act almost simultaneously, the arteries may be found as full as the veins. Dr. Richardson next remarked on that condition of blood in which it was found in the arteries in long coagulated threads. In these cases the arteries had probably been left full; but the blood in them having coagulated and become separated into two parts, clot and serum, the serum was drawn off by osmotic action, first into the tissues, and afterwards into the veins or tissues, in the same manner as water is taken out of arteries injected with it in dissecting-room subjects.

A very animated discussion followed the reading of this paper.

Dr. SNOW contended that the power of the left ventricle was not sufficient to empty the arteries. The contraction of the arteries during life was shown in the gradual feebleness of the pulse during exhaustive diseases. There must be some other kind of force in the capillaries to cause the arteries to empty themselves completely.

Dr. CRISP denied the muscularity of the arteries, and their active contractile power. The elasticity of the fibrous coat of an artery was contrary to the idea of muscularity. The act of blushing showed a relaxed state of the vessels, and in the arteries no kind of contraction could be elicited by irritation similar to that action which could be so long kept up after death in the intestines and other organs possessing muscular fibres.

Dr. PAVEY urged that the left ventricle could not by its contraction alone empty the arterial tubes. It must push something, such as a column of air, before it, in order to produce such an effect. In experiments on animals, he had often observed the contractility of arteries, and had seen an artery reduced by contraction to the condition of an impervious cord. The contraction of arteries after death resembled the contractile power of the bladder, by which the urine was sometimes expelled in the dead.

Mr. HIRD doubted if the same physical effects could be produced in the living artery as were produced in the dead. The condition of the blood itself had not a little to do with its motion; in the main, however, he agreed with Dr. Richardson.

Dr. HARE contended that the heart could not of itself empty the arteries. More than this, the arteries could be seen contracting in the frog's foot. In anæmic states, where the heart was feeble, the action of the arteries was often most active.

Mr. PILCHER remarked on the elastic property of arteries, and on their faculty of shortening during a diastole. He believed that cadaveric rigidity extends to the arteries. The contraction of an artery was analogous to contractions in other canals, such as the urethra and lachrymal duct.

Dr. MURPHY thought that all the causes that had been named might lead to the results described. The causes named

by Dr. Richardson were probably the main ones, but the others might be subsidiary.

Dr. O. WARD observed that strictures of the urethra or lachrymal duct resulted from local irritation, and could not therefore bear on the subject of arterial contraction or non-contraction.

Dr. HENRY said that some of the exceptions to the Harveian rule described by Dr. Richardson were scarcely exceptions, but rather extensions of the rule itself. He would like to hear how Dr. Richardson accounted for the oscillations of blood in the arteries during feeble states of the circulation, without the aid of arterial contraction.

Dr. CHOWNE would like to hear from Dr. Richardson what he supposed the arteries contained in cases where they were quite empty of blood. They certainly were not vacuous. He did not think that sufficient facts were before us to explain all the phenomena connected with the state of the circulation and respiration in the act of death.

Dr. RICHARDSON, in reply, observed, that if the arteries really contracted after death so as to empty themselves in any one case, they ought to do so in all. He asserted from observation that the arteries did not undergo cadaveric rigidity. He believed, with Dr. SNOW, that there was a force exerted by which fluids in the arteries could be drawn into the tissues, and thence into the veins; that this force was osmotic, and went on in the dead as well as in the living subject for a time. The violent action of the arteries in exhaustive diseases showed a want of tone in the arterial tunics, and the hæmorrhagic pulse was essentially characteristic of the same condition. He could not answer the important question put by Dr. CHOWNE as to what the arteries did contain when empty of blood; certain it was, however, that they were not vacuous. Mr. PILCHER's argument about stricture of muscular tubes could only be brought to bear on this subject when the muscularity of the arteries was proved to be a fact. Oscillations in the arteries, in feeble states, were produced merely by the systole and diastole of the heart during a period when there was diminished supply of blood in the arterial system.

## ROYAL SOCIETY.

ON THE FREQUENT OCCURRENCE OF INDIGO IN HUMAN URINE, AND ON ITS CHEMICAL, PHYSIOLOGICAL, AND PATHOLOGICAL RELATIONS.

BY ARTHUR HILL HASSALL, M.D.,

MEMBER OF THE ROYAL COLLEGE OF PHYSICIANS, PHYSICIAN TO THE ROYAL FREE HOSPITAL, ETC.

(Communicated by Professor SHARPESY, Sec. R.S.)

THE present communication embraces some further observations and experiments on the occurrence of indigo in human urine. From these it appears that the presence of that substance is even more common than the author was led to anticipate from his first inquiries, the results of which were communicated to the Society in June last. The author furnishes additional proofs of the blue colouring matter in question being really indigo, by converting it into isatine and aniline; for this purpose it was necessary to obtain the pigment in considerable quantity. Contrasting its chemical and physiological relations with hæmatin and urine pigment, he shows that indigo is closely allied in its nature and origin to those substances, and he considers that when indigo is met with in urine in considerable amount, it forms a vehicle for the elimination of any excess of carbon contained in the system. This view is borne out by the important fact, that the greater number of cases in which indigo has been observed to be developed in the urine in large amount, have been cases in which the decarbonizing functions are greatly impaired, as in extensive tubercular disease of the lungs, and in most cases of cholera.

## Reviews and Notices of Books.

*A Manual of Pathological Anatomy.* By C. HANDFIELD JONES, M.B., F.R.S.; and EDWARD H. STEVENS, M.D. Foolscape 8vo, pp. 788. London: Churchill. 1854.

EVERY ONE who has studied the science of Medicine as such a science ought to be studied, must long ere this have arrived at the conclusion that there are two of its departments—those of pathology and therapeutics—in which there is yet much to

be done. Both, however, are of the most vital importance, and the former takes natural precedence, as, without understanding disease, it is plain that we can know little of methods of cure.

Just as the action of remedies is the very foundation of therapeutics, so is pathological anatomy the foundation of correct pathology. We have been hitherto sadly in want of a good handbook on this subject. The Sydenham Society has done good service by their publication of a translation of Haase, and another of the still more classical and copious manual of Rokitsansky. Unfortunately, the distinguished Vienna professor has not yet completed his work, which must also, on account of its size, be inaccessible to many. The profession, therefore, is much indebted to Dr. Sieveking, one of the translators of Rokitsansky, for having combined with Dr. Handfield Jones for the purpose of giving us the first English epitome of the subject.

It is a work which we can recommend with confidence. The descriptions are simple, but sufficient; the work is well and carefully arranged; a complete account is given of each matter referred to in its turn, and contested opinions are discussed with candour.

On the important question of cancer, the authors (very properly, as it seems to us,) are of opinion that the microscopic diagnosis of a cancer-cell is at least a doubtful, and often an impossible, thing. They agree in the main with Dr. Walshe as to the small benefit to be expected from operative interference. We may observe that M. Velpeau has just arrived at the contrary opinion, and states that he has positively cured twenty-one cases of cancerous disease. Here we leave this subject by recommending M. Velpeau's treatment to the favourable consideration of the officers of the Cancer Hospital.

On another vexed question, that of tubercle, we find Dr. Jones expressing the opinion of Rokitsansky, that the grey and carious varieties are distinct from the first, and not mere phases of the same formation, as supposed by Walshe and many others. With regard to the microscopic recognition of tuberculous matter in early phthisical sputa, as stated by many sanguine histologists, our own opinion is that it is impossible. To rely upon such minute and uncertain characters as the irregular shape of a few nuclei, apart from any other more palpable sign, would be unadvisable and even dangerous.

Some criticism may be allowed where so much praise is deserved. In the event of another edition, which may be confidently anticipated, it would be as well to mention that the style in which the work is written is in many places careless and inelegant. It should be revised. The account of the various forms of nephritis is unnecessarily obscure.

*History of the Epidemic Yellow Fever at New Orleans, &c., in 1853.* By E. D. FENNER, M.D., one of the Visiting Physicians to the New Orleans Charity Hospital, &c. New York, 1854. pp. 84.

WELL aware of the fact that New Orleans was a very unhealthy place, we certainly were not prepared for Dr. Fenner's statement, that the annual mortality in proportion to population more than doubles that of any other city either in Europe or America. The inhabitants seem neither much afraid nor ashamed of its being so. "They either disregard the solemn truth, or flatly deny it; saying there must be some mistake, and calling those who bring to light such unwelcome facts enemies to the city, and traducers of its fair fame." (p. 4.) Since the commencement of the present century, New Orleans has been many times severely visited by yellow fever, and last year was scourged by an epidemic of it more malignant and unmanageable than any that ever before happened there. (p. 49.) Between May 28th and October 8th, 7813 persons were certified to have died of it, and 385 are believed to have died of it uncerified, thus making a total of 8198 deaths. (p. 47.)

"From the best information I can obtain, New Orleans was in existence three quarters of a century before the first epidemic of

the disease prevailed here; and it is only within the present year that it has prevailed over the large plantations within sight of the city. Is it not possible to restore the sanitary condition that existed before this disease prevailed here? Many cities and towns have been severely scourged by yellow fever for successive years, but finally got rid of it. Let us endeavour to ascertain how they got clear of it, and do as they did. If they expelled it by removing all filth and stagnant water, let us make our city clean and dry..... The great subject of public health must be set aside and neglected no longer, but should command that serious consideration which its importance deserves."—p. 5.

Dr. Fenner's tractate is both important and interesting in a high degree.

*Pathological and Surgical Observations, including a short Course of Lectures delivered at the Lock Hospital, and an Essay On the Surgical Treatment of Hæmorrhoidal Tumours.* By HENRY LEE, F.R.C.S., &c. 8vo, pp. 232. London: Charchill.

OUR limits will not permit us to give a lengthened notice of this work. Mr. Lee is already favourably known to the profession by his monograph "On Inflammation of the Veins." His opportunities of experience on the subject of Syphilis, both at the Lock Hospital and in the out-patient department at King's College Hospital, must have been most extensive, and would alone render his opinions on this subject of much value.

Besides his Lectures at the Lock Hospital, in which the much-vexed question of Syphilization is discussed, as well as the nature of Infecting and Non-infecting Sores, we have in this book an account of Mr. Lee's experiments on Phlebitis; some ingenious remarks on the Movements of the Eye-ball; an essay on Suppuration and other Diseases of Bone, and another on the Surgical Treatment of Hæmorrhoids.

This volume does great credit to Mr. Lee, and will add to the reputation which he has already acquired as an able and scientific surgeon.

## New Inventions

IN AID OF THE

## PRACTICE OF MEDICINE AND SURGERY.

### THE CHARCOAL RESPIRATOR.

CHARCOAL has long been employed for purposes of purification in a variety of ways. Some new and ingenious applications of that highly useful substance have, however, occurred to Dr. Stenhouse. Its value in the purification of water has long been known, and it frequently enters into the composition of the bed through which, in our house filters, the water is made to pass. Calling to mind this use of charcoal, as well as its extraordinary capability of absorbing, retaining, and oxydizing the majority of even the most offensive gases, Dr. Stenhouse conceived that it might be used with equal advantage in the construction of respirators, and with this object he was led to make many experiments in order to ascertain the nature and extent of the deodorizing action of charcoal, and he found that it was even more effective than he had anticipated.

The charcoal respirator is especially adapted for use in those forms of dyspepsia and in those diseases of the lungs in which the breath is at all fetid or offensive, as it frequently is; also in an infected atmosphere, and in chemical and manufacturing establishments where it is desired to prevent the inhalation of noxious or offensive effluvia. Since not only is the air inspired deprived to a great extent of any disagreeable miasmata or gases which it may contain, but at the same time its temperature is raised, the charcoal respirator answers all the purposes of the ordinary metallic respirator, while its cost is trifling. There are three forms or modifications of the instrument; the one is adapted to the mouth only, the others include both mouth and nose, and are more particularly suited for use in laboratories and infected atmospheres.

## THE LANCET.

LONDON: SATURDAY, NOVEMBER 25, 1854.

At the time when the Lunacy Laws were being hurried through Parliament, under a newly-arranged, but not amended form, we lost no opportunity of exposing their manifold defects; of pointing out how little security was taken for the protection of the insane, or to prevent those laws from being wrested to the foulest purposes, to the incarceration of individuals on the *unproved* imputation of insanity, and to the evasion of justice.

We are therefore disposed to scrutinize with jealousy the details of any case which may exhibit the appearance, not merely of illegality—for the foulest of moral crimes may be perpetrated under the most scrupulous adherence to the legal requirements of these Lunacy Laws—but of an attempt to transgress, for improper motives, those bounds set up between justice and injustice by the normal sense of right, often a better safeguard against the abuse of power than statute-law.

It is in this spirit that we have anxiously investigated the circumstances connected with the confinement of the Rev. E. HOLMES in the Heigham Hall Asylum, with the object, as it is alleged, of rescuing him from an indictment for a criminal offence. Some of these circumstances, constituting what may be called an *ex-parte* statement, were brought forward at the last quarterly sessions of the Norwich magistrates, in the shape of a distinct charge against Messrs. NICHOLS and WATSON, the proprietors of the asylum. Mr. NICHOLS was publicly accused of having used the machinery of the Lunacy Acts for the purpose of sheltering a member of an opulent family, under a false allegation of insanity, from the operation of the criminal law. It was also charged against Messrs. NICHOLS and WATSON, that they had further been guilty of a distinct infraction of the Act by retaining the Rev. E. HOLMES in their asylum, in the character of a boarder, after his discharge as a patient.

In proportion to the enormity of the first charge, and the probable consequences to the accused should that charge be substantiated, is the necessity for full, deliberate, and public inquiry. We might reasonably expect that those who were foremost in zeal in urging the accusation, and most earnestly bent on directing that accusation exclusively against the medical proprietors of the asylum, would have also been foremost in calling for an open inquiry. Strange to say this has not been the case. The accusers, who assume before the world the character of being the champions of the public, have not evinced any great zeal to put the accused upon their trial. Unless Messrs. NICHOLS and WATSON can *themselves* force a public inquiry, they are in danger of being condemned unheard. The letter of Mr. WATSON, which we publish this week, reveals the fact that they have spared no means, no exertion, to obtain a full investigation; and still, although suffering under all the weight of a most odious imputation, they have been unable to obtain an inquiry that deserves to be called full, impartial, or public. Such an inquiry it will be seen they still demand. We know not how it can in justice be refused. But those who challenge publicity have at least this right,—a right which the public has never withheld,

—of being considered innocent until, after open inquiry, they have been proved guilty; and of being entitled to fix the charge of malignity upon their accusers, should that inquiry be denied. Seeing the reluctance of the magistrates of Norwich and of the Commissioners in Lunacy to institute a public official inquiry, the proprietors of the asylum appeal to the public press. The letter of Mr. WATSON contains a clear and methodical statement of the leading circumstances of the case. This letter, together with other independent sources of information, supplies us with the materials for arriving at a comprehensive and accurate view of all the features of the case.

It will at once be seen that the gravamen of the charge consists in the allegation, that the Rev. E. HOLMES, being accused before the magistrates of Wymondham of having committed a serious offence against the criminal law, was, by the intervention of Mr. NICHOLS, “rescued from the gripe of the law” on the false plea of insanity. It has been strangely overlooked by those who would make Mr. NICHOLS the sole offender, that in this charge Mr. NICHOLS cannot stand alone. He must have had many accomplices. Firstly, the magistrates connived at, if they did not prompt, a flagrant violation of the law. Secondly, Mr. GEORGE HOLMES, the brother of the alleged lunatic, under whose order he was consigned to the asylum, was a party to the offence. Thirdly, two respectable medical practitioners, Messrs. GILLET and TAYLOR, who signed the medical certificates required by the Act, have been grossly imposed upon, or they are *participes criminis*. Fourthly, the Commissioners in Lunacy and the Visiting Justices of the city of Norwich have either evinced the most scandalous want of vigilance in the duty imposed upon them by the law, of taking care that no sane person shall be confined as a lunatic; or they have been so infamously corrupt in the discharge of their public functions as to give refuge in a private asylum to a man whom they knew to be under a criminal charge, whom they knew to be of sound mind, and therefore responsible to the laws of his country. If the charge directed against Mr. NICHOLS be true, what shall be said of the delinquency of the Wymondham and Norwich magistrates and of the Lunacy Commissioners? Fifthly, a physician of character, Dr. HULL, has, during two years, harboured a guilty knowledge of a grave offence against the law. We of course infer all this from the assumption that the Rev. E. HOLMES, at the time of his admission at Heigham Hall, was of sound mind, and that those who were concerned in procuring his admission and detaining him as a lunatic believed him to be of sound mind.

The presumption against the existence of so much folly or so much knavery, conspiring to defeat the law, is certainly great. But was the Rev. E. HOLMES sane or insane? Upon the answer to this question hangs the intellectual or moral reputation of the Wymondham magistrates, Messrs. NICHOLS and WATSON, Dr. HULL, Messrs. GILLET and TAYLOR, the Visiting Magistrates of Norwich, and the Lunacy Commissioners. What is the evidence? It appears that the Wymondham magistrates had abundance before them. Mr. HOLMES's eccentric conduct had long been matter of notoriety in the neighbourhood. HANNAH BUNN, who had lived in service with Mr. E. HOLMES, deposed to various acts of eccentricity and violence. ROSE BAILEY, who had also been in his service, gave similar evidence. ROBERT BUNN, the husband of HANNAH BUNN, declared that he had many times been compelled to hold Mr. HOLMES down

on the floor, for half an hour at a time, to prevent him from doing violence to himself or his wife. ELIZABETH BUNN, the mother of the girl against whom it is alleged the offence was committed, "was satisfied Mr. HOLMES was not right in his mind. She felt very much afraid of him; he was very violent at times." SAMUEL BARRETT, the policeman, who went to take the charge, was "fully satisfied that Mr. HOLMES was of unsound mind." Two years before the date of the transaction, his friends, believing Mr. HOLMES to be insane, had consulted Mr. NICHOLS as to the propriety of confining him. At this time he had committed no overt act against the law. Had Mr. NICHOLS been open to those influences which are imputed to him, he might then have received Mr. HOLMES in his asylum. He, however, was not satisfied of the necessity of such a step. The Rev. Mr. ANDREW, who "was constantly in the habit of seeing Mr. HOLMES," says "his general conduct was that of a person of unsound mind; he was accustomed to speak of his housekeeper as being possessed with seven devils; that he should some day murder her; on one occasion he filled her mouth with pieces of raw potatoes; he desired above all things to get into the Castle, (gaol,) as that would do him good." This was not all the evidence; but it is surely greater in amount and more convincing in character than what has too often been deemed sufficient to make good the allegation of lunacy. It is but proper to add that Mr. GILLET and Mr. TAYLOR had no doubt of his insanity. Placed under medical care, it was found that Mr. HOLMES was labouring under a variety of bodily complaints that had a pernicious reaction upon his mental health. This was in June, 1852. We are to presume that the Visiting Magistrates and the Lunacy Commissioners recognised his insanity; otherwise it was their duty to order his discharge. The chairman of the Visiting-Board, Sir SAMUEL BIGNOLD, and the secretary of the Commissioners, each speaking for the bodies they respectively represented, declare their belief that Mr. HOLMES was insane at the time of his admission.

But we proceed in the history. Under judicious treatment, Mr. HOLMES's bodily diseases were relieved, and he recovered from his mental distemper. It was considered desirable to give him suitable employment. He was therefore appointed, at first on probation, chaplain to the male side of the asylum. He entered upon this duty on the 8th of August, 1852. A chaplain's book was provided, in which entries were regularly made. His appointment was made with the full cognizance of the Visitors and Commissioners. The book was submitted to their inspection, and there is evidence to show that he continued to perform his duties with efficiency and propriety down to September, 1853. Why the unfitness of his appointment should then become apparent to the Visiting Magistrates it is not easy to understand. Why, if any individual, official or private, had believed that Mr. HOLMES ought never to have been confined as a lunatic, or was an unfit person to be made chaplain to the asylum, such person had not at a much earlier period demanded inquiry into the circumstances, is only to be explained on the supposition that, not the sense of public duty, but feelings of a personal nature had arisen to instigate proceedings which it was hoped might be prejudicial to the proprietors of the asylum. Into these motives or springs of action it is not now our intention to enter. Malevolence is never slow to discover or to make occasions of accusation.

After the lapse of two years, during which time no one had publicly questioned the conduct of the parties concerned in

the detention of Mr. HOLMES, rumours got abroad that Mr. NICHOLS had himself betrayed the inconceivable folly of boasting, that "he had rescued Mr. HOLMES from the gripe of the law!" Dr. RANKING, who had recently become interested in the asylum, joined his co-proprietors in insisting upon an inquiry. An inquiry took place. Had that inquiry been public, public scandal might have been dispelled. It was private, and therefore answered no good purpose whatever. The magistrates however declared their conviction that the Rev. E. HOLMES had been properly confined. They also made a discovery which ought to have occurred to them a year before, namely, that the Rev. E. HOLMES was not a fit person to have been appointed chaplain to the asylum. Why was he not fit? We do not pretend to episcopal jurisdiction; we do not think it pertinent to express any opinion of our own upon this point. But what is the subsequent history of Mr. HOLMES? Suspended from his clerical duties at the asylum, he is immediately accepted as a curate of a considerable parish. The Bishop does not interpose; and the Rev. Mr. COBB, knowing his antecedents, gives the following testimony:—

"During his sojourn at Wymondham, he became less and less responsible for his actions; at the present time he is as competent to discharge any duty requiring a sound mind as any one; he has, I believe, conducted himself with the strictest propriety during the entire time in which he has been connected with my parish; he has endeared himself to many of my poor people; and on all sides, wherever I have heard his name mentioned, it has been with approbation."

If so well qualified for a curacy, why not for a chaplaincy to an asylum? But it has been urged, as a proof that the proprietors were conscious of the impropriety of the appointment, that they restricted his ministration to the male side. Surely there is some obliquity in this view of the matter. Considering the nature of the mental alienation under which Mr. HOLMES had laboured on admission, would not calm judgment pronounce that the conduct of the proprietors was guided by a wise discretion? The disapprobation of the Visitors, excited only after a year's silence, spent perhaps in coming to the conclusion that he ought not to have been appointed, will not go for much. It may be conjectured that this tardy decision was determined by a feeling that it was "necessary to do something" when they were called upon to institute an inquiry. It does not appear that their resolution was influenced by the slightest evidence of general unfitness, impropriety of conduct, or inefficiency displayed by Mr. HOLMES during his incumbency. We are therefore not informed of any circumstance, beyond the fact of former insanity, that should disqualify the Rev. Mr. HOLMES from resuming his professional functions.

The charge of having infringed the section of the law which forbids the retention of a discharged patient in the character of a boarder, we have adverted to on a former occasion. (See THE LANCET, Nov. 4th.) The only circumstance that could lend weight to this accusation would be, concealment of the transaction from the Justices and Commissioners. But concealment there was none. Messrs. NICHOLS, RANKING, and WATSON were pressing Justices and Commissioners for a fuller inquiry. They conceived they had a right to that inquiry. They expected it would be granted. Pending this matter, Mr. HOLMES resided in the asylum, himself writing from that place to the Commissioners, begging for inquiry. It is doubtful whether even the letter of the Act was transgressed. The spirit certainly was not.

The most serious charge, that of rescuing an alleged criminal

from the gripe of the law, is one which it concerns the magistrates, and the magistrates alone, to answer. Mr. NICHOLS received into his asylum a patient admitted to be insane under all the technical requirements of the law. The magistrates are the natural guardians of the law: if they permitted an alleged criminal to be wrested fraudulently from their power, theirs is the responsibility.

Such is the summary of this case, which has given rise to so much scandal. If discredit rests anywhere, it is not with the proprietors of the asylum, who, by the open, straightforward course they have taken, show that they have nothing to fear; but rather with those who, by their long silence and tardy accusations, have given ground for the suspicion that, not public zeal, but a less commendable motive, has prompted their proceedings.

But not to lose a general application, we would ask, where is the perfection of the Lunacy Laws, if an abuse such as the one imputed can be perpetrated by means of those very enactments which some people contend are an effectual security for the liberty of the citizen and the sanctity of the law? Of what value are the Lunacy Commissioners, if they are unable to vindicate the conduct of those who appeal to them for inquiry?

Two things at least are obvious,—that the plan of administering the Lunacy Laws by a system of secrecy and mystery, is the surest way of conjuring up in the public mind suspicions of corruption; and that if, as we believe in the present instance, no legal or moral offence have been committed, if the Lunacy Laws have not been made subservient to the incarceration of persons of sound mind, and the evasion of justice, those laws contain ample facilities for the commission of such enormities.

THE late notice of the Court of Examiners of the College of Surgeons, that they will admit to examination for the diploma during next month—and we understand the 15th is fixed for the first day—all those students who are twenty-one years of age, whose period of hospital study shall not expire until the end of March, 1855, does them great credit, inasmuch as it shows the anxiety of the Court to aid the Government in sending out duly-qualified surgeons to assist our brave soldiers in the East, who now stand in urgent need of their assistance. The period of study required by the College is four years, the three last of which should be passed in attendance on an hospital or school of anatomy,—such period being considered sufficient to obtain a sufficient degree of knowledge for men of ordinary capacity, although others of greater natural talent and application may perhaps be able to acquire it in less time. These latter gentlemen, if such there be, have now the opportunity of showing it, provided they are desirous of obtaining the opportunity of further distinction in the service of their country and in the cause of humanity.

To send to the army half-educated students as dressers would be a great error, provided young, educated men can be obtained of an age and strength to admit of their bearing privations and of enduring great labour. We do not hesitate to affirm, that they may be obtained in sufficient numbers, provided a reasonable compensation be offered to them. It is said that efforts have been made at different hospitals to obtain the services of unqualified students, by the offer of 6s. 6d. a day, and a gratuity of £25 on being dismissed—a proceeding (if true) highly discreditable to the Government, and which, we hope, will be brought under the cognizance of Parliament at its first

meeting. It was tried during the last war. Many ignorant persons, unworthy of a commission from their professional inability, had warrants granted to them, under which they cured or killed as they best could; and the evil results of their employment are shown in those excellent lectures of Mr. GUTHRIE which were published seventeen years ago, and should now be a warning to the nation not to submit to such an abominable proceeding. Good and sufficient surgeons are to be procured in adequate numbers for any emergency, provided they are fairly paid and honourably treated; and if the people of England do not insist on this being done, they should not mourn for their friends and relations as lost to them in many instances from the accidents of the war, but from their own parsimony in not insisting that proper medical assistance be immediately supplied, at any cost.

It is stated in the newspapers that one surgeon only was furnished during the war in the Peninsula to every 157 men, but it is as well known to the profession that there were never half the number present which were required, during nearly the whole of that war. Mr. GUTHRIE, the greatest authority on these subjects the country possesses, or has perhaps ever possessed, in his pamphlet published in April last, and entitled "Some account of the Brigade of Hospital Conveyance Carts attached to the Army of the East," but which carts were not with the army on the Alma when they were most wanted, says:—

"A regiment of 800 bayonets, when before the enemy, should have present, if possible, one surgeon, and three assistant-surgeons of at least one year's standing; officers who understand their duties as soldiers as well as surgeons. An assistant staff-surgeon may be attached to each regiment as a fourth, for instruction as well as use—for good and sufficient medical men never were in proper numbers on a field of battle—and unless these additions take place, it may be doubted whether the deficiency will not again occur."—p. 7.

Looking with almost a second sight into what was about to occur, he says, in the preface to his work "On Injuries of the Chest," published in 1848,—“The number of the wounded received into the hospitals at Toulouse, after the battle so named, was 1359, including 117 officers. The number of medical men in the first week was 54, in the second week, 68; not one surgeon of a regiment being amongst them:” and he adds, “They all worked from six in the morning until nine at night.” Was there a staff of this kind present to take charge of the wounded on the Alma, and to accompany them to Scutari? Was there a similar proportion present on the 5th of November? These are points that ought to be inquired into, and stated to the public, that they may know their brave countrymen have not been lost for want of surgical aid.

A medical officer in the army should be not only qualified in surgery but in physic; he cannot fail to be employed in both branches of his profession; and this is the most important reason why ignorant people should not be resorted to, in order to save a little money, at the sacrifice of human life and happiness. We give the following from an unquestionable source, without a comment:—

“On the 25th of September, one officer and 111 English soldiers were sent on board a troop ship in the Black Sea without a medical officer, nearly all suffering from cholera, the remainder from diarrhoea; many were speechless. Three were found dead in the boat, twenty died the same night, two more on the 26th, four on the 27th, and the officer; and before the vessel arrived at Scutari, fifteen more; in all forty-two. 246 were afterwards sent on board at Balaklava, of whom ten died, all without an officer or a non-commissioned officer to take charge of them. There were under sixty beds on board for this mass of 340 soldiers, in the worst state of disease.

There were, however, two assistant-surgeons of the navy, who laboured for their fellow-men with a devotion above all praise. But it is dreadful to think of what they could not do, and what our unfortunate soldiers suffered. Well may those who have survived say, *INGRATA PATRIA!*"

On the 9th of next month, the twelfth list of contributors to the Medical Benevolent College will be published. It is gratifying to observe that an institution so much needed has hitherto progressed in so satisfactory a manner. Recollecting the difficulties which had to be overcome, the opposition from parties who should have supported it, and the fears of friends of its ultimate success, it is really marvellous that in less than four years such progress should have been made. Not the least significant sign of the prosperous condition of the new institution is, that many who held back at the commencement have now become its supporters, and others who really opposed it as a chimera have since subscribed largely to its funds. As this is truly a national undertaking, it should be firmly and immediately supported by the practitioners of Medicine throughout the length and breadth of the land.

We sincerely trust that the forthcoming list of subscriptions will include the names of very many who have hitherto neglected the sacred duty of aiding the cause of their suffering brethren, and administering to the maintenance and comfort of their widows and children. The urgent necessity for such an institution has been sufficiently evinced by the fact, that the number of applicants for admission within its walls has already exceeded the capability of admitting them. An object at once so necessary and desirable requires no urgent appeal to those who cannot be unacquainted with the wants of the profession. We shall make no such appeal, convinced as we are that the members of our noble profession will come forward in aid of so good a cause, and in support of the unwearied and most honourable exertions of the founder of the MEDICAL BENEVOLENT COLLEGE.

As much misapprehension has existed respecting the position occupied by the new class of army medical officers, designated "Acting Assistant-surgeons," we may state, for the information of those interested in the subject, that these gentlemen are engaged for service with the army as commissioned assistant-surgeons. When their services are no longer required, they will not receive the half-pay granted to staff assistant-surgeons, but in lieu thereof, two months' full-pay, reckoning from the day they cease to do duty. They must possess a diploma in surgery, by a body lawfully qualified to grant one, and are required to undergo a practical examination by a board of army medical officers appointed for the purpose.

## THE MEDICAL DIRECTORIES.

YEARSLY V. WAKLEY.

OUR readers will be glad to learn that this suit, in reference to the "London and Provincial Medical Directory," and the "British Medical Directory," has at length, through the intervention of mutual friends, been brought to an amicable termination in a manner satisfactory to both parties. In pursuance of this arrangement, the "British Medical Directory" will be merged in the "London and Provincial Medical Directory," which by this combination will, we trust, be rendered well worthy the patronage of the profession, to

whom we shall the more readily recommend it, inasmuch as it will continue to be conducted on the principles so long advocated by us, of excluding the titles and honorary distinctions of homeopaths, and others of that stamp.

### THE HEIGHAM HALL ASYLUM.—THE CASE OF THE REV. E. HOLMES.

To the Editor of THE LANCET.

SIR,—A portion of the public press has, within the last few days, directed attention to the alleged misconduct of two of the proprietors of this asylum. Your leading article of the 4th inst. gives me reason to suppose that your views with reference to the matter are still unprejudiced by the virulence of the attack levelled against them. I therefore tender an explanation, and feel that your sense of equal justice to all will ensure its insertion.

The facts of this distorted case are as follow:—On the 12th of June, 1852, the Rev. E. Holmes was admitted a patient into this asylum upon the certificates of two surgeons and by the authority of his half-brother. Nearly two years before this admission, Mr. Nichols had been called upon by his relatives to ascertain the state of his mind, which, although disturbed, was not such as, in Mr. Nichols' opinion, rendered removal to the asylum necessary. For some time prior to admission, his friends had serious doubts of his sanity; and when he committed an indecent assault upon a girl of thirteen years of age, (but neither perpetrating a rape, nor even attempting it, as stated in a cotemporary journal,) the magistrate, Mr. Cann, sen., to whom the girl's mother complained, as well as Mr. Andrew, the rector of the parish, (Wymondham,) judged, from their previous knowledge of the Rev. E. Holmes, that he was insane, and communicated their opinion to his brother, who thereupon instituted inquiry, and caused him to be placed under medical care in this asylum. And he it observed, no warrant or summons was issued, or even thought of, and the policeman himself, who heard of the case, considered, after inquiry, that the offence was of so slight a character that he was not authorized to interfere. Can this be termed a rescue from the gripe of the law, unless by a perversion of words? At the end of twelve weeks' medical and moral treatment the Rev. E. Holmes was considered so far recovered as to be entitled to his discharge, and was so discharged by the recommendation of Mr. Nichols. He then wished for employment in his profession, and was appointed chaplain to his own side of the house, but not until the proprietors were satisfied, by previous trial, of his fitness for the office. From that time until June, 1854, he performed his duties with zeal and propriety; and so firmly had he re-established his character for moral integrity, that the incumbent of an adjacent parish solicited his services as assistant there, and for twelve months he has performed his clerical functions in that parish with equal zeal and fidelity.

This arrangement continued until the commencement of the present year, when the proprietors determined to associate with themselves Dr. Ranking, a physician of the highest repute in the city and county—a gentleman in every way calculated to advance the interests, and stamp the highest respectability upon the establishment.

Shortly after this union, certain injurious reports were circulated by a physician, (Dr. Hull,) to the effect, that nearly two years ago Mr. Nichols had requested him to sign a certificate for a clergyman charged with rape, who, and whose family, wished him to be represented as mad, in order to escape the vengeance of the law, and that he refused to be a party to such a transaction. In part Dr. Hull states the truth. Mr. Nichols did apply to him; but Dr. Hull objected to see, and did not see, the patient; and he is inaccurate when he asserts that Mr. Nichols urged his signature for certain impure considerations, or with a view to the evasion of justice.

In consequence of these reports, Dr. Ranking felt desirous that the respectability of the establishment with which he had associated his name, and in which he had invested a considerable capital, should be fully established; and in this he was cordially seconded by the original proprietors. An application was made to the visiting justices for an inquiry, which resulted in the report already published in your journal, but which report was founded upon the inferences drawn from the replies of a witness,

Mr. Cann, jun., produced by the proprietors, and which inferences Mr. Cann utterly disclaims and repudiates. That report you will observe perfectly exonerates the proprietors of the asylum from all blame, except for appointing Mr. Holmes as chaplain, which appointment the justices considered improper.

A copy of this report was forwarded by the justices to the Commissioners in Lunacy, who acknowledged its receipt, but paid no further attention to it.

The Rev. E. Holmes was at this time, and in consequence of the report, suspended from the performance of his duties in the house; but the proprietors could not, upon what they considered unfounded and insufficient evidence, allow the matter to rest here, and obtained the evidence of all the parties connected with the case, and laid it before the chairman (Sir Samuel Bignold) of the visiting justices, as well as before the Commissioners in Lunacy. Sir Samuel Bignold appointed a time for re-hearing the case, but subsequently considering the re-hearing unnecessary, wrote the following letter to a friend of the proprietors.

"Surrey-street, Norwich, August 10th, 1854.

"DEAR SIR,—The affair of the Rev. E. Holmes having been alluded to in the House of Commons, I think you would do right to request some member to explain that the case was investigated by the visiting justices, at whose meeting I acted as chairman, that the fullest evidence was tendered to them, and that they agreed to a report, which was signed by every justice, and forwarded to the Commissioners in Lunacy, who have acknowledged the receipt, but have not suggested any further steps as called for. Some additional evidence has been placed before me touching the sanity of Mr. Holmes, in June, 1852, when the transaction referred to occurred, and the impression produced upon my mind in reading such evidence is, that he was rightly placed in *Heigham Hall Lunatic Asylum*, at the period when he was lodged there. I am now urged by the family and friends of Mr. Holmes, to summons afresh the visiting magistrates to go again into the inquiry, but in my opinion, the case is so clear that any renewed inquiry would be superfluous. I do trust that the matter will now be suffered to drop. Mr. Holmes' family are an opulent family, and they deem it best that he should continue a boarder at the asylum, though in a state of convalescence, and this disposal of him is, I think, most wise and proper.

"SAMUEL BIGNOLD, Mayor of Norwich."

This letter speaks for itself, and I considered the affair terminated, having the sanction of the chairman of the visiting magistrates to Mr. Holmes' residence as chaplain. During this interval the Rev. Mr. Holmes was suspended, but continued to reside in the asylum, efforts being continually made to have the case re-opened.

On the 27th of September last the visiting magistrates made a report, to the effect that the Rev. E. Holmes was a boarder in the house, in variance with the Act of Parliament of 16 and 17 Vic., cap. 96, which, be it observed, came into operation on the 1st of November, 1853, more than a year after Mr. Holmes was appointed resident chaplain, upon which application was made to the Commissioners in Lunacy to legalize his residence as such; but they considered Mr. Holmes did not come under the clause of the Act, and therefore refused the permission. Mr. Holmes immediately left the house. If the breach of this law be the breach complained of, I can only say it occurred in perfect innocence on our part; and the Commissioners, in reference to it, state, in a letter dated the 5th of October, 1854, as follows:—

"The Commissioners are satisfied that, in retaining Mr. Holmes as a boarder since the cessation of his services as chaplain, consequent upon the inquiry by the visitors, you acted under a misapprehension of the provisions of the Act 16th and 17th Vic., cap. 96, and that you did so under the expectation that Heigham Hall would be shortly visited by some of the Commissioners, and that they would sanction the arrangement.

(Signed) "R. W. S. LUTWIDGE, Secretary."

And on the 11th of October they further wrote as follows:—

"19, Whitehall-place, October 11th, 1854.

"GENTLEMEN,—With reference to the correspondence and discussion which has taken place with reference to the Rev. E. Holmes, the Commissioners in Lunacy deem it only fair towards you to say that they are satisfied that when sent to Heigham Hall he was insane, and a proper person to be placed, as such, under medical care in an asylum.

(Signed) "R. W. S. LUTWIDGE, Secretary.

"To Messrs. Nichols, Ranking, and Watson, Heigham Hall."

At the last sessions, application was made for the renewal of the license, and opposed by Mr. Palmer, one of the magistrates,

on the grounds of an infraction of the law, on which occasion Mr. Sultzer, another of the magistrates who had taken an active part in the inquiry, made the following remarks upon the management of the asylum:—

"I have great pleasure in taking this opportunity to state, that so far as the internal arrangements of this institution and the treatment of the patients are concerned, they reflect the highest credit upon the resident proprietor. I have never gone through the establishment without feeling great satisfaction that persons reduced to the deplorable condition of lunatics are so well cared for, and so well treated, with a view to their restoration to society. This circumstance would certainly induce me to give my vote in favour of the renewal of the licence."

These proceedings at Quarter Sessions were reported at length in the local papers, and upon such reports the *Daily News* and *Examiner* formed articles, not too severe were the facts such as would appear from the reports furnished to them. Permit me to add that the proprietors had no desire to conceal this appointment of chaplain, but the reverse, for they caused to be made a conspicuous chaplain's book, in which, on the 21st of September, 1852, the chaplain made his first entry, and to which he signed his name. And, moreover, on the following 16th of November, this chaplain's book was exhibited to the visiting magistrates, read by them, and signed by them.

That the visiting magistrates were not ignorant who the chaplain was is proved by an entry made in the visitors' book, on the 16th of September, 1852—viz., that "divine service is performed on Sunday by a clergyman of the Church of England, recently discharged as a patient from the establishment, but still residing there."

To show their perfect knowledge and appreciation of this fact, the word "patient" was underlined by the visitors.

The visiting magistrates should not plead ignorance of Mr. Holmes' case, since his case was minutely stated in the case-book, and which case-book was exhibited to, and signed by, them and the Commissioners in Lunacy no less than ten times during the period Mr. Holmes officiated as chaplain; in addition, this chaplain's book continued to be exhibited to the visitors, and signed by them, and a similar number of entries with reference to the performance of Divine service were made in the visitors' book, in which disapprobation was not even hinted at. It must be admitted, if the appointment was improper, it was at least sanctioned by those whose authority should at once have pointed out its lately discovered flagrancy; but it is a singular fact that it was not until Dr. Ranking became a proprietor at Heigham Hall, that Dr. Hull's sense of public justice induced him to make known that he (a magistrate himself) had, two years before, become acquainted with what he calls a rescue from the gripe of the law, and that this should have been concealed by him while on friendly terms with Mr. Nichols, and only published when that gentleman united himself with a too successful rival to Dr. Hull in public estimation. Was not this concealment as improper as the alleged offence itself?

Permit me to say, in conclusion, that we alike court and challenge inquiry, and are sure that a full, public, and searching investigation into the admission and appointment of Mr. Holmes, and the alleged infraction of the law, will end in a complete exoneration of the proprietors, and disappointment to the originators of this malicious attack.

I am, Sir, your obedient servant,

JOHN FERRA WATSON,

Resident Medical Proprietor of Heigham Hall Asylum.  
Heigham Hall, November, 1854.

## NURSES FOR THE SICK AND WOUNDED AT SCUTARI.

To the Editor of THE LANCET.

SIR,—In reference to the subject of nurses for the East, to which your attention has lately been drawn by a correspondent signing himself "One Interested," I have been anxiously looking for your opinion on the plan adopted by the Government. In his celebrated letter to Miss Nightingale, our sentimental Secretary-at-War says—"There is but one person in England that I know of who would be capable of organizing and superintending such a scheme;" and "I must not conceal from you that upon your decision will depend the ultimate success or failure of the plan." So then, according to this, had not Miss Nightingale been coaxed and flattered into compliance, our sick and wounded soldiers would have been left without nurses. Mr. Sidney Herbert speaks of the difficulty of finding nurses at all versed in their business, but I have yet to learn that such were properly sought for. Amongst the many plans

and suggestions from the various parties who seem to have considered it their province to interfere in a matter which ought, in my humble opinion, to have been left altogether in the hands of the Director-General of the Army Medical Department, I have not heard of the simple one of applying to all the large hospitals in the United Kingdom. Had Dr. Smith, instead of listening to so much sentimental twaddle, despatched a circular something like the following—"Wanted, two matrons and forty nurses for the hospital at Scutari," I have very little doubt that two ladies, capable of "organizing and superintending, directing and ruling," and the requisite number of nurses thoroughly versed in their business, would speedily have been forthcoming; at least, this would have been the proper way to have "tested the willingness of trained nurses." It would seem, from most of the letters which have appeared in the daily papers on the nurse scheme, that devotion and self-sacrifice are to be found only in nunneries and sisterhoods, and that it is to such establishments as that of Miss Sellon, and not to our hospitals, that we are in future to look for nurses. Just fancy a number of these young ladies, *unformed* in black, doing duty at Scutari! The whole scheme is bad, *un-English*, unbusiness-like; and yet it is said the authorities are determined to adhere to it. There are at present a number of young ladies anxiously expecting the word of command from the official with "plenary authority over all the nurses," and "of unlimited power in drawing upon the Government," to start for the East. Some of these would-be nurses are to walk the hospitals for two or three weeks for the purpose of becoming "*certificated*," and then there will be as little doubt of their qualification as of their "*call*" to go forth for the sake of their country and their church.

Do, Mr. Editor, let your voice be heard in support of a better system, ere another batch of incapables be sent out. If more nurses are wanted, let such as are physically and in every other way qualified be despatched—good, sturdy Englishwomen; and let us hear no more of the necessity of lady nurses in order to prevent the ribald jokes of the sick soldiers.

November, 1854.

ANOTHER INTERESTED.

**DEATH OF MR. KNIGHT HUNT.**—This gentleman, so well known on the London and provincial press, expired on the 18th instant at his residence, Forest-hill, near Sydenham. The career of this gentleman has been an instructive one, exhibiting how much may be done by honourable industry. At an early age the subject of this brief notice found himself entirely dependent on his own exertions, not only for the support of himself, but for a widowed mother, younger brothers and sister. He therefore entered himself a medical student at the Charing-cross Hospital. On the 13th of November, 1840, he was admitted a Member of the Royal College of Surgeons. Shortly after this the health of Mr. Hunt became considerably impaired. He retired into the country, where he commenced the practice of his profession, and in the active duties of surgeon to the Docking Union, Norfolk, and by the invigorating country breezes, his health was soon recruited. Finding, however, that his professional receipts were not equal to the increasing wants of his family, he again returned to town, and was appointed editor of the *Pictorial Times*, and became the "London Correspondent" to several provincial papers, in addition to which he established *Hunt's London Journal*. On the establishment of the *Daily News*, he was appointed sub-editor, and during the last two or three years had the entire management of that journal. But it soon became evident to his friends that the intense application he devoted to his literary occupations was preying seriously on a naturally delicate constitution; and a few weeks since, on his return home after an unusually busy night at the office, he complained of a slight cold, which soon became a severe attack of bronchitis. From this, however, he was recovering, when he attacked by typhus fever of so bad a character as to leave no hopes of recovery, notwithstanding the unremitting attention of his old and valued friend, Dr. Paul, of Camberwell-house, assisted by Sir John Forbes and Mr. Wells. He died on Sunday evening, aged forty-one, at a small freehold estate he had only lately purchased, situated at Forest-hill. The deceased was well known as the author of "The History of the Fourth Estate," 2 vols.; "The Book of Art; or Cartoons, Frescoes, Sculptures, &c.," 4to; "History and Scenery of the Rhine;" and many other works; and several popular Guide Books. Indeed, Mr. Hunt could never remain idle at any place he visited for the restoration of his shattered health. He accordingly made himself thoroughly acquainted with the history and antiquities and other objects of interest to the tourist, and before returning to town a book was ready for the publisher.

## Medical News.

**ROYAL COLLEGE OF SURGEONS.**—The following gentlemen having undergone the necessary examinations for the diploma, were admitted Members of the College at the meeting of the Court of Examiners on the 17th inst. :—

BOND, JOHN SULLIVAN, William-street, Dublin.  
DARBY, EDMUND, Bath.  
HALE, THOMAS EGERTON, Maccen, Cheshire.  
LANE, WILLIAM RALPH, Army.  
MAYNE, ROBERT FURLONG, Newton-Abbot, Devon.  
REYNOLDS, THOMAS, Necton, near Swaffham.  
SEWARD, THOMAS, Petersfield, Hants.  
SHUTER, HENRY, North-end, Fulham.  
TAYLOR, CHARLES GIBSON, Australia.

At the same meeting of the Court, Mr. ROBERT SPROULE passed his examination as Naval Surgeon. This gentleman had previously been admitted a Member of the College, his diploma bearing date 20th of December, 1850.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, November 16th, 1854.

DYSON, EDWARD, Almondbury, Yorkshire.  
NEWMAN, WILLIAM, Bradfield, Sheffield.

Names of the gentlemen who passed their examination in Classics and Mathematics, on Tuesday and Wednesday, the 21st and 22nd of November, 1854 :—

ABBEY, WALTER, Queen's College, Birmingham.  
BELL, JAMES VINCENT, Rochester.  
BROWNE, HENRY ERNEST, 13, Berkeley-square.  
DAVY, JOHN SWEET, Chulmleigh.  
FACER, JOHN HENRY, Rugeley, Staffordshire.  
FERGUSON, GEORGE, Giltspur-street.  
GODDARD, LEONARD, 5, St. John's-street-road.  
GRIFFIN, RICHARD WILLIAM W., Weymouth.  
HAMMOND, SAMUEL, Lower Edmonton.  
HORNIBLOW, WILLIAM R., Shipston-on Stour.  
HOSKINS, EDMUND J., College, St. Bartholomew's Hospital.  
HUNTSMAN, THOMAS, 6, Mount-street.  
LEACHMAN, ALBERT WARREN, Compton-terrace.  
MACY, ERNEST A., West-town, Somerset.  
MILLIGAN, PERCY, Keighley.  
MOXON, WALTER, Belitha-terrace, Islington.  
PHILLIPS, DANIEL WELD, Queen's College, Birmingham.  
POWELL, WILLIAM L., Macclesfield.  
RAULSTON, WILLIAM HENRY, Helperby, Boro'bridge.  
SANSOM, ARTHUR ERNEST, King's College.  
SHEA, JOHN, Blackfriars-road.  
SIMONDS, THOMAS, Abbots Barton, Winchester.  
SPRAGUE, CHARLES GORDON, Ashford, Kent.  
WILLIAMSON, HENRY, Sherborne.  
WINTERBOTHAM, W. L., Strand.

**HUNTERIAN SOCIETY.**—At the next meeting, on Wednesday, the 29th inst., Dr. Hughes will read a paper "On some Cases of Paracentesis Thoracis."

**HARVEIAN SOCIETY.**—Dr. Sieveking will read a paper "On Epilepsy," on Thursday, December 7th.

The ST. MARY'S HOSPITAL SCHOOL has received the recognition of the Royal College of Surgeons.

**SOCIETY FOR THE WIDOWS AND ORPHANS OF MEDICAL MEN.**—The following gentlemen have been elected directors of this Society: Sir J. Eyre, M.D.; Dr. J. Clarke; R. L. Thorn, Esq.; G. Filcher, Esq.; J. Propert, Esq.; H. Blenkarne, Esq.

**APOTHECARIES TO THE FORCES.**—We have been requested by the Director-General of the Army Medical Department to publish the following memorandum: "It is understood that apothecaries to the Forces will be selected from the dispensers of medicines who are already employed with the army in the East."

**APPOINTMENT.**—Mr. Eubulus Williams has been appointed resident surgeon to the Royal Berkshire Hospital.

**ELECTION AT ST. BARTHOLOMEW'S.**—Dr. Martin has been elected assistant-physician to St. Bartholomew's Hospital. The time has not yet come for the "average man," or perhaps it has gone by. We think it must at length be acknowledged, even by those to whom the truth is unwelcome, that THE LANCET has rendered the most signal service to this institution, and to those whose hope of advancement rests on their scientific merit.

**TESTIMONIAL TO MR. AND DR. JOHN ARTHUR POWER.**  
—Mr. and Dr. Power having laboured long and zealously in the faithful and conscientious discharge of their responsible duties, many of their old pupils desired to present those gentlemen, their much respected teachers, with some mark of their good will and gratitude; they therefore subscribed for this purpose a very considerable sum of money, and, on the evening of the 7th of November, the Chairman and Committee of the "Fund," the Messrs. Power, and several of their old pupils and friends, assembled at the Sussex Hotel, Bouverie-street, Fleet-street. After dinner, the testimonials were presented to Mr. and Dr. J. A. Power, by Dr. Hassall, in an address, which was warmly responded to by all present. The testimonials consisted of a first-rate Microscope by Smith and Beck, and a Silver Vase and Candelabrum. The presentation was acknowledged by Mr. and Dr. Power, in very suitable and feeling speeches. Several healths were, of course, drank, and toasts proposed. Amongst others, that of the elder Dr. Power, the father of the Messrs. Power. Altogether the affair went off with great spirit, and nothing could exceed the good feeling displayed towards both Dr. and Mr. Power on the occasion. One fact was alluded to, which in justice to the Messrs. Power, we consider should be known; it was, that while, out of those who went up to the Hall and College for examination from all other quarters, twenty per cent. were rejected, of those who went up from their classes the rejections amounted to only four per cent.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, NOVEMBER 18.**—In the week that ended last Saturday, 1309 deaths were registered in London. Having fallen to 1160 in the previous week, the lowest number attained since the late epidemic, the deaths again exhibit an increase, the effect of increased cold in the closing months of the year. Twelve deaths were caused by cholera, and 31 by diarrhoea. Small-pox was fatal in 29 cases, measles in 24, whooping-cough in 34, and scarlatina in 106. To the entire class of zymotic diseases, 332 deaths—a high mortality—are referred; and to diseases of the respiratory organs, 240, which is also more than the average at this period.

Last week the births of 666 boys and 627 girls, in all 1293 children, were registered in London.

## Obituary.

**DEATH OF PROFESSOR EDWARD FORBES.**—We regret to announce the death, in the thirty-ninth year of his age, of Professor Edward Forbes, late of King's College, London, and the Government School of Mines, and known by his valuable contributions to natural science, and particularly to geology. The mournful event took place on Saturday last. Dr. Forbes, it will be remembered by very many, only recently left London to succeed the veteran Jamieson in the chair of Natural History in the University of Edinburgh. This was with Forbes the highest object of ambition; and had his life been spared, it would have been dedicated to extending its already great reputation, so that no school probably in the civilized world would have equalled it in greatness. With this view he had formed gigantic and most able plans, which, through his great influence with the Government, would have been liberally supported, and we have no doubt ultimately carried out. But, arrived at the culminating point of his ambition, and at the commencement of his long-matured schemes of usefulness, he has been removed from us, when we were beginning to appreciate his worth. A chronic disease, contracted when in the East, re-excited and rendered violent by a severe cold caught last autumn on a geological excursion, and which burst out with uncontrollable fury about ten days ago, was the immediate cause of his premature death.

On the 16th inst., at Port Isaac, Cornwall, MILES MARLEY, Esq., F.R.C.S., late of Cork-street, Burlington-gardens, and Inverness Villa, Bayswater.

## TO CORRESPONDENTS.

**Mr. Joshua Waddington, (Margate).**—Reference was made in the last number of THE LANCET to Mr. Waddington's praiseworthy exertions to keep open the Margate Infirmary during the entire year. We extracted the more salient points of his letter to the inhabitants of Margate. The pressure upon our columns prevents us from giving further space to the subject on this occasion. We trust, however, that his efforts may be successful.

**A Young Surgeon.**—The subject is alluded to in a leading article in this day's LANCET.

**Mr. S. Brownridge, (Hull).**—The comments which we thought it our duty to make upon the late trial of the Apothecaries' Company *versus* Brownridge, were written with a full conviction of the evils resulting to the public from unqualified persons engaging in the practice of medicine. Mr. Brownridge's excuse for his conduct is, that the poor in Hull are neglected when sick by the qualified practitioners in that town. We have reason to believe such a charge to be not only unfounded, but grossly libellous to the medical gentlemen of Hull, who, true to the character of their profession, are ever humane and attentive to the poor. We cannot publish attacks upon respectable gentlemen merely for the purpose of glorifying Mr. Brownridge. Mr. Brownridge, by practising medicine without any qualification whatever, rendered himself justly liable to be proceeded against for infringing the law. He knew beforehand that he was so infringing, and he has now no right to whimper and complain at the punishment righteously inflicted upon him. Did we wish still further to humiliate Mr. Brownridge, we might do so by publishing his letter *verbatim et literatim* as we received it.

**M. F. P. and S.**—We could not form an opinion unless we had an opportunity of perusing the article. Our correspondent should forward it to the Office. The subject is most important at the present time.

**Students** will find several pages of Dr. Tanner's "Manual of the Practice of Medicine" devoted to the consideration of the diagnosis and treatment of insanity.

### BEGGING FOR THE "ASSOCIATION JOURNAL."

To the Editor of THE LANCET.

SIR,—You ought to inform the members of the Provincial Medical and Surgical Association that Dr. John Bosc Cornack is personally canvassing members in London for subscriptions to the £1000 Fund! Thus it would appear that the Association absolutely needs eleemosynary aid! Is this the way to uphold the "honour and dignity of the profession, and the influence and respectability of the Association?"

I am, Sir, your obedient servant,

A MEMBER OF THE PROVINCIAL MEDICAL AND SURGICAL ASSOCIATION.

London, November, 1854.

We do not find the name of the gentleman who has written to us respecting the publication of cases by Dr. Hastings in either of the Medical Directories. Dr. Frost is thanked. The report of the case shall be published in our next.

**Tempora Mutantur.**—The following appears in the records of the Royal Medico-Chirurgical Society:—"John Want, elected March 27th, 1810. Mr. Want's name was erased January 24th, 1815, in consequence of having published the proceedings of the Society."

**Charles F.**—State the case unreservedly to a respectable surgeon. Advertising quacks must be avoided. They will not only ruin the health, but plunder the pocket. The titles which they assume are generally fictitious.

**Amicus.**—We do not give advice in this place. Under proper treatment, cases like that detailed occasionally admit of cure. Any qualified practitioner will be enabled to answer the questions propounded, and give instruction as to the proper mode to obtain relief.

**A Patient, (Tottenham-court-road).**—We know nothing of Dr. Roguler and his practice. Handbills of the character of that forwarded are not issued by respectable practitioners.

**W. F.**—Such a course of proceeding, though it may not transgress any rule of professional etiquette, would certainly not be conducive to the honour or respectability of the profession.

**Mr. Winkley, jun.**—Attention shall be paid to the request.

**J. P. and J. E.**—A gentleman holding the diploma of the Royal College of Surgeons can legally hold the office of surgeon to a Forester's Court.

**THE** correspondence of **Mr. Ratcliffe** arrived too late for insertion this week.

**Mr. John Parkin, (Macclesfield).**—Dr. Addison is treasurer; Dr. Risdon Bennett, secretary.

**Mr. George Allarton.**—The request shall receive attention.

**Mr. Hayes.**—Declined.

**G. P.**—The town named was free from cholera in 1849. A mortality table is published weekly, which our correspondent might easily obtain by applying to the registrar.

**X. Y.**—B. wins.

**A Poor-Law Surgeon.**—A distinct reply next week.

**COMMUNICATIONS, LETTERS, &c.**, have been received from—Dr. Andrew Smith; Dr. McWilliam; Mr. H. Spencer Smith; W. F.; Another Interested; Mr. J. K. Spender, (Bath); A Poor-Law Surgeon; Mr. Ball, (Spalding, Lincolnshire); Mr. Winkley, (Harrow); Dr. John Furlonge, (Antigua); Dr. Trull, (Bath); Mr. J. J. Thompson, (Edinburgh); Mr. Huxley, (Groombridge); M. F. R. and S.; The Shade of Romeo's Apothecary; Mr. Henry Wilkinson, (Rotherham, Yorkshire); Mr. G. Hayes; Mr. Alexander Douglas, (Stratford); Mr. George Allarton; A Patient; G. P.; Mr. W. W. Scott; Mr. Robert Birch, (Swineford, Ireland); Mr. Warner; J. C.; L. S.; Mr. J. Waddington, (Margate); Mr. Mitchell; Mr. Hall; Mr. J. Prout, (Lipton, Lancashire); A. P.; Mr. Brownridge; R. W.; Mr. J. Gangel; C. Y.; Mr. Paget; Mr. Loyset, (Crystal Palace, Sydenham); Mr. Walter Blundell; Mr. Devonshire, (Woking); Dr. Robertson; The Secretary of the Hunterian Society; The Secretary of the Harveian Society; Amicus; Mr. Parkin, (Macclesfield); Mr. Peire, (Lincoln); J. P. and J. E.; X. Y.; Mr. J. Hawkes, (Bolton-le-Moors); Mr. J. N. Ratcliffe, (Dewsbury); Dr. Frost; An Old Supporter of THE LANCET; Veritas; Mr. Potter; Mr. Williamson, (Brighton, with enclosure); Mr. C. Thompson, (Westerham, with enclosure); Dr. Denton, (Hornsea, with enclosure); Mr. A. Tomkinson; Mr. J. Milner; Mr. J. Lonsdale, (Newchurch, with enclosure); Mr. A. Taylor, (Tavistock, with enclosure); Mr. John Carr; Mr. G. T. Chene, (with enclosure); Dr. Crossby, (Accrington, with enclosure); Dr. P. L. Burchell, (Kingsland-road); A Member of the Provincial Medical and Surgical Association; &c. &c.

# MEDICAL BENEVOLENT COLLEGE.

The Council of the MEDICAL BENEVOLENT COLLEGE desire to announce that the TWELFTH LIST OF CONTRIBUTORS will be published in the MEDICAL JOURNALS on SATURDAY, the 9th of DECEMBER next; and to express an earnest hope that those Members of the Profession who have not yet favoured the Institution with their support may be induced to do so, in order that the Council may be able, in JUNE next, to open the College, and to render the assistance that is so much needed by many of their less fortunate brethren.

The names of Subscribers and Donors, if forwarded by the 5th of December, will be in time for publication.

Donors of TEN GUINEAS are LIFE GOVERNORS, and Subscribers of ONE GUINEA annually are GOVERNORS during the continuance of their Subscription.

By order of the Council,

EDWARD HENRY SIEVEKING, M.D.

HERBERT WILLIAMS, Assistant-Secretary.

Office, 37, Soho-square, Nov. 15th, 1854.

**CAUTION.**—Have the QUALITY of the GOLD STATED in the INVOICE, and REDRESS is OBTAINABLE in a COUNTY COURT.—WATHERSTON and BROGDEN beg to announce that they have TAKEN SPACE in the CRYSTAL PALACE, with the view of giving universal publicity to the principle of SELLING GOLD CHAINS by weight and workmanship. To those who have not yet tested its value, the following examples will be found useful, showing the relative prices paid for Labour in the purchase of a genuine and of a spurious Gold Chain:—

Genuine Gold Chain.		Electro-Gilt, or Polished Zinc Gold Chain.	
Assumed cost of gold chain, of equal weight...	£10 0 0	Assumed cost of gold chain, of equal Weight...	£10 0 0
Intrinsic value, if the gold is of 15 carats .....	7 0 0	Intrinsic value, if the gold is of 7½ carats .....	3 10 0
Left, for labour and profit.....	£3 0 0	Left, for labour and profit .....	£6 10 0
Difference, 115 per cent.			

WATHERSTON and BROGDEN, Goldsmiths, Crystal Palace, Central Transept, No. 23, Gallery of Precious Metals.—Manufactory, No. 16, Henrietta-street, Covent-garden, London. Established A. D. 1798.—Assays made of Chains and Jewellery for 1s. each.

## The Arctic Expeditions.—The whole

of the Ships of the various expeditions which have wintered in the Ice, including those of Sir John Franklin and Captain Collinson, have been Warmed by SYLVESTER'S HOT AIR APPARATUS.—For prospectus and prices, apply to SYLVESTER and CO., Engineers and Manufacturers of Heating Apparatus, 98, Great Russell-street, Bloomsbury, London.

## Ten Thousand Stoves.—The Tenth

Thousand of the PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, and CO., 46, King William-street, London-bridge, and may be obtained of most ironmongers. The Improved Patent Ventilating Stove, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded, post free.

## Metcalf and Co.'s New Pattern

TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfumery for the toilet.—At METCALFE, BINGLEY, and CO.'S only establishment, 130 and 131, Oxford-street, second and third doors west from Holles-street. Metcalf's Alkaline Tooth Powder, 2s. per box.

## Ford's Eureka Coloured Shirting is

now ready, in 200 different patterns. Specimens in varied colours sent post free on receipt of six stamps.

FORD'S COLOURED EUREKA SHIRTS, Six for 27s. FORD'S WHITE EUREKAS, best quality, Six for 40s.; second quality, Six for 31s.; if washed ready for use, 2s. extra.

CARETAKERS.—Ford's Eureka Shirts are stamped "38, POULTRY, LONDON," without which none are genuine.

\*.\* Catalogues with particulars post free.

RICHARD FORD, 38, POULTRY, LONDON.

## Abstract regarding Economy in

CLOTHES.—From *The Times* of October 30th, 1854.

"Every yard of Cloth sold at THE LONDON CLOTH ESTABLISHMENT is sold at the WHOLESALE PRICE, and Gentlemen purchasing Cloth at the London Cloth Establishment (if they wish) have it made up on the premises at the expense only of the workman's wages, in addition to the price of the trimmings."

### THE ECONOMY OF THIS SYSTEM

Is Proved by the saving of from thirty to fifty per cent. in the price of every garment; besides the very obvious advantage of selection from such a stock, with the guarantee of a superior fit, good taste, and the best work. The Proprietors refer with satisfaction to the high character which their "Tyrian Dye" Black Cloths and Dressings have obtained; they never change colour, and will (without injury) bear the application of the strongest acids.

LONDON CLOTH ESTABLISHMENT, No. 16, Coventry-street,

## The 16s. Trousers reduced to 14s.—

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

## R. T. Pigram, Practical Tailor, and

Inventor of the Indicator of the Human Figure, whereby a perfect fit is secured, respectfully invites the attention of the public to his mode of art, since none can doubt the importance of an easy and exact adjustment of wearing apparel. Superior Trousers at 17s. 6d. per pair.

R. T. PIGRAM, 51, Lamb's Conduit-street, Foundling Hospital.

TO THE NOBILITY, CLERGY, AND GENTRY.

## Walker Babb's Two-Guinea Coats,

One-Guinea Trousers, and Half-Guinea Vests, made from Welsh, Scotch, and Irish Wools, in their pure state. Will stand any wear, and can be worn in any climate. For Fishing and Shooting nothing can equal them. The Black Tweed is well adapted for Clergymen's Riding Trousers. Waterproof Pocket Coats and Capes, Box Coats, Liveries, &c. &c.

DOYLEY'S SCOTCH WOOLLEN WAREHOUSE, 346, Strand, opposite Waterloo-bridge.

## Assistant-Surgeons.—Gentlemen

receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at

L. PHILLIPS, 28, WEST STRAND, LONDON, the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed Lists of the articles required on taking up a Commission, with prices affixed, and every necessary information, may be obtained on application.

THE SYDENHAM TROUSERS.  
17/6

## Samuel Brothers,

29, LUDGATE-HILL,

Inventors and Sole Manufacturers of the

SYDENHAM TROUSERS, at 17s. 6d.

Unequalled for superior style, fit, quality, perfect ease, and gracefulness, so requisite for gentlemanly appearance, and so rarely obtained.

Patterns sent free on application.

SAMUEL BROTHERS' Stock of OVERCOATS for the present Season is worthy of your inspection.

## Medical Galvanic Coil, complete, at

27s. 6d. Powerful ELECTRO-GALVANIC MACHINES for Medical purposes, of very superior finish, with Battery and Conductor, complete, at 27s. 6d., at C. BAKER'S Surgical, Optical, and Philosophical Instrument Warehouse, 244, High Holborn.

## Anatomical and Dental Repository,

45, Museum-street, Bloomsbury, London. — JOHN HARNETT begs most respectfully to call the attention of Lecturers, Students, and Gentlemen connected with the Medical Profession, to his large and select Stock of Anatomical Preparations, consisting of Skeletons, loose and articulated Skulls, Hands and Feet, Vertebrae, and Loose Bones, at the lowest possible prices.

## The Respirator.—The assumption of

the name of Respirator for various discreditable and defective imitations of MR. JEFFREYS' Instruments, the value of which in medical practice has given a wide reputation to the name, can only mislead unwary persons not acting under professional advice.

City Office for the Respirator, 25, Bucklersbury; West-end Depot, 25, Holles-street, Oxford-street, London. In London and all Towns, the principal Chemists and Surgical Instrument Makers are Agents for Mr. Jeffreys' Respirators.

## Elastic Supporting Belts, of the same

beautiful fabric as Pope and Plante's Elastic Stockings for Varicose Veins. Those for ladies' use, before and after accouchement, are admirably ADAPTED FOR GIVING ADEQUATE SUPPORT WITH EXTREME LIGHTNESS—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed.

Instructions for measurement and prices on application, and the articles sent by post from the manufacturers, POPE and PLANTE, 4, Waterloo-place, Pall Mall, London.

## Walters' India-rubber URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

Made of Solid India-rubber, with Patent Valve, and adapted for Ladies, Gentlemen, and Children.

Manufacturer also of the PATENT HYDRO-STATIC TRUSS. One of the advantages of this Truss is, that the pad, being filled with water, adapts itself with perfect accuracy to the form of the body, thereby keeping up a firm but easy pressure on the internal ring.

F. WALTERS,  
16, MOORGATE-STREET,  
LONDON.

## Mr. Hooper's Water Mattresses or

BEDS, and CUSHIONS for AIR or WATER, for placing on an ordinary Bedstead. Being made of India-rubber, without the admixture of cloth materials, leakage is avoided. (Extract from THE LANCET, Jan. 25, 1851.)

CUSHIONS FOR BED-SORES.—Whether threatened with Sloughing, or in which Sloughing has taken place, Fractures, Diseased Joints, Spasms, Lassitude, Typhoid and other Fevers, Rheumatic Affections, Dropsy, Coldness of the Stomach and Feet, Consumptive and all Bed-ridden Patients. They are simply to be placed on an ordinary bedstead. These Cushions and Beds are not affected by Heat or Cold, and will bear water at any temperature.

Finsbury-square, February 27, 1852.

I have in several instances employed Mr. Hooper's Water Cushions and Mattresses; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water Bed.

JOHN PERKINS, M.D., Physician to the London Hospital.

Infirmary, Chichester, March 21, 1852.

Sir,—We are all much pleased with your Cushions, and still more so with the Mattresses.

Yours truly,

THOS. NEWHAM, House-Surgeon.

HOOPER, 7, PALL MALL EAST, and 55, GROSVENOR-STREET.

## Water Filter for the Pocket, with

DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.

J. SOLOMON, Wholesale Optician, and Photographic Depot, 22, Red Lion-square.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

## Important Saving, by Pre-payment,

in the PURCHASE of

NEW WHITE MOULDED VIALS.

APSELY PELLATT and CO. submit the following PRICES of VIALS, for

PRE-PAYMENT only:—

1 oz., 1 oz., & 1 1/2 oz. per Gross, 6s.	
2 oz. " 7s.	
3 oz. " 8s.	
4 oz. " 10s.	
6 oz. " 15s.	
8 oz. " 18s.	
4 1/2 oz. graduated in 3 doses 12s. 6d.	

In quantities of not less than Six Gross, assorted to suit the convenience of the purchaser, delivered to carriers in London. No charge for Package. Breakage at risk of Purchaser.

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,

APSELY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

## Huxley's Fulcrum

ABDOMINAL BELT will be found, from its mechanical arrangement, (acting diagonally,) and producing the required support for the lower part of the Abdomen, to be the most complete and comfortable arrangement ever invented. It is extremely light, weighing only 4oz. Price 18s.

Measures required.—Circumference at A, B, and C; depth from A to C.

A discount of 20 per cent. to the profession.

HUXLEY and CO., 8, Old Cavendish-street, late of 5, Vere-street, Oxford-street.

## Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

FIG. 1. At home from One till Five. FIG. 2.

FIG. 1. MR. BOURJEAUD'S NEW BELT AND AIR-PAD FOR INGUINAL HERNIA.—Mr. Bourjeaud begs to state that the smaller ends of the pyriform air-pads are seen below the inferior margin of the belt. The latter is made of elastic strips, about one inch in breadth, which, by being sewn together in a peculiar manner, effect an equable compression around the abdomen. On the internal and front part of the belt two air-pads are attached, exactly on the spot where the belt comes in contact with the inguinal rings; and these yielding pads exercise a gentle compression upon the rings, which compression may be increased or diminished in changing, by means of a small tube and stopcock, the quantity of air contained in the pads. This apparatus is now driving the steel springs completely out of the field; and Mr. Bourjeaud is happy to say that the hernia belt is getting more and more a favourite among the leading surgeons of the metropolis and the provinces. It is plain to all, that two ends should be kept in view as to apparatus for hernia: first, the support of the intestinal mass; and, secondly, prevention of protrusion through the rings, without giving the patient pain, or causing inflammation and gangrene by pressure on the abdominal parietes with unyielding steel springs. These generally acknowledged desiderata the new belt for hernia completely satisfies; and it becomes every practitioner's duty to advise its use to such of his patients who are affected with hernia.

FIG. 2. POSTERIOR VIEW OF THE HERNIA BELT AND AIR-PAD.—This diagram has been drawn in order to illustrate the latest improvement Mr. Bourjeaud has introduced touching this extremely useful apparatus. It had, namely, been found that, in the sitting posture, the pressure of the air-pads upon the inguinal rings became somewhat weaker; to guard against this change the tubing attached to the lower margin of the belt and terminating in the air-pad, has been made to swell towards its centre, posteriorly. When the patient sits down, he drives the air contained in this kind of reservoir into the air-pad in front; the latter becomes a little larger, and the slight difference alluded to above is compensated without any effort on the part of the patient. This contrivance gives to the hernia belt a most valuable accuracy.

## Mr. Edwin Osborne, of 24, Savile-

ROW, LONDON, the Sole Licensee and Maker of PALMER'S PATENT LEG, adapts this beautiful substitute to every form of amputation; and having had great experience in its manufacture, feels confident of giving comfort and satisfaction to those persons who may favour him with their patronage. References given, (if required.)

## Henry Bigg, 9, St. Thomas's-street,

Borough, Surgical Instrument-maker to Guy's and St. Thomas's Hospitals, begs to call the attention of the Medical Profession to the following valuable Instruments, made from designs and suggestions kindly given by the Gentlemen whose names are attached—viz., Mr. Le Gros Clark's Talipes Instrument; Mr. Bransby Cooper's Ovarian Trocar; Mr. Cook's Recto-Vesical Trocar; Mr. Cooper Forster's Ear Speculum; Mr. Hilton's Speculum Ani; Dr. Lever's Midwifery Instruments; Mr. Solly's Elastic Catheter, with Catgut Director. These Instruments being constructed on the premises secure their excellence and perfect finish.

9, St. Thomas's-street, Borough, London.

## Dr. Lever's Improved Elastic Utero-

ABDOMINAL BELT being constructed by Mr. H. Bigg, 29, Leicester-square, under the immediate suggestion of Dr. Lever, will be found to combine every advantage possible to obtain. It upholds the parietes of the abdomen, secures support to the uterus, and admits of the elastic force immediately above the pubes being increased by the patient after the Belt is applied.

To be had only of Mr. H. BIGG, 29, Leicester-square.

## Spinal Curvature.—Mr. H. Bigg, 29,

Leicester-square, particularly invites the attention of the Faculty to two new and distinct forms of SPINAL APPARATUS he has recently invented. The principle on which they are constructed, thoroughly supplants the "brute force" of the screw, yielding instead an elastic power analogous to muscular motion; it also encourages respiration, admits of the spine being moved in any direction, and possesses a weight so trifling as hardly to be felt by the wearer.—PATENTED.

To be had only of the Patentee, 29, Leicester-square.

## Treatment of Club Feet, Spinal

CURVATURE, &c., WITHOUT THE EMPLOYMENT OF THE SCREW.—MR. HEATHER BIGG, 29, Leicester-square, begs to invite the attention of the Faculty to an entirely new principle he has discovered for constructing the various apparatus for deformities of the feet and spine.

"The living structures do not with impunity tolerate the brute force of the screw." "In any case in which the force of the screw is employed, unless for a very brief period, excoriation, sloughing, intolerable pain in the parts compressed will inevitably result." "Dr. LITTLE, on "Deformities," pp. 34, 35.

Mr. H. Bigg has recently invented four distinct forms of Orthopædic Instruments for Talipes Varus, T. Valgus, T. Equinus, Lateral Curvature, &c., in all of which the principle of muscular elasticity is simulated and the "brute force" of the screw ignored.—PATENTED.

29, LEICESTER-SQUARE.

## New Spinal Support.—Fr. G. Ernst,

Lamb's Conduit-street, Foundling Hospital, begs to draw the attention of the Faculty to his recently-invented SPINAL APPARATUS, which, after some months of trial, has proved superior to any of the various kinds hitherto used, and produced the most satisfactory results. This appliance, being self-adjusting, free bodily motion is permitted; thus, while equal and necessary support is given to the wearer, all injurious or painful pressure is avoided, and a great amount of comfort and benefit consequently yielded. It can be modified so as to suit any FORM OF SPINAL DEFLECTION; its weight is comparatively trifling, and from its capacities for nice adaptation elicits no observation when on the body.

To be had only of the Inventor, 43, Lamb's Conduit-street.

TO THE MEDICAL PROFESSION.

## Fr. G. Ernst, Anatomical Machinist

and MANUFACTURER OF SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF of BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam ERNST (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &c.

## The Eye Douche, for applying Lotion

to or bathing the Eye, is self-acting, simple, and portable. The immediate relief obtained from its use particularly recommends it to the notice of all who are much engaged in reading, writing, or designing; it has been employed with the most favourable results by patients under the care of Haynes Walton, Esq., Surgeon to the Central London Ophthalmic Hospital. Price 20s.; carriage paid to any railway station.

Manufactured by WILLIAM T. COOPER, 28, Oxford-street, London.

COOPER'S LAVEMENT APPARATUS is the most perfect ever invented; the possibility of air entering the bowels is prevented, and the labour of pumping is avoided; being constructed entirely of metal, without valves, it cannot become out of order, which renders it particularly suitable for use in the country or in foreign climates. Price 35s. Enema Apparatus from 10s.; Superior Reservoir Apparatus from 27s.—Each instrument in mahogany box with lock and key.

Manufactured by WILLIAM T. COOPER, 28, Oxford-street, London.

THE CORK RESPIRATOR is the lightest cheapest, and most efficacious ever produced; allows free respiration, and from being easily applied and removed, is specially adapted for the use of invalids, or Ladies attending evening meetings or places of amusement. Price 3s., free by post.

Wholesale only of WILLIAM T. COOPER, 28, Oxford-street, London.

Illustrated Catalogues free by post.

## Gas Horse-Singeing Lamps.—The

Nobility and Gentry are informed that SINGEING LAMPS, embracing the most recent improvements, with flexible Hose of any length, may be obtained at M. SALT and SON'S, Surgical Instrument Manufacturers and Cutlers to the Queen, Bull-street, Birmingham.

## Royal Polytechnic Gas Fire.—

BACHHOFFNER and DEFRIES'S PATENT.—The Public is respectfully informed that arrangements have now been made for the supply of this unique and beautiful mode of Warming Private Houses, Shops, Public Buildings, &c. Smoke, dust, ashes, and accidents from fire are effectually prevented by its use, while it presents all the comfort and appearance of an open coal fire, securing, at the same time, perfect ventilation. To be seen in action at DEFRIES'S Office, 145, Regent-street, London.

## Gas-heating Apparatus.—H. Mather

begs to call attention to his GAS-COOKING STOVES, which will cook dinner for Twenty Persons at a cost of Fourpence.—Gas Gridiracs, Broiling and Boiling in Five minutes.—Small Stoves to Boil and Fry, which can be put anywhere, Eight Shillings each.—Gas Stoves for Operative Chemists, Jewellers, and all purposes where heat is required.—Manufactured on the premises at 76, GRAY'S-INN-LANE, LONDON.

N.B.—Gas-fitting done in all its branches.

## Purification of Linen.—Prevention of

DISEASE.—J. BOILEVE, 55, King William-street, City, London, solicits the attention of the Nobility and Gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

69, Marylebone-lane, London, Feb. 2nd, 1854.

SIR,—I have much pleasure in informing you, that I am entirely satisfied with the performance of your No. 3 Calorifere, lately put up for warming my manufactory; it has been in operation for a month, and I believe it to be the best and most economical means of drying yet invented, and particularly suited to my business, as there is no dust arising from its use, as there is from the old stoves. The consumption of coke is about one bushel per day.

I am, Sir, yours truly,

SAMUEL HUBERT,

To J. Boileve, Esq.

Firm of JOHN WOOLLAWS and Co., Paper-stainers.

## Warming and Ventilating by Hot

AIR, CHURCHES, HOSPITALS, TOWN-HALLS, and other PUBLIC BUILDINGS.—J. BOILEVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

New Independent Chapel, Longsight, Manchester,  
January 10th, 1852.

SIR,—I am instructed by the building committee of the above Chapel to order one of your No. 3 Calorifere, for heating and ventilating the School in connexion therewith. As the sub-committee, upon examination of most of the public buildings, churches, and chapels in the town, find such general satisfaction with the existing apparatus and their imperfect heating and ventilation, they have examined your Calorifere as in operation, and believe it best adapted to meet their wants. It is intended, should it prove successful, to apply another apparatus to the chapel.

To J. Boileve, Esq.

SAMUEL RIGBY, Secretary.

New Independent Chapel, Longsight, Manchester,  
April 12th, 1854.

DEAR SIR,—I am authorized to inform you that the No. 4 Calorifere, erected to warm the Longsight Independent Chapel, is in every respect satisfactory to the committee and the congregation.

To J. Boileve, Esq.

Yours respectfully,

ROBERT RUMFET, Chairman.

## John Harvey, Nephew and Successor

to the late Mr. ANDREW SPRINGWEILER, No. 2, Duke-street, Smithfield, London, Medicine Chest and Dressing Case Maker. Ship Medicine Chests according to Act of Parliament. Emigrant Chests, &c., for all Climates.

Chemical and Plate Chests, Toilette, Jewel, Liqueur, and Sample Cases, Writing Desks, Despatch Boxes, &c., &c.

Wholesale and for Exportation.—Warranted to stand any Climate.

J. H., in soliciting of the medical profession and the trade generally a continuance of the liberal patronage enjoyed for so long a period by his late uncle, begs to inform them that the firm of Springweiler and Thompson (which existed in name only) was dissolved nearly two years prior to Mr. Springweiler's death, and that J. H., as successor and executor of the deceased, continues to carry on the business at the premises occupied for so many years by Mr. Springweiler.

**Recherché Wines.—Sherry:** A very fine Sherry, (Amontillado and Montilla.) Brown and Pale, for Cash, at 42s. per dozen; £21 per quarter-cask; £42 per hoghead; £24 per butt.  
**Port.**—Very fine old dry Wine (Vintage 1827, 1830, 1832, 1834), lately imported: from the Wood at 49s., 54s., 63s., and 68s. per dozen.  
**First Class Champagne**, (Ay, Avize, Pierry, Verzenay, and Sillery.) Sparkling and Still Moselle, Sparkling, Still, and Red Hocks, and Bordeaux Wines, at very moderate prices.

These Wines are patronized and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples and List of Prices forwarded on application.

H. H. HAMMICK, Importer, 11, Pall-mall, London, opposite the "Travellers' Club."

**Allsopp's Pale Ale in Bottle**, as supplied to the CRYSTAL PALACE; also in casks of 18 gallons Recommended by BARON LIEBIG.  
 Address, HARRINGTON PARKER and CO., 54, Pall-Mall, London.

**Pale India Ale and Stout, 4s. 6d.**  
 per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts. Delivered free within four miles of London, and carriage free to all railway stations in England at 6d. per dozen extra.  
 WOOD & WATSON, 16, Clement's-lane, City.

**Allsopp's Pale Ale.—Medical gentlemen** who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1852, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTTY, 132, Upper Thames-street, London.

**Soyer's Aromatic Mustard.—"M."**

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration."—THE LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

**To Invalids and those desirous of**

**PRESERVING HEALTH.**—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO.'S HOMOEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

## DOMESTIC ECONOMY

**H. Sparrow and Co. beg to announce**

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.

Fine Souchong, 3s. 4d., 3s. 8d., and 4s.

Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 6d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

**Pure as well as Fine Tea.**

Tea, when pure, is well-known to produce a most wholesome beverage; the impolicy of allowing it to be coloured by the Chinese is fully set forth by the Analytical Sanitary Commissioners, in THE LANCET, and also in THE TIMES, (October 6th, 1852.) The fact, therefore, is now familiar to most, that artificial colour is used to give the Spring crop and the spent Autumn benefit would arise; first, the fine qualities would have all the fragrance and strength unimpaired; and, secondly, the inferior faded leaves could not then be passed off as good, causing the flat, insipid infusion, so frequently the subject of complaint. The uncoloured Tea imported from China, by HORNIMAN and CO., London, is perfectly pure; the Green, from the absence of the usual artificial colouring, is of a natural olive hue. The Black, and also the Green, are exclusively of the Spring product from young and vigorous plants, which yield not only more strength, but the full degree of fragrance which FINE Tea, when purely natural, and seasonably selected, alone possesses; ONE TRIAL induces a continued preference. The prices are REDUCED:—

Finest Congou, 3s. 8d. Finest Lapsang Souchong, 4s. and 4s. 8d.  
 Fine and Pure Green, 3s. 8d., 4s., and 4s. 8d.

HORNIMAN and CO., Wormwood-street, London, Importers of the most approved Teas in general use, but free from the objectionable artificial colour on the surface.

Agents in London, PURSSELL, 90, Cornhill; and ELPHINSTONE, 227, Regent-street, and 366, Oxford-street.  
 Sold by authorized Firms in all Towns, in 1 lb., ½ lb., and ¼ lb. packages only.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

**Robinson's Patent Barley, for making**

superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than thirty years, have been held in constant and increasing public estimation as the purest farinæ of the oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.

The proprietors of ROBINSON'S PATENT BARLEY and PATENT GROATS, desirous that the public shall at all times purchase these preparations in a perfectly sweet and fresh condition, respectfully inform them that every packet is now completely enveloped in the purest Tin-foil, over which is the usual and well-known paper wrapper.

Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets at 6d. and 1s., and in Family Cansisters at 2s., 6s., and 10s. each.

**Pure Country Bread, supplied every**

Day by Train by G. BILLINGS, of Sawbridgeworth, Herts.

Sawbridgeworth, Herts, 1852.

George Billings begs respectfully to call the attention of the Public to the subjoined Testimonial (vide THE LANCET, March 26th, 1852) as to the pure and unadulterated nature of Bread made by him.

Having been earnestly solicited by numerous parties in London to introduce it to the public, he has appointed as his agents:—Mr. DAVID BILLINGS, 7, Ivy-place, Hoxton; Mr. HOLLOWAY, 18, Liverpool-street, Bishopsgate.

N.B.—All Bread supplied to the London public is stamped,—G. BILLINGS, Sawbridgeworth."

London Hospital, March 17th, 1853.

I have made a careful analysis of the Bread manufactured by Mr. George Billings, Sawbridgeworth, Herts, and I find that it is perfectly free from everything of a deleterious nature: besides which it is of good colour and light texture, is pleasant to the taste, entirely free from acidity, easy of digestion, and apparently well suited to the wants of the dyspeptic.

HENRY LETHBRIDGE, M.B.,

Professor of Chemistry, &c., in the London Hospital.

18, Upper Seymour-street, Portman-square,

November 4th, 1853.

Having submitted to careful analysis a loaf of bread, manufactured by Mr. George Billings, of Sawbridgeworth, Herts, and placed in my hands for that purpose by Mr. D. Billings, of Ivy-place, Hoxton, I find the bread to be well made, free from acidity and all deleterious matter, and accordingly well adapted for the sustenance both of invalids and of persons in health.

ANDREW URE, M.D., F.R.S., Analytical Chemist.

\*.\* Orders by post punctually attended to.

AT THE CRYSTAL PALACE.

**"The Duobus," a cheap close Carriage**

for a "Country Practice," having all the comfort and convenience of a Brougham, with the weight of an ordinary Gig. Price £42. This Carriage can be seen at the new Crystal Palace, and sketch and particulars obtained on application to T. R. Starey, Coachmaker, Nottingham.

**Purify Sick Rooms, and give comfort**

to Patients and perfect Safety to Attendants.—The most offensive atmosphere is instantaneously purified, and the air impregnated with refreshing fragrance, by SAUNDERS' ANTI-MEPHITIC FLUID, prepared by J. T. Saunders, Perfumer, 315s, Oxford-street, Regent-circus. Sold by all Druggists and Perfumers. Price 1s.

**Metal Bed-Pan,**

Price 6s.—Acknowledged to be the most convenient in form, and much more durable than any now in use.

To be had of the Manufacturer, J. LAWRENCE, 20, Great Charlotte-street, Blackfriars; of Messrs. Gale, Baker, Warde, and Oldfield, Bouvée-street, Fleet-street; and of Messrs. Leadbitter and Hollon, York.

Orders from the Country must be accompanied by a Remittance.

**Poultices superseded by the use of**

MARKWICK'S PATENT SPONGIO PILINE.

As a substitute for common poultices and fomentations, the superiority of this article is unquestionable. It is strongly recommended by the most eminent of the Faculty for its cleanliness, economy, lightness, and general efficacy, and is now used in several of the hospitals. Also Markwick's Patent Piline, for Cholera Belts, Rheumatism, Chest Protectors, Respirators, Lumbar, &c.

Sold, retail, by Chemists and Druggists, and wholesale only by GEORGE TRIMBEY, 41, Queen-street, Chapside.

**HYGIENIC BATHS.**

JENSON'S TONIC

**DAPHNE MARINA SALT BATHS**

When dissolved in a Cold, Tepid, or Warm Bath, imparts an eminently strengthening and beneficial properties to the same, that, when once tried, a Bath will scarcely ever be taken without it. In the buoyancy and freshness it produces in the system, it is far superior to any known Sea Bath.

Sold at 6d. and 1s. per packet, by the Proprietor, C. MENING, 103, Leadenhall-street, and 213A, Piccadilly, (near Regent-circus,) and by all Chemists, and Bathing Establishments.

**Mr. G. Hind, F.R.C.S., resumed his**  
**DEMONSTRATIONS** on the morning of the 16th of September, at the usual hour.

TREASURER.

John Ince, Esq.

BANKERS.

Messrs. Gosling and Sharpe, 19, Fleet-street.

SECRETARY-SUPERINTENDENT.

John Capes, Esq.

The objects of this Society are—  
 1st. To provide a safe and efficient medium by which the Medical Profession may secure more certain and regular payment for their services; with every consideration for the convenience of those who are willing, but unable directly to discharge their liabilities; with rigour for those who are able, but have not the disposition, to remunerate medical men.

2nd. With the machinery necessary for carrying out the foregoing purpose, to establish a means of privately negotiating the transfer of Practices and Partnerships.

3rd. A Register is kept for Assistants and Pupils.

4th. To raise a Benevolent Fund by devoting to that object the profits arising from the general operations of the Society.

The Members of this Society consist of qualified Practitioners only. Annual Subscription, One Guinea; a Firm, consisting of two Partners, a Guinea and a half; a Firm of three Partners, Two Guineas. Fixed rates of Commission are charged on Business transacted.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

**Brown's Cantharidine Blistering**

**TISSUE**, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lytta P.L., easily applied and removed, and will not produce stranguary or troublesome after-sores. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing ten square feet, 6s. 6d.; and small Cases of five square feet, 3s. 6d. each.

**BROWN'S TISSUE DRESSING**.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing ten square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1852.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.,

"To Mr. Brown," Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction.

"60, Grosvenor-street, London."

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. Brown's Blistering Tissue has been used extensively in the Military Hospital,—has been found effective as a Vesicatory, when carefully applied, and has not been productive of any degree of Stranguary.

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. Brown, Druggist, Handsworth, Birmingham."

Prepared by Thomas B. Brown, Pharmaceutical Chemist, 42, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignee, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

TO THE PROFESSION.

**Mr. Bowmer, M.R.C.S. Eng., 50,**  
**LINCOLN'S-INN-FIELDS,** continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.  
 Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.  
 Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

MEDICAL.

**French**—Hy. Pottevin, Esq., (Paris.)

**Music**—Dr. Charles Steggall, Trinity College, Cambridge; Professor of the Royal Academy of Music, London.

The system of this School is particularly adapted to prepare Boys for the Medical Profession, the Army, whether Line or Artillery, the Navy, and Civil Service.

The Terms for the Sons of Medical Men are:—Boys under Fourteen years of age, £40 per annum. Above Fourteen, the terms vary with the age. The terms include everything except books.

A Prospectus, with full details, may be had on application to the Head Master, at the School.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS,

14, JOHN STREET, ADELPHI.  
(Established A.D. 1838.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.  
Office hours from 12 till 4.

**A Qualified Assistant Wanted immediately,** accustomed to Country Practice. Salary, £20.—Address, S. B., Mr. W. Jones Painter, 43, High-street, Islington, London.

**Wanted, by a General Practitioner** in the country, an ASSISTANT, chiefly to Dispense and to Visit Parish and Club Patients, and attend Midwifery when required.—Address, M., Post-office, Northampton.

**Wanted, a Qualified Assistant to** Dispense and Visit. He must be unmarried, and of unexceptionable character. No Club or Union Practice. Salary, £20.—Apply to E. C. May, Tottenham, Middlesex.

**A Surgeon, 40 years old, is desirous** of taking charge of a Gentleman's Practice during his absence, or as an ASSISTANT, with a view to Partnership, in town or country.—Address, Y. Z., 2, Lovegrove-place, East Greenwich, Kent.

**Medical Assistant. — A Surgeon,** residing in a Town in one of the Eastern Counties, requires the services of a Qualified ASSISTANT to Visit and Dispense. Salary, £50 per annum.—Address, H. M., Post-office, Bury St. Edmunds.

MEDICAL.

**To be Disposed of, an Old-established** PRACTICE, within a few miles of the city of York.—For further particulars address to X. Z., care of Mr. John Spurr, Druggist, Goodramgate, York.

MEDICAL.

**Wanted, by a Young Gentleman,** aged twenty-three, an engagement as ASSISTANT. He has attended all Lectures, Hospital Practice, &c. He has also attended Midwifery.—Address, Y. Z., Post-office, Queen's-road, Dalston.

**A Medical and Surgical Assistant,** above Thirty years of age, qualified to Practise without a Diploma, is Disengaged, and would be happy to treat with any Practitioner who may require immediate assistance.—Address, Henry Bell, Deeping-gate, Northamptonshire.

**Lunacy.—To be Disposed of, an old-** established ASYLUM, situated within a few minutes' ride of town by railway.—For further particulars, address, by letter only, to A. Z., care of Mr. Darroch, Surgical Instrument-maker, 2, New-street, St. Thomas's-street, Borough.

**To be Disposed of immediately, on** very moderate terms, a respectable GENERAL PRACTICE, long established, in the County of Hants, and presenting good prospects to any qualified Gentleman of address and experience prepared to take it at once.—Address, enclosing reference, A. B. C., THE LANCET Office, 423, Strand, London.

**A Surgeon wishes to place his Son,** who is in his fifteenth year, and has been accustomed to Dispense Medicine, keep Medical Books, &c., with a General Practitioner for two or three years.—Apply by letter to C. D., Messrs. Witherby, Law Stationers, Birchin-lane, London.

TO SURGEONS, &c.

**A Gentleman, aged 30, who is a** neat, quick, and accurate Dispenser, and has had considerable experience in Midwifery, is desirous of forming a permanent Engagement as ASSISTANT with a Surgeon or Firm in the country.—Address, Alpha, Post-office, Madeley, near Wellington, Salop.

MEDICAL.—TO ASSISTANTS AND PRACTITIONERS.

**A Gentleman, retiring from the** active duties of his Profession, wishes to meet with a SUCCESSOR. His Practice returned last year upwards of £400. The Premium to be paid by £50 yearly instalments out of the proceeds of the Practice, the first payment being made upon taking possession.—Address, A. B. C., care of Mrs. Wilson, No. 3, Newcastle-place, Mile-End-road.

**Surgical Museum.—To be Disposed** of, a MUSEUM, comprising an extensive series of Wet and Dried Preparations of Surgical Pathology, numerous Casts, Skeleton, and Lay Figure for Bandaging, and upwards of Two Hundred Coloured Drawings, arranged for the illustration of a Course of Lectures on Surgery. Also, suitable Glass Cases containing the Preparations. The whole Collection is in perfect preservation, having been recently used as a Teaching Museum. Parties wishing further information are permitted to refer to Dr. John Struthers, Surgeon's Hall, Edinburgh.

Medical Transfer and Partnership.

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent** and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RELINQUISH, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

TO SURGEONS AND CHEMISTS.

**A very handsome Shop, with capital** Dwelling-house, admirably placed for combining Practice with Business, in the immediate vicinity of Blackheath, and at present yielding a good return, is to be Disposed of. The command of £500 required.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

MEDICAL.

**A Practitioner in Town will relin-** quish a PRACTICE of £450 yearly, and beneficial Lease, to an active qualified Practitioner, who will pay £300 down, and account for the residue of the purchase-money from the receipts of the business.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

TO SURGEONS AND CHEMISTS.

**A Practitioner, combining Practice** and Retail, near University College, wishes for a PARTNER, who must have £500 at command, for an equal share in the interests of each department.—Apply to A. J. H., care of Mr. ORRIDGE, 30, Bucklersbury.

**Wanted, by a Surgeon in the** Country, a Dispensing ASSISTANT; one who has been used to the routine of the Surgery preferred. There is no Union or Club Practice.—Apply, personally or by letter, stating Salary required and all particulars, to Messrs. Hodge and Hone, 103, Blackman-street, Borough.

MEDICAL.

**Wanted, by a Gentleman, 28 years** of age, a Situation as Visiting and Dispensing ASSISTANT, accustomed to a General Practice. Good references and recommendations.—Address, E. S., Messrs. W. Thomas and Co., Universal Advertising Offices 10 to 21, Catherine-street, Strand.

**Wanted, an active and legally-** qualified ASSISTANT, of from twenty-five to thirty years of age, to Visit, Dispense, and attend Midwifery, in a manufacturing district. The advertiser would not object to give an interest in the Practice to one wishing a permanency, and of active habits.—Address, Medicus, Mr. Turner's, Druggist, Arlington-street, Salford, Manchester.

**Medical Partnership.—A Surgeon,** M.R.C.S. and L.S.A., well accustomed to General Practice, desires to become a PARTNER in a respectable Practice in or near London. The Advertiser can introduce some very excellent connexion, and will be happy to pay an adequate premium. The strictest investigation is courted.—Address, in the first instance by letter only, M.R.C.S., 17, Cheapside.

MEDICAL.

**A Young Gentleman, aged 25, who** has recently had charge of a Practice during the absence of the Principal, wishes for a similar engagement or a situation as Visiting, or Visiting and Dispensing ASSISTANT. Has had great experience in Midwifery, and understands Parochial and Club Practice. The best of references and testimonials.—Address, Medicus, Post-office, Notting-hill-gate.

MEDICAL.

**A Young Gentleman, aged 20, who** has served his apprenticeship at an Infirmary and Dispensary, and has been an Assistant with a Surgeon, wishes for an engagement as a DISPENSER to a Public Institution or a Surgeon in town. The most satisfactory testimonials can be afforded, with unexceptionable references.—Apply to Delta, 8, Pickard-street, City-road.

**Medical Practice, Kent.—In a village** a few miles distant from a fashionable Watering-place, suitable to a Gentleman disposed to receive a few Nervous Patients. There are nine acres of land attached, and large garden, with good stabling, &c. The property, which is freehold, can be purchased or taken at a rental, and the furniture, carriage, horses, &c. at a valuation. Three Cottages belonging to the estate are also to be Sold. The Practice is small, but capable of much improvement.—Address, M.R.C.S., Post-office, Tunbridge Wells.

**To the Medical Profession.—To be** Disposed of immediately, by private treaty, at Northwich, Cheshire, in consequence of the decease of the Proprietor, the Stock, Surgical Instruments, Fixtures, &c., of a Surgeon, together with a large Collection of Valuable Surgical Books, if required. Any Gentleman wishing to Commence Business will find this well worthy his attention, the late proprietor having had an extensive Practice for the last eleven years.—For particulars, and to treat for the same, apply to Mrs. Weston, Northwich; or to Mr. Thompson, Chemist, 12, Church-street, Liverpool.

Just published, 8vo, cloth, 5s.

London: John Churchill, New Burlington-street.

Just published, 8vo, cloth, 7s. 6d., illustrated with Lithograph and Woodcuts,

**Pathological and Surgical Observations:** including an Essay on the Surgical Treatment of Hemorrhoidal Tumours. By HENRY LEE, F.R.C.S., Surgeon to the Lock Hospital.  
London: John Churchill, New Burlington-street.

Just published, 8vo, price 2s.

**On the Relative Merit of the two OPERATIONS FOR STONE.** By FREDERICK C. SKEY, F.R.S., Professor of Anatomy and Surgery to the Royal College of Surgeons.  
London: John Churchill, New Burlington-street.

Just published, Second Edition, revised and enlarged, post 8vo, cloth, 8s.

**On the Physical Diagnosis of the DISEASES OF THE LUNGS AND HEART.** By HERBERT DAVIES, M.D., Physician to the London Hospital; Senior Physician to the Royal Infirmary for Diseases of the Chest.  
London: John Churchill, New Burlington-street.

Just published, post 8vo, 1s. 6d.

**On the Triple Aspect of Chronic DISEASE:** having especial reference to the Treatment of Intractable Disorders chiefly affecting the Nervous and Muscular System. By WILLIAM BAYES, M.D., Licentiate of the Royal College of Physicians, and Physician to the Brighton Dispensary.  
London: John Churchill, New Burlington-street.

Just published, 8vo, cloth, 5s.

**Lettsomian Lectures on Insanity;** delivered at the Medical Society of London, by FORBES WINSLOW, M.D., D.C.L., late President of the Society.

"The Lectures are three in number, each being highly interesting and suggestive. The first is devoted to a treatise on the Psychological Vocation of the Physician, in which is vividly described how great is his responsibility; the second refers to the Medical Treatment of Insanity; and the third, to the all-important subject of Medico-Legal Evidence in cases of Insanity. This, with the other two, contains an amount of matter invaluable of its kind, and well worthy of its eminent writer, whose untiring labours in promoting the increased well-being and welfare of the insane entitle him to hold a high rank amongst the philanthropists and bright lights of the age."—DUBLIN QUARTERLY JOURNAL OF MEDICAL SCIENCE for November.

London: John Churchill, New Burlington-street.

Just published, post 8vo, cloth, 7s. 6d.

**Elements of Psychological Medicine.** An Introduction to the Practical Study of Insanity. Adapted for Students and Junior Practitioners. By DANIEL NOBLE, M.D., Physician to the Clifton-hall Retreat, near Manchester.

"We have great satisfaction in being able warmly to recommend Dr. Noble's little treatise, as extremely well-adapted to supply the desideratum which we have long felt and lamented."—BRITISH AND FOREIGN MEDICO-CHIRURGICAL REVIEW.

"The book is, indeed, full of instruction. Every student and every practitioner who reads it will be charmed with the cleverness and elegance of the diction. No one can close it without forming a high estimate of the intellectual capacity and the soundness of the practical views of the author."—THE LANCET.

"There is an earnestness of purpose and love of truth in every page, that win the attention of the reader, and are well calculated to excite in the mind of the student a taste for the study of this class of diseases."—DUBLIN MEDICAL PRESS.

London: John Churchill, New Burlington-street.

Third Edition, with 120 Illustrations on Steel and Wood, 8vo, cloth, 22s.

**The Principles and Practice of OBSTETRIC MEDICINE AND SURGERY.** By F. H. RAMSBOTHAM, M.D., Physician to the Royal Maternity Charity.

"This new edition of Dr. Ramsbotham's work forms one of the most complete and thoroughly useful treatises on midwifery with which we are acquainted. The entire work has undergone a careful revision, with additions. We have already given specimens of the work sufficient to justify our hearty recommendation of it as one of the best guides that the student or practitioner can follow."—BRITISH AND FOREIGN MEDICAL REVIEW.

"It is the book of midwifery for students—clear, but not too minute in its details, and sound in its practical instructions. It is so completely illustrated by plates, (admirably chosen and executed,) that the student must be stupid indeed who does not understand the details of this branch of the science, so far at least as description can make them intelligible."—DUBLIN JOURNAL OF MEDICAL SCIENCE.

"This is one of the most beautiful works which have lately issued from the medical press, and is alike creditable to the talents of the author and the enterprise of the publisher. As a work conveying good sound practical precepts, and clearly demonstrating the doctrines of obstetrical science, we can confidently recommend it either to the student or practitioner."—EDINBURGH JOURNAL OF MEDICAL SCIENCE.

"This book forms a very handsome volume. Dr. Ramsbotham has treated the subject in a manner worthy of the reputation he possesses, and has succeeded in forming a book of reference for practitioners, and a solid and easy guide for students. Looking at the contents of the volume, and its remarkably low price, we have no hesitation in saying that it has no parallel in the history of publishing."—PROVINCIAL MEDICAL AND SURGICAL JOURNAL.

London: John Churchill, New Burlington-street.

JACKSONIAN PRIZE TREATISE OF THE ROYAL COLLEGE OF SURGEONS.

Just published, with Plates, cloth, 8vo, 10s.

**Stricture of the Urethra, its Pathology and Treatment.** By HENRY THOMPSON, F.R.C.S., M.R., Surgeon to the Marylebone Infirmary, &c.

"Mr. Thompson has produced a most judicious and excellent work: and any further eulogium would be superfluous, as the volume possesses a substantial merit which cannot fail to insure it success."—BRITISH AND FOREIGN MEDICO-CHIRURGICAL REVIEW.

"Mr. Thompson deserves no small credit for the dispassionate manner in which he has executed his task, and for the calm, discriminating judgment displayed in appreciating the various methods of treatment. The book is calculated to be most useful to the profession, and to reflect great credit on Mr. Thompson, both as an author and as a practical surgeon."—EDINBURGH MONTHLY JOURNAL.

"We now take leave of Mr. Thompson's treatise, and we cannot better express our approval of it than by stating that, for accuracy, perspicuity, and methodical arrangement of the different departments of the subject, it surpasses any on the pathology and treatment of stricture which we have ever perused. Added to the work is an appendix of many pages, containing most excellent instruction, both pathological and practical."—DUBLIN QUARTERLY JOURNAL.

"Mr. Thompson has given the profession by far the most complete treatise on urethral strictures that it possesses, and has produced a monograph that, for laborious pathological research and originality of investigation, does him infinite credit, and establishes his character as one of the ablest pathologists of the day in that department of surgical practice which he has undertaken to elucidate. It is a work that ought to be in the library of every surgeon."—THE LANCET.

"An elaborate essay, embracing all points connected with the important disease in question."—MEDICAL TIMES AND GAZETTE.

"We cordially recommend to our readers the monograph before us as the most comprehensive, accurate, and practical treatise on the whole subject of urethral stricture and its consequences, which has yet been presented to the profession. It will naturally become the text-book to this important department of urinary pathology."—RANKING'S ABSTRACT.

"An excellent summary of all that is known relating to stricture of the urethra and its treatment."—ASSOCIATION JOURNAL.

"Un ouvrage vraiment à part pour la valeur et le nombre des documents originaux sur les quels ses conclusions se trouvent appuyées."—GAZ. HEBDOM. DE PARIS.

London: John Churchill, New Burlington-street.

DR. STEGGALL.

STUDENTS' BOOKS FOR EXAMINATION.

**A Manual for Apothecaries' Hall** and other MEDICAL BOARDS. Eleventh Edition, 12mo, cloth, 10s.

**A MANUAL FOR THE COLLEGE OF SURGEONS;** intended for the Use of Candidates for Examination and Practitioners. Second Edition, 12mo, cloth, 10s.

**GREGORY'S CONSPECTUS MEDICINÆ THEORETICÆ.** The First Part, containing the Original Text, with an Ordo Verborum, and Literal Translation. 12mo, cloth, 10s.

**THE FIRST FOUR BOOKS OF CELSUS;** containing the Text, Ordo Verborum, and Translation. 12mo, cloth, 8s.  
\* \* \* The above two Works comprise the entire Latin Classics required for Examination at Apothecaries' Hall.

**A TEXT-BOOK OF MATERIA MEDICA AND THERAPEUTICS.** 12mo, cloth, 7s.

**FIRST LINES FOR CHEMISTS AND DRUGGISTS** PREPARING FOR EXAMINATION at the PHARMACEUTICAL SOCIETY. 18mo, cloth, 3s. 6d.

London: John Churchill, New Burlington-street.

Just published, Second Edition, price 1s.

**On Syphilitic Eruptions, Ulcerations, AND OTHER SECONDARY SYMPTOMS, WITH ESPECIAL REFERENCE TO THE USE AND ABUSE OF MERCURY.** By THOMAS HUNT, F.R.C.S., Surgeon to the Western Dispensary for Diseases of the Skin.  
London: John Churchill, New Burlington-street.

Just published, Third Edition, 8vo, cloth, 12s. 6d.

**On the Diseases of the Uterus.** By J. HENRY BENNET, M.D., late Physician-Accoucheur to the Western General Dispensary.

"We are firmly of opinion that in proportion as a knowledge of uterine diseases becomes more appreciated, this work will be proportionably established as a text-book in the profession."—THE LANCET.

"When, a few years back, the first edition of the present work was published, the subject was one almost entirely unknown to the obstetrical celebrities of the day; and even now we have reason to know that the bulk of the profession are not fully alive to the importance and frequency of the disease of which it takes cognizance. The present edition is so much enlarged, altered, and improved, that it can scarcely be considered the same work."—DR. RANKING'S ABSTRACT.

London: John Churchill, New Burlington-street.

PRINTED by THOMAS CHOATE SAVILL, at his Printing Office, No. 4, Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the county of Middlesex; and published for the Editor by GEORGE CURRIE, of No. 423, Strand, in the Parish of St. Martin-in-the-Fields, Westminster, in the said county, at No. 423, Strand, aforesaid; and sold by all Booksellers and News-vendors in Great Britain and Ireland and the Colonies.—Saturday, November 25, 1864.

## H. Silverlock's Medical Label Ware-

house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.

The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letter-press, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent per post on application.

## Poultices superseded by the use of MARKWICK'S PATENT SPONGIO PILINE.

As a substitute for common poultices and fomentations, the superiority of this article is unquestionable. It is strongly recommended by the most eminent of the Faculty for its cleanliness, economy, lightness, and general efficacy, and is now used in several of the hospitals. Also Markwick's Patent Piline, for Cholera Belts, Rheumatism, Chest Protectors, Respirators, Lum-bago, &c.

Sold, retail, by Chemists and Druggists, and wholesale only by GEORGE TRIMBEY, 41, Queen-street, Cheapside.

## Hare-Lip.—Extraordinary Application and CURE.

Communication from Mr. BROADBENT, Surgeon, Ferry Hill, Durham.

Mr. BENJAMIN NICKELS,

SIR,—I wish to state concerning your Plaster to the following effect. About ten days after an operation for Hare-lip, the boy fell against a stone step and ruptured the lip. The day previously I had received your Elastic Plaster, and on being summoned to the boy, (without much hope of success,) I applied three strips of the Plaster, extending from ear to ear, bringing the ruptured edges into apposition. Seven days after, the Plaster retained the cheeks in the position I had left them on the day of application. Fresh strips were then applied, and the edges ultimately united. In my opinion, no other plaster could have answered the intention, and I think it specially adapted to wounds on the face.

I remain yours obediently.

(Signed) G. W. BROADBENT.

NICKELS'S PATENT ELASTIC ADHESIVE PLASTER, and ELASTIC ADHESIVE BANDAGES, which are made on quite a new principle, rendering them a cheap, efficient, unvarying support as a spiral covering, or stocking (without the trouble of lacing), for varicose veins, sprains, weak joints, and all rheumatic affections. These Bandages may also be cut and applied as ordinary strapping.

The Patente has had the honour of receiving the highest testimonials in approbation of his ELASTIC PLASTERS from the following most eminent Members of the Profession, and many other Gentlemen, by whom they are patronized and used in their hospital and private practice:—J. C. W. LEVER, M.D., Physician Accoucheur, Guy's Hospital. Mr. FERGUSON, Surgeon to his Royal Highness Prince Albert, Prof. Surgeon, King's College, London; Surgeon King's College Hospital. Mr. HILLOW, Surgeon, Guy's Hospital, Surgeon to the City of London Hospital for Diseases of the Chest.

THE PATENT ELASTIC COURT PLASTERS are found most superior both in appearance and quality.

Sold by all principal Chemists in the United Kingdom, and by Mr. BENJAMIN NICKELS, Surgical Plaster Manufacturer, 9, Camberwell-green, London.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

TISSUE, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lyttae P.L., easily applied and removed, and will not produce stranguary or troublesome after-sores. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing ten square feet, 6s. 6d.; and small Cases of five square feet, 3s. 6d. each.

BROWN'S TISSUE DRESSING.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing ten square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1852.

"DEAR SIR,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"JOHN GAY, F.R.C.S.,

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown."

"June 24th, 1850.

"Mr. Dalrymple presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction.

"60, Grosvenor-street, London."

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that Mr. BROWN'S BLISTERING TISSUE has been used extensively in the Military Hospital,—has been found effective as a Vesicator, when carefully applied, and has not been productive of any degree of Stranguary.

"ANDREW SMITH, M.D., Deputy Inspector-General of Hospitals.

"Mr. T. B. BROWN, Druggist, Handsworth, Birmingham."

Prepared by Thomas B. Brown, Pharmaceutical Chemist, 42, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignee, Mr. William Bailey, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

## W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible; also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atropo, Belladonna, Cotyledon Umbilicus, &c.) also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alternative), Liq. Parietarie (diuretic), and Liq. Belee (prepared from the Eagle Marmelos, or Indian Bacl), for Dysentery and Diarrhoea.

W. T. has a large supply of INDIAN BAEL on hand.

2, Edward's-street, Portman-square.

## Newfoundland Cod-Liver Oil.—

Messrs. CHARLES FOX and CO. beg to announce that they have just returned from their Sixth Voyage to Newfoundland, with a supply of PURE COD-LIVER OIL, the whole of which is now in the hands of the Wholesale Houses. They confidently recommend it to the Medical Profession and the Public generally, as the very best Oil offered in the Market. It has been most carefully prepared, without any other process but the slight application of heat, under their own immediate personal inspection, and its purity is fully guaranteed, as Newfoundland affords no other livers for the preparation of the Oil but those which are legitimate. References to houses of the highest respectability can be had on application to Messrs. CHARLES FOX and CO., Cod-liver Oil Merchants, Scarborough.

November 24th, 1854.

## Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 5s. 4d. per lb.

Impassinated Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 20s. per lb.

TARAXACUM (Davenport's) Liquor, or Fluid Extract, prepared by Spontaneous Impassation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

## Dinneford's Pure Fluid Magnesia,

now greatly improved in purity and condensation.

"Mr. Dinneford's Solution may fairly be taken as a type of what the preparation ought to be."—PHARMACEUTICAL JOURNAL, May, 1846.

This excellent remedy, in addition to its extensive and increasing sale amongst the public, is now very largely employed in DISPENSING; for which the cheapest and most convenient form is in the STONE JARS; half-gallon, 5s. 6d.; gallon, 9s. 6d.; specially adapted for the use of Surgeons and Chemists. To be had from the manufacturers, DINNEFORD & CO., Chemists, 172, Bond-street, London; and all respectable Wholesale Druggists and Patent Medicine Houses.

## Mr. Hooper's Water Mattresses or

BEDS, and CUSHIONS for AIR or WATER, for placing on an ordinary Bedstead. Being made of India-rubber, without the admixture of cloth materials, leakage is avoided. (Extract from THE LANCET, Jan. 25, 1851.)

CUSHIONS FOR BED-SORES.—Whether threatened with Sloughing, or in which Sloughing has taken place, Fractures, Dislocated Joints, Spasms, Lassitude, Typhoid and other Fevers, Rheumatic Affections, Dropsy, Coldness of the Stomach and Feet, Consumptive and all Bed-ridden Patients. They are simply to be placed on an ordinary bedstead. These Cushions and Beds are not affected by Heat or Cold, and will bear water at any temperature.

Finsbury-square, February 27, 1853.

I have in several instances employed Mr. Hooper's Water Cushions and Mattresses; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water Bed.

JOHN. PERRIN, M.D., Physician to the London Hospital.

Infirmary, Chichester, March 21, 1853.

SIR,—We are all much pleased with your Cushions, and still more so with the Mattresses.

Yours truly,

THOS. NEWHAM, House-Surgeon.

HOOPER, 7, Pall Mall East, and 55, GROSVENOR-STREET.

PRELIMINARY ADVERTISEMENT.

Accountant to the Medical Invalid Assurance Society, 25, Pall-mall.

Consulting Actuary.

FRANCIS G. P. NEISON, Esq., F.L.S., &c., 25, Pall-mall.

Bankers.

THE LONDON JOINT STOCK BANK, 69, Pall-mall.

Actuary and Secretary.

EDWIN H. GALSWORTHY, Esq., F.S.S.

FEATURES OF THE COMPANY.

**AGENTS.**—1st. The Agents of this Company will be entitled, beyond the ordinary Commissions, to a direct and substantial interest in the realized Profits. This important feature is expressly provided for under the Company's Deed of Settlement, and will be extended to all **Solicitors, Medical Men, and officially-appointed Agents.**—2nd. A provision has likewise been made to remunerate out of realized profits, those persons who may introduce Agents to the Company.

**CAPITAL.**—More than one-half of the Deposits on Shares, or, upwards of £10,000 will be actually paid up before business is commenced.

**QUALIFICATION FOR DIRECTOR.**—Every Director will pay down £500, at least, on Shares, immediately upon the complete registration of the Company.

**BUSINESS.**—The Business of this Company will include the granting of Assurances on Lives and Survivorships, Annuities and Endowments; also, the purchase of Reversions, Loans on Securities, &c., and will be fully set forth in the detailed Prospectuses.

**AGENCIES.**—Application for Agencies and the remaining Shares are requested to be made to the Secretary at the Chief Office.

The preliminary Prospectuses, detailing the plan and principles of the Company, and every information, may be obtained post free, on application to

EDWIN H. GALSWORTHY, Secretary.

Bank of Deposit, National Assurance,  
and INVESTMENT ASSOCIATION, No. 3, PALL-MALL EAST,  
LONDON.

Established A.D. 1844.

Empowered by Special Act of Parliament.

Parties desirous of investing Money are requested to examine the Plan of this Institution, by which a high rate of Interest may be obtained with perfect security.

The Interest is payable in January and July, at the Head Office in London; and may also be received at the various Branches, or through Country Bankers, without delay or expense.

PETER MORRISON, Managing Director.

Prospectuses and Forms for opening Accounts sent free on application.

Hooper's Waterproof Sheeting, for  
protecting Bedding from Sloughing Sores, Incontinence of Urine,  
Hæmorrhage, &c.

MR. HOOPER has succeeded in obtaining Waterproof Sheeting, at a great reduction in price, soft, and inodorous; it is not affected by Urine, Heat, nor Cold, Acids, nor Alkalies, and may be washed as family linen.

Also, IMPROVED INVALID URINALS, with Valves, for sitting, lying, or travelling, in any position.

FOR EPILEPSY.

**COTYLEDON UMBILICUS.**—The introduction of this valuable agent has proved a valuable discovery. The satisfactory accounts Mr. HOOPER has received have induced him to pay great attention to its collection and preparation. He cautions medical men against the use of worthless preparations, passed off for his, and as prepared for Mr. Salter, &c. Mr. Hooper has instructions to state that Mr. Salter has never used any but that obtained from him. A copy of Mr. Salter's reports in the "Medical Gazette" sent free by post.

**GALUUM APARINE (HOOPER'S) FOR CUTANEOUS DISEASES, PSORIASIS, &c.**—Dr. Winn, of Finsbury-square, having published in "The Medical Gazette," October 4th, 1851, an account of the peculiar properties of the Galium Aparine in Cutaneous Diseases, Lepra, Psoriasis, &c., Mr. Hooper has given his attention to preparing it in various forms. Dr. Winn finds the inspissated juice the most efficient preparation, which can be had from Mr. Hooper, or direct through the Wholesale Houses.

HOOPER, Operative Chemist, Pall Mall East, and Grosvenor-street.

Medical Galvanic Coil, complete, at

27s. 6d. Powerful ELECTRO-GALVANIC MACHINES for Medical purposes, of very superior finish, with Battery and Conductor, complete, at 27s. 6d., at C. BAKER'S Surgical, Optical, and Philosophical Instrument Warehouse, 244, High Holborn.

Second-Hand Surgical and Optical

INSTRUMENTS.—C. BAKER, 244, High Holborn (opposite Day and Martin's), begs to call the attention of the Profession to his extensive Stock of SECOND-HAND SURGICAL INSTRUMENTS, suitable for Emigration, Military, and Private Practice; also, to his large assortment of OPTICAL, PHILOSOPHICAL, AND SCIENTIFIC INSTRUMENTS, at extremely low prices. Every description of Instruments Purchased or taken in Exchange.

Established 1765.

The Respirator.—The assumption of

the name of Respirator for various discreditable and defective imitations of MR. JEFFREYS' Instruments, the value of which in medical practice has given a wide reputation to the name, can only mislead unwary persons not acting under professional advice.

City Office for the Respirator, 25, Bucklersbury; West-end Depot, 25, Holles-street, Oxford-street, London. In London and all Towns, the principal Chemists and Surgical Instrument Makers are Agents for Mr. Jeffreys' Respirators.

The Pure Warm Air Charcoal

RESPIRATOR, invented by Dr. Stenhouse, of St. Bartholomew's Hospital, for preventing and alleviating diseases of the Throat and Lungs, and also as a safeguard against Fevers and other Infections, which no other will do, is in appearance like the ordinary Respirator, but half its weight. When the breath is fetid, which is the case under many forms of dyspepsia, &c., the disagreeable effluvia are absorbed by the Charcoal, and pure air alone is inspired. There are three kinds—one Oral, price 6s.; and two Orinal, one for infected atmospheres, 8s., the other for Chemical and Manufacturing Establishments, 10s., by post 6d. extra.

WM. B. ROOFF, Manufacturer, 8, Willow-walk, Kentish-town; where, also, may be had every description of Respirator, from 2s. 6d. each.

# Three Lectures ON THE SPINAL SYSTEM AND ITS DISEASES.

*Delivered at the Chatham-street School of Medicine,  
Manchester.*

By MARSHALL HALL, M.D., F.R.S.L. & E.,  
FOREIGN ASSOCIATE OF THE IMPERIAL ACADEMY OF MEDICINE OF PARIS, ETC.

## LECTURE III.

### THE MODES OF DEATH AND THE THERAPEUTICS IN DISEASES OF THE SPINAL SYSTEM.

GENTLEMEN,—In my lecture of yesterday I explained to you two modes in which spinal seizures may issue in death: the first, by apoplexy of the medulla oblongata and paralysis of the pneumogastric nerve; the second, by shock on the heart; the former, somewhat slowly—the latter, suddenly.

There is another mode of death in epilepsy. It is the result of sheer nervous exhaustion, from the rapid or constant repetition of severe paroxysms.

This subject will be best illustrated by an experiment:

I divided the cerebral from the spinal centre in this frog, and then dropped on its surface a few drops of a solution of the acetate of strychnine. It has become affected by the poison: the least touch, the least jar of the table throws it into a tetanoid paroxysm.

If I avoid excitement, the animal survives in its state of strychnism for a long time. But if I continue to repeat the excitation, the excitability and life soon become extinct.

I will suppose the frog without injury, but placed under the influence of strychnia; if it be secured from all excitation, it recovers; if it be exposed to repeated excitation, it dies.

So it is in the dog.

Even in tetanus in the human subject, I believe some patients would recover if preserved absolutely from excitation, who die under its exhausting influence.

The same event occurs in epilepsy. In a case detailed in THE LANCET for October 14th of this year, page 309, by Dr. Bucknill, in which tracheotomy had been performed, and in which, therefore, laryngismus had lost all its baneful influence, the patient died of pure exhaustion, "distinctly not of coma."

Death from nervous exhaustion must therefore be added to the other forms and modes of death in epilepsy.

There is still another source of danger and of death in epilepsy. It arises out of trachelismus assuming the form of torticollis, and attended with twisting of the body.

Some time ago a medical student, affected with epilepsy, called on me, and, whilst we engaged in conversation, uttered a fearful cry, became affected with twisting of the neck and body, and would have fallen had I not held him forcibly on his chair.

The next morning he was found dead in bed, with his face buried in his pillow!

He had doubtless had a fit in the night, which, assuming the form I had observed and have described, turned him in bed.

In this manner a patient has been suffocated in a fit of epilepsy, the face being found literally buried in the soft soil of a newly ploughed field, or submerged in shallow water.

Such, then, are the principal modes of death in epilepsy. Another topic which I must discuss briefly before I enter on the subject of the therapeutics of the spinal system, is, the mode and degree of recovery from attacks of epileptic or convulsive affection.

An epileptic fit probably ceases frequently from nervous exhaustion of the spinal centre, just as we observe the tetanoid spasm cease in the frog affected with strychnia.

From this exhaustion reaction usually takes place, and the spinal centre passes into a state of undue excitability, just as reaction follows repeated attacks of syncope in cases of loss of blood, passing into excess.

In this condition of excessive excitability, the slightest causes of the epileptic seizure are usually but too operative. It constitutes indeed the continued *predisposing* cause of epilepsy.

This undue excitability of the spinal centre is by no means incompatible with a shattered condition of the general system; and therefore we frequently observe the epileptic patient pale, thin, and feeble, though in other cases there are a florid complexion, a robust form, and much muscular power.

Besides the spinal centre, the cerebral centre is apt to be

affected in severe epilepsy, and the patient is left comatose, maniacal, or with loss of memory or intellect. These events appear sometimes to depend entirely on intra-vascular congestion, and sometimes on effusion, ecchymosis, softening, or other lesion.

You will not, gentlemen, be surprised that from any mode of treatment we look for success, not in cases with organic lesion, or of inveterate standing, but in the comparatively recent cases, of ex-centric inorganic origin, and still without organic change.

Now let us consider what may be accomplished in the treatment of epilepsy or other convulsive disease.

Once more I beg your attention to my Table. Look at this list of *causes*. The first part of our treatment depends on carefully avoiding all these.

The excitements, the irritations must be, as far as possible, avoided. The morbid conditions of the blood must be remedied. A low posture and deep sleep must be carefully shunned. The neck must be cautiously guarded against a tight collar.

One event we must constantly suspect: an undue acidity in the stomach. Against this, the bicarbonate of potass is the present remedy, and should be taken on every recurrence of a threatening symptom. Many patients have carried about with them a solution of twenty-five grains of this bicarbonate in two ounces of water, and taken it in such circumstances with the greatest advantage.

Another event to be suspected is the formation and retention of scybala in the colon. These are only effectually removed by an enema of three pints of warm water, slowly administered. But in this manner, too, the threatened attack has been averted.

One patient succeeded in replacing an attack by a fit of vomiting, taking for that purpose, on any threatening, half a drachm of ipecacuanha. To this I have sometimes added an equal quantity of the bicarbonate of potass.

The bowels should be kept well relieved daily; but I have known a dose of purgative medicine constantly to produce a seizure.

One patient took many remedies empirically. None did good. But the turpentine acted injuriously.

Of all our remedies, none is more important than a well-regulated, simple, digestible, nutritious diet.

Against the undue excitability of the spinal centre in epilepsy, well-appointed walking exercise is the specific remedy. But *effort* or *fatigue* adds to the evil.

I think there is as the cause of sleep a latent trachelismus. The usual posture during sleep is the recumbent. Both these must conduce to the epileptic seizure. I have constantly recommended a posture during sleep at an angle of fifty degrees. And I think that I have seen advantage from gentle movements and noises in the patient's room during the first sleep, to prevent deep sleep.

All empirical remedies may be safely discarded. It is very improbable that any individual agent should be able to accomplish all that is required in a case of epilepsy. We may well ask, now that this malady is somewhat understood, why epilepsy should be treated empirically more than apoplexy, or than infantile or puerperal convulsion?

It has appeared to me that the hyoscyamus may allay the nervous excitability so frequently observed in epilepsy. As a little spirit obviously does good in the undue cerebral excitement of delirium tremens, I have thought that minute doses of strychnia may be useful in the undue spinal excitability in epilepsy. For the organic changes induced by epilepsy, mercury is the remedy.

You will observe, in the Table, that after enumerating the remedies which I have briefly noticed, I have asked, is there any *specific* remedy in epilepsy? I am compelled to answer, No! And I must add, that the sooner the profession ceases from this derogatory mode of prescription the better, and the more honourable. Zinc, copper, silver, valerian, the cotyledon, the sambul, are all given in vain.

We must discard empiricism, and treat epilepsy as we do other diseases, on rational principles, tracing causes, effects, and, in a word, every link of the formidable chain, and act on science and common sense.

I must now, gentlemen, retrace my steps, and take up one of the topics which I have noticed briefly, and treat it at greater length. This topic is—*laryngismus*, and its remedy, and the remedy against its effects—*tracheotomy*.

I have already noticed the two kinds of laryngismus which occur in the first and last stages of a severe epileptic seizure, respectively—the *first* being *spasmodic*; the *second*, *paralytic*.

The former frequently closes the larynx perfectly, and a

*breath-struggle* is superadded, or there is simple suspension of respiration; the neck, face, eyes, become turgid and purple, the intra-cranial tissues being equally congested.

In proportion, in some degree, to this congestion is the damage inflicted on the cerebral faculties, coma, mania, dementia, being the melancholy effects—the lunatic asylum or the workhouse the melancholy doom.

All these are averted by timely and efficient tracheotomy.

I would strongly urge you to seize some opportunity, during the period of your studies—for I am addressing myself to the younger part of my audience—to witness and write down accurately, the phenomena of the epileptic seizure. It is *not* in any or every kind of epilepsy that I recommend tracheotomy, but solely and exclusively in the *epilepsia laryngea*. It is *not* for epilepsy, but for *laryngismus*, that tracheotomy is proposed.

It is necessary to state this emphatically, for a feeble and malevolent critic has either misunderstood or misrepresented this matter.

We must begin, in the administration of this, as in that of all cases of important remedies, by a most careful and accurate *Diagnosis*:—

1. The efficacy of the remedy is precisely proportionate to the degree of *laryngismus* and its effects;

2. The hope from the remedy is proportionate to the earliness of the period at which it is performed;

3. By the institution of this remedy, the *laryngeal* and most fearful form of the disease is *changed* into some milder or *abortive* form; or,

4. The seizures may cease, or decline and cease, altogether. The former was the happy result in the most interesting case of Mr. Cane.

There are many cases of epilepsy in which tracheotomy would be inappropriate. It would be inappropriate in cases involving *organic lesion*, original or induced, and in cases already become *inveterate*. It would be wrong to institute this operation in cases beyond *hope* of benefit; in the cases already deemed *incurable*; and therefore in most of the cases consigned to the lunatic asylum or the workhouse. In these, all that we ought to expect from this, or any remedy, is some *mitigation* of so dire a calamity.

In the cases in which tracheotomy has been performed, this preliminary *diagnosis* has not always been instituted. The result has been precisely what ought to have been anticipated; yet it has been such, when duly weighed and considered, as to confirm and raise all my hopes from this important and heroic remedy in this Herculean malady. In some the fits have been mitigated a hundredfold; in several a failing intellect has been greatly *restored*, the occupation of the patient, necessarily relinquished, being resumed!

I proceed to notice the second or *paralytic laryngismus*. This is the result of a severe attack of epilepsy—always, I think, the *epilepsia laryngea*. The *trachelismus*, the *laryngismus* especially, the *breath-struggles*, have congested the cerebrum, and left a deep coma; with this, stertor or *paralytic laryngismus* has been combined—an event which *reads* on the cerebral centre, augmenting the coma and the stertor. The patient is frequently seen to be in hourly jeopardy of his life from asphyxia. The countenance is livid, the veins of the neck distended, the integuments tumid. The respiration becomes more and more impaired and stertorous. A diffused bronchial rattle establishes itself.

The form of the asphyxia is, as I have already stated, twofold, *laryngeal* and *bronchial*; at first *laryngeal*, afterwards both *laryngeal* and *bronchial*.

If tracheotomy be now efficiently instituted, the *laryngismus* is disarmed of its danger. The lividity of the countenance, the distention of the veins, the tumefaction of the integuments disappear *à vue d'œil*. The respiration is free; the danger from *laryngeal asphyxia* averted!

I need scarcely repeat, that if this tracheotomy be not only efficiently but *timely* performed, the patient's life is saved. But if the operation be delayed, it will be performed too late: if the bronchia have become clogged and choked with mucus, it will *assuredly* be performed in vain. The patient, however rescued from *laryngeal*, will succumb to *bronchial asphyxia*.

These observations do not relate to epileptic coma or apoplexy alone, but to *simple apoplexy* in all its forms; that so well described by Abercrombie, the apoplexy of deep intoxication, of narcotic poisons, &c. It is the present remedy, and, if timely instituted, the effectual remedy, for the *laryngeal asphyxia* in all these cases!

Gentlemen, do not these views excite a deep interest in you? Examine them; judge them *for yourselves*; and be not misled by the ill-natured criticism of any superficial observer or thinker, who leaves *diagnosis* and every other just considera-

tion neglected, and wonders that a fistula, left by a cut-throat, is not a remedy for—*laryngismus*, and its effects? No! but—for epilepsy!

Having thus stated in *what* circumstances tracheotomy may be available in epilepsy, I will now beg your attention to *that* which I finally regard as the simplest, the safest, *mode* of performing of it.

I present you with a pair of scissors, so ground at the point as to leave a notch. (See THE LANCET, vol. i. for 1854, p. 645.) I propose that, having selected the point of the trachea at which the orifice should be made, you take up a fold of integument over it, and, by means of the scissors, make a vertical incision; that the scissors be now turned one-fourth round; that their points, brought together, be made to pierce the trachea, and then be separated, so as to *stretch* the tissues, and make an orifice of the proper extent.

The points of a little wire *cage*, such as I now show you, made of the proper size and strength, are then to be brought together, pressed into the orifice, and allowed to expand to the proper extent, in their turn; this being limited by a thread properly attached to it, and placed round it.

Not a minute of time, or a drop of blood has been lost, no danger has been incurred, and yet—the operation is performed!

The cage admits of being compressed, and easily removed, washed, and restored. No veil of viscid mucus will obstruct its aperture in any part, and the danger arising from such obstruction, hidden from observation, but detected by Dr. Edwards, will be effectually averted—a danger which I believe to have existed in many cases in which the ordinary *tube* has been long worn.

I will now, gentlemen, very briefly revert to the cases of epilepsy in which tracheotomy has been used. Mr. Cane's was the first, and the most splendid: life was immediately saved, and the fits were afterwards averted. Life was saved from a present danger in Dr. Herrick's and Dr. Williams' cases. The fits were reduced to a very mild and abortive form in Dr. Edwards' and Dr. Bucknill's cases.

Every event concurs to encourage the *benevolent* inquirer.

There are other applications of tracheotomy.

The patient afflicted with hydrophobia has hitherto fallen a victim to *laryngeal asphyxia* and to *nervous exhaustion*. If tracheotomy were performed the instant the *diagnosis* was made, the patient would *not* die, as he has hitherto, of this *laryngeal asphyxia*. Query, would he necessarily die? If the patient were, further, protected absolutely, like the frog rendered tetanoid by strychnine, from causes of excitement, he *might* not die of nervous exhaustion. Query, is it possible that even the poison of hydrophobia may be, if life were prolonged, as by tracheotomy and security from excitation, eventually eliminated from the system, and life saved?

There is still greater hope of good from these measures in certain cases of *laryngeal tetanus*. My friend, Dr. Webster, once performed tracheotomy in a case of this kind. The benefit was so marked as only to lead to a regret that it had not been performed earlier.

You will find, in a paper which I published in THE LANCET about two years ago, a list of cases in which tracheotomy might be necessary. It is of considerable extent. It demonstrates the value of this remedy, and the importance of being prepared to perform it; for almost *all* the cases requiring it are cases of *emergency*, life being in jeopardy. All that is really required is a pair of pointed scissors and a teaspoon! The former may keep the orifice patent horizontally, the latter vertically, until better instruments are procured—and life is spared: indeed, the very issues of life are in some instances fearfully held, as it were, in our fingers!

Here the lecturer paused, but shortly added,—Gentlemen, I thank your kind invitation to give these lectures, and for your kind attention to them. I trust the three hours have not been spent in vain, and especially that the younger part of my audience will long remember with advantage the principles of medical doctrine which I have inculcated.

The lecturer having been invited to take the chair, Mr. WILSON rose and said that he should propose a vote of thanks to Dr. Marshall Hall for the kindness and courtesy he had shown in coming amongst them to communicate information, illustrated by experiment, concerning the physiology and pathology of the nervous system, which it had been the great pursuit of his life to investigate. The students of the Chatham-street School of Medicine should, indeed, regard the present occasion as *red-letter days*. As for himself and the rest of his professional brethren who had attended this course of lectures, he could say with confidence that they deeply appreciated the philosophic views of Dr. Marshall Hall; and, when they contemplated the state of nervous physiology as it was in their

own early day, and looked at it now, they must be greatly impressed with the debt of gratitude due to those eminent men who had so perfected this branch of science; foremost amongst whom he had no hesitation in placing their distinguished visitor. He concluded by moving the cordial thanks of the assemblage to Dr. Marshall Hall.

Dr. NOBLE had great pleasure in seconding the motion so justly and so appropriately submitted by Mr. Wilson. Thanks, certainly, were eminently due to their distinguished visitor for his kindness in coming amongst them, and in thereby giving to the gentlemen present an important advantage. They had not only had the gratification of meeting the propounder and discoverer of great physiological truths, but that also of listening to his own exposition of them, and of witnessing some of the experiments and demonstrations by which they are substantiated. And here he would observe that, however accurately such doctrines might be learnt from books, by the aid of diagrams, and by repeating the experiments, there was always an especial benefit in drinking in knowledge and valuable precepts at their spring. Look at certain analogies in literary experience. How clear and effective was the appreciation of history by him who had gone for his knowledge to the sources,—to the old quartos and the big folios, instead of to modern duodecimos! He could speak with gratitude of his own experience. He supposed it was some twenty years since that he had first applied himself to the physiological discoveries and practical teachings of Dr. Marshall Hall; probably he soon acquired a fair appreciation of their nature and value. Seven or eight years ago, however, he had had the privilege, through Dr. Hall's kindness and courtesy, of witnessing at that gentleman's own house a long series of experiments made by him, and for several days of conversing with him upon all the allied topics; and from this experience he could tell how much more clear and decided was the apprehension of facts and conclusions learnt in this way. The brief course of lectures now terminated had, in some measure, furnished the students, and the numerous practitioners who had attended the course, with a similar advantage. He was sure that they would feel, as he had felt, in having been so privileged, delighted to have been taught the physiology, and much of the pathology, of the *Spinal System* by the eminent mind that conceived the same; and to have had demonstrations presented to them by the hand that first brought them out. For all these reasons, it was with pleasure, sincerity, and pride, that he seconded Mr. Wilson's motion.

Dr. MARSHALL HALL then rose and thanked the mover and seconder of this vote of thanks; and, after briefly observing that nearly a quarter of a century had elapsed since he first began the studies which led to the detection of the *Spinal System*, urged the students present to pursue their profession with enthusiasm, and early to select some special subject for study and investigation. Such a proceeding was sure, in due time, to bring its reward in reputation and in practice.

#### ON THE

### LAW OF MORTALITY AND SICKNESS OF THE LABOURING CLASSES OF ENGLAND.

By THOMAS ROWE EDMONDS, Esq.,

ACTUARY TO THE LEGAL AND GENERAL LIFE ASSURANCE SOCIETY.

(Concluded from p. 332.)

It has already been stated that sickness, in duration for each year of life, increases with the age, according to the same law which regulates the increasing proportion of deaths to the number living at successive ages. From the unity of law between sickness and death in relation to life, it necessarily follows that the sickness endured at any age bears a constant proportion to the deaths at any specified age. This proportion is commonly found to be, that of two years of sickness to one death. Occasionally this proportion is as low as one year and three-quarters, and as high as two years and a half, of sickness to each death. In addition to the law determining the duration of sickness at each age, there is another law which connects together the number of attacks or cases of sickness with the number of deaths, and consequently with the number of living, and with the duration of sickness at each year of age. The law which regulates the attacks of sickness was first communicated to the public in THE LANCET of the year 1836, (vol. i., p. 855), in an article wherein I showed, from recent observations, that the fatality of cases or attacks of sickness increased with the age according to the law which regulates the increase

of mortality and the increase of duration of sickness for each year of life. I then stated it to be an inevitable consequence of the identity of the numbers regulating the proportion of attacks of sickness to deaths, of duration of sickness to life, and of deaths to life at each age, that the number of annual attacks of sickness for a given number living was the same at all ages, and that the duration of each attack of sickness increased with the age in the same degree as the mortality increased.

The most interesting and remarkable of the above laws of sickness, is that which makes the proportion of annual attacks of sickness to the number living constant at all ages. Notwithstanding its extreme simplicity, the existence of such a law does not appear to have been suspected previous to its announcement; nor did there exist, at that time, any facts which could be appealed to as supplying direct evidence of its existence. The public were subsequently indebted to Dr. Farr for adducing facts directly proving the constancy of the proportion of the numbers attacked by sickness to the number living at various ages of adult life. In the returns from Friendly Societies published by Mr. Neison and Mr. Finlaison, a great multitude of facts have been collected in further corroboration of the proportion of attacks of sickness being constant, and independent of age—at least in the period of florescence. According to Mr. Neison, the constant proportion of living persons attacked by sickness, in any year between 20 and 50 years of age, is 22 per cent. According to Mr. Finlaison, the constant proportion is 24 per cent. in each year. In both observations there is a depression of about 2 per cent. in the attacks near the age of 33 years, which is the age at which the greatest number of admissions of new members occurs; and which consequently is the age at which "selection" might be expected to have the greatest disturbing effect, whether on sickness or on mortality.

In the period of senescence, or at ages exceeding 50 years, the facts bearing on the laws of sickness (whether of attacks or of duration) are everywhere imperfectly recorded, on account of the difficulty of distinguishing cases of sickness from cases of debility from old age. Judging from all observations hitherto made, there appears to be no ground for doubting that the law of attacks, like the law of duration, of sickness, is continuous throughout the two periods of "florescence" and "senescence," or from the earliest to the most advanced age of adult life. The returns of Mr. Neison are not available for the purpose of determining whether the proportion of attacks of sickness is constant at advanced ages, as well as at ages under 50 years, because no attempt has been made to distinguish therein sickness from old age. But the returns of Mr. Finlaison, which professedly represent pure sickness, free from cases of debility from old age, are sufficient for the present purpose. There is, however, a preliminary correction to be made in the numbers which Mr. Finlaison takes to represent attacks of sickness, which correction is of small amount at ages below 50 years, but is of great magnitude at very advanced ages. Mr. Finlaison assumes the number of persons who have been on the sick-list in the course of the year to represent the number of new attacks of sickness in the year. This assumption is obviously incorrect, for in such list is included the cases of sickness remaining at the end of the previous year, and transferred to the new year. The number of such transferred old cases of sickness is represented by the proportion of living constantly sick at the particular year of age, which is the correction to be applied in diminution of Mr. Finlaison's alleged numbers of attacks. For example, according to Mr. Finlaison's tables, and taking decennial intervals of age, the proportions constantly sick at the ages 50 and 80 years, respectively, are  $3\frac{1}{4}$  and 26 per cent. Also, according to the same tables, the annual proportion of persons on the sick-list is  $26\frac{1}{2}$  per cent. at the age of 50 years, and 56 per cent. at the age of 80 years. If we subtract from the latter numbers the corrections previously given, we obtain the numbers 23 and 30 per cent. as the corrected per-centage of new annual attacks at the respective ages of 50 years and 80 years. These two numbers approach sufficiently near to each other to warrant the presumption that a defect in the observation is the cause of the failure to obtain an exact coincidence. The apparent excess of attacks at the age of 80 years is in all probability owing to the complication of debility from old age with cases of sickness. Seven out of 30 cases of sickness would not have had the visible effect of producing incapacity for labour, if the man of 80 had not been subject to a debility from which the man aged 50 was comparatively free.

On inspection of Table III., it will be seen that at the mean age of 40 years, the rate of sickness obtained by combining all three observations, is 1.17 weeks to one year (or 52 weeks) of

life, which is the same thing as 2·24 years of sickness to 100 years of life, or 2·24 per cent. of the living constantly sick. From the same table it will be seen that the mean number of deaths at the same age, according to the same combined observations, was 1·02 in one year out of every 100 people

living. There was consequently 2·24 years of sickness to 1·02 deaths, or 2·20 years of sickness to one death. This relation of sickness to death remains constant when other ages are compared in the assumed observation representing the mean of all three observations.

TABLE III.

SHOWING, for Decennial Intervals of Age, the Rates of SICKNESS in Rural, Town, and City Districts, according to each of three Observers; also showing the Mean Rates of Sickness and Mortality in each of the same three Districts, for comparison with the results of Theoretical Tables, in all of which the period of "Senescence" commences at the age of 48 years.

The relation of sickness to death, which is constant for different ages in the same observation, is subject to variation in different observations. For example, in rural districts, the proportion of sickness to one death, at every age, is found to be 2·52 years, when the average of all three observers is taken; whilst in town and city districts, the averages similarly obtained are 2·29 and 1·92 years of sickness to one death. This result, from combining the three observations on each of the three districts, is not, however, in accord with the separate observations, for Mr. Finlaison states the disproportion between rural and city sickness to one death to be much greater than the disproportion stated by the other two observers.

The present three observations, when closely investigated, do not, however, either of them make good the proposition, that the quantity of true sickness to one death is less in cities than it is in rural districts. Mr. Finlaison, in showing the effect of "heavy" labour in increasing the apparent sickness, has supplied a cause sufficient to account for the apparent excess of rural sickness over town and city sickness. The apparent sickness, according to Mr. Finlaison, depends in a great measure on the occupation or labour of members being "heavy" or "light." He has shown that, at any given age, whether in rural or city districts, whether the mortality is high or low, the apparent sickness is 20 per cent. greater for heavy than it is for light labour. In the two cases, the real amount of sickness is probably the same, but the incapacity for labour, or apparent sickness, is 20 per cent. greater in the case of heavy labour. This excess probably arises from minor degrees of sickness, which are sufficient to incapacitate for heavy, but not for light, labour. The proportion of "heavy" labour is much greater in rural than in city districts. We have thus a reason for expecting more apparent sickness in the former than in the latter districts. The cause now mentioned, when taken in combination with the opposite methods of treating superannuation, is also sufficient to account for the disproportion of rural to city sickness being greater, according to Mr. Finlaison, than it is according to the other two observers; for a considerable proportion (one-fourth part) of the sickness exhibited in the tables of Mr. Neison and Mr. Ratcliffe, consists of the life-time

of superannuated members, who do not engage in labour, whether heavy or light. On the other hand, Mr. Finlaison, in his tables, takes no account of superannuation, except to exclude it from any connexion with sickness. It thus happens that all Mr. Finlaison's recorded sickness is affected by the distinction of heavy and light labour; whilst three-fourths only of the sickness recorded by Mr. Neison and Mr. Ratcliffe is so affected.

The laws of mortality, of sickness, and of health, may be said to be the three chief regulators of human life. It has been already shown, that there exists such a parallelism between the two laws of mortality and sickness (in duration,) that when the mortality at any age is known, the sickness at the same age is also known, by means of the existing constant relation of sickness to death at all ages, (about two years of sickness to one death.) It remains to be seen that the degrees of health at different ages also bear a simple and constant relation to the mortality. It is first to be noticed that health-time, being that portion of a man's life-time which is not sick-time, will of course decrease with the age as sick-time increases; so that, at very advanced ages, sick-time and health-time will form nearly equal portions of a man's life-time. At the early ages, however, of adult life, the proportions of health-time to life-time decrease so slowly, that, for the purpose of estimating the amount of health enjoyed at any age between 20 and 50 years, the element of time may with propriety be neglected, and the degree or intensity of health be alone regarded. On reflection it will be easily perceived that the degree of health possessed at any age is identical or synonymous with the vital force possessed at that age. The mortality is the inverse measure of the vital force, and is consequently the inverse measure also of the intensity of health.

For the purpose of illustrating the combined effects of the laws of mortality, sickness, and health, let any two ages in the period of "floreence," differing from each other by the interval of 24 years, be taken, this being the interval in which the mortality doubles itself. For example: if the mortality, sickness, or health, be numerically expressed for the age 20 years, we have only to multiply such mortality or such sickness by 2, in

order to obtain the numbers expressing the mortality and sickness respectively as existing at the age 44 years. Similarly the intensity of health at the age 44 years, is obtained by dividing by 2 the number expressing intensity of health enjoyed at the age of 20 years. If, instead of comparing people of different ages in the same class of population, we compare people of the same age in different classes of population, whereof the mortalities differ in the proportion of 1 to 2, we obtain the same results as those just stated: if the mortality is increased 100 per cent., the sickness will be simultaneously increased 100 per cent., and the intensity of health reduced 50 per cent. Sickness and death are unquestionable evils, which increase as the force of life or health decreases. Additions to intensity of life or health are unquestionable benefits, because they have the effect of diminishing unquestionable evils. Independently of these unquestionably beneficial effects, there is ground for assuming that life or health is intrinsically a benefit: whence it would follow, that additions to intensity of life, or robustness of health, must also be benefits. If the intensity of life or health be doubled, there is nothing to oppose the conclusion that the intrinsic benefit, pleasure, or happiness is also doubled.

All three observers have devoted much of their attention to investigations of the mortality of members of Friendly Societies, classed according to occupation, with a view to discover the effect of any particular branch of labour or occupation in prolonging or shortening the duration of life. So far as regards the great majority of branches of labour examined, the comparative results elicited by the three observers are unsatisfactory, since they fail to exhibit any principle of classification applicable to trades in general. In one important respect, however, the three observers are nearly agreed, viz., as to the two classes which occupy the extremes of the scale of vitality. The highest rank is occupied by agricultural labourers; the lowest rank is occupied by those in the occupation of clerks. The highest degree of vitality belongs to the class whose corporeal powers are most exercised; the lowest degree of vitality belongs to the class whose corporeal powers are least exercised. According to the observations of both Mr. Neison and Mr. Ratcliffe, the vitality of clerks is lower than that of painters, potters, and miners; that is to say, an occupation involving no corporeal labour is apparently more detrimental to life than occupations involving corporeal labour in a poisoned atmosphere.

According to the observation of Mr. Finlaison, "heavy" labour in rural districts is attended by increased vitality, whilst in town and city districts heavy labour has no similar advantage over light labour. This opposition of results is open to question on the ground of imperfect classification of the trades taken as the constituents of heavy labour and light labour respectively. A large proportion of the trades carried on in towns and cities has been classed by Mr. Finlaison as heavy labour, although confined to the hands and arms, and involving little exercise of the chief or lower limbs of the body. Such labour cannot, with reason, be considered as the counterpart of the unmistakably "heavy" labour of the agriculturist. It is highly probable that, if the distinction between heavy labour and light labour were as well marked in towns and cities as it is in rural districts, a similar advantage would be shown to exist in all three cases in favour of the vitality of the classes whose labour is "heavy."

The amount of bodily labour undergone, or muscular force exerted, by any particular class of labourers, appears to afford a correct index of the vitality of that class. This principle, which has been shown to be applicable to the opposite extremes (agriculturists and clerks) in the scale of vitality, would probably be found applicable to the intermediate classes, if they could be arranged in well-marked grades of labour undergone. This principle, when applied to the aggregate of trades collected in rural, town, and city districts respectively, will serve to explain why the vitality of rural is greater than that of town populations, and that of town greater than the vitality of city populations. For it cannot be doubted that the average amount of labour undergone by each man is greater in rural than in town, and in town greater than in city, districts. The disparity in the vitalities of the rural, town, and city populations would be greater than that observed if the native residents alone of rural, town, and city districts had been compared; for there is a great interchange of population by migration between rural and town districts, and between rural and city districts, whilst at the same time the balance of gain by migration is always against rural districts, and in favour of town and city districts. This transfusion of the rural element unduly elevates the vitality belonging to the native populations of towns and cities, at the expense of the vitality belonging to natives of rural districts. If such recruiting from rural districts were stopped, the population of a large city, in how-

ever healthy a locality, would, in no long period of time, become unable to maintain its members by propagation.\*

When classes of people engaged in different occupations are compared, there appears to be no reason for doubting that the vitality of each class is proportional to the amount of labour performed by that class. It is only when single individuals of the same or different classes are compared that the principle is found to be inapplicable. The vitality of an average agricultural labourer is greatly superior to that of an average clerk; but there are many clerks who possess a greater degree of vitality than that of an average agricultural labourer. An agricultural labourer commonly exercises his power of labour to its full extent, whilst many a clerk, possessing a great power of labour, does not exercise that power. In the former case, labour undergone and capacity for labour are almost exact measures of one another; but in the latter case the labour of an individual is no index of his capacity for labour. Amongst individuals engaged in the same occupation, it may be said, with great appearance of truth, that the vital force of each is proportional to his capacity for labour. Having arrived at this principle, governing the vitality of the members of any one trade, there appears to be no obstacle to the extension of the principle to individuals of different trades when compared together, and to say generally, that the vitality of any individual is proportional to his capacity for labour. In the majority of occupations (excluding that of agricultural labourers) the capacity for labour is generally in excess of the labour actually performed; but the proportional excess is probably nearly the same in most trades, whilst the excess itself has a continual tendency to diminution. This tendency is a consequence of the general law, that capacity for labour increases with the full exercise of that capacity, but diminishes when that capacity is insufficiently exercised.

The vital force of any human being is closely and almost inseparably connected with the capacity for muscular exertion. The greater the muscular force, the greater the vital force; a conclusion which might be arrived at without the aid of statistical observations of the number living and dying. Nearly all the known elements of animal vitality are included or involved in the capacity for hard labour. The animal organization is tasked to its full extent by hard labour; if any of the principal organs be unsound, hard labour will prove the defect. The capacity for long continued hard labour cannot exist without powerful digestive and respiratory organs, a great strength of muscular fibre, and nearly all other known elements of strong vitality.

The vital force of mankind (and probably of animals in general) is subject to a composite law, consisting of three parts, one of which is immutable, and the other two variable, and capable of being influenced by human agency. The constant annual rate of increase of the vital force throughout the period of "childhood," the constant annual rate of decay of the vital force during the period of "florescence" or reproduction, and the greater constant annual rate of decay of the vital force during the period of "senescence," are in all probability immutable quantities which, like the law of gravitation, form part of the foundations of the universe. The second part of the composite law consists in the extent of the two periods of childhood and florescence respectively. In different masses of population, and in the same mass at different times, the extent of the period of childhood has been known to vary so much as three years, and the extent of the period of florescence so much as ten years. The cause of these variations is yet unknown. If the cause, when discovered, should prove to be under the control of human agency, the extent of these periods may be permanently prolonged, of which the effect would be more than a proportional prolongation of human life. The third and last part of the composite law of vital force, consists in the absolute amount of that force possessed at birth, or at any specified age, by the average individual of a class. This amount in England has been shown to vary so greatly, that there exist classes of population whose mortalities at the same age differ from each other in the high proportion of one to three. These great variations have been shown to have a close connexion with degrees of bodily labour, and are apparently, to a great extent, under the control of human agency. Without any interference of man, the laws of nature operate to promote the increase of the classes possessing the higher

\* Since the above remarks were written, the commissioners of the Census of 1861 have published their Report, exhibiting, for the first time, the birth-places of the English population. It is there shown, that out of every 100 adult persons resident in London and 61 other large towns of England, only 40 were resident in the towns wherein they were born; whilst of the remaining 60, immigrants, 20 were born in other parts of the counties in which they reside, 30 were born in other counties of England, and 10 were born in Ireland and Scotland.

degree of vitality, and to retard the increase of the classes possessing the lower degrees of vitality. It is, however, within the power of man greatly to aid the operations of nature, by offering additional rewards to the higher degrees of labour, and affording additional facilities for the increase of that part of the population which is now ascertained to possess the highest degree of vitality.

October, 1854.

## OBSERVATIONS ON CHOLERA.

By ROBERT MOLLOY, M.D.

AN attentive perusal of the many valuable papers on cholera which have appeared in *THE LANCET*, has forced me to conclude that we, as a professional body, have departed somewhat from the track of legitimate inquiry. In our anxiety to obtain a cure or antidote for this formidable disease, we have overlooked the Baconian rule of progression from the "better to the less known," and have forgotten that the surest way to secure available information is to study the antecedents and accompaniments of this, as well as of every other epidemic. The late outbreak afforded me an opportunity of making a few observations upon some of the phenomena which precede and attend upon cholera; and as no reference that I am aware of has been made to them by previous writers, I hasten to lay them before you as briefly as I may.

*Observation 1.*—During the prevalence of the cholera *no one was absolutely well*. All I came in contact with, with scarcely an exception, were suffering from furred tongue, mal-aise, languor, depression of spirits, pains in the back and limbs, with other symptoms of low fever; indicating the existence of "something" of general influence (predisposing).

*Observation 2.*—Universality of diarrhoea, even in persons usually least disposed to such attacks. When diarrhoea was not absolutely present, there were fugitive pains in the bowels, flatulent rumbling and roaring of intestines, to such an extent that it might be heard frequently several yards off; and the evacuations from the bowels, when examined, were lumpy, containing little or no bile. This condition almost invariably terminated in diarrhoea, and has been well described by "M.D." in *THE LANCET* of Nov. 4th.

*Observation 3.*—Tendency of diarrhoea when it first appeared, about the end of July and commencement of August, to pass into dysentery, with bloody motions, intense and distressing tenesmus, occasionally going on to prolapse of anus, both of which would persist for days after the intestinal secretions had been rendered healthy.

*Observation 4.*—The peculiar mode in which diarrhoea commonly made its appearance; the instantaneous nature of the attack, with the impossibility of resisting or even controlling it by any exertion of will; and the great force with which the secretions were ejected from the bowels.

*Observation 5.*—Singular manifestation of the cholera poison, wholly different from what we have seen before, (at least, I have never seen it.) Many patients in a state of collapse would seem to improve: vomiting, purging, cramps, would all leave, warmth and pulse return, reaction be established, and at the time when a favourable prognosis might fairly be given, and hope at the highest, they would quietly pass away in a painless sleep. Is this due to a compound poison—a narcotico-irritant? Like arsenic, giving rise to extreme irritation of the digestive mucous membrane primarily, and at length causing death by its narcotic action on the nervous centres?

*Observation 6.*—On the subsidence of cholera, typhus and other fevers of a low type resumed their influence; but it has been especially followed by an epidemic affection of the glands of the throat and mouth, external as well as internal, which become suddenly enlarged, and acutely painful, without any disposition to pass into suppuration or ulceration.

As the few remarks which succeed are intended to be speculative and suggestive rather than explanatory, I would venture to draw some deductions from the pre-announced observations, which I shall put interrogatively, in order the better to fix the attention and elicit the opinions of those of your correspondents who have had the greatest experience in the treatment of this virulent disease.

*Conclusion 1.*—That a stage preceding diarrhoea must be admitted? This may be caused by starvation, excess in drink, exhaustion, illness, mental anxiety, anything in short which reduces the constitutional powers below par.

The sequence may be thus stated:—Low fever, or other systemic derangement—diarrhoea—collapse.

*Conclusion 2.*—That the presumable seat of disease is the gastro-intestinal mucous membrane?

*Conclusion 3.*—That cholera is contagious? Using the term as synonymous with infectious. A peculiar poison in cholera is now very generally admitted, and if the preceding observations be correct, causation by predisposition is complete—a poison and a fit recipient.

*Conclusion 4.*—That the purgative or "eliminative" treatment is not the rational treatment may be clearly demonstrated by the following reasons:—That cholera has not unfrequently been caused by the use of aperients—that the excessive discharge does not cure itself—that it is inadmissible, and would be highly injurious in diarrhoea following fevers, the diarrhoea of phthisis, of exhaustion, or of dysentery—and by the nearly unanimous experience of the contrary practice adopted in the diarrhoea which almost invariably precedes cholera. Besides, if the truth of the fifth observation be conceded, it would tend to show that death does not necessarily result from the presumed drain of the serum of the blood, and its consequent thickening, but from the narcotic influence of the cholera poison upon the nervous centres.

November, 1854.

## EARLY OPERATION FOR HARE-LIP.

By ALEXANDER DOUGLAS, Esq., M.R.C.S., Stratford.

THE earliest operation on record for this malformation, I believe, was performed by me on a child now ten weeks old. I attended the mother in her labour, which was a natural but rather protracted one, it being her first. There was no tumefaction of the child's scalp or features, which were strong and healthy. Two hours after birth, finding the child tranquil, I operated in the usual manner, it being a case of single hare-lip, without fissure of the palate; instead of pins I used fine sewing needles, cutting off the points with pliers. There was but trifling hæmorrhage. The third day the child drew the breasts, and on the fourth I removed the needles. The case was very successful, having healed by the first intention.

My reasons for operating thus early were—Nature's law, that infants bear much injury during birth without fatal results, and their capability of fasting for the first three days after birth, milk being seldom secreted until then.

## GUY'S AND ST. MARY'S HOSPITALS.

### AMPUTATIONS AT THE ANKLE-JOINT.

(Performed by Mr. BIRKETT and Mr. URE.)

*CASE 1.*—This operation is now so frequently performed at the various hospitals of this metropolis, that putting them upon record can have but a statistical interest. It would, however, be very desirable, as to statistics, if the profession could learn, by well-arranged figures, the per centage of cases where the flap alongs, and also the proportion of patients who eventually are enabled to make a satisfactory use of the stump. But this is not this day our object, we wish merely to acquaint our readers with certain modifications in the operation which bears Mr. Syme's name. One of these consists in an attempt to render the plantar flap firmer and more resisting; the other in the sawing of the thin plate of bone on the lower portion of the tibia and fibula, without disarticulating, after the soft parts have been dissected into the proper flaps. The latter modification was lately introduced by Mr. Birkett at Guy's Hospital, the former by Mr. Ure at St. Mary's.

Mr. Birkett's patient is a young man, about twenty years of age, who has been suffering for some time from scrofulous caries of the metatarsus. An operation had been undertaken some

months before the one which we are going to describe, and consisted of the removal of almost the whole metatarsal bone of the great toe. The results of this measure had not been of a satisfactory kind, and the patient, wearied by suffering and debilitated by suppuration, requested amputation. On the 7th of November, Mr. Birkett proceeded to remove the foot in the following manner:—The usual incision was first made across the instep, and the soft parts dissected upwards to a short extent; the knife was then carried across the sole of the foot from one of the extremities of the upper incision to the other, and Mr. Birkett now began a dissection upwards and backwards at the back of the os calcis, until he arrived behind the tibio-tarsal articulation. He thus obtained a large and sufficient posterior flap, and then formed a complete anterior one, in dissecting upwards from the original line of incision until he had reached about half an inch above the upper articular surface of the astragalus. The saw was now applied across the malleoli, and these processes were removed with the thin plate of bone of the lower articular surface of the tibia, which is generally taken off in Syme's amputation at the ankle-joint.

It will be perceived that Mr. Birkett did not disarticulate at all, as is ordinarily done in this operation; and if we may be allowed to express the effect of this modified amputation upon the spectator, we would say that the whole proceeding looked very effective and secure. Of course this modification can hardly have any material influence on the ultimate results of the amputation; but it may perhaps be looked upon as a step towards simplifying the operation. Mr. Birkett, in examining the foot after the operation, drew attention to the work of repair which had been going on at the site where bone had originally been removed; union had taken place by means of firm, fibrous tissue. Some sloughing of the flap has since taken place, but the patient is now doing well, and likely to recover with an useful stump. Let us now turn to the second modification of Syme's amputation at the ankle-joint.

#### ST. MARY'S HOSPITAL.

##### AMPUTATION AT THE ANKLE-JOINT.

(Performed by Mr. URE.)

CASE 2.—Thomas P.—, aged nineteen years and a half, was admitted on 17th March, 1854. He has sandy hair, grey irides, and tumid upper lip. About eight months previously he was attacked with pain and swelling of the right instep. Eight weeks subsequently an abscess formed, and burst in two places, one near the inner side of the dorsum, the other near the ball of the great toe. He was confined to the house, but still followed his employment, that of a grocer's assistant, in spite of the discharge, till about a fortnight before his admission into the hospital, during which period he had attended, without benefit, at a dispensary. The patient was unable to assign any cause for the swelling of the foot, which was nearly double its natural size. There was a sinuous opening about one inch and a half from the angle between the first and second toes; and another near the tarsal end of the fifth metatarsal bone. Through both of these, carious bone could be detected by means of a probe. The man complained of pain at the instep when standing up; he was lethargic, subject to occipital headache, and his mind occasionally wandered during the night; his pulse was quick, tongue furred, and his bowels were costive.

Mr. Ure was led, from the general appearance and symptoms of this patient, to infer tubercular disease of the brain.

Fourth day after admission.—An abscess formed over the metatarsal end of the great toe, which was opened; at the bottom of it diseased bone was discoverable.

As there was no prospect of improvement, Mr. Ure, on the 22nd, amputated the great toe, removing, at the same time, about an inch of the adjoining portion of the metatarsal bone. This latter portion of bone, and the proximal phalanx, were both affected with caries. He likewise gouged out the carious surface of the fifth metatarsal bone.

Tenth day after the operation.—The patient complained of severe headache the preceding evening, which was relieved by the application of two leeches; after which he slept well. The skin was cool; pulse 120; bowels were open. He took with relish his daily allowance of food. The wound seemed healing, and was dressed with dilute solution of chloride of soda.

Towards the middle of April—namely, twenty-five days after the operation—the wounds were nearly cicatrized, but the foot continued swollen, and two sinuous ulcers formed a little below the instep.

A fortnight afterwards the man's appetite began to flag, having previously been good. There was no discharge from

the openings, but the surface appeared inflamed, at times tender and puffy.

As the disease had evidently extended to the tarsus, and his health and strength, about two months after the removal of the great toe, were manifestly giving way, it was determined, on consultation, to amputate the foot at the ankle-joint, which was done as follows, on the 24th of May, by Mr. Ure.

The patient having been rendered insensible by chloroform, an oval incision was made across the instep, from one ankle to the other, and the knife was then carried in a semicircular direction across the sole of the foot, the points of both incisions being made to meet in front, a little below the malleoli. The tibio-tarsal articulation was then opened at the outer side, the internal lateral ligament divided, and the astragalus luxated. As the os calcis was sound, Mr. Ure removed with the saw its anterior portion, thereby leaving a thin plate of the convex posterior surface of the bone in the heel. After sawing off the malleoli, together with a thin disc of the articular surface of the tibia, and securing the tibial arteries, the above-mentioned portion of os calcis was brought into as close apposition as possible with the cut surface of the tibia. This last step was not effected in a satisfactory manner, owing to the retractile agency of the tendo Achillis; and Mr. Ure conceives that advantage would be gained in any similar operation, by a preliminary subcutaneous division of that tendon. The edges of the wound were then placed in contact, and retained by means of sutures, a fold of wet lint laid over the stump, and the patient conveyed to bed. The ends of the metatarsal bones, and the bones of the tarsus, with the exception of the astragalus and os calcis, were extensively carious. The synovial membranes were in a state of pulpy degeneration. Both the diseased synovial membranes and the cancellous texture of the affected bones were infiltrated with tubercular corpuscles. These consisted of irregular ovoid corpuscles, containing from six to eight dark molecules.

First day after amputation at the ankle-joint.—Slept well the first part of the night, after having taken an opiate; pulse 80; tongue dry and rather glazed; no complaint of any kind; he enjoyed his breakfast; there is a slight oozing of sero-sanguinolent fluid from the wound.

Second day.—Slept tolerably well; took his dinner with relish, along with a pint of porter; pulse 120; tongue moist; there was a faint blush of red, extending about six inches up the limb from the stump; the stump itself was looking favourably.

Third day.—Slept well; pulse quick; tongue moist; appetite good; margins of the wound suppurating; dilute solution of chloride of soda as a dressing.

Fifth day.—Pulse 120, more firm than previously; enjoying his daily food; tongue clean; bowels open; edges of the wound somewhat sloughy; the end of the tibia can be felt. Erythematous blush was arrested by pencilling the margin with nitrate of silver.

Sixth day.—Pulse continued quick; wound was granulating at the outer angle; temperature of the under flap natural. Compound tincture of benzoin as a dressing under a linseed poultice.

Eighth day.—Has been several times sick; a good deal of the lower end of the tibia laid bare through partial destruction of the flap by sloughing; discharge copious. Mr. Ure ordered one minim of creosote in three drachms of compound galbanum pill to be taken thrice a day.

Eleventh day.—Edges of the wound looked healthier than before; discharge thick and yellow; tongue red; face flushed; bowels open; skin cool; pulse 108; passed a good night; vomiting was stopped by the creosote and galbanum pills.

Fifteenth day.—Pulse 120; about an inch of the surface of the tibia exposed, from which granulations are sprouting; discharge healthy, and diminished in quantity; painful sensation in the stomach after taking food. Mr. Ure ordered three grains of extract of conium and two of dried soda to be taken three times a day.

Sixteenth day.—Countenance improved; tongue clean; slept well; no return of vomiting or pain in the stomach; bowels rather costive; stump looked well; discharge still further diminished; granulations healthy.

Twenty-sixth day.—Stump has made favourable progress; discharge copious; pulse 120; countenance pale; expressed himself as on the whole improved in health; appetite was good; slept well; has latterly had six ounces of wine in the day, two ounces of brandy, together with a liberal allowance of food. He was now ordered five grains of citrate of iron and quinine in a pill, to be taken thrice a day; dilute solution of chloride of soda as a dressing.

Twenty-ninth day.—Much better in bodily health.

Thirty-second day.—Slight erythematous blush appeared at the lower part of the limb, for which a solution of acetate of lead with opium was ordered; the pulse, though quick, was amended in strength; appetite good; nights good; bowels regular; complained of headache. The pills of iron and quinine were discontinued.

Thirty-eighth day.—Granulations were healthy. He seemed improved in constitution, but the face was flushed, and the pulse quick. Soon after this, an abscess formed at the outer side of the stump, which was opened. On introducing a probe through the opening, it came in contact with a denuded portion of the plate of the os calcis. The wound was nearly cicatrized. Without any obvious cause, he had three fits of an epileptic character at intervals of a few days. The last occurred on the forty-first day after the operation, soon after he had eaten his dinner, and proved fatal within five minutes.

It was ascertained, on cadaveric inspection, that the edge of the lower and posterior part of the tibia was rough, that there were firm bands of adhesion between the tibia and os calcis externally, the base of the plate of the os calcis being situate behind and to the right side of the tibia. About one-half of the cut surface of the remnant of the os calcis was in a state of necrosis.

On removing the calvaria, the membranes and whole surface of the brain were dry, and the surface-vessels rather empty. About five ounces of fluid were found in the ventricles. The lower part of the right side of the cerebellum was in a soft, pulsatous state, containing tubercle in various degrees of softening, and which, in fact, infiltrated the cerebral mass. The thoracic viscera appeared natural. In the abdomen, traces of bygone tubercular peritonitis were discernible, and a highly congested condition of the left kidney.

CASE 3.—Wm. D—, a labourer, aged twenty-eight years, was admitted March 17th, 1854, with an enlargement of the left ankle-joint, which commenced about five weeks previously, and has increased in a very gradual manner. It has been the seat of occasional, but not of severe pain. The only treatment employed has been poulticing.

It was ascertained, on examination, that there was considerable effusion into the cavity of the ankle-joint, which was nearly double the size of the other, and that pain was produced by pressing the articular surface of the astragalus against that of the tibia. One of the sub-maxillary glands on the right side was enlarged to the size of a marble, adjoining which was an abscess that discharged a little. The glandular swelling began about a year anterior, after a cold. Mr. Ure ordered three grains of iodide of potassium, and ten of bicarbonate of potash, in infusion of quassia, to be taken thrice a day, and a blister over the tumour.

Seventh day.—Ankle much the same. Blister rose well, and is now healed. Repeat the blister.

Tenth day.—Ankle much the same in size. To be pencilled over every other day with tincture of iodine, and a roller applied.

The ankle continued to get worse up to the third month after admission, when considerable swelling over the outer ankle occurred, in which the fluctuation of fluid was perceptible, the superincumbent skin presenting a faint, red blush. An exploratory puncture having been made and pus detected, a crucial incision was made with a bistoury through the external wall of the abscess, just below the outer ankle, which gave egress to a quantity of blood and flaky matter.

A succession of abscesses now formed, up to the thirteenth week, and as the patient's health was rapidly declining, and as there was extensive disorganization of the structures composing the ankle-joint, amputation was performed on the 25th of June, thirteen weeks after admission, the patient having been previously rendered insensible by chloroform.

As there was an ulcerated opening on each side, communicating with the ankle-joint, Mr. Ure planned his incisions accordingly. Commencing behind the outer ankle, he carried the knife from below towards the external border of the foot, then passing it under the sole, prolonged the incision to the internal border, terminating about three quarters of an inch before the inner ankle. He next connected these two points by a somewhat transverse incision upon the back of the foot. His object was to preserve the artery in the flap. The operation was concluded by dividing and detaching the soft parts, so as to procure the removal of the foot, and, by applying the saw, to separate the malleoli and a thin plate of the articular surface of the tibia.

Three vessels were secured by ligature. Little blood was lost during the operation. By the above mode of procedure plenty of integument was saved, so that there was no lack of

flap. The edges of the wound were brought together and retained with sutures, and covered with a pledget of moistened lint.

On examining the affected structures, there were found pulpy degeneration of the synovial membrane, extensive erosion of the cartilages, and caries, with softening of the contiguous surfaces of the astragalus and tibia. The microscope revealed, in the juice of the morbid synovial membrane, degenerate cells, varying in size from that of a pus corpuscle to treble that magnitude, and containing granules, besides small oval, and some caudate, cells.

Hospital gangrene was at this time prevalent in the wards, and this patient did not escape the infection. On the fourth day after the operation, the anterior portion of the flap began to slough. The destructive process extended so as to expose the end of the tibia. By the employment of charcoal poultices, together with a generous diet and a liberal allowance of wine and brandy, the sloughs were all detached on the twelfth day from the operation. A dilute solution of chloride of soda was then substituted for the charcoal poultice. His pulse was 120, rather weak; the tongue was clean, and he was taking his food well.

Fourteenth day after the operation.—Wound clean, and granulating in a healthy manner; pulse 108; countenance good; tongue clean; appetite good; sleeps well.

Thirty-fourth day.—Granulations on the surface of the wound rather flabby; general health good. Sore to be dressed with a dilute solution of sulphate of zinc.

From the above date all went on favourably, and by the latter part of September, three months after the operation, the granulating surface was completely cicatrized. The result has been an excellent stump.

Being on the subject of scrofulous affections of the bones of the foot, and having given examples of the obstinacy with which the disease often resists the best-directed therapeutical efforts, we may as well throw a little light on the dark picture, and close our account by quoting a case in which Mr. Coulson succeeded in arresting the progress of caries by complete gouging of the affected portion of bone.

Bridgett S—, aged eleven years, was admitted into St. Mary's Hospital, March 31st, 1854.

About two years previously, in consequence of exposing the naked feet to cold and damp, she became affected with pain and swelling in the right foot, which ended in the formation of matter. This passed off; but about four months before her admission, a small blister was perceived a little above the outer ankle, which ran on to inflammation, and ended in the formation of matter. Three weeks before the child came to this hospital, inflammation about the external malleolus set in, and an abscess formed, which was opened.

There is at present a swelling over the outer malleolus, fungoid granulations beneath, and three unhealthy openings communicating with each other:—

Has been accustomed to poor fare, and the pain in the part is increased on exposure to cold. She has been taking cod-liver oil for the last three weeks, but with no very marked benefit.

Mr. Coulson ordered castor oil, a poultice to the part, and one ounce of cod-liver oil three times a day.

Fifth day.—On probing, dead bone was detected, most likely about the astragalus; and on the thirteenth day, portions of dead bone were taken away from the outer side of the os calcis. A cavity was now discovered between the calcaneum

and astragalus, from which some portions of bone were likewise removed.

Fifteenth day after the operation.—Has much better colour; wound looks well; some motion in the joint. Ordered to be dressed with iodide of mercury, and to be well bandaged.

Sixth week.—Has been rapidly improving; moves the ankle freely, and without pain; wound is covered with healthy granulations.

Third month.—Discharged to-day for the purpose of getting her down to the Margate Infirmary. Walks perfectly well; the wound on the foot entirely healed, with the exception of a small superficial ulcer.

### Medical Societies.

#### MEDICAL SOCIETY OF LONDON.

MR. HEADLAND, PRESIDENT.

SATURDAY, NOVEMBER 25TH, 1854.

MR. I. B. BROWN briefly referred to a case of

#### INVERSION OF THE UTERUS,

which occurred in the practice of a friend in the country. The patient had remained eight hours before she was seen by the medical attendant, during all which time a six months' fetus, with the uterus inverted, and the placenta attached, had lain between the thighs of the woman, who was found in a state of collapse. The placenta having been detached, the uterus was replaced, and the woman got well without a bad symptom.

Several fellows having expressed a wish that further particulars respecting this unusual case should be obtained, Mr. Brown promised to procure them and lay them before the Society.

#### INJECTION OF OVARIAN CYSTS WITH IODINE.

Dr. TYLER SMITH referred to the remarks recently made by Professor Simpson, at the Medico-Chirurgical Society of Edinburgh, on the successful injection of single ovarian cysts with the tincture of iodine, after tapping. Dr. Simpson had now performed the operation many times, and in one case, at the end of a year and a half, there had been no return of the disease. Dr. T. Smith described a case of ovarian dropsy, under his care, in which he had, on the previous Tuesday, with the assistance of Mr. Nunn, drawn off the fluid, and injected four ounces of the tincture of iodine into the cyst. As regards any danger from the operation, the patient had done remarkably well, quite as well as if only ordinary tapping had been performed. The pulse had not at any time exceeded 100. The smell of iodine had been very powerful in the secretions. Both the urine and saliva had darkened silver very readily, showing that iodine had been absorbed, and probably from the peritoneal surface, as it was difficult to understand that the cyst could absorb, or that its injection could be effected without the entrance of some portion of the tincture of iodine into the peritoneal cavity. The injection of the cyst certainly offered another method of dealing with this formidable affection.

Mr. I. B. BROWN remarked that the plan mentioned had been resorted to in Paris in several cases; in only one instance he believed had inflammation, followed by suppuration, supervened, proving fatal to the patient, showing the little liability of the living cyst to be affected by dangerous inflammatory action. Cases so operated upon should be of the simple kind, such as were generally amenable to treatment by tapping, pressure, &c.

Mr. HANCOCK had known of one case, in which a French surgeon had resorted to the operation in question, the pain resulting from which was so agonizing, that for fourteen hours the patient had to be held by four men; but the patient was ultimately cured of the disease.

Dr. TYLER SMITH had not been aware of this operation having been resorted to by the French, but he knew that they had injected iodine in cases of ascites.

The PRESIDENT referred to a case in which Lugol's tincture of iodine had been injected into an ovarian cyst with a successful result.

Mr. DENDY read a paper "On Counteraction," which will be published in THE LANCET.

A somewhat desultory discussion followed, in which many points in the paper were referred to. One of these had reference to the influence of pregnancy in arresting phthisis.

Mr. HIRD thought that facts were against such an arrestment. His own observation had led him to the opinion that

pregnancy tended to hasten the progress of phthisis. Dr. M'Cintock had arrived at the same conclusion from a very large experience. Such was also the opinion of Dr. Chambers. Mr. HIRD mentioned two cases of phthisis, which terminated fatally during the period of pregnancy.

Mr. ALDER FISHER believed that one source of fallacy on the subject under discussion arose from cases of what had been called "hysterical phthisis" having been mistaken for the true disease. In the former cases matrimony would do good; in true phthisis, pregnancy, he believed, hastened the fatal result.

Mr. I. B. BROWN believed that pregnancy arrested phthisis in the early stage of disease, in the later stages it accelerated it. He referred to the effects of pregnancy and lactation in arresting attacks of asthma, several of which cases had come under his notice.

Mr. ROSS thought pregnancy arrested phthisis in the early, though not so in the more advanced, stages of the disease.

Dr. SEMPLE observed that pregnancy retarded the progress of phthisis, the life of the mother appearing to be prolonged until the ovum reached maturity. After delivery the disease progressed more rapidly.

Dr. RICHARDSON remarked that many cases of bronchorrhea, and other diseases which had been arrested by pregnancy, were regarded at the time as cases of phthisis, hence a source of fallacy. In its early stages, however, phthisis was probably retarded by pregnancy, which, by diverting the blood to another part of the body, relieved the congestion of the lungs, in the same way as digitalis or bleeding might relieve the disease.

Dr. EDWARD SMITH remarked that when phthisical persons died rapidly after delivery, the fatal result might have been due to concomitant circumstances, such as the loss of blood consequent upon delivery, and not to the fact of the disease having been arrested by the pregnancy.

The PRESIDENT, out of a pretty large experience, only recollected the case of one phthisical woman dying during pregnancy.

Some other points were hinted in the discussion, which were not available for report.

#### WESTERN MEDICAL AND SURGICAL SOCIETY OF LONDON.

DR. SEATON, Vice-President, in the Chair.

FRIDAY, NOVEMBER 17TH, 1854.

Dr. PETTIGREW having glanced at the difficulties in the way of successful classification of tumours, proceeded to speak of diagnosis, and dwelt strongly upon its importance, and related some sad and melancholy results of false diagnosis. The difficulty of diagnosing abdominal tumours was dwelt upon at some length. How frequently were impacted faeces mistaken for diseases of the liver, pancreas, mesentery, or ovary, by some of our best practitioners; large doses of calomel alone being sufficient for the removal of this state. Easy as the diagnosis of the uterus being gravid might appear to the inexperienced, yet how often the really experienced practitioner has been deceived. A puzzling case of tumour in the lumbar region was mentioned by the author, which after death proved to be Bright's disease, occurring in a horse-shoe kidney, producing during life contraction of the lower limbs upon the abdomen, from pressure upon the nerves supplying them. He passed rapidly on to speak of the causes of tumours, and stated that they depended upon extra vascular supply, from irritation, local or distant, and congenital. Thus, in cases of polypoid tumour, probably resulting from irritation of mucous membrane, the author seldom resorted to operation, which did not eradicate the disease; but he as seldom failed to effect this object by the use of an ointment, composed of equal parts of sulphate of zinc and lard, applied twice daily. Troublesome polypi of the nose were by this means speedily removed. Three cases were related as arising from blows, and occurring on divers parts of the body, which, upon due exploration, were found to contain echinococci. Irritation producing near or distant tumours was dwelt upon, and the author related several cases in illustration: one in which some glands in the spermatic cord had enlarged, and had been subjected to treatment for several years, but without avail. These tumours were the result of distant irritation; for the urine, upon examination, was found to be loaded with crystals of oxalate of lime. The mineral acids, and abstinence from saccharine matters, restored the patient to his usual health, and the tumours eventually disappeared. An instance of tumour from immediate local irritation was pre-

sented in the case of a young lady, who having cut three of her wisdom teeth, all in irregular places, was waiting the appearance of the fourth, when an osseous tumour developed itself, involving the whole of the angle of the jaw as high as the condyle. It was deemed advisable that this tumour should be removed. No tooth was found in it, but a pulpy substance existed in the centre, and gave rise to the supposition that it was either the degenerated pulp of the tooth, or a malignant disease. The patient speedily recovered the operation, and three months ago the wisdom tooth appeared opposite the second bicuspid on the inner side of the jaw. Operations and observations upon congenital tumours were referred to, and an interesting and original method of operating upon a nœvus of the tongue was demonstrated; and the removal of small nœvi by the pressure exerted by the peculiar stringent property of collodion was mentioned. The author then related three cases of removal of cerebral tumours, arising from arrest of development: one in the parietal region, where there was deficiency of bone and protrusion of brain, nine years ago. The child is still living, and perfectly cured. The second arose from deficiency of occipital bone, and consisted merely of fluid and membranes. The operation was successful, and the child died fifteen months afterwards of scarlatina. The third, also in the occipital region, which was removed, the sac containing the whole of the cerebellum. The child lived seventeen days, not a symptom of disease occurring. The wound healed; the child could cry, feed, had power over all its movements, but suddenly, on the seventeenth night after the operation, died in a convulsive fit. Our limited space does not permit us to dwell further upon this paper, but many more interesting cases were related; and, in conclusion, the author offered some observations upon the local, constitutional, and operative treatment of tumours, and also upon the question whether it is expedient to operate upon malignant tumours or not, himself evidently leaning to the operative side.

The meeting adjourned to Friday, the 1st of December, when Dr. Baines was announced to read a paper "On Diuretics and their Uses."

## Reviews and Notices of Books.

*A Practical Compendium of the Recent Statutes, Cases, and Decisions affecting the office of Coroner; comprising the New Enactments relating to the Poor, Police, Registration, General Board of Health, Removal of Nuisances, Prevention of Disease, Scurvy, &c.; also the Laws and Decisions in relation to Burial Clubs, Riotous Assemblies, Steam-boat Navigation, Railroad Travelling, Collisions, &c.; the Explosions of Steam-boilers, Mines, and Gas; and Cases of Poisoning. With Precedents of Inquisitions and Practical Forms.* By WILLIAM BAKER, Esq., one of the Coroners for Middlesex. London: Butterworths; Dublin: Hodges and Smith. 12mo, pp. 702.

*The Parish; its Obligations and Powers, its Officers and their Duties: with Illustrations of the Practical Working of this Institution in all Secular Affairs.* By TOULMIN SMITH, Esq., of Lincoln's-inn, Barrister-at-Law. London: Sweet, 1854. 12mo, pp. 611.

THE works of Sir John Jervis, of Sewell, Umfreville, &c., have been for many years the text-books of coroners in what relates to the duties of their office. That of Mr. Baker, one of the present coroners for Middlesex, is, as he tells us in his preface, to be regarded "in many respects as a supplement" to those digests of the laws regulating the functions of the coroner's court. But we may award to Mr. Baker's work a higher merit than this, inasmuch as of itself it will serve as a text-book for medical practitioners and others to whom a knowledge of the rules governing the proceedings of coroners may be requisite. It points out particularly that in which the elder works are unavoidably deficient—viz., the new duties incumbent upon coroners, and upon medical practitioners as well, which have arisen out of recent Acts of Parliament, chiefly as having reference to sanitary measures, and other means for promoting and securing the public health, and safety of life and limb.

It would naturally be expected,—from the nature of the localities in which a large proportion of Mr. Baker's judicial functions are exercised, consisting of the densely-populated

quarters and suburbs on the eastern side of the metropolis, which not only abound with the sources of disease, but are inhabited in a great part by a fluctuating population, subject to privation and exposure, and frequently of very irregular habits,—that the attention of the coroner should have been forcibly directed to the means of carrying out the intentions and purposes of the General Board of Health. It is obvious to every person acquainted with those localities—Wapping, Shadwell, Stepney, Spitalfields, Limehouse, &c.—that Mr. Baker, in the course of his laborious career, must have acquired a large amount of experience in all kinds of cases which become subjects for inquiry on the part of a coroner. He correctly and very graphically remarks:—

"The experience of twenty years in one of the most busy portions of the metropolitan district, containing a dense and, for the most part, a poor population, abounding in works of very considerable extent and magnitude, comprising almost every species of manufacture, a frontage to the river Thames for a distance of six miles, the whole of the collier pool, and near all the great docks for shipping, has enabled the author to collate, from time to time, some valuable information on the duties of coroner, whilst the practical execution of his office has brought under his notice almost every species of death arising from felonious, accidental, and other causes."—*Preface*, p. iv.

No rational doubt can exist that Mr. Baker, during so lengthened a tenure of office in a district not surpassed, if equalled, in the United Kingdom, for containing within itself the sources of death from disease, violence, crime, and negligence, has become eminently fitted to write a work having for its object to convey information on the sphere, powers, and duties of the coroner's office, and the advantages rendered to the community by that ancient institution, which has descended to us from the times of the Heptarchy.

Accordingly, we have presented, in the treatise before us, a very complete summary of the matters engaging the attention of coroners and medical jurists, alphabetically arranged, and of which the following are some of the principal heads:—Assault; Burial Clubs; Destitution; Drunkenness; Drowning; Fires and Gas Explosions; Homœopathy; Hydropathy; Infanticide; Insanity; Murder; Manslaughter; Poisons; Railroad Accidents, &c. &c.; and at the end of this portion of the work is a copious Appendix, consisting of the Acts of Parliament relating to Coroners, Medical Witnesses, Steam Navigation, Coal Mines, Poor-Law Relief, Contagious Diseases, and numerous other matters; and a very large portion of print appropriated to the consideration of measures calculated to assist the sanitary endeavours of the General Board of Health. It will be seen, therefore, that a great share of the work is devoted to medical topics. The classification of the subjects might indeed, in a future edition, which we hope soon to see, admit of some alteration. The work of Mr. Baker will be found to contain, together with the standard works on medical jurisprudence, all that is necessary for the guidance of the members of our profession as to the duties they are called upon to fulfil in reference to evidence given by them in the Coroner's Court. The work contains a vast fund of useful information on the subjects of which it treats.

Mr. Toulmin Smith has highly distinguished himself as an uncompromising champion of ancient Anglo-Saxon institutions, amongst which the Coroner's Court holds a prominent place. His work, entitled "The Parish," is a remarkable protest against a centralizing spirit, which is one of the characteristics of modern legislation; and he inveighs with great earnestness and boldness against what he considers to be unconstitutional innovations on the old local customs and time-honoured laws of the country. His book displays considerable erudition, and is admirably written in an energetic, "sharp, short, and decisive" style. With the whole of the sentiments entertained, and the conclusions drawn by him, we certainly cannot agree; but in a great many particulars we consider his reasoning and the domestic policy he advocates sound and trustworthy. We quote here the major portion of Mr. Toulmin Smith's

remarks on the Coroner's Court, which will afford a very good specimen of the contents of his book:—

"One form of the courts and habitual inquiries that have been alluded to, does indeed still exist in active vigour; though not without many attempts having been lately made at its emasculation. The coroner's court remains in daily use; and there is no institution in England of more essential importance and value.

"The coroner himself is an elected magistrate. He holds the next rank in the county to the sheriff; and is, indeed, in many cases, substituted for the latter. It is greatly to be regretted that the true character and dignity of this office are not better understood. The coroners are the principal conservators or justices of the peace within the county; and so ought to take precedence of all other justices, all of whom are of far more modern origin."—p. 333.

"The coroners ought, by law, to hold their inquests more frequently than they do, and in a wider range of matters.\* But, though their office is a far more ancient one, and of far higher dignity, than that of ordinary justices of the peace, modern legislation has done all it can to destroy the value of the institution, by making the payment of the coroner's fees subject to the supervision of the latter justices.† A greater absurdity cannot well be conceived: a thing more diametrically opposed to the very spirit of the institution it were impossible to devise. The great object of the common law, in this institution, is, that no man shall die otherwise than by the clearly ordinary course of natural disease, without searching inquiry as to the causes:—and this, whether or not there be any actual suspicion of foul play. Every case of sudden death, or of death by force of any kind, ought, without exception, to be inquired into. Besides this, all cases of death under special circumstances—such as of persons in prison; or in hospitals—ought to be inquired into. The common law of England sets so much value on human life that it requires this. It is needless to point out how the true principle of watch and ward is thus carried practically out, and the public protection served. In addition to these instances, every case of suspicion or doubt should be inquired into. The result that may happen to be found in any case is no test of the propriety of inquiry;—as the marvellous wisdom of justices would often endeavour to represent. If the result could be known beforehand, no inquiry, on any subject, need ever be held. It ought to be satisfactory to find that there has been no foul play. It is a most unwholesome state of mind and reasoning which seeks to make out that, in every case, there must be a foregone conclusion of foul play; and which only considers inquiry satisfactory when such is the result. This is the very opposite of the spirit and principle of the institution itself. It is, in fact, only offering a premium to the bad, when the searchingness and inevitableness of inquiry are checked, by the practical threat that the payment of fees will be disputed, unless the verdict in every case tallies with a foregone conclusion.

"Many other unlawful and most mischievous attempts have been of late years made, and are being continually made, to tamper with the institution of the coroner's inquest. Every such tampering is a premium upon crime; a publication of the determination,—however disguised, and even not consciously intended by the promoters of it,—to shelter and so foster crime. There is no one of our existing criminal courts so valuable as is that of the coroner's inquest; serving so many public interests; so great and daily a protection alike against private crime and malice, and against the carelessness (not to say recklessness) of public companies, and the risks arising from competitive enterprise."—334-6.

"It must always be remembered that the coroner's court is not a court for prosecution. It is a court simply of inquiry how the person dead (or wounded) came by his death (or wounds). It is to find out whether there has been any wrongdoing or foul play—not to try a charge of wrongdoing, and put an accused on his defence. It is this speciality and impartiality that constitute its characteristics and its value. He is an enemy to the institutions of his country, and the safety of the citizens, who, either by fettering the action of this court, or otherwise

tampering with its due and ordinary course, would impart to it a different tone, or destroy these its principles and characteristics."—p. 337-8.

## INTERMENT OF THE BODIES OF CHOLERA PATIENTS.

To the Editor of THE LANCET.

SIR,—I beg to lay before you the following copy of a correspondence with the General Board of Health on the interment of the corpses of cholera patients, and request its insertion in THE LANCET.—I am, Sir, your obedient servant,  
Dewsbury, Nov. 1864. JOHN N. RADCLIFFE.

To the General Board of Health.

GENTLEMEN,—I request most respectfully an expression of your opinion on the following custom, practised by some of the clergy of the established church and ministers of other denominations, in the interment of those who have died from cholera. During the epidemic of 1848-49 the corpses of those who died from cholera were in many places refused admission to the churches and chapels used for public worship, and to which were attached burial-grounds, and were immediately conveyed to the grave. Often also they were interred in a plot of ground set apart for those dying of the disease, none being allowed to be interred in family graves. This course has been adopted by the clergy and other ministers of this town since the present outbreak of cholera in it, and the effect is that of confirming the great fear which all classes entertain of the virulently contagious character of the disease—an opinion upon which the measure itself seems to have been founded. The same result was witnessed in the epidemic of 1848-9; and it is evident that so long as this opinion of the disease is entertained, so long it will be difficult to obtain proper attention to the sick. Several painful instances of desertion and neglect from this cause have already come under my notice in this town, and I could refer to many examples which occurred in Leeds during the prevalence of the epidemic in that town in 1849.

As the late General Board of Health and other authorities have taught that the cholera is not virulently contagious, and, indeed, generally speaking that it is not so at all, and as the directions issued for the early burial of the dead do not repose upon the doctrine of contagion, but upon the evil effects which may arise hygienically in crowded houses from the presence of a corpse; and as the rendering of the same duties to the dead from cholera as to the dead from scarlet or typhus fever or small-pox would, I believe, materially appease the great alarm felt by all classes during the prevalence of the disease, and facilitate the adoption of measures for its prevention or cure, I most respectfully request an expression of your opinion upon the point.—I am, Gentlemen, your most obedient servant,  
Dewsbury, Nov. 1864. JOHN N. RADCLIFFE.

The General Board of Health, Whitehall, Nov. 16th, 1864.

SIR,—In reply to your letter of the 14th inst., in which you request to have the opinion of the General Board of Health as to the expediency or necessity of excluding the corpses of cholera patients from churches and chapels during the performance of the burial service, and also of interring such corpses in plots of ground set apart for the purpose, I am directed to state that the Board, while they strongly recommend the speedy removal from dwellings and the early interment of corpses during the prevalence of epidemic, (whatever may have been the cause of death,) do not consider that such precautionary measures as your letter refers to are at all necessary for the protection of the public health.

I am, Sir, your obedient servant,  
J. N. Radcliffe, Esq., Dewsbury. T. TAYLOR, Secretary.

\* "In 1854 occurred a case of unconstitutional interference with the coroner's court, which, however good the motives that prompted it, deserves the strongest reprobation, and is of most dangerous precedent. Upon *ex parte* representations made to him, the Secretary of State for the Home Department took upon himself to order the Coroner for Middlesex to hold an inquest on a child (Alfred Richardson). The Home Secretary has no sort of lawful authority or power to interfere in the slightest manner with the Coroner's jurisdiction. If the Coroner fails to hold inquest upon notice, he is both severely punishable, and can be compelled by *mandamus* to hold it. Nothing can be more reprehensible or alarming than such entirely illegal, and, in fact, purely arbitrary and despotic tamperings with our institutions, under cover of whatever pretences of humanity. There was a lawful, extremely simple, and regular course to have taken, in order to ensure the holding of this (or any other) inquest. The taking, instead, an illegal and irregular one, is strong proof that the case was not a fair one. The whole course pursued on that inquest was, indeed, so grossly irregular, and so highly unconstitutional, that such an inference is strengthened. Counsel was allowed to prosecute and to defend! and even to assume to appear as 'assessor' for the Crown!! Nothing more monstrous was ever heard of."

\* "Where any be slain, or suddenly dead, or wounded, or where houses are broken, or where treasure is said to be found," are the express words of the 4 Edw. I.

† "7 Will. IV. and 1 Vict. cap. 68. There are other attempts continually going on, on the part of justices—that is, of some few of the body who are unable to appreciate the institutions of their country—to undermine the office of coroner altogether;—by illegally detaining accused persons from attending the inquests, and by various other means as contrary to law and right as they are to the common interests of the public and of justice.

‡ "An illustration of the importance of this was afforded in the year 1863; when, solely owing to an inquest held on a death within the prison, certain tyrannical and illegal proceedings of the prison authorities of Birmingham were exposed, and so put an end to.

## UNIVERSITY OF EDINBURGH.

## Clinical Lectures in Surgery,

DELIVERED IN

THE ROYAL INFIRMARY.

BY JAMES SYME, F.R.S.,

Professor of Clinical Surgery.

THE subject of Clinical Instruction in Medicine and Surgery has recently engaged much of the attention of the profession, and the complaints are universal, that Clinical Lectures are very much neglected in many of the national hospitals of this metropolis. It is quite certain that wherever this mode of instruction is carried out in the largest and broadest sense, students obtain advantages infinitely greater than can be derived in places where no such system prevails. In this matter the press have a duty to perform, and we have no right to complain of the neglect of others, unless we at the same time contribute, by every means at our disposal, to aid the efforts of those teachers who devote themselves most energetically to Clinical Instruction.

It has long been proverbial in the profession, that Edinburgh holds the most distinguished place in British Medicine with respect to the admirable clinique carried on in that renowned Medical and Surgical School. The Clinical Lectures of Professor SYME, especially, have acquired a celebrity equal to the practical lectures which Sir A. COOPER formerly delivered in St. Thomas's Hospital. Placing, as we do, the highest value on instruction of this description, and anxious to give an impulse to the cause of Clinical Teaching, our attention has been naturally directed to the Surgical Chair of Edinburgh, in consequence of the great reputation which Mr. SYME has acquired, both as a practical surgeon and clinical instructor. We resolved, therefore, to apply for permission to publish reports of his Lectures in Clinical Surgery. Our application was accompanied by an expression of regret at the reception which some of the contributions of Mr. SYME to the improvements of Surgery have met with from some of the journals of this metropolis. We felt assured that any differences

which had existed between Mr. SYME and ourselves, would not prevent that gentleman from seeing the question in its true light, and that his desire to aid the cause which he so zealously supports would be paramount to every other consideration. We were not disappointed: Mr. SYME, in a spirit of perfect candour and liberality, unhesitatingly complied with our request. The profession will learn, we are sure, with feelings of satisfaction, that correct reports of the lectures given by Mr. SYME to the class of Clinical Surgery in Edinburgh, will appear in the pages of the ensuing volumes of THE LANCET, and that the first of the series will be published in No. I. of THE LANCET for 1855, on

SATURDAY, THE 6TH OF JANUARY NEXT.

The readiness displayed by Mr. SYME in acceding to our request, furnishes indisputable proof that his own opinion of his knowledge of Surgery is such that he has nothing to fear from the just criticism of the civilized medical world. Occasionally there has been some sharp fighting between Mr. SYME and portions of the English medical press, and it must be admitted, that on many occasions the opinions expressed by Mr. SYME have not been discussed by his opponents with that dignified spirit of forbearance and toleration which ought to form one of the highest ornaments of our profession. On this subject, however, whatever ground of complaint may have hitherto existed, will, we trust, have no substantial basis in the case of Mr. SYME, after his real acquirements and capabilities as a practical surgeon, and an original thinker, shall have become fully known to the profession of this and of all other countries.

The subjects of the Lectures will be illustrated, when necessary, by carefully-executed engravings.

## THE LANCET.

LONDON: SATURDAY, DECEMBER 2, 1854.

THE magistrates of Norwich and of the county of Norfolk have lately evinced considerable zeal in questioning the management of one of the best-conducted private asylums in the kingdom. They have been, at the same time, strangely oblivious of the fact that they themselves are the responsible

managers of certain public asylums which have for a long time past been pointed at by official and public censure as deserving unqualified reprobation. The Justices in whom is vested the sacred duty of providing humane treatment and efficient medical care for the pauper lunatics of the city and county, might, with some advantage to the public interest and their own credit, look to Heigham for many lessons in improvement that are sadly needed at the Infirmary Bethel, and at Thorpe. The magistrates who have so long neglected an imperative duty require to be reminded that it is the public asylums which ought to lead the way in the rapid progress of improvement; that it is their duty so to watch over the asylums they

conduct that they shall exhibit the fruit of all the improvements that modern science and experience have approved, and stand out as establishments which the world may acknowledge to be worthy to replace the private asylums. It cannot be unknown to them that there is a growing feeling in the minds of those who are competent judges and influential actors in matters relating to lunacy legislation, that the care and treatment of *all* those whose personal liberty is restrained on account of insanity should cease to be objects of private commercial interest. This great reform can only be brought about by the gradual extension and improvement of public asylums, so that these shall in time, both in capacity and superiority of resources, render private establishments unnecessary. Magistrates who, having ample authority and means at their command, suffer their asylums to fall so far behind the requirements of the age as to exhibit an unfavourable contrast to the private asylums, are justly chargeable with a most disgraceful neglect of their public duties, by indefinitely postponing, or rendering impossible, a revolution that is urgently called for, alike by the voice of humanity and the principles of sound government.

The magistrates have not wanted warnings to remind them of their duty. We may, in the first place, observe that it is plainly incumbent upon those gentlemen who undertake the office of Visiting Justices to qualify themselves for the efficient discharge of their functions by diligent inquiry, by means of study and personal observation, of all that relates to the proper construction and regulation of Lunatic Asylums. We are entitled to presume that the magistrates whom we are now addressing have done this. But having assumed so much, we find ourselves in this position: we have assumed what it would be injurious to the magistrates not to assume—namely, that they have conscientiously possessed themselves of all the knowledge and experience necessary to enable them to act efficiently; we then find that they have *not* acted efficiently; we find the asylums under their care shamefully defective in all that is essential to the care and protection of the insane. What is the alternative? Knowing their duty, the magistrates have not performed it. But they have not been abandoned to the feeble stimulus of their own sense of duty. They have not wanted repeated admonitions from others. Out of the many intelligent men who have made the care and treatment of the insane the subject of their study, and who, bringing the light of great experience, have visited the Norfolk and Norwich Asylums, not one has been able to speak in terms of praise of those benighted institutions. On the 23rd of April of last year we ourselves called the attention of the Norfolk magistrates to the deplorable condition of their asylum. Whilst we gave them credit for having been amongst the first to erect a County Asylum in 1814, we took occasion to remind them that they were not by that circumstance exempted from the duty of carrying improvement further. Their buildings are still defective; their internal arrangements of the most obsolete and barbarous kind; their administration, the administration of half a century ago; their superintendent is still a promoted workhouse steward, looking forward to the governorship of a gaol as the natural pinnacle of his career; their medical officer is still a subordinate officer, under the control of the promoted BUMBLE; and, as a natural consequence, their asylum still continues to exhibit the most defective arrangements for the cure and treatment of the insane, and to be the scene of deeds of violence that rouse the indignation of the country. The last event that has added to the unhappy notoriety of this asylum

we have purposely delayed commenting upon, indulging the hope that the magistrates could not fail to be roused by it to institute a rigorous public inquiry, and to evince a resolution to carry out such reforms as would render the recurrence of similar enormities impossible. That hope, we are informed, is vain.

A patient named WILLIAM SIZER was found one morning unable to rise from his bed. The fact was reported to the surgeon? No! to the superintendent, who “directs” the surgeon to examine him. It was found that the poor lunatic’s “ribs were badly broken.” Inflammation of the chest set in, and he died shortly after. It was then discovered that *four ribs on each side* were fractured. How did this occur? A coroner’s jury, making the best they could out of what information was vouchsafed them by the people of the asylum, came to the verdict that—“WILLIAM SIZER died from the effect of a serious “injury he received; but how, or by what means, the same “was inflicted, there is no evidence to prove; and the jury “consider *there is some mystery in the case!*” And well may they say there is some mystery; and well may any one say, where there is some mystery in a case of this kind, there is something that will not bear the light. The tale put forward by the attendants is, that the patient must have broken four ribs *on each side* by letting his bedstead fall upon his chest! This will hardly be believed out of the asylum. The circumstances hardly leave a doubt that SIZER had actually received his mortal injuries some days before he was seen by the resident medical officer. What a comment is such a case upon the government of the asylum! What an illustration of the expediency of that policy so cherished by the magistrates, of depriving the resident medical officer of all authority, and centering it in a non-professional superintendent! Such is the Norfolk Asylum now. The magistrates had but recently driven away a medical officer, qualified by his zeal and abilities to redeem the character of the asylum, and who had, in spite of every adverse circumstance, initiated some useful reforms. He had dared to assert his claim to direct the medical and physical treatment of the patients. He was looked upon with the same sort of dread as is a red republican. The supremacy of Beadledom must not be questioned. He resigned. Well is it for Dr. FOOTE that this catastrophe did not happen in his time.

Let us look in at the City Asylum; let us hear what the Commissioners in Lunacy have to say about that. Their recent report contains the following passages:—

“In our last annual report we stated, that should the Justices of the city of Norwich persist in neglecting to make a fit provision for their pauper lunatics, we should feel it our duty to bring the subject under the notice of the Secretary of State.”.....“Owing to the illness and absence of the medical officer, the books had not been duly kept, and there existed a great want of regular or systematic employment.”.....“High boundary walls still remain, the system of drainage is still imperfect.”.....“We think that the authorities of the city of Norwich should be compelled, without further delay, to make a proper provision for all their lunatic paupers.”.....“Few or none of the improvements now existing in well-conducted asylums are practicable in the present building.”

According to our observation, the Commissioners do not usually condemn defective asylums with undue haste or severity. We have little doubt, therefore, that all they have urged is amply justified.

But Norwich possesses yet another public asylum, for the defects of which the Visiting Justices are, to a great extent, responsible. The Norwich Bethel has long been a disgrace to

the town. The Commissioners, referring to this establishment, "regret to state, that as yet no effective steps have been taken by the Governors to promote the removal of the "Bethel Hospital, Norwich, to a more suitable site."

It thus appears that the city of Norwich and the county of Norfolk enjoy the unenviable distinction of obstinately upholding three public asylums of such a character as to give occasion to grave reflection upon the intelligence, the humanity, and the public spirit of the inhabitants.

We have already, on several distinct occasions, directed the attention of the local authorities to the construction and conduct of their asylums. We have hitherto done this in a spirit of friendly warning, willing to believe that temporary obstacles to improvement existed, which the Justices were labouring to overcome. The strange perversity of the county magistrates in adhering to a system of government condemned alike by science and humanity, compels us at length to abandon this opinion. Deaf to reason, they must be made amenable to the persuasions of the law. Let them reflect, that if the Commissioners do their duty, another session of Parliament cannot pass over without public animadversion upon their conduct, nor, we hope, without reforms being dictated in a tone that can neither be misconstrued nor evaded.

The following resolution has been adopted by the Court of Examiners of the Society of Apothecaries:—

"The Court of Examiners of the Society of Apothecaries having learned that many gentlemen desirous of entering the public medical service are prevented doing so by their inability to present themselves for examination before the termination of their curriculum, have resolved:—That candidates whose term of study would terminate in April, 1855, will be admitted to examination before this Court, after the 1st of January, 1855, provided they bring testimonials from competent authority that they have entered, or are about to enter, the public medical service, together with certificates from their teachers, of general diligence and good conduct."

The system of secrecy still prevails in the government of Bethlehem. The *Daily News* informs us that a reporter presenting himself at the last quarterly meeting of Governors, was excluded on the ground that the proceedings were *strictly private*. That a body of men should, by virtue of the payment of an inconsiderable sum of money and self-nomination, assume the right of secretly controlling large revenues, derived from public and Parliamentary sources, and which are destined to the maintenance of a public institution admitting State lunatics, is one of those anomalies which cannot be reconciled with common sense and propriety. When men dealing with public funds think it necessary to meet with closed doors, it is high time for the Charitable Estates Commission, or Parliament, to force the locks.

THE LATE DR. D. ANDERSON.—Letters from Constantinople report that Second Staff-Surgeon DAVID ANDERSON, M.D., Edinburgh, son of A. Anderson, Esq., of Whiteside, Dumfriesshire, N.B., died at the Military Hospital, Scutari, on the 4th ult. Dr. Anderson, whose premature death is deeply lamented, was an accomplished physician, a skilful surgeon, a dexterous operator; zealous, humane, and unremitting in his attention to the sick and wounded. In performing an operation he sustained an injury of the hand, in consequence of which his general health suffered, and inflammation of the chest following soon after, carried him off in the prime of life, and from a sphere of usefulness in which his services of late have been invaluable. He may be said to have fallen on the professional battle-field—after having escaped the dangers and privations of the Sulej campaign, in which he served at Moodkee, Ferozshah, and Sobraon, as assistant-surgeon of the 9th Foot.

SOLIDS AND FLUIDS  
CONSUMED BY ALL CLASSES OF THE PUBLIC.

### GIN, AND ITS ADULTERATIONS.

GIN was made originally in Holland, in the distilleries of Sohiedam, and hence that which is brought to this country is termed Hollands Gin. At one time, when the duty was low, it used to be largely imported, but owing to the high rate of duty levied upon it for some years past, which was, until 1846, £1 2s. 10d. per imperial gallon, and since that period has remained at 15s.,—but little now reaches this country.

In Holland it is made solely from unmalted rye and barley-malt, rectified with juniper berries. In Britain, gin is for the most part obtained from a mixture of malt and barley, molasses and corn being sometimes employed, particularly when there is a scarcity of grain, and it is usually flavoured not only with juniper berries, but with certain other substances, most of which are aromatics, and amongst which are the following: coriander seeds, cardamom seeds, caraway seeds, grains of paradise, angelica root, calamus root, crushed almond-cake, liquorice powder, and orange-peel. These ingredients, variously combined, form what are known in the trade as gin-flavouring.

In Dr. Muspratt's "Chemistry, Theoretical, Practical, and Analytical," the following receipts from the note-book of an extensive distilling rectifier are given.

"For a *Fine Gin*, take  
960 gallons of spirit, hydrometer proof.  
96 lbs. German juniper berries.  
6 lbs. coriander seeds.  
4 lbs. grains of paradise.  
4 lbs. angelica root.  
2 lbs. orris root.  
2 lbs. calamus root.  
2 lbs. orange peel.

Eighty or ninety pounds of liquorice powder are occasionally added to impart colour and sweetness.

*Plain or London Gin* is made as follows:—

700 gallons of the second rectification.  
70 lbs. German juniper berries.  
70 lbs. coriander seeds.  
3½ lbs. almond cake.  
1½ lbs. angelica root.  
6 lbs. liquorice powder.

For the manufacture of *West Country Gin*, the annexed is the process:—Introduce into the still 700 gallons of the second rectification, and flavour with—

14 lbs. German juniper berries,  
1½ lb. calamus root, cut, and  
8 lbs. sulphuric acid.

This gin is much used in Cornwall, and particularly in the western counties of England; it is also used in making British Hollands, and in that case is mixed with about five per cent. of fine gin, reduced to twenty-two under-proof with liquor.

For *Geneva*, charge of still being 950 gallons of second rectification, the proportions are—

84 lbs. juniper berries.  
112 lbs. coriander seeds.  
6 lbs. cassia buds.  
4 lbs. angelica root.  
6 lbs. calamus root.  
6 lbs. almond cake.  
½ lb. cardamoms.

*Plain Geneva*.—For 950 gallons of spirit of second rectification, take—

84 lbs. juniper berries.  
84 lbs. coriander seeds.  
2 lbs. almond cake.  
2 lbs. orris root.  
2 lbs. calamus."

Another prescription for making Geneva, and one which is much esteemed, is the following:—"Add to 950 gallons—

14 lbs. grey salts, and  
4 lbs. white salts.

The rectification to be conducted with the usual care.  
At the second operation, add—

168 lbs. juniper berries.  
74 lbs. coriander seeds.  
12 lbs. almond cake.  
8 lbs. grains of paradise.  
8 lbs. angelica root.  
1 lb. cardamoms.  
2 lbs. calamus."

#### ON THE ADULTERATION OF GIN.

Turning to our earliest great authority, Accum, on the adulteration of spirituous liquors, including gin, we, as usual, meet with much valuable and important information. "If we examine gin as retailed," states Accum, "we shall soon be convinced that it is a custom, pretty prevalent amongst dealers, to weaken this liquor considerably with water, and to sweeten it with sugar. This fraud may readily be detected by evaporating a quantity of the liquor in a tablespoon over a candle to dryness; the sugar will thus be rendered obvious, in the form of a gum-like substance, when the spirit is volatilized.

"One hundred and twenty gallons of genuine gin, as obtained from the wholesale manufacturers, are usually made up by fraudulent retailers into a saleable commodity, with fourteen gallons of water, and twenty-six pounds of sugar. Now this dilution of the liquor produces a turbidness, because the oil of juniper and other flavouring substances which the spirit holds in solution become precipitated by virtue of the water, and thus cause the liquor to assume an opaline colour; and the spirit thus weakened cannot readily be rendered clear again by subsidence. Several expedients are had recourse to to clarify the liquor in an expeditious manner; some of which are harmless, others criminal, because they render the liquor poisonous.

"One of the methods, which is innocent, consists in adding to the weakened liquor first, a portion of alum dissolved in water, and then a solution of sub-carbonate of potash. The whole is stirred together, and left undisturbed for twenty-four hours. The precipitated alumina thus produced from the alum by virtue of the sub-carbonate of potash, acts as a strainer upon the milky liquor, and carries down with it the finely divided oily matter which produces the blue colour of the diluted liquor. Roche or Roman alum is also employed, without any other addition, for clarifying spirituous liquors."

Further on Accum writes—"Another method of fining spirituous liquors consists in adding to it first a solution of sub-acetate of lead, and then a solution of alum. This practice is highly dangerous, because part of the sulphate of lead produced remains dissolved in the liquor, which it thus renders poisonous. Unfortunately this method of clarifying spirituous liquors, I have good reason to believe, is more frequently practised than the preceding method, because its action is more rapid, and it imparts to the liquor a fine complexion, or great refractive power; hence some vestiges of lead may often be detected in malt spirit.

"The weakened spirit is then sweetened with sugar, and, to cover the raw taste of the malt spirit, a false strength is given to it with grains of paradise, Guinea pepper, capsicum, and other acrid and aromatic substances."—pp. 271, 272.

Under the head, "Spirituous Liquors and their Adulterations," Mitchell writes—"Spirituous liquids, as brandy, rum, gin, &c., being unfortunately in such common use, and bearing so high a price, are peculiarly adapted for the purposes of adulteration, which may be of various kinds; the most general, however, is the addition of water. Were this the only adulteration practised, it would be rather productive of good than harm, for obvious reasons; yet, in reality, it has the very opposite effect; for in order to disguise the dilution, it is necessary to add some substance, capable, by its pungency or other similar property, of completely counteracting the addition of water; such substances are capsicum, Guinea pepper, oil of turpentine, &c., all of which, when taken in combination with spirit, affect the stomach very injuriously."

Again, at page 144, Mr. Mitchell remarks—"Gin is usually adulterated with water in considerable quantity; sugar is also added, and a mixture, composed of alum, carbonate of potash, almond oil, sulphuric acid, and spirits of wine; this compound not only fines the gin, but communicates to it the property of 'beading,' or hanging in pearly drops or beads on the sides of

the glass containing it. When gin does this, it is generally supposed to be strong in proportion as it beads, and the above mixture communicates to weak gin that property, so that it will be evident gin can be considerably diluted with water, and yet, by the addition of the above, appear of its proper strength."

On the detection of the adulterations of gin with capsicum, cherry-laurel water, &c., Mr. Mitchell makes the following observations:—

"*Detection of Capsicum, &c.*—If the spirit suspected to contain capsicum, guinea-pepper, or grains of paradise be evaporated to dryness in a water-bath, the residual matter will, if the sample had been adulterated, taste of the above-mentioned substances, and in proportion to the quantity present.

"*Detection of Cherry-laurel Water, or Spirit of Almond-cakes.*—Take a portion of the suspected spirit, and distil it nearly to dryness; add to the distilled liquid a slight excess of caustic potash, and evaporate until the bulk of the liquid is considerably diminished. Divide the evaporated liquid into two equal portions; to the one add a few drops of a solution, obtained by dissolving protosulphate of iron (green vitriol) in water, and exposing the so-made solution to the action of the air for a short time, (ten or twelve hours,) and a few drops of a solution of potash. If, now, a little hydrochloric acid be added, and the liquid acquires a blue tinge, the spirit under examination has been falsified with cherry-laurel water, or spirit of almond-cake.

"The rationale of the above process is as follows:—Both cherry-laurel water and spirit of bitter almond-cake contain hydrocyanic (prussic) acid. When spirit thus adulterated is distilled, hydrocyanic acid passes over with the spirit, and on the addition of caustic potash is converted into cyanide of potassium. It is then concentrated by evaporation, and the addition of the salt of iron and hydrochloric acid causes the formation of prussian blue, which is a certain indication of the presence of hydrocyanic acid, and consequently of cherry-laurel water, or spirit of almond-cakes.

"The following process can be performed on the other half of the liquid. This method has been lately described by Liebig, and is far more sensitive than the above, so that smaller quantities of the substances in question can be detected.

"Hydrochloric acid in slight excess, must be added to the reserved portion of the liquid, and then a drop of sulphide of ammonium added, and the whole heated until colourless. If, now, a little perchloride of iron be added, a blood-red colouration will immediately ensue. This depends on sulpho-cyanide of ammonium being formed by the reaction of sulphide of ammonium on hydrocyanic acid, which strikes a blood-red colour with a persalt of iron, in common with all the soluble sulpho-cyanides."

In Shannon's work, "On Brewing and Distilling," we meet with the following instructions for reducing unsweetened gin, and for preparing and sweetening British gin:—

#### "To Reduce Unsweetened Gin.

"A tun of fine gin.....	252 gallons
Water .....	36 "

which, added together, make...	288 "
The Doctor is now put on, and it is further reduced with water }	19 "

which gives ..... 307 gallons of gin.

"This done, let one pound of alum be just covered with water, and dissolved by boiling; rummage the whole well together, and pour in the alum, and the whole will be fine in a few hours.

"*To Prepare and Sweeten British Gin.*—Get from your distiller an empty puncheon or cask, which will contain about 133 gallons. Then take a cask of clear rectified spirits—120 gallons—of the usual strength as rectifiers sell their goods at; put the 120 gallons of spirits into your empty cask.

"Then take a quarter of an ounce of oil of vitriol, half an ounce of oil of almonds, a quarter of an ounce of oil of turpentine, one ounce of oil of juniper berries, half a pint of spirit of wine, and half a pound of lump sugar. Beat or rub the above in a mortar. When well rubbed together, have ready prepared half a gallon of lime-water, one gallon of rose water: mix the whole in either a pail or cask, with a stick, till every particle shall be dissolved; then add to the foregoing, twenty-five pounds of sugar dissolved in about nine gallons of rain or Thames water, or water that has been boiled: mix the whole well together, and stir them carefully with a stick in the 133 gallon cask.

"To force down the same, take and boil eight ounces of alum

\* Treatise, page 265.

† On the Falsification of Food, p. 140.

in three quarts of water for three quarters of an hour: take it from the fire, and dissolve by degrees six or seven ounces of salt of tartar. When the same is milk-warm, pour it into your gin, and stir it well together as before, for five minutes, the same as you would a butt of beer newly fined. Let your cask stand as you mean to draw it. At every time you purpose to sweeten again, that cask must be well washed out, and take great care never to shake your cask while it is drawing."

But it appears there are other little practices, beside those connected with adulteration, which are sometimes had recourse to by retailers of spirits. Mr. Shannon, from whose work "On Brewing and Distilling" we have just quoted, gives the following advice and recommendations as to certain manipulations and particulars which should be observed in retailing spirits over the counter.

"When you are to draw a sample of goods to show a person that has judgment in the proof, do not draw your goods into a phial to be tasted, or make experiment of the strength thereof that way, because the proof will not hold except the goods be exceedingly strong; but draw the pattern of goods either into a glass from the cask, to run very small, or rather draw off a small quantity into a little pewter pot, and pour it into your glass, extending your pot as high above the glass as you can without wasting it, which makes the goods carry a better head abundantly, than if the same goods were to be put and tried in a phial.

"You must be so prudent as to make a distinction of the persons you have to deal with; what goods you sell to gentlemen for their own use who require a great deal of attendance, and as much for time of payment, you must take a considerably greater price than of others; what goods you sell to persons where you believe there is a manifest, or at least some hazard of your money, you may safely sell for more than common profit; what goods you sell to the poor, especially medicinally, (as many of your goods are sanative,) be as compassionate as the cases require."

#### *Method of Estimating the Quantity of Alcohol present in any Spirituous Liquid.*

There are several methods by which the amount of alcohol contained in any spirituous liquid may be determined with greater or less accuracy. One of the readiest of these means is to ascertain the specific gravity of the spirit by a specific-gravity instrument for liquids. Of these instruments, many different kinds have been invented, with scales adapted to the range of the liquids for the determination of the density of which they have been constructed: thus we have urinometers, saccharometers, hydrometers, alcoholometers, &c.; but the principle on which these instruments are constructed is alike in all cases.

The instrument in general use for determining the specific gravity of spirituous liquids in this country is what is known as Sykes' hydrometer. It differs, however, from the ordinary hydrometer in the division of its scale, and also in the use of weights. The hydrometer is calculated to show the strength in spirit either above or below a certain fixed standard, denominated "proof." The stem of the instrument is graduated and subdivided, so as to meet the extremes of variation in the strength of the liquors examined by it.

Sykes' hydrometer is the instrument mostly used by the excise, by brewers, distillers, and publicans.

Since the specific gravity of a spirituous liquid is subject to great variations at different temperatures, it is necessary that the temperature of the spirit at the time of taking its weight should be noted, and corrections made for this by means of certain tables which have been constructed for the purpose. The temperature at which the specific gravity of the spirit is referred as the standard is usually 60° Fahrenheit.

The specific gravity test for determining the amount of alcohol present in liquids is applicable only when they are free from any solid substance, as extractive, sugar, &c., the presence of which, by affecting their weight, of course influences their specific gravity. When, therefore, any liquid contains saccharine or any other solid matter, it is requisite that the spirit should be separated by distillation, and that the specific gravity of the alcohol thus obtained should be taken. Where strict accuracy is required, it will be necessary to have recourse to distillation in almost all cases, since there are but few spirits which do not contain more or less solid matter.

A considerable improvement on Sykes' hydrometer is the instrument invented by M. Gay Lussac many years since, called the centesimal alcoholometer. This instrument, when immersed in any spirituous liquid at the temperature of 15° centigrade, equal to 59° Fahr., at once indicates the quantity of alcohol by measure present. As its name implies, the stem is divided

into a hundred parts or degrees, and is so contrived that each degree represents one hundredth part of anhydrous or pure alcohol; thus the point at which it floats, when immersed in any spirit at a certain temperature, indicates exactly the per centage of absolute alcohol contained in that spirit. The great value of this instrument is, that it shows at once the per centage of alcohol, all subsequent calculations, with the loss of time involved, and the possibility of inaccuracies, being thereby avoided.

Another instrument, constructed on a totally different principle to the ordinary densimeters, is the ebullioscope or ebullition alcoholometer. This instrument is based upon the fact that the boiling point of spirituous liquids varies according to the amount of alcohol contained in them, (a discovery made by the Abbé Brossard-Vidal, of Toulon,) without its being essentially modified, like the other instruments, by the presence and nature of any solid ingredients which may be contained in them.

There are several forms of this instrument; there is the original one of M. Brossard-Vidal, and the modifications by M. Conaty, by MM. Lerebours and Secretan, and by Dr. Ure.

The mercurial thermometer used in the modification of the instrument by MM. Lerebours and Secretan is graduated centesimally in degrees, which correspond to those of the centesimal alcoholometer of M. Gay Lussac, and its bulb is plunged in the liquid to be proved. The liquid is carefully heated by means of a spirit lamp, the flame of which should not be strong, lest it occasion the too rapid ebullition of the spirit. Before using the instrument, it is necessary to determine the boiling point of pure water, and the barometrical pressure of the atmosphere on the day on which the experiments are made.

In Dr. Ure's modification of the instrument, the scale is adapted to that of Sykes' hydrometer.

It would be of the greatest possible advantage—would save immense time and trouble—if densimeters of all kinds were revised, and were reduced to one uniform centesimal scale, as is done, in fact, in many of the instruments in use on the Continent.

The ebullioscope is probably sufficiently accurate in the results which it furnishes as to be of considerable service to the distiller, the rectifier, the wine-maker, and the brewer; but is certainly not so where strict accuracy is required.

Dr. Ure's modification of the ebullioscope, together with a full description of its principles and application, may be obtained of Mr. Joseph Young, Little Tower-street.

Another instrument which has been invented for the determination of the proportion of alcohol in spirituous liquids is the alcoholometric dilatometer of M. Silbermann. By this instrument, the amount of spirit is determined by the dilation of the spirituous liquid at various temperatures.

A still more accurate method of determining the quantity of alcohol contained in spirituous liquids from their specific gravity, is by means of the specific-gravity bottle. In using this, the same precaution with regard to temperature and the presence of any solid substance in the spirit must be observed.

For ordinary purposes, in the hands of manufacturers and dealers, of all the instruments for determining the strength of spirituous liquors, the centesimal alcoholometer of M. Gay Lussac is the safest and best, and, next to that, Sykes' hydrometer. But the chemist, when any solid matter is contained in the liquid to be examined, should, in all cases, separate the alcohol by distillation, and determine its amount from the distilled liquid, and this is the method by which we have proceeded in the determination of the alcohol contained in the samples of gin the results of the analyses of which we are about to make known. The exact steps adopted were as follows:—

The temperature of the several spirits was reduced in all cases, by means of a solution of ice and salt, to one uniform degree—viz., 60° Fahr., and their specific gravities at that temperature determined by means of the specific gravity bottle; 1500 grains by measure were next distilled, and the distillation carried nearly to dryness; the distilled liquor was cooled down to 60° Fahr., weighed, and its specific gravity again taken. These particulars being determined, the per centage of alcohol was ascertained by the alcoholometrical table of Tralles.—(See opposite page.)

The third column of this table exhibits the differences of the specific gravities which give the denominator of the fraction for such densities as are not found sufficiently near in the table, and the difference of their numerators is the next greatest to the density found in the table; for example, if the specific gravity of the liquor found for 60° Fahr. = 9.605, (the per centage will be between 33 and 34,) the difference from 9.609 (which is the next greatest number in the table) = 4, and

the fraction is  $\frac{1}{3}$ , therefore the true per-centage is  $33\frac{1}{3}$ , or, decimally, thus, 33.31. In order to ascertain the amount, by volume, of alcohol in the gin or other spirit under examination, it is necessary to proceed as follows:—In order to find the per-centage of absolute alcohol of 7.939 specific gravity in a sample of spirit, divide the number of grains distilled over by the specific gravity of the distilled spirit. Multiply this quotient by the per-centage according to Tralles, and divide this sum by the bulk of the original sample taken; the quotient is the per-centage. This per-centage multiplied by 700 gives the number of grains of absolute alcohol by volume in the gallon. The above comprise all the calculations necessary for arriving at this result. The following is a statement of the several sums:—

1500 gr. by volume yield 1334.6 gr. by weight; sp. gr. .9484; per centage, 41.62

The bulk of the distilled spirit is obtained by  
As .9484 : 1 :: 1334.6 : A

The volume of absolute alcohol obtained by  
As 100 : A :: 41.62 : B

The per centage by volume in the sample by  
As 1500 : B :: 100 : C = 39.09

To find the quantity of absolute alcohol in a gallon,  
As 100 : C :: 700 : D  
the quantity required.

From the construction of Tralles' table, the per-centage of alcohol by weight may also be found—for instance, multiply the number representing the volumes of alcohol given in the table for any determinate specific gravity of the mixture by the specific gravity of the pure alcohol—that is, by 7.939, and the product is the number of pounds of alcohol in so many pounds, as the specific gravity multiplied by 100 gives. Thus, in the mixture, 9.510 specific gravity, there are 40 measures of alcohol; hence there are also in 95.100 lbs. of this spirit  $7.939 + 40 = 31.756$  lbs. of alcohol; and in 100 lbs. of the spirit of 0.9510 specific gravity 33.39 lbs. of alcohol are contained.

#### Method of Determining the Amount of Sugar in Gin.

This is readily determined in either of the two following

ways:—The syrupy liquid contained in the retort after distillation should be removed and evaporated with a gentle heat, until the water has been driven off, and the sugar crystallized. Or a fresh weighed portion of the gin may be evaporated in the same manner, and the weight of the sugar furnished by it ascertained. The latter is the more accurate method, because the heat employed in distilling off the spirit not unfrequently modifies the sugar considerably, so that in all cases it will not crystallize properly.

#### Method of Detecting the Presence of Capsicum, Grains of Paradise, and other fixed Acrid Substances in Gin.

The presence of these may usually be ascertained by simply tasting a portion of the syrupy extract left after distillation. The acrid principle of capsicum is a fixed one, and no part of it passes over during distillation. Of the two acrid principles contained in grains of paradise, one is volatile, and the other fixed. The taste of the fixed principle very closely resembles that of Cayenne pepper, but may be usually distinguished with a little care. The plant which furnishes Malaguella pepper, or grains of paradise, is the *Amomum Granum Paradisi*.

#### On the Detection of Cinnamon or Cassia in Gin.

As the flavour of these depends upon the presence of essential oils, they of course readily pass off during distillation, and the extract, therefore, does not usually furnish any evidence characteristic of their presence. For the purpose of detecting these oils, the spirit should be gently evaporated, and at such a temperature as does not occasion the volatilization of the oils.

#### On the Detection of Sulphate of Zinc in Gin.

The sugar, having been dried, and its weight determined, is to be re-dissolved in distilled water. Half of the solution is to be tested with acid nitrate of baryta for sulphuric acid, and the other half treated with sulphuretted hydrogen, by which means the zinc will be thrown down as a white hydrated sulphuret.

If sulphuric acid be contained in gin, either in a free or combined state, its presence will be indicated by the baryta test, added to a small quantity of the gin, a drachm or so, in a test tube.

(To be continued.)

QUEEN'S COLLEGE, BIRMINGHAM.—At the last monthly board, held on the 14th ult., the Rev. Charles Law, the Vice-President, in the Chair, it was proposed by the Dean and Faculty that the prize of ten guineas, offered to the students by Charles Ratcliffe, Esq., should be given for the best essay "On the Means of Preventing Epidemic, Endemic, and Contagious

Diseases amongst the Working Classes." The prizes for the sessions 1854-55 were then agreed to, and the principal one, the interest of £1000, it was determined should be given for the best treatise "On the Anatomy and Physiology of the Human Eye," the subject to be handled in a practical and professional manner, according to the evidences of fact and phenomena.

## Correspondence.

"Audi alteram partem."

## MICROSCOPICAL RECOGNITION OF TUBERCULOUS MATTER.

To the Editor of THE LANCET.

SIR,—In an excellent review of Jones and Sieveking's "Pathological Anatomy," which appeared in last week's LANCET, the following sentence occurs:—

"With regard to the microscopic recognition of tuberculous matter in early phthisical sputa, as stated by many sanguine histologists, our own opinion is, that it is impossible."

I respect highly that judicial caution which induces your reviewer to speak with suspicion of what is merely new and flashy; and to reject with vigour the results of occasional, hasty, and crude observations. At the same time an excess of this quality may lead to the repudiation of important truths; and in this case I conceive has led, inadvertently, to an error of ratiocination as well as of fact.

Had this matter been one simply of opinion, I would not have presumed to offer mine in opposition to that of your reviewer; but as it has risen to a question of fact, I hope you will afford me a portion of your valuable space to say a few words upon the subject, and to propose a practical test for the decision of the dispute.

During five years that I held the office of pathologist at Haslar, I devoted several hours daily to the investigation of this subject, and examined, figured, and described expectoration from upwards of a thousand patients. The conclusions at which I arrived were embodied in one of a series of lectures on Pathological Histology; and these conclusions were frequently and practically tested by Sir John Richardson and other senior medical officers of the hospital.

One of these indeed became himself the subject of investigation; and as his case bears upon the question, I shall relate it.

This gentleman was dyspeptic, had wandering pains about his shoulders, "*hemmed*" frequently, expectorated occasionally little gelatinous or solid purulent-looking pellets, which, as he described, leaped into his mouth without effort. I examined the expectoration on various occasions, and found it to contain the elements of tubercle in scattered heaps. One specimen, which I preserved, could scarcely be distinguished microscopically from soft yellow tubercle removed from the dead body. Some months after this he became worse, and was attended by Sir John Richardson. To him I communicated my opinion, and he to his patient, who ridiculed the idea. Some time after this he consulted Dr. Williams and other eminent men in the metropolis, who declared his lungs to be free from disease. Not many months from the time of his return, however, he had slight hæmoptysis, and the hem and expectoration increased. He recovered, and remained pretty well, till he took a slight cold, and had another slight hæmoptysis. At last serious pulmonary symptoms set in; the disease became no longer doubtful, and he sunk I think about two years and a half from the time I first examined his expectoration.

It was on cases such as the above that I based one of the conclusions embodied in my lectures—"That the presence of the process of tuberculization can often be recognised during life in the characters of the sputum, when the physical signs and general symptoms are too obscure of themselves to justify that conclusion."

I think your reviewer has been led into an error of ratiocination in declaring the recognition of tuberculous matter in early phthisical sputa to be impossible. It has been satisfactorily demonstrated that the expectoration in certain stages of pneumonia contains the same histological elements as are found in the hepatized air-vesicles after death. The products of tuberculosis occupy the same seat as the products of pneumonia—that is, the free surface of the membrane lining the air-vesicles, the inter-vesicular passages, or the lobular bronchi. Now if the products of pneumonia can, during life, be extruded from the lung, and recognised in the sputum, why may not the products of tuberculosis be so extruded and recognised likewise?

It is not, however, as a matter of ratiocination that I desire to deal with this question, but as a matter of fact. I do not wish to appeal even to drawings, which may be distorted, but to actual preparations, which must collectively constitute the means of an *experimentum crucis*.

I believe that the specimens of early phthisical sputum in my possession clearly prove this point; and that the tubercular matter present in them may be readily recognised by an observer of ordinary experience and skill. To these preparations

I appeal; and I am so far anxious for the truth, that I shall gladly, with your reviewer's permission, wait upon him with my preparations on any day that he may appoint. He will thus, without the toil of investigation, be placed in nearly the same favourable condition as myself for judging of the truth or error of the conclusion at which I have arrived.

I have the honour to be, Sir, your obedient servant,

ANDREW CLARK,  
Assistant-Physician and Pathologist  
to the London Hospital.

Montague-place, Russell-square,  
November, 1854.

## TREATMENT OF DELIRIUM TREMENS WITHOUT OPIUM.

To the Editor of THE LANCET.

SIR,—I read with much interest Mr. Dixon's case of "Delirium Tremens treated without Opium." There is no doubt that delirium tremens may be, and has been, treated and cured without opium, just as scabies has been cured without resorting to sulphur. But the question is, whether we are at liberty to attempt the treatment of a malady for which we believe we have a specific medicine, without using that medicine at the moment when it appears to be most wanted?

And this brings me to the point of my letter. The statement which occurs at the close of Mr. Dixon's communication, that "those cases treated successfully with opium get better in spite of it, and not by its assistance," certainly reads very contradictorily; for a disease cannot be cured with a remedy in spite of which it disappears; and, further, it involves an assertion which not only does not logically follow upon the recital of the case, but is not sanctioned by experience.

We all gladly welcome simple ungarlished facts which in any way enlarge our resources of the *materia medica*, or our knowledge of the history of disease. But all inferences and hypotheses are useful only so far as they help to establish laws. A bare assertion, unsupported by evidence, is what anybody can make, but it can never meet with intellectual approval. In all branches of science, students must be content with a plain and faithful statement of what immediately falls under their observation.

Now, there is every *a priori* ground for supposing that opium would be a valuable medicine in delirium tremens. It is a narcotic, with a very small amount of stimulant; and Dr. Billing has defined a narcotic to be a thing which *impedes the transmission of nervous force*, which is just the desideratum we require in cases of excessive sensibility, which, in fact, is the essence of delirium tremens. By diminishing that excessive sensibility, opium indirectly procures sleep, and sleep often removes this hyper-sensibility altogether.

I would ask now, where is the evidence for supposing that delirium tremens gets well in spite of opium, instead of by its assistance? Do not all *a priori* reasoning and actual experience point the other way?

I remain, Sir, your obedient servant,

Bath, Nov. 1854.

JOHN K. SPENDER.

## TREATMENT OF STRICTURE OF THE URETHRA BY EXTERNAL INCISION.

[MR. SYME'S OPERATION.]

To the Editor of THE LANCET.

SIR,—In the last number of THE LANCET (Nov. 25th) are given the details of a case of stricture of the urethra, in which the stricture was divided by external incision, in King's College Hospital, on the 14th of October, and in regard to which, it is stated that the man has since died of purulent deposit.

In the remarks upon this case, the operation is said to have been "*emphatically Mr. Syme's*." But, Sir, there are several points mentioned in the details of the operation which differ so essentially from Mr. Syme's operation, that I think it right to call attention to them.

In the first and principal place, then, the grooved staff which Mr. Syme recommends to be passed through the stricture previous to the incision, and which he always employs himself, was not introduced, but, in place of it, a silver catheter. It may be observed that Mr. Syme insists strongly on the use of this staff, so as to enable the surgeon to divide the walls of the urethra accurately in the mesial line. Secondly, the catheter, which was introduced after the operation, in place of being allowed to remain in the bladder thirty-six or forty-eight hours, as recommended by Mr. Syme, "*was left for eleven days, when it was found to be incrustated with calcareous de-*

posita." And thirdly, it is stated that all the "fistulous tracts," of which there were several, "were largely incised." I have seen Mr. Syme operate in many cases of stricture of the urethra complicated with fistula in perineo, but we have never seen him incise the fistulous tracts, when these lay out of the mesial plane, and for the reason recorded by himself, that fistula in perineo "requires for its remedy nothing more than removal of the stricture connected with it."

I am the more inclined to call attention to this matter, as on a previous occasion (November 13th, 1852) I saw what was called Mr. Syme's operation performed in King's College Hospital, in a manner similar to the above, viz., by the substitution of a silver catheter for the grooved staff, and I cannot help thinking that want of attention to the instructions laid down by Mr. Syme may in some measure account for the fact that London surgeons, in performing this operation, have not met with the same great success with which we know the operation has been attended in the hands of the Edinburgh Professor.

I am far from making these remarks in any party spirit, or with a wish to enter into any angry discussion, of which there has already been too much; but I think, Sir, that the members of the profession, before they decide against the merits of a new operation, should observe the results in cases in which the operation of the propounder has really been performed.

I have the honour to remain, Sir,  
Your very obedient servant,

ONE WHO HAS SEEN MANY  
SUCCESSFUL CASES OF THE  
EXTERNAL INCISION.

November, 1854.

## THE COLLEGE OF SURGEONS AND SURGEONS FOR THE ARMY.

To the Editor of THE LANCET.

SIR,—I do not fear that, with the love of fair play displayed in your excellent motto, "*audi alteram partem*," you will find space for a few remarks, although widely differing from those of your correspondents of last week.

"One who has seen Foreign Service" is "astounded" by what I should call the first step in the right direction by the College of Surgeons. He declares "a two-year-and-a-half student of the highest capabilities is not fit for service;" and then proceeds to the deliberate mis-statement, that "for two years he is not engaged in practical studies at all," while he ought to know that the College requires him to attend surgical practice during the whole three years of his attendance. In my opinion, the curriculum is already too long, and any attempt to relieve the student should be hailed with gratitude. No advantage results from the greater portion of his time, and the only reason for keeping it up must be to provide comfortable berths for lecturers and tutors.

The only way in which the College is injurious to the profession is by its illiberal conservatism, which shuts out from its ranks many an ornament to science. I do not object to stringent examinations, but if a man is able to pass them, it matters not whether he obtained his knowledge from the lecture-room or the study.

Your own political career must sympathise, when we say that "Whig expediency" must triumph. Free-trade in science—fair competition—will yet be the cry of the nation.

At present a poor student is compelled to ruin his health by inhaling for three years the air of the dissecting-room and the sick wards, because "two years and a half" are not enough. I venture to say that much less would prove enough for many an industrious student, who under the present system too often sinks and dies early, or lays the foundation of disease which will embitter all his after life. One student will acquire in three months as much information as another in three years. One will learn far easier from books than lectures. Why not, then, fix the examinations at the necessary amount, and admit all who are able to pass? Let the College pursue the good work; they will thus encourage industry, and put an end to illegal practice.

Whence, Sir, do you suppose the *illegals* come from? Many, I am sure, from the very threshold of our colleges and halls. They commence without any other idea than belonging to the *legal* bodies, but, meeting insuperable obstacles, often turn aside. I myself commenced my career by apprenticeship, which is a great shame to a learned profession. Being one case in a thousand, I had opportunities of inquiring knowledge in this time. My next step was to enter at an hospital. The money paid, I attended regularly; but it soon became obvious to all

that I was injuring my health, and at the close of the first summer session my physicians plainly told me I must relinquish all hospital study, or make up my mind to die. Well, Sir, what could be done? I had not fulfilled the curriculum. I applied to the College—I applied to the Hall, but their portals were closed; and after years of application I must abandon all hopes of a qualification. My case is not singular, or if it is, why will they not make an exception in my favour? Hundreds are thus driven from a calling they would otherwise adorn, while the professed charlatan survives, and becomes wealthy. They may possibly become assistants; but these places are not easy, probably would not suit their health; and if they would, who can brook, after receiving an education worthy of the profession, to be limited to a paltry £50 or £60 per annum? They are driven then to practise without a licence, and who is to blame but those who so liberally drive them? I do not blush to say that on any good opening that occurs, I shall not scruple to enter into practice without the bit of paper which the examining boards refuse. Let them raise the standard of their examinations, if they please, but let them admit to it all who, like myself, are willing to undergo the ordeal. Illegal practice would then be unknown, for no person of education would refuse to become candidates, and amongst the grossly ignorant little harm would be done, for none would apply for their aid; or when the portals of our colleges and halls were thus thrown open, it would be easy to prevent those from practising who refused to become members. Hoping you will thus let both sides be heard.

I am, Sir, your obedient servant,

V. T. R.

Nov. 1854.

## MILITIA SURGEONS.

To the Editor of THE LANCET.

SIR,—Can you or any of your readers inform the large body of militia surgeons how they are likely to be affected by the new Militia Act? We ought not to be taken by surprise. We have all found our expenses to have been far beyond our pay up to the present time, and many of us might be enabled to retain the surgeoncy if we were allowed time to make the arrangements. I know that the emergency as to troops is great; but a great country and government should have the welfare of the few cared for, whose interests are involved in the greater public affairs. The militia surgeons, in a quiet way, have done great service to the country, and I hope Government will not swamp them by a *laissez faire* policy, or by ungenerous provisions.

I am, Sir, your obedient servant,

AN OLD AND WILLING HAND.

Nov. 1854.

## THE ARMY AND NAVY MEDICAL DEPARTMENTS.

To the Editor of THE LANCET.

SIR,—It would almost appear to be the rule to censure the medical department of the army after a battle; at all events Mr. Guthrie tells us that, after the battle of Salamanca, he found himself without conveyance, without stores, except those that the panniers of the regimental surgeons contained, and encumbered with near three thousand wounded in the village of Valverde. "The doctors all worked as no men ever worked before; the toil was incessant, we thought ourselves happy in the improvement of many around us, and that our reward would follow in the approbation of the higher authorities; when lo! to our astonishment, comes a letter from the Adjutant-General, through the Deputy-Inspector of Hospitals at Elvas, informing him that he had been acquainted, by an officer deserving credit, of the neglect, &c., with which the wounded had been treated; of his great disapprobation, &c. You may conceive our anger; but that is not the way to meet an attack of this sort; when a man errs on the wrong side of truth, the only way to settle the matter is to convict him. I therefore read the letter to the Commandant, the late Sir Aretas Young, and to all the wounded officers, and then desired them to tell the Adjutant-General the truth; this I forwarded, with a request that the person who was now shown to be a villifier might be brought to justice; but no, the Adjutant-General was pleased to express, in reply, his happiness at finding he had been mistaken as to the wounded of Valverde, but thought the word villifier was too strong. I entreated the Deputy-Inspector to go and insist upon an apology from the officer, or a reprimand for him from the Adjutant-General, but it was of no use; the Deputy was a worthy man, but who would as soon have faced the devil as an Adjutant-General, and he

gravely wrote me word back, we had got remarkably well out of the scrape, and to be quiet. I was not at all contented, but I could not move him. He is long since dead, and I believe with the most profound dread of both these potentates. Well, gentlemen, the matter ended thus; the English papers were full of our valour; our courage and our difficulties were the theme of every tongue, the humanity-men were even satisfied; the generals and staff officers obtained stars and ribbons, the officers commanding regiments, whether in or out of action, received medals, many of them were promoted, the regiments inscribed Albuhera on their colours in letters of gold; some few persons of inferior note, who had disappeared and had been reported dead, returned to life; the poor doctors alone got nothing. Do you wonder now, gentlemen, that a staff surgeon even might prefer a comfortable bed and a good dinner at Santarem or Abrantes, at Portalegre or at Elvas, to the field of Albuhera or the trenches of Badajoz?"

I am, Sir, your obedient servant,

J. H.

## THE CHOLERA IN THE WEST INDIES.

To the Editor of THE LANCET.

SIR,—Perhaps the following may interest some of the numerous readers of THE LANCET. Trinidad is at present suffering much from that great scourge, cholera, and in a letter from a lady, the wife of a physician, to her relative in this island, she states that the monkeys, both wild and those kept as pets, have suffered much from cholera; that persons travelling through the woods meet them in all stages of the disease; some dying, and some dead; those living showing symptoms of most malignant cholera. The lady also writes, that when, some time since, small-pox was prevalent there, it was observed that they suffered also from the disease. The husband of the lady is one of the first physicians in the island. It would seem, by THE LANCET, that the profession in England is coming round to the contagion doctrine, as regards cholera. The evidence for it possessing the property is, in my opinion, as strong as that regarding variola. St. Kitt's, within less, in some parts, than a mile from Nevis, has escaped, by carrying out most stringent quarantine regulations, and the authorities have therein shown their wisdom. We here have hitherto escaped, but whether we are destined to be visited by the epidemic, God only knows. Our quarantine is not as rigid as it ought to be. The governor (son of the late Sir James Macintosh) is a staunch non-contagionist, and with him (by law) and his privy council rest the formation and carrying out the quarantine regulations, instead of being controlled as they ought to be by a board of medical men.

I am, Sir, yours &c.,

JOHN FURLONGE, M.D., Health Officer, &c.

Antigua, October, 1854.

## Medical News.

**ROYAL COLLEGE OF SURGEONS**—The following gentlemen having undergone the necessary examinations for the diploma, were admitted Members of the College at the meeting of the Court of Examiners on the 24th ult. :—

BIRD, SAMUEL DOUGAN, Birkenhead, Cheshire.  
CORNER, FRANCIS MEAD, Whitby, Yorkshire.  
DANIELL, CYRUS OCTAVIUS, Army.  
DYMCK, WILLIAM, Willisborough, Ashford, Kent.  
GROWSE, JOHN LAWRENCE, Bildistown, Suffolk.  
HALL, JOHN, Sheffield Infirmary.  
HAMMOND, EDWARD BECK, Ipswich.  
LAWTON, SAMUEL, Sheffield.  
NESFIELD, STEPHEN, Whitby, Yorkshire.  
SARGINT, EDWARD HENRY, Australia.  
SEITZ, HARTWIG LUDWIG CHRISTOPHER, Bombay.

At the same meeting of the Court, Mr. CHARLES EDWARD PLAYFAIR passed his examination for naval surgeon. This gentleman had previously been admitted a Member of the Royal College of Surgeons, his diploma bearing date 25th of June, 1850.

At a special meeting of the Court on the 25th ult., Messrs.

BEAUFOY, CHARLES, Oxford,  
CAMPELL, EDWARD WILLIS, Woolwich,

having undergone the necessary examinations, were admitted Members of the College.

At another special meeting, on the 30th ult., Messrs.

MARSHALL, FRANCIS, Hackney.  
MEYER, JOHN, India.

**APOTHECARIES' HALL**.—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, November 23rd, 1854.

BALY, GEORGE, Warwick.  
HICKMAN, JOHN LOCKLEY, Wolverhampton.  
WATTS, WILLIAM EDWARD MOCKTON, Battle, Sussex.  
WEST, HENRY ROGER, Clavering, Bishop's-stortford.  
YORK, GEORGE BILLING, St. John's-wood-road.

**FELLOWSHIP EXAMINATIONS**.—The following were the questions on anatomy and physiology submitted to the senior candidates for the Fellowship of the Royal College of Surgeons, at a meeting of the Court on the 28th ult. :—

1. The anatomy of the knee-joint, and the muscles and tendons around it.
2. The course of the arteries of the upper extremity, from the commencement of the subclavian to their termination in the fingers.
3. The muscles, nerves, and bloodvessels of the face.
4. The situation, structure, and function of the kidney.
2. The composition and chemical qualities of urine in health, and, as far as possible, in disease.
6. Describe the form, situation, and structure of the salivary glands, with the chemical qualities of their secretions.

The following were submitted to the junior candidates :—

1. Describe the medulla oblongata from its uppermost part to its junction with the spinal cord, distinguishing all the points in the medulla usually named, together with the nerves proceeding from it to their termination.
2. Describe the structure of the wrist-joint, together with the origin and termination of the muscles or tendons which pass in front and behind it.
3. Describe the larynx, its cartilages and muscles, ligaments and nerves, with the manner in which its functions are performed.
4. Describe the retina, its connexions, peculiarities, extent, appearances before and after death.
5. Describe the uterus, its ligaments, with their contents; the changes, as far as known, which take place in that organ from infancy to old age.
6. Describe the minute structure of the stomach and intestines, as connected with the physiology of digestion.

The following questions on pathology and surgery were submitted to the senior candidates, on the 30th ult., viz :—

1. The diseases of the testis, non-malignant, malignant, and their treatment.
2. The treatment of umbilical hernia in the female, when incarcerated or strangulated.
3. The application of caustics in cancer, when advisable, and to what parts?
4. The symptoms and treatment of internal hæmorrhoids by operation or otherwise, more particularly when complicated by a large descent of the internal membrane of the rectum.
5. Describe the distinction presumed to exist between the various kinds of syphilitic ulcers of the penis and their treatment.
6. Describe the first set of secondary symptoms.

The following were submitted to the junior candidates :—

1. Symptoms and treatment of rheumatic iritis.
2. In what cases of strangulated femoral hernia is it advisable to leave the hernial sac unopened? and describe the operation.
3. In what cases of mortification, impending or complete, of the extremities is amputation imperatively demanded, with the preceding symptoms?
4. What operation is to be done on the calf of the leg in the case of a wound of one of the great arteries, the injury of which cannot in the first instance be accurately determined?
5. What is the best manner of amputating the thigh at the hip-joint when the soft parts are much injured in the vicinity? and name all the parts to be divided.
6. The symptoms and treatment of calculus vesicæ in the female.

**MARISCHAL COLLEGE AND UNIVERSITY, ABERDEEN**.—The following Medical Degrees were conferred during the Autumn Examination Term, after the usual examinations, viz :—The degree of M.D. on THOMAS MATHER ASHTON,

Lancashire; JAMES DIXON, Cheshire; WILLIAM PHILIP HARRISON, Manchester; HENRY KINGSLEY, Warwickshire; WILLIAM JOHNSTON LONG, H.E.I.C.S.; THOMAS THOMSON, Aberdeenshire; WILLIAM (THOMSON), Kincardineshire.—And the degree of M.B. on JOHN FELIX JOHNSON, Surgeon R.N.

**EPIDEMIOLOGICAL SOCIETY.**—At the meeting of this Society to be held on Monday next, the 4th of December, a paper by George Bodington, Esq., "On the Causes of Exemption of Birmingham from Cholera and other Epidemic Diseases," will be read.

**ST. MARY'S HOSPITAL.**—We recently announced the fact of the recognition of the new school established in connexion with this hospital, by the Council College of Surgeons. Through the energy of the medical staff, aided by the co-operation of the governors, a building larger than the school of St. George's Hospital in Kinnerton-street, has been erected in less than four months. It contains accommodation for nearly three hundred students, and there is every promise that in a few years it will become one of the most flourishing schools in the metropolis. The museum has been already furnished with a large number of valuable and interesting preparations. The best specimens of Mr. Lane's extensive anatomical and surgical collection have been transferred from Grosvenor-place to the new school. In the obstetric department the museum, too, is particularly rich. Mr. North, for many years the able teacher of midwifery at the Middlesex Hospital, has presented the whole of his splendid museum, the collection of which occupied him nearly fifty years, to St. Mary's. Dr. James Bird has also made a gift of a complete set of Thibert's models of uterine disease.

**PRESENTATION OF PLATE TO MR. B. HUNT, OF THE QUEEN'S COLLEGE, BIRMINGHAM, BY THE STUDENTS.**—On Friday, the 17th ult., the students of the Queen's College, Birmingham, gave a grand entertainment, at the Swan Hotel, to the Professors and other superiors of the College, on the occasion of the retirement of Mr. B. Hunt, late surgeon to the hospital. Amongst the guests were Dr. Birt Davies, Dr. Healop, Dr. Fife, Dr. Jordan, and the Vice-President of the College, Mr. B. Hall. After the disposal of the usual loyal toasts, the Vice-President handed over to Mr. B. Hunt a suitable testimonial, in the shape of a service of plate, as a mark of respect from the students, on his retirement from office; as also an elegant address, drawn up by the students, expressive of their great and deep regret at Mr. Hunt's retirement. Upwards of forty gentlemen sat down to dinner, and the utmost harmony and cordiality evidenced itself throughout the proceedings, and the company did not break up until a late hour.

**MUNIFICENT BEQUESTS.**—In the will of John Hinchcliffe, Esq., late of Notting-hill-terrace, aged ninety-five at the time of his death, and which has just been proved at Doctors' Commons, the following unusually liberal bequests are contained in favour of the undermentioned charitable institutions for the relief of suffering and afflicted poor persons:—Indigent Blind Asylum, £1000; Journeymen Tailors' Institution, £1000; Magdalen Hospital, £1000; Lock Hospital, £1000; London Truss Society, £1000; Middlesex Hospital, £1000; St. Mary's Hospital, Westbourne-terrace, £1000; Houseless Poor, Broad-street, London, £500; Deaf and Dumb Institution, £1000; Westminster Hospital, £1000; London Fever Hospital, Liverpool-road, Islington, £1000; Charing-cross Hospital, £1000; Asylum for Idiots, £1000; Cancer Hospital, £1000; Prevention of Cruelty to Animals' Society, £500. The above princely legacies, amounting to £14,000, are payable by the executors upon the death of Mrs. Hinchcliffe, who is at present of very great age.

**ADULTERATION OF FOOD AND DRUGS.**—A meeting of medical and scientific gentlemen was recently held, at Birmingham, to consider what measures should be adopted by the Legislature to prevent the adulteration of food and drugs. The chair was filled by Mr. Scholefield, M.P., who described the progress of the movement for diminishing, if not of entirely eradicating, the great evil of adulteration; and stated his intention of moving, early in the next session of Parliament, for a select committee on the subject. The hon. gentleman at some length pointed out the practices of bakers and others in the adulteration of flour and other articles of food, and the way in which guano and other commodities were rendered worthless by the admixture of deleterious and cheap ingredients. Mr. Postgate stated the results of the analyses he had made of flour, milk, &c., and the danger which arose from adulteration. A discussion followed, in which the statements were corroborated by several gentlemen. After a vote of thanks to the chairman, the meeting separated.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, NOVEMBER 25.**—The deaths of 1262 persons, namely, 618 males and 644 females, were registered in London in the week that ended last Saturday. This is a high mortality as compared with the returns of ten corresponding weeks of the years 1844-53, in which the average number of deaths was 1021, or as compared with this average raised in proportion to increase of population, which is 1123. A hundred and thirty-nine persons died last week above the number thus estimated. Although the aggregate number of deaths last week was less than that of the previous week, (when it was 1309,) it will be seen that fatal cases arising from zymotic diseases remained exactly the same, having been 332 in each return, while those from diseases of the organs of respiration suffered a considerable increase, rising from 240 to 292. Both these classes of diseases exhibit at present an excess above the ordinary mortality. The deaths from scarlatina rose to 118; there were 23 from small-pox, 33 from measles, 37 from whooping-cough, 6 from influenza, 50 from fever, 8 from cholera, and 21 from diarrhoea. From bronchitis 144 persons died, the corrected average being 73, and from pneumonia 121, the average being 103.

## Obituary.

On the 24th ult., HENRY DAVIS, Esq., surgeon, Worcester, aged forty. He was highly respected in this city and neighbourhood.

At Balairic View, Belfast, JAMES THOMSON, M.D., R.N., aged ninety-one.

At Leeds, JONATHAN WHITE, Esq., surgeon, aged eighty-three.

Near Neath, WILLIAM LEYSON, Esq., surgeon R.N.

At West Bromwich, JOHN W. SAVAGE, Esq., surgeon, aged forty.

At Bampton, Devon, THOMAS LANGDON, Esq., surgeon, aged sixty-nine.

On the 28th ult., at his residence, Blackfriars-road, from an attack of laryngitis, CHARLES BRADY, Esq., M.R.C.S., in the forty-eighth year of his age, deeply regretted by all who knew him.

At Toronto, Upper Canada, THOMAS DEASELY, M.D., of Tyrone, Ireland, and late a professor of Trinity College, Toronto.

## TERMS FOR ADVERTISING.

The following is the Scale of Charges for Advertisements:—  
For 7 lines and under..... £0 4 6 | For half a page ..... £2 12 0  
For every additional line ... 0 0 6 | For a page ..... 5 0 0  
Advertisements which are intended to appear in THE LANCET of any particular week, should be delivered at the Office not later than on Wednesday in that week.

The circulation of THE LANCET far exceeds that of any other Medical Journal in the world.

## TERMS OF SUBSCRIPTION TO "THE LANCET."

One Year ... ..	£1 14 8
Six Months ... ..	0 17 4
Three Months ... ..	0 8 8

To be paid in Advance.

Post-office Orders to be addressed to EDWARD THOMAS, THE LANCET Office, 423, Strand, London, and made payable to him at the Strand Post Office.

## TO CORRESPONDENTS.

*The Rev. E. Holmes.*—In the event of our recurring to the subject, the facts detailed will receive every attention; but we now trust that Mr. Holmes will perceive that our immediate object having been to discuss the question as to the alleged infractions of the Lunacy Laws, it was unnecessary to dwell upon circumstances having but an incidental bearing upon that question.

*To the Editor of THE LANCET.*

SIR,—I beg to call the attention of your scientific readers to a small physiological fact which has not, to my knowledge, been previously noticed by any one. It is simply the existence of the *spheroidal* form of ciliated epithelium on the lips of the oyster. Perhaps I may be better understood if I use the common term, and say "beard," meaning those thin, flat muscles, through which it appears to draw its nourishment. Anatomists state that this variety is only known in the frog's mouth, on the surface of the ovum, and the choroid plexuses of fetal quadrupeds; but in the above-mentioned structure I have lately discovered their existence, and may add that it is a source for obtaining examples of ciliated epithelium so convenient for demonstration that I need scarcely apologise for calling the attention of students and others to the subject.

I am, Sir, your obedient servant, J. HAWKES, House-Surgeon,

The Infirmary, Bolton-le-Moors, Nov. 1864.

**A Friend.**—We have perused the article on the "Grievances of Naval Assistant-Surgeons," which appeared in the last number of the *Illustrated News*, with much pleasure. The writer thoroughly understands the subject of which he treats. The position of the assistant-surgeons of the navy is altogether so unsatisfactory, and there are so many anomalies with respect to the medical public service generally, that an inquiry before Parliament is urgently necessary. The service has been so deteriorated by the mismanagement of lay officials, that a thorough reform is absolutely necessary.

**THE MESSRS. POWER AND THEIR CLASSES.**  
To the Editor of THE LANCET.

SIR,—I fear that a misapprehension might arise from the latter part of your report of the presentation of the "Power Testimonial," which I wish to correct.

I stated that my statistics referred only to our "general or Hall class" in comparison with the rejections at the Apothecaries' Hall. Of the statistics of the College of Surgeons it is next to impossible to obtain a regular and correct report; but my brother and myself have for many years kept an accurate weekly account of those of the Hall, which we are able to verify.

I stated also that from our general class, during a certain time, 1080 gentlemen had passed, and 54 had been rejected—i.e., 20 to 1; not that there were only 4 per cent. of rejections, as given in your report—while from all other sources, 1050 gentlemen had passed the Hall, and 256 had been rejected—i.e., about 4 to 1. The latter number, or rather 105 to 25, is very nearly accurate for the years 1847 to 1853 inclusive.

I put the statement in this way, and did not make out the *per centage*, and have no doubt that the error arose from mistaking the numbers 20 and 4 for per centages.

I have the honour to be, Sir, yours obediently,  
Royston Hall, Kilburn, Nov. 1854. WM. HENRY POWER.

**A Reader and Controvertist.**—Certainly not "purely white."

**A Dispensary Surgeon, (Bath.)**—Inquiry shall be made into the subject, and the omission rectified.

**Mrs. Caroline Welchman.**—No such practice is allowed. The fee would not be accepted under any circumstances. Information of the description required is never given.

**REWARDS TO MEDICAL PRACTITIONERS.**  
To the Editor of THE LANCET.

SIR,—As it is somewhat a rare circumstance for the services of medical officers to be appreciated, and as I observed in your last number some notices of that character on the part of parochial authorities, perhaps you will not think it improper to give publicity to what the trustees of the poor of this parish of St. Leonard, Shoreditch, have lately done. They confirmed a resolution of the previous board meeting, to give each of their surgeons £50 for the extra services rendered during the late epidemic. This (as it may be considered) liberally might be held up as a good example to boards of guardians presiding over very much richer parishes than our own. The names of the medical officers are—Mr. James Clarke, Mr. G. W. H. Coward, Dr. P. L. Burchell, Mr. T. P. Collier, Dr. Nicol.

I am, Sir, truly yours  
Kingsland-road, Nov. 1854. P. L. BURCHELL, M.B.

**S. B.**—We know nothing of the person in question.

**A Member.**—The subject might be brought forward with advantage.

**A. B.**—Whatever may be the result of such a proceeding, our correspondent will at all events have the satisfaction of knowing he has done a good action.

**UNQUALIFIED PRACTITIONERS.**  
To the Editor of THE LANCET.

SIR,—You may think me perhaps troublesome; but now that the Iron is hot, let us strike it. In THE LANCET of November 18th is a letter from "M.R.C.S.E. and L.A.C.," respecting unqualified practitioners. Now, pray let me state my case:—"An individual, without any qualification, is practising in my neighbourhood," holding two clubs, one the Foresters, the other a Temperance Club, and having several very excellent patients, "and I blush to add that qualified medical men meet him in consultation," but this case differs from the preceding one, inasmuch as this man's father-in-law resides in the same place, and is one of the most wealthy in the town, so that we could not say here "Poor fellow!" All I can say about this is, that it is a great shame that we are not better protected. There is no wonder that so many of our fraternity are poor when they are being daily robbed by impostors and quacks.

I am, Sir, yours obediently,  
November, 1854. SINOM.

**Frederika.**—An answer appeared in the last number of THE LANCET.

**N.**—The meetings are held weekly from October to May.

**A Student.**—The preliminary examination at Apothecaries' Hall is not compulsory.

**THE CRYSTAL PALACE.**  
To the Editor of THE LANCET.

SIR,—I have seen the Crystal Palace, and perused pages 142 to 148 of the "Guide." Let me beg of you to do so too. You will find great names of every art and every age, the bright examples whom the authorities of this quasi-national enterprise hold up for the imitation of our sons and daughters.

Of the great amongst those of our brothers who have been, Hippocrates represents the Greeks, while Hufeland alone from the glorious ranks of Continental Medicine, and Hunter alone from those of England, have been found worthy to illustrate the past; and Skye, of whom you may perhaps have heard, (he was the author of certain lectures published not long since), has alone won the honours of the living. Such glory is too weighty for one man to bear, even for Skye; and in the full zeal of brotherhood, such as animates all members of our profession, I boldly offer myself as his companion in the immortal phalanx.

Now for the ladies. Pray keep your daughters from the Palace; their ambition will be roused by contemplating the effigies of the glorious dead, and they will labour to deserve a place upon the roll of honour in one of the three classes of women, who at the Crystal Palace are alone deemed illustrious, queens, actresses, and (see 28, 217, 235, 301) courtizans! Does the "Handbook," to which "visitors are referred for the lives," enter fully "into the claims to renown of these nobilities?"

I am, Sir,  
November, 1854. THE SHADE OF ROMEO'S APOTHECARY.

**J. P. and J. E., (Manchester.)**—The term "general practitioner" is vague and almost absurd. The laws regulating the medical profession are most unsatisfactory, and often antagonistic to each other. A "general practitioner," in the common acceptance of the word, is a medical gentleman who dispenses medicine for his own patients. To be "legally qualified" to practise all branches of the profession, it is necessary that he should possess the licence of the Society of Apothecaries, and the diploma of the College of Surgeons.

**TREATMENT OF CHOLERA BY ACIDS.**  
To the Editor of THE LANCET.

SIR,—I cannot agree with Mr. Bodington that I have no right to sign merely the letters "R. W." I cannot agree with him that he laid no claim to originality in "having suggested" the use of acids in the treatment of cholera. These are his words, to be found in THE LANCET of the 14th of October:—"There is a letter with the signature 'R.' headed 'Causes of Cholera,' which I wrote..... It was only when I saw parties making statements in your journal of their having first suggested the treatment by acids, that I wrote to you, Sir, in my own name, in vindication of my prior claim. Previously I had written anonymously....."

It was this assertion I answered. I certainly never read his pamphlet. We all read THE LANCET with a view to information, and he who contributes to it must expect, if he cannot corroborate his statements, to have them refuted. I wage no war with Mr. Bodington. I will not therefore say anything harsh on his assertion, that I said, directly or indirectly, that Asiatic cholera was known 260 years ago. Those who think my letter of the 28th of October worth reading can soon see what I did say.

Cholera appears to afford the fairest field in the world for discussion. Scarcely anyone fears to write nonsense, when this disease is his theme. Even I may venture to state, that when the mysterious cause of cholera is hovering around and about us, the poison affects us all in different degrees, from the slightest nervous sensations upwards through the stages of diarrhoea, cholera, to Asiatic cholera itself; and who can after all say that Asiatic cholera is not merely a more severe form of what we call English cholera? At all events, the treatment of nearly every medical man is founded on such a supposition. "Stop the diarrhoea and you escape the cholera," has become a maxim; "stop the diarrhoea, stop the vomiting, and you have no collapse." Now, Sir, it was to fulfil this indication that sulphuric acid was proposed; and without going back to *musty old books*, I will just quote from a text-book, which was in the hands of all the class when I was a student (in the year 1836):—"Two writers on the Diseases of India (Curtis and Johnson) mention that a very severe and fatal spasmodic cholera, proceeding from acrid bile, is a very prevalent disease on the coast of Malabar, where it is known by the name of *mort de chien*...... I have been informed by a medical friend that he found large doses of diluted sulphuric acid to abate the irritation of the stomach more readily than even opium." I have done. I go back to my *cloisters to scrape and fumble over musty books*, in one of which I read something like the following:—

"Hoc ego versiculos feci, tulit alter honores."

I am, Sir, your obedient servant,  
November, 1854. R. W.

**Mr. S. Brownridge, (Hull.)**—In acknowledging the receipt of Mr. Brownridge's letter of the 26th ult., we beg to inquire if it still be his wish that we should publish his communication of the 20th ult. just as we received it?

**Unqualified, (New-road.)**—It is probable that an appointment as dresser might be obtained.

THE admirable sketch forwarded by Dr. Conolly is unavoidably postponed.

**Aspic Finem** says:—

"Giving advice gratis brings before the practitioner many forms of disease which otherwise he would not see, and by extending his experience increases his knowledge. It enables him to effect a pecuniary saving, by giving merely a prescription to those whom he would otherwise be obliged to supply with medicine, if he attended them at all. If the applicants who are apparently well to do are rejected, it cannot be said to rob the profession, at least wittingly. It puts the prescribing into the hands of the medical man, and merely allows the druggist the opportunity of selling the drugs; thus it indirectly tends to dissipate the idea that druggists are acquainted with medicine. It causes those to obtain a medical opinion who would not wish to be attended on the parish account, yet who from poverty cannot pay a medical man, and must either go to a druggist or remain without advice. The system of giving advice gratuitously is so general at charitable institutions, that unless the private unattached general practitioner adopts it, he can see none of the interesting cases amongst the poorer classes, by which his attached brother surgeon gains his experience and becomes known to the public; and hence, on the ground of self-defence, the system holds out many inducements for adoption. Is not the informing of the public by means of brass plate a preferable method to making a confidant of a druggist?"

\*.\* Insertion is readily given to the above, the writer being a highly respectable member of the profession.

**A Constant Subscriber.**—1. Application should be made to Dr. Andrew Smith, Principal of the Medical Department of the Army.—2. Assistant-surgeon.—3. The Apothecaries to the Forces will be appointed from those already engaged in the service.

COMMUNICATIONS, LETTERS, &c., have been received from—Mr. France; Mr. Humble; A Reader and Controvertist; A Dispensary Surgeon, (Bath); J. B.; Such is Life; One who has seen many Successful Cases of External Incision; Secretary of the Empire Assurance Company; Mr. Tucker; N.; R. W.; An Old Subscriber, (Brighton); An Old and Willing Hand; Mr. Brownridge, (Hull); X. Y. Z.; Mr. Roper, (Worcester); J. P. and J. E., (Manchester); Mr. Jackson; Mr. T. Hopgood, (Chipping Norton, with enclosure); Mr. J. Nance, (Ecclestone, with enclosure); Messrs. Fowler, (Manchester, with enclosure); Mr. R. Richardson, (Rhayader, with enclosure); Mr. W. J. Jameson, (Ponteland, with enclosure); Mr. John Day, (with enclosure); Dr. Wallis, (with enclosure); Mr. Huxley, (with enclosure); Mr. T. Dixon, (with enclosure); Mr. M. Ingle, (Ashby-de-la-Zouch, with enclosure); The Rev. E. Holmes; Frederika; A Constant Subscriber; S. B.; Mrs. Caroline Welchman; Mr. Wm. Henry Power; A Friend; A. B.; Sinom; A Student; Unqualified, (New-road); A Member; Aspic Finem; An Inquirer; &c. &c.

**CAUTION.—Have the QUALITY of the GOLD STATED on the INVOICE, and REDRESS is OBTAINABLE in a COUNTY COURT.**—WATHERSTON and BROGDEN beg to announce that they have TAKEN SPACE in the CRYSTAL PALACE, with the view of giving universal publicity to the principle of SELLING GOLD CHAINS by weight and workmanship. To those who have not yet tested its value, the following examples will be found useful, showing the relative prices paid for Labour in the purchase of a genuine and of a spurious Gold Chain:—

<i>Genuine Gold Chain.</i>	
Assumed cost of gold chain, of equal weight...	£10 0 0

WATHERSTON and BROGDEN, Goldsmiths, Crystal Palace, Central Transept, No. 23, Gallery of Precious Metals. — Manufactory, No. 16, Henrietta-street, Covent-garden, London. Established A. D. 1798. N.B. Assays made of Chains and Jewellery for 1s. each.

## Ford's Eureka Coloured Shirting is

now ready, in 200 different patterns. Specimens in varied colours sent post free on receipt of six stamps.

FORD'S COLOURED EUREKA SHIRTS, Six for 27s. FORD'S WHITE EUREKAS, best quality, Six for 40s.; second quality, Six for 31s.; if washed ready for use, 2s. extra.

CAUTION.—Ford's Eureka Shirts are stamped "38, POULTRY, LONDON," without which none are genuine.

\* Catalogues with particulars post free.

RICHARD FORD, 38, POULTRY, LONDON.

## The 16s. Trousers reduced to 14s.—

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

## R. T. Pigram, Practical Tailor, and

Inventor of the Indicator of the Human Figure, whereby a perfect fit is secured, respectfully invites the attention of the public to his mode of art, since none can doubt the importance of an easy and exact adjustment of wearing apparel. Superior Trousers at 17s. 6d. per pair.

R. T. PIGRAM, 51, Lamb's Conduit-street, Foundling Hospital.

## To Professional Men and others.—

The Oxford Mixed Doeskin Trousers, price 21s. The Stratus Cloth Vest, price 10s. 6d. Stock for choice, or to measure.

S. BATTAM, Coat and Trousers Maker, 160, Tottenham-court-road, four doors south of Schoolbred and Co's.

Patterns of the material and Directions for Measuring sent free per post.

## Assistant-Surgeons.—Gentlemen

receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at

L. PHILLIPS, 38, WEST STRAND, LONDON, the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, and every necessary information, may be obtained on application.

## Abstract regarding Economy in

CLOTHES.—From *The Times* of October 30th, 1854.

"Every yard of Cloth sold at THE LONDON CLOTH ESTABLISHMENT is sold at the WHOLESALE PRICE, and Gentlemen purchasing Cloth at the London Cloth Establishment (if they wish) have it made up on the premises at the expense only of the workmen's wages, in addition to the price of the trimmings."

### THE ECONOMY OF THIS SYSTEM

Is Proved by the saving of from thirty to fifty per cent. in the price of every garment; besides the very obvious advantage of selection from such a stock, with the guarantee of a superior fit, good taste, and the best work. The Proprietors refer with satisfaction to the high character which their "Tyrian Dye" Black Cloths and Doeskins have obtained; they never change colour, and will (without injury) bear the application of the strongest acids.

LONDON CLOTH ESTABLISHMENT, No. 16, Coventry-street.

THE SYDENHAM TROUSERS.  
17/6

## Samuel Brothers,

29, LUDGATE-HILL,

Inventors and Sole Manufacturers of the

SYDENHAM TROUSERS, at 17s. 6d.,

Unequalled for superior style, fit, quality, perfect ease, and gracefulness, so requisite for gentlemanly appearance, and so rarely obtained.

Patterns sent free on application.

SAMUEL BROTHERS' Stock of OVERCOATS for the present Season is worthy of your inspection.

## Metcalf and Co.'s New Pattern

TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perumery for the toilet.—At METCALFE, BINGLEY, and CO.'S only establishment, 130s and 131, Oxford-street, second and third doors west from Holles-street. Metcalf's Alkaline Tooth Powder, 2s. per box.

## Metal Bed-Pan,

Price 6s.—Acknowledged to be the most convenient in form, and much more durable than any now in use.

To be had of the Manufacturer, J. LAWRENCE, 20, Great Charlotte-street, Blackfriars; of Messrs. Gale, Baker, Warde, and Oldfield, Bouverie-street, Fleet-street; and of Messrs. Leadbitter and Hollon, York.

Orders from the Country must be accompanied by a Remittance.

## Funeral Extortion avoided, by Exe-

cutors and bereaved Relatives of deceased Noblemen, Gentlemen, Tradesmen, and others, sending in the first instance to SHILLIBEER'S OFFICE, CITY ROAD, near Finsbury-square, or to 12, NORTH STREET, QUADRANT, BRIGHTON, instead of employing their Upholsterer, or the nearest Undertaker, who, not possessing the needful requirements, resort to the Funeral Furnishers, to hire them, and consequently inflict twofold profits.

Shillibeer's Establishment combines under one charge, to any scale of pomp and humility desired.

Funerals of every class, and the most varied description of conveyances, old and new styles, and first-rate equipments, at charges so moderate as to defy competition. Catholic Fittings from Paris. No extra charge within ten miles. A Nobleman's Funeral, Thirty Guineas; Gentleman's, from Ten Guineas; Tradesman's, £8; Artisan's, £4 and upwards.

Originated in 1842.

AT THE CRYSTAL PALACE.

## "The Duobus," a cheap close Carriage

for a "Country Practice," having all the comfort and convenience of a Brougham, with the weight of an ordinary Gig. Price £42. This Carriage can be seen at the new Crystal Palace, and sketch and particulars obtained on application to T. B. Storey, Coachmaker, Nottingham.

## Improved Invalid Cot Carriages—

the greatest luxury and comfort ever introduced for removing invalids, being fitted up with the patent noiseless wheels. These carriages may be engaged, on moderate terms, for any journey, upon application to H. and J. READING, coachbuilders, 14, Riding House-lane, Cavendish-square.—N.B. A good assortment of new and second-hand carriages for sale or hire.

## Patent Perambulators.

C. BURTON, Inventor, Patentee, and Sole Manufacturer to Her Majesty by appointment.

The distinguished patronage, the flattering encomiums, and the increasing demand, are sufficient proofs of the utility and excellence of these fashionable, safe, and elegant Carriages for adults, children, and invalids, propelled from behind by the slightest effort. Country and Shipping orders. Illustrated Circulars.

OFFICE, 497, NEW OXFORD-STREET.

Also, C. BURTON'S PATENT PERAMBULATOR FOR THE MILLION. Price Two Guineas.

CAUTION.—To avoid unprincipled and dangerous imitations, look for Burton's Label on each Carriage.

**M. Pillischer's Newly-Constructed**  
**STUDENT'S MICROSCOPE**, which, for solidity, portability, and reasonable price, surpasses any Microscope hitherto made by any English or Continental maker. The Student's Microscope, with coarse and fine adjustments, single mirror, one eye-piece, a one-inch and one-quarter-inch French achromatic object-glasses of best quality, the whole packed in mahogany case, 7 in. by 8 in., 25 10s.; or with M. Pillischer's own-made, 1 in. of 18 degs. angular aperture, and 3 in. of 60 degs., 27.  
 The above stand with lever stage, extra eye-piece, double mirrors, animalcule cage, &c., 2s.; or with Pillischer's glasses, 2s 10s.  
 A list of prices will be sent free on application to M. Pillischer, 88, New Bond-street.

**New Spinal Support.—Fr. G. Ernst,**  
 Lamb's Conduit-street, Foundling Hospital, begs to draw the attention of the Faculty to his recently-invented **SPINAL APPARATUS**, which, after some months of trial, has proved superior to any of the various kinds hitherto used, and produced the most satisfactory results. This appliance, being self-adjusting, free bodily motion is permitted; thus, while equal and necessary support is given to the wearer, all injurious or painful pressure is avoided, and a great amount of comfort and benefit consequently yielded. It can be modified so as to suit any **FORM OF SPINAL DEFECTION**; its weight is comparatively trifling, and from its capacities for nice adaptation elicits no observation when on the body.  
 To be had only of the Inventor, 43, Lamb's Conduit-street.

TO THE MEDICAL PROFESSION.  
**Fr. G. Ernst, Anatomical Machinist**  
 and MANUFACTURER OF SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of **APPARATUS for the CURE and RELIEF of BODILY DEFORMITIES**, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam Ernst (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &c.

**Every excellence which the**  
 Surgeon can require—viz., Lightness, Durability, Strength, and Economy—is realized by **HUXLEY'S SURGICAL STOCKINGS, KNEE-CAPS, ANKLETS, &c.**  
 H. and Co. have much pleasure in informing the Profession that they have perfected an **ABDOMINAL BELT** of new construction, which, acting diagonally, is not liable to displacement; its weight is only four ounces. Price 18s. Diagrams and particulars forwarded by post. Every kind of Surgical Stocking made. Spiral Stockings at a great reduction. Measure required for Stocking: Circumference at A, B, C, D, and E; length from A to D, and D to E.

**HUXLEY and CO., 8, Old Cavendish-street, late 5, Vere-street, Oxford-street.**

**Mr. Bourjeaud's Registered Elastic**  
**APPLIANCES**, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mirart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

FIG. 1. At home from One till Five.

FIG. 2.

**FIG. 1. THE BELT AND AIR-PAD FOR FEMORAL HERNIA.**—Mr. Bourjeaud begs to state that this has been extensively tried, and has met with great approbation, especially at Guy's and St. Bartholomew's Hospitals. (See THE LANCET, Jan. 10th, 1852, page 43; and March 13th, 1852, page 287.) The air-pad is carefully adjusted, so that it may exactly rest on the femoral ring, the tube and stopcock being free, to allow of the pad being subjected to more or less insufflation. The belts in all these apparatuses possess the great advantage of encompassing the abdomen without distressing the patient, and of giving such support to the intestines as to lessen the chance of hernial protrusion. It is, in fact, extremely erroneous to confine the pressure to the rings; the whole abdominal mass should be well supported, and the pressure on the rings will then be effectual, without being exerted with the violence so often connected with the steel trusses.

**FIG. 2.—APPARATUS FOR UMBILICAL HERNIA.**—The belt is of the same kind as those figured in the other diagrams, but an air-pad sufficiently large is here fixed to the centre of the belt, and has the advantage, by its yielding and resilient properties, to fill, in some degree, the umbilical ring; thereby preventing protrusion, and leading the way, especially in children, to the final closure of the ring. Mr. Bourjeaud has had several cases of radical cure with young subjects. (See THE LANCET, July 12th, 1851, page 33; and Feb. 12th, 1853, page 153.)

**Mr. Edwin Osborne, of 24, Savile-**  
 ROW, LONDON, the Sole Licensee and Maker of **PALMER'S PATENT LEG**, adapts this beautiful substitute to every form of amputation and having had great experience in its manufacture, feels confident of giving comfort and satisfaction to those persons who may favour him with their patronage. References given, (if required.)

**Army and Navy Surgeons can be**  
 supplied with the best **SURGICAL INSTRUMENTS** cheaper than any other house in the trade, at **PRATT'S**, 420, Oxford-street. Travelling Urinals, from 12s.; Brass Enema Syringe in Case, 7s. 6d.; Elastic Stockings, 5s.; Case of Amputating Instruments, £3 15s.; Pocket Case, 30s.; Tooth Instruments, from 25s.  
**PRATT, Surgical Instrument Maker, 420, Oxford-street.**

**Henry Bigg, 9, St. Thomas's-street,**  
 Borough, Surgical Instrument-maker to Guy's and St. Thomas's Hospitals, begs to call the attention of the Medical Profession to the following valuable Instruments, made from designs and suggestions kindly given by the Gentlemen whose names are attached—viz., Mr. Le Gros Clark's Talipes Instrument; Mr. Bransby Cooper's Ovarian Trocar; Mr. Cock's Recto-Vesical Trocar; Mr. Cooper Forster's Ear Speculum; Mr. Hilton's Speculum Ani; Dr. Lever's Midwifery Instruments; Mr. Solly's Elastic Catheter, with Catgut Director. These Instruments being constructed on the premises secure their excellence and perfect finish.  
 9, St. Thomas's-street, Borough, London.

**Dr. Lever's Improved Elastic Utero-**  
**ABDOMINAL BELT** being constructed by Mr. H. Bigg, 29, Leicester-square, under the immediate suggestion of Dr. Lever, will be found to combine every advantage possible to obtain. It upholds the parietes of the abdomen, secures support to the uterus, and admits of the elastic force immediately above the pubes being increased by the patient after the Belt is applied.  
 To be had only of Mr. H. BIGG, 29, Leicester-square.

**Spinal Curvature.—Mr. H. Bigg, 29,**  
 Leicester-square, particularly invites the attention of the Faculty to two new and distinct forms of **SPINAL APPARATUS** he has recently invented. The principle on which they are constructed, thoroughly supplants the "brute force" of the screw, yielding instead an elastic power analogous to muscular motion; it also encourages respiration, admits of the spine being moved in any direction, and possesses a weight so trifling as hardly to be felt by the wearer.—PATENTED.  
 To be had only of the Patentee, 29, Leicester-square.

**Treatment of Club Feet, Spinal**  
**CURVATURE, &c., WITHOUT THE EMPLOYMENT OF THE SCREW.**—MR. HEATHER BIGG, 29, Leicester-square, begs to invite the attention of the Faculty to an entirely new principle he has discovered for constructing the various apparatus for deformities of the feet and spine.  
 "The living structures do not with impunity tolerate the brute force of the screw." In any case in which the force of the screw is employed, unless for a very brief period, excoriation, sloughing, intolerable pain in the parts compressed will inevitably result." \* \* \* Dr. LITTLE, on "Deformities," pp. 34, 35.  
 Mr. H. Bigg has recently invented four distinct forms of Orthopedic Instruments for Talipes Varus, T. Valgus, T. Equinus, Lateral Curvature, &c., in all of which the principle of muscular elasticity is simulated and the "brute force" of the screw ignored.—PATENTED.  
 29, LEICESTER-SQUARE.

TO THE SURGICAL AND MEDICAL PROFESSION.  
**W. F. Dürroch, late Smith, begs to**  
 inform the Profession, that he continues to MANUFACTURE **SURGICAL INSTRUMENTS** of every description, and that he has attained the highest reputation by the approval and patronage of the most eminent practitioners and lecturers for the improvements made in various articles. Gentlemen favouring him with their orders may rely on having their instruments finished in the best and most modern style. Surgical and Medical Instruments made to drawings, and kept in repair. Established 1798. No. 2, New-street, St. Thomas's-street, (near the Hospital,) in Southwark.  
 Superior dissecting instruments and equally moderate in price, well worth the inspection of the student.  
**SPECULUM ANI**, made by W. Dürroch, for John Hilton, Esq., may be had at a moderate price.

## ELECTRICITY.

FOR NERVOUS, FUNCTIONAL, AND RHEUMATIC DISEASES.

**MEINIG'S New and Greatly Improved GALVANIC ELECTRO-GENERATOR**, for supplying vito-functional energy to any organ in want of the same, and to the system generally, may now be had at the Establishments, 103, Leadenhall-street, and at 213A, Piccadilly. All wet and metallic contact with the body is entirely obviated; it acts with water alone, without acid, the action lasts more than twenty-four hours after each damping, and can be renewed and regulated without undressing, the Generator, enclosed in an envelope, being carried in the pocket or suspended from the neck.

THE EXTRAORDINARY CURATIVE VIRTUES OF THESE MILD CURRENTS OF ELECTRICITY ARE NOW FULLY ESTABLISHED BY EXPERIENCE. The Prospectus (to be had gratis, or by post for two stamps) contains the names of more than 600 persons cured within the last eighteen months, and this remedy is now adopted in nearly all the Hospitals, and by the most eminent practitioners. Sold at 6s. and upwards, according to power, at C. MEINIG'S, 103, Leadenhall-street, and 213A, Piccadilly.

N.B.—In the first stages of CHOLERA the continuous current from the colon to the abdomen has been found eminently successful in checking the further progress of the disease.

**POCKET-BATTERIES** for Medical Practice on the same principle. (Intensity of 120 cells within the space of a small pocket-book.)  
 103, LEADENHALL-STREET and 213A, PICCADILLY (near Regent-circus.)  
 Prospectus gratis, or by post for two stamps.

## Recherché Wines.—Sherry: A very

fine Sherry, (Amontillado and Montilla.) Brown and Pale, for Cash, at 42s. per dozen; £21 per quarter-cask; £42 per hogshead; £84 per butt.  
**Port.**—Very fine old dry Wine (Vintages 1827, 1830, 1832, 1834), lately imported: from the Wood at 48s., 54s., 63s., and 68s. per dozen.

First Class Champagne, (Ay, Arize, Pierry, Verzenay, and Sillery,) Sparkling and Still Moselle, Sparkling, Still, and Red Hocks, and Bordeaux Wines, at very moderate prices.

These Wines are patronized and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples and List of Prices forwarded on application.

H. H. HAMMICK, Importer, 11, Pall-mall, London, opposite the "Travellers' Club."

## Allsopp's Pale Ale in Bottle, as

supplied to the CRYSTAL PALACE; also in casks of 18 gallons. Recommended by BARON LIEBIG.

Address, HARRINGTON PARKER and CO., 51, Pall-Mall, London.

## Pale India Ale and Stout, 4s. 6d.

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts. Delivered free within four miles of London, and carriage free to all railway stations in England at 6d. per dozen extra.

WOOD & WATSON, 16, Clement's-lane, City.

## Allsopp's Pale Ale.—Medical gentle-

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S. University College, London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 16, 1852, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BOTTLE PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTTY, 132, Upper Thames-street, London.

## Soyer's Aromatic Mustard.—"M.

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration."—THE LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

## To Invalids and those desirous of

PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO'S HOMEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

## DOMESTIC ECONOMY

## H. Sparrow and Co. beg to announce

that in consequence of the late reduction of duty, and the present depressed state of the Tea market, they are enabled to offer

Good Breakfast Congou at 2s. 8d., 3s., 3s. 4d., and 3s. 8d. per lb.

Fine Souchong, 3s. 4d., 3s. 8d., and 4s.

Young Hyson, 3s. 4d., 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Gunpowder, 3s. 8d., 4s., 4s. 4d., 4s. 8d., and 5s.

Fresh Roasted Coffee, 11d., 1s., 1s. 4d., and 1s. 6d.

With every other article in the trade proportionately cheap, and of that sterling quality for which they have been celebrated for the last Twenty Years; a price-list of which may be had on application, post free, and parcels of £2 value and upwards, rail paid, to any station in the kingdom.

Address, HENRY SPARROW and CO., Wholesale Dealers in Tea, 372, Oxford-street, London.

## Pure as well as Fine Tea.—

Tea, when pure, is well-known to produce a most wholesome beverage; the impolicy of allowing it to be coloured by the Chinese is fully set forth by the Analytical Sanitary Commissioners, in THE LANCET, and also in THE TIMES, (October 6th, 1852.) The fact, therefore, is now familiar to most; that artificial colour is used to give the Spring crop and the spent Autumn picking the same appearance. If this practice were discontinued, a twofold benefit would arise; first, the fine qualities would have all the fragrance and strength unimpaired; and, secondly, the inferior faded leaves could not then be passed off as good, causing the flat, insipid infusion, so frequently the subject of complaint. The uncoloured Tea imported from China, by HORNIMAN and Co., London, is perfectly pure; the Green, from the absence of the usual artificial colouring, is of a natural olive hue. The Black, and also the Green, are exclusively of the Spring product from young and vigorous plants, which yield not only more strength, but the full degree of fragrance which FINE Tea, when purely natural, and seasonably selected, alone possesses; ONE TRIAL induces a continued preference. The prices are REDUCED:—

Finest Congou, 3s. 8d. Finest Lapsang Souchong, 4s. and 4s. 8d.  
 Fine and Pure Green, 3s. 8d., 4s., and 4s. 8d.

HORNIMAN and CO., Wormwood-street, London, Importers of the most approved Teas in general use, but free from the objectionable artificial colour on the surface.

Agents in London, PURSELL, 80, Cornhill; and ELPHINSTONE, 227, Regent-street, and 368, Oxford-street.

Sold by authorized Firms in all Towns, in 1 lb., ½ lb., and ¼ lb. packages only

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

## Robinson's Patent Barley, for making

superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than thirty years, have been held in constant and increasing public estimation as the purest farinæ of the oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.

The proprietors of ROBINSON'S PATENT BARLEY and PATENT GROATS, desirous that the public shall at all times purchase these preparations in a perfectly sweet and fresh condition, respectfully inform them that every packet is now completely enveloped in the purest Tin-foil, over which is the usual and well-known paper wrapper.

Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets at 6d. and 1s., and in Family Canisters at 2s., 5s., and 10s. each.

## Royal Polytechnic Gas Fire.—

BACHHOFFNER and DEFRIES'S PATENT.—The Public is respectfully informed that arrangements have now been made for the supply of this unique and beautiful mode of Warming Private Houses, Shops, Public Buildings, &c. Smoke, dust, ashes, and accidents from fire are effectually prevented by its use, while it presents all the comfort and appearance of an open coal fire, securing, at the same time, perfect ventilation. To be seen in action at DEFRIES'S Office, 145, Regent-street, London.

## Ten Thousand Stoves.—The Tenth

Thousand of the PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DEAY, and CO., 46, King William-street, London-bridge, and may be obtained of most ironmongers. The Improved Patent Ventilating Stove, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded, post free.

## Warming and Ventilating, by Hot

AIR, CHURCHES, HOSPITALS, TOWN HALLS, and other PUBLIC BUILDINGS.—J. BOILEVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

Eardiston House Worcestershire, March 1st, 1854.

SIR,—I am much pleased in being able to give you a justifying account of your Calorifere. Since I burn nothing but coke in it, the change has been quite surprising. I must say, that now I have a very high opinion of your machine, and find it a great comfort in my house, the cost of warming it was one shilling per day.

To J. Boileve, Esq.

WM. SMITH. (Sir, Baronet.)

## Purification of Linen.—Prevention of

Disease.—J. BOILEVE, 55, King William-street, City, London, solicits the attention of the nobility and gentry to his CALORIFERE, for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

From his Grace the DUKE OF BEDFORD, Woburn Abbey, Sept. 24th, 1853.

SIR,—His Grace the Duke of Bedford has desired me to say, his Grace has received your letter inquiring about the Calorifere (drying machine) just up in the Laundry at Woburn Abbey in May, 1852, by Mr. Boileve. In answer to that inquiry, I have to state, that nothing can exceed it in effect and economy. I sent to the Laundry for the man who has the management of it, and he says, that they can dry off the linen in much less time than they could with the old stove, without dust or dirt of any kind in the Laundry. They can obtain any degree of heat they wish for, and that at a great saving of fuel.

I am, Sir, your obedient servant,

J. Boileve, Esq.

J. PALFREMAN, House Steward.

## A New Discovery.—Mr. Howard,

Surgeon-Dentist, 52, Fleet-street, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without springs, wires, or ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR OR DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed teeth rendered sound and useful in mastication.

52, Fleet-street. At home from Ten till Five.

## Teeth.—Mr. Alfred Jones, of Gros-

venor-street, has recently completed a new and important improvement in the construction of ARTIFICIAL TEETH. The superiority of their appearance, and the unerring accuracy with which they are fitted to the mouth, without wires, springs, or ligatures, and the lightness of their construction, gives greater facility in mastication and freedom to the speech, and imparts a more youthful appearance to the countenance than has hitherto been attained; they support any teeth that may be loose, and have been tested by many of the first medical men, the nobility, and gentry, from whom he has received the most flattering acknowledgments of success. Supplied only by Mr. ALFRED JONES, Surgeon-Dentist to Her Royal Highness the Duchess of Gloucester, her late Royal Highness the Princess Augusta, and his late Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street, Grosvenor-square.—At home from Eleven until Five.

**Water Filter for the Pocket, with**  
**DRINKING-CUP and INSTRUCTIONS,** and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.  
**J. SOLOMON,** Wholesale Optician, and Photographic Dépôt, 22, Red Lion-square.

**Infants' New Feeding Bottles.—These**  
 celebrated Nursing Bottles, the best Artificial Mother ever invented, enabling the most delicate infant to feed from its birth with the greatest comfort and ease, are adapted to milk, biscuits, and all kinds of food. The Nipple, of novel material, is elastic, soft, durable, very clean, and so beautiful an imitation of nature, that no infant ever refuses it.—**BENJAMIN ELAM,** 193, Oxford-street.—7s. 6d.—Each is stamped with my name and address.

**Anatomical and Dental Repository,**

**The Eye Douche, for applying Lotion**  
 to or bathing the Eye, is self-acting, simple, and portable. The immediate relief obtained from its use particularly recommends it to the notice of all who are much engaged in reading, writing, or designing; it has been employed with the most favourable results by patients under the care of **Haynes Walton, Esq., Surgeon to the Central London Ophthalmic Hospital.** Price 20s.; carriage paid to any railway station.  
 Manufactured by **WILLIAM T. COOPER,** 26, Oxford-street, London.

**COOPER'S LAVEMENT APPARATUS** is the most perfect ever invented; the possibility of air entering the bowels is prevented, and the labour of pumping is avoided; being constructed entirely of metal, without valves, it cannot become out of order, which renders it particularly suitable for use in the country or in foreign climates. Price 35s. Enema Apparatus from 10s.; Superior Reservoir Apparatus from 27s.—Each instrument in mahogany box with lock and key.  
 Manufactured by **WILLIAM T. COOPER,** 26, Oxford-street, London.

**THE CORK RESPIRATOR** is the lightest cheapest, and most efficacious ever produced; allows free respiration, and from being easily applied and removed, is specially adapted for the use of Invalids, or Ladies attending evening meetings or places of amusement. Price 3s., free by post.  
 Wholesale only of **WILLIAM T. COOPER,** 26, Oxford-street, London.  
 Illustrated Catalogues free by post.

**Mathey Caylus' Gluten Capsules**  
 contain the purest Cofeiba, either simple or combined with Citrate of Iron, Ratanhy, Cubebs, &c.; acknowledged by the London and Paris Hospitals; also by the Looch Hospital; M. Leseur, chef de Travaux Chimiques à l'Académie de Médecine; Drs. Bloor, Cullerier, &c., who have granted written attestations, to be the best prepared Medicine for the cure of certain diseases.

*Extract of a Letter from Dr. Cullerier:—*  
 "I cannot induce you too much to extend the use of your preparations; by so doing you will render a valuable service to the therapeutic of hemorrhagic affections."  
 "I am, &c.,  
 "CULLERIER,  
 "Chirurgien de l'Hôpital de Lourcine."

Sold in Bottles, at 2s. 9d. and 4s. 6d., sealed and stamped with the Government stamp, bearing the name of the Patentee.  is required for the **WESTERN GENERAL DISPENSARY**, New-road, St. Marylebone. Candidates must be Members of the Royal College of Surgeons of England, Edinburgh, or Dublin, and Licentiates of the Apothecaries' Company to practise in London, and are required to attend (with their qualifications and testimonials) a Meeting of the Board of Directors on Thursday evening, December 14th, at Eight o'clock, when the Election will take place.—Further particulars may be obtained at the Dispensary.  
 Nov. 29th, 1854. By Order, **J. MARTIN, Sec.**

**London Fever Hospital.—The Com-**  
 mittee will proceed to the Election of a **RESIDENT MEDICAL OFFICER** for this Institution on Saturday, the 16th of December. All Candidates are required to send in their applications and testimonials to the Secretary, at his Office, No. 33, Ely-place, Holborn, on or before the 9th day of December. Candidates will obtain, on application to the Secretary, full information in respect to the duties, qualifications, and salary of the Resident Medical Officer, as set forth in the established rules of the Hospital.  
 Dated this 30th November, 1854.  
**CHARLES HYDE, Secretary.**

**Royal Isle of Wight Infirmary.—**  
 Wanted, a legally-qualified Gentleman as **RESIDENT MEDICAL OFFICER**, who, in addition to the House duties, will be required to Visit Patients and act as Secretary. Salary, £240 a year, with board, &c.—Diplomats of qualifications and testimonials to be addressed, on or before the 21st day of December, to **J. Worsley, Esq., Treasurer, Ryde.**  
 The Election will take place on Wednesday, the 17th day of January.

**Wanted, a House-Surgeon to the**  
**CARDIFF INFIRMARY.** He must be a Member of the College of Surgeons of London, Edinburgh, or Dublin, and a Licentiate of Apothecaries' Hall, London. Salary, £100 per annum, with apartments in the house, coal, and candles. Testimonials and applications to be addressed to the Committee of the Glamorganshire and Monmouthshire Infirmary, care of Mr. Granger, at the Cardiff Infirmary. The Election will take place on Thursday, 4th day of January, 1855.

**Aërated Waters of sufficient and**  
 uniform strength. **BLAKE, SANDFORD, and BLAKE,** 47, Piccadilly, having given great attention to the manufacture of Mineral Waters, and feeling it important that medical men should be assured of the quantity of Alkali contained in each kind, beg to submit the following list of their preparations:—  
 Potash Water, 18 grains of the Bicarbonate in each bottle; Citrate of Potash, (a new and valuable auxiliary in Gout and Rheumatic affections,) 30 grains; Soda, 15 grains; Magnesia, 12 grains, and Ammonia, 10 grains.  
 B. S. & B. would especially recommend their Seltzer and Vichy Waters; the latter now bottled in half-pints as well as pints.  
**BLAKE, SANDFORD, and BLAKE, 47, Piccadilly.**

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS.

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.

Office hours from 12 till 4.

TO THE PROFESSION.

**Mr. Bowmer, M.R.C.S. Eng., 50,**  
LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with Assistants, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

**Lunatic Asylums.—Wanted,** by a fully-qualified Medical Man of experience in the treatment of the Insane, an Engagement in an Asylum.—Address to Delta, care of Messrs. Corbyn, Poultry, Cheapside, London.

TO MEDICAL PRACTITIONERS.

**A Gentleman, aged 30, (unqualified,)** wishes to meet with a Re-engagement as Visiting and Dispensing ASSISTANT.—Address, Mr. Henry Reddcliff, Lifton, near Lannceston, Cornwall.

**Partnership wanted in a well-established Medical Practice,** in Town or Country, by a Gentleman, about forty years of age. Particulars to be addressed to X. B., Mr. Robinson's, No. 11, Union-court, Old Broad-street, City.

**Wanted, by a Married Man, aged 33,** a Situation as MESSENGER, LIGHT PORTER, or other capacity in which the Advertiser could make himself useful. Undeniable references.—Apply by letter, pre-paid, to W. H., No. 2, Charles-street, St. John's-wood.

**An Easy Introduction to a Practice.** To LET, a SHOP and PART of a HOUSE, furnished, (Rent £35,) where a good Retail and a moderate Practice were done by the last occupier.—Apply to Mr. Candler, on the premises, 21, High-street, Poplar.

**A Qualified Assistant Wanted immediately,** in a purely Country Practice, to Visit, Dispense, attend Midwifery, and accustomed to ride on horseback. Salary, £50, with board and lodging.—Address L. N., Post-office, Alconbury, Hunts.

**Wanted to Exchange, an Inland Practice,** well-established, of £300 per annum, for one of similar value in a Watering-place on the South, South-Western, or Western Coast of England.—Letters to be addressed to A. Y., THE LANCET Office, Strand.

**To be Disposed of immediately, a small Practice,** capable of great improvement, in a much-frequented town in the county of Kent; the present Proprietor having an Appointment. Annual receipts, including several Clubs, from £250 to £300. Premium required, £150.—Apply by letter, post-paid, to J. C., care of Mr. Forsyth, 47a, Moorgate-street, City.

**An Assistant required by the Resident Surgeon of a Suburban Dispensary.** The Situation is worthy the attention of any Gentleman desirous of obtaining an extended practical knowledge of his profession. A Gentleman possessing one of the Diplomas preferred.—Address, X. Y. Z., THE LANCET Office, 423, Strand.

**Wanted immediately, by a Surgeon in the Midland Counties, an ASSISTANT to Visit and attend Midwifery,** he must possess both qualifications. He will be treated in every respect as one of the family. Salary, £50 for the first year, to be increased annually till it amounts to £80.—Address, Mr. Benson, Messrs. Southall and Son, Chemists, Bull-street, Birmingham.

**Medical Practice, Kent.—In a village** a few miles distant from a fashionable Watering-place, suitable to a Gentleman disposed to receive a few Nervous Patients. There are nine acres of land attached, and large garden, with good stabling, &c. The property, which is freehold, can be purchased or taken at a rental, and the furniture, carriage, horses, &c. at a valuation. Three Cottages belonging to the estate are also to be Sold. The Practice is small, but capable of much improvement.—Address, M.R.C.S., Post-office, Tunbridge Wells.

**To the Medical Profession.—To be** Disposed of immediately, by private treaty, at Northwich, Cheshire, in consequence of the decease of the Proprietor, the Stock, Surgical Instruments, Fixtures, &c., of a Surgeon, together with a large Collection of Valuable Surgical Books, if required. Any Gentleman wishing to Commence Business will find this well worthy his attention, the late proprietor having had an extensive Practice for the last eleven years.—For particulars, and to treat for the same, apply to Mrs. Weston, Northwich; or to Mr. Thompson, Chemist, 12, Church-street, Liverpool.

Medical Transfer and Partnership.

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent** and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RELINQUISH, (either wholly or in part,) and also to those about COMMENCING Practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

MEDICAL.

**Death Vacancy.—The decease of a** highly-respected Practitioner in an important town renders the Succession Vacant to a select and considerable Practice. It is important that Gentlemen applying should be able to command a few hundred pounds, and to supply references in London, if practicable.—Apply to Mr. ORRIDGE, 30, Bucklersbury, London.

MEDICAL.

**A Gentleman, who has had considerable experience in the Profession** is desirous of becoming a PARTNER in a respectable Practice in or near London, or a large Provincial Town.—Address, by letter, W. B., Messrs. Corbyn and Co., 300, Holborn.

TO SURGEONS, &c.

**A Retail, with handsomely-fitted up** Shop and excellent Premises, in thorough repair, situate in a most improving suburb north of London, and most eligible suited for a Surgeon, for immediate Transfer, under satisfactory circumstances. Coming in, about £120.—Apply to Mr. Jacobson, No. 38, Walbrook, City.

MEDICAL.

**A General Practitioner in the** Country wishes to meet with an ASSISTANT who has been accustomed to Union Practice. One or both of the legal qualifications will be required. Salary, £50 per annum.—Apply to Messrs. Westwoods and Hopkins, Wholesale Druggists, 16, Newgate-street.

TO GRADUATES.

**A Gentleman about to pass his Examination at the Royal College of Physicians,** is desirous of reading with a Gentleman fully qualified, who is willing to devote an hour or two twice a week.—Address, stating name and terms, to D. A., THE LANCET Office, 423, Strand.

TO SURGEONS AND CHEMISTS.

**The Proprietor going to Sebastopol,** offers, at half the original cost, an elegantly-fitted SHOP, well stocked; convenient House of nine rooms, with garden; snug Surgery, and where a good Retail and large Practice are certain.—Address, Medicus, Mr. Woods, 30, Felix-terrace, Islington.

MEDICAL.

**A Married Medical Man, aged 30,** the Son of a Clergyman, is now open to an Engagement as Out-door Visiting ASSISTANT with a Surgeon in Town or Country. Has been accustomed to Union, Club, and Private Practice. No objection to take charge of a Branch Practice, or House-Surgeon to an Asylum or Infirmary. Can give high testimonials as to moral conduct and professional ability.—Address, by letter, to C. W., Post-office, East Dereham, Norfolk.

**Practice to be Sold, realizing upwards of £400 a year.** A Poor-law Appointment, yielding £100, is part of the business. The Proprietor will take £200 down, and £100 additional subsequently, from an immediate Purchaser, who would find no difficulty in succeeding to the business. A Surgery, furnished, with Drugs included.—Apply, M.D., Gale, Baker, Warde, and Co., Bouverie-street.

**Surgical Museum.—To be Disposed of,** a MUSEUM, comprising an extensive series of Wet and Dried Preparations of Surgical Pathology, numerous Casts, Skeleton, and Lay Figure for Bandaging, and upwards of Two Hundred Coloured Drawings, arranged for the illustration of a Course of Lectures on Surgery. Also, suitable Glass Cases containing the Preparations. The whole Collection is in perfect preservation, having been recently used as a Teaching Museum. Parties wishing further information are permitted to refer to Dr. John Struthers, Surgeon's Hall, Edinburgh.

**Manchester Royal Infirmary and DISPENSARY, LUNATIC HOSPITAL or ASYLUM.**

In consequence of the Board having determined to appoint two House-Surgeons to these Charities in future, WANTED, an unmarried Gentleman to fill the office of one of the HOUSE-SURGEONS. Every candidate for the office will be required to produce a Diploma from the Royal College of Surgeons in London, Edinburgh, or Dublin, and a License from the Worshipful Society of Apothecaries in London. He must make an engagement for twelve or eighteen months. No salary is given, but the whole Medical and Surgical Practice of the house will be open to him; and he will be provided with board and lodging in the Infirmary.—Letters from candidates, together with the Diplomas and Testimonials, are to be sent free of postage, on or before Saturday, the 16th of December next, addressed to the Secretary. By order of the Board,

ROBERT THORPE RADFORD.

November 23rd.

# DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY, AND  
PUT TO THE TEST OF CHEMICAL ANALYSIS.

PRESCRIBED BY EMINENT MEDICAL MEN AS THE MOST EFFECTUAL REMEDY FOR  
CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, RHEUMATISM, SOME DISEASES OF THE SKIN, RICKETS,  
INFANTILE WASTING, GENERAL DEBILITY, AND ALL SCROFULOUS AFFECTIONS.

## PURE AND UNADULTERATED.

THE great difficulty of obtaining genuine and good Cod-liver Oil has long prevented a just appreciation of its acknowledged remedial virtues, and precluded many suffering invalids from realizing the beneficial effects of this truly valuable Medicine.

Dr. de Jongh's Light-brown Cod-liver Oil is of the best kind and finest quality, being extracted from the liver of the Dorse—*Gadus Callarias*, a species of Cod-fish caught at the Great Fishery of the Loffoden Isles—by a process yielding a much larger proportion of iodine, phosphate of lime, volatile acid, the elements of the bile, and other essential principles, than the Pale Oils manufactured in England and Newfoundland, which, by their mode of preparation, are deprived in a great measure of their active elements.

The well-merited celebrity of Dr. de Jongh's Oil is attested by its extensive use in France, Germany, Holland, Belgium, and Italy, by numerous spontaneous testimonials from eminent members of the Faculty and scientific Chemists of European reputation, and since its recent introduction into this country, by the marked confidence, as well as great success, with which it has been prescribed by Medical Practitioners.

*Testimonial from the late JONATHAN PEREIRA, M.D., F.R.S.E., F.L.S., Professor at the University of London, Author of "The Elements of Materia Medica and Therapeutics," &c. &c.*

"MY DEAR SIR,—I was very glad to find from you, when I had the pleasure of seeing you in London, that you were interested commercially in Cod-liver Oil. It was fitting that the Author of the best analysis and investigations into the properties of this Oil should himself be the Purveyor of this important Medicine.

"I feel, however, some diffidence in venturing to fulfil your request by giving you my opinion of the quality of the Oil of which you gave me a sample, because I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this Medicine as yourself, whom I regard as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of responding to your application. The Oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer Oil can be procured.

"With my best wishes for your success, believe me, my dear Sir, to be very faithfully yours,

"Finsbury-square, London, April 18th, 1851.  
"To Dr. de Jongh."

(Signed)

"JONATHAN PEREIRA.

*Extract from "THE LANCET," July 29th, 1854.*

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de Jongh gives the preference to the light-brown Oil over the pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. In the preference of the light-brown over the pale Oil we fully concur.

"We have carefully tested a specimen of the Light-brown Cod-liver Oil, prepared for medical use under the direction of Dr. de Jongh, and obtained from the wholesale agents, Messrs. Ansar, Harford, and Co., 77, Strand. We find it to be genuine, and rich in iodine and the elements of bile."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S Stamp and Signature, by

**ANSAR, HARFORD, & CO., 77, STRAND, LONDON,**

Sole Consignees and Agents for the United Kingdom and British Possessions, and may be obtained from respectable Chemists and Druggists in Town and Country, at the following prices:—

HALF-PINTS (10 ounces) 2s. 6d. | PINTS (20 ounces) 4s. 9d. | QUARTS (40 ounces) 9s.

IMPERIAL MEASURE.

**\*.\* Hospitals and other Charitable Institutions requiring large quantities may be supplied on considerably reduced terms.**

PRINTED by THOMAS CHOATE SAVILL, at his Printing Office, No. 4, Chandos-street, in the parish of St. Paul, Covent-garden, Westminster, in the county of Middlesex; and published for the Editor by GEORGE CURCHILL, of No. 423, Strand, in the parish of St. Martin-in-the-Fields, Westminster in the said county, at No. 423, Strand, aforesaid; and sold by all Booksellers and Newsvendors in Great Britain and Ireland and the Colonies.—Saturday, December 2, 1854.

## CONTENTS.

APPARATUS. Urinometer in Case.—Graduated 2-oz. Measure.—Pipette.—Stirring rod.—Microscopic Slides and Thin Glass.—Watch-glasses.—Test-tubes.—Tube-holder.—Brass Forceps.—Platinum Foil.—Spirit Lamp, with wire ring.—Seven capped Dropping Bottles for the following Re-agents: Nitric Acid, Acetic Acid, Ammonia, Potash, Nitrate Barytes, Nitrate Silver, Oxalate Ammonia, Test-Papers. Price, £1 11s. 6d.

**HIGHLEY'S RE-AGENT CABINET FOR MICROSCOPICAL TESTING**, containing 12 capped dropping bottles, 16s.

**HIGHLEY'S MICROSCOPIC CAMERA**, consisting of an Arrangement and Condenser fitted to a double Telescope Chamber having a range from 12 to 24 inches, with Focusing Glass 6 inches square, Plate and Bath Frames, Glass Bath, Box fitting inside Camera, containing all the necessary Chemicals and Apparatus. The whole contained in a Packing-case arranged for the adjustment of this instrument to any angle. Complete, £9.

**STUDENTS' COLLECTION OF MICROSCOPICAL OBJECTS**. £1 5s. per Series of 24 slides. FIVE SERIES PUBLISHED.  
London: Samuel Highley, 32, Fleet-street.

No. 1632.

Just published, in 8vo, with many Woodcuts, price 23s.

**Pereira's Elements of Materia Medica AND THERAPEUTICS.** A New Edition of the First Volume. Edited by A. S. TAYLOR, M.D., &c., and G. O. REES, M.D., &c.  
London: Longman, Brown, Green, and Longmans.

MR. SWAN'S NEW WORK ON THE BRAIN.

Just published, in One Volume, 8vo, price 6s.

**The Brain in Relation to the Mind.**

By JOSEPH SWAN, Esq., Author of various Works on the Brain and the Nervous System.

London: Longman, Brown, Green, and Longmans.

DEDICATED BY PERMISSION TO THE RIGHT HONOURABLE THE LORD ST. LEONARDS.

Just published, fcap. 8vo, price 4s. 6d.

**Unsoundness of Mind in relation to**

CRIMINAL ACTS; being an ESSAY, to which the FIRST SUGDEN PRIZE was this year awarded by the King and Queen's College of Physicians in Ireland. By JOHN CHARLES BUCKNILL, M.D. Lond., Physician to the Devon County Lunatic Asylum, &c.

London: Samuel Highley, 32, Fleet-street.

SIMON'S LECTURES.

8vo, cloth, price 7s. 6d.

**General Pathology: a Course of**

Twelve Lectures delivered to his Class, at St. Thomas's Hospital, by JOHN SIMON, F.R.S.

"We heartily thank Mr. Simon for the instruction he has communicated to us in a form so agreeable, and strongly advise our readers to peruse the original."—LONDON JOURNAL OF MEDICINE.

London: Henry Benschaw, 366, Strand.

Just published, post 8vo, 7s. 6d. cloth,

**Diseases of the Rectum.** By Richard

QUAIN, F.R.S., Professor of Clinical Surgery in University College, and Surgeon to University College Hospital, With Coloured Lithographic Plates.

"This treatise is eminently of a practical character, and contains much original and valuable matter. It is not indeed a literary compilation, but rather an exposition of the author's opinions and practice in these diseases."—ASSOCIATION JOURNAL.

London: Walton and Maberley, Upper Gower-street, and Ivy-lane, Paternoster-row.

## THE LANCET OF JANUARY 6TH, 1855,

BEING NO. I. OF THE NEW VOLUME,

WILL CONTAIN THE FIRST OF A

## Course of Clinical Lectures in Surgery,

By JAMES SYME, F.R.S.,

PROFESSOR OF CLINICAL SURGERY TO THE ROYAL INFIRMARY OF EDINBURGH,

Illustrated by Numerous Engravings.

Price, 7d. ; Stamped, 8d.

LONDON: PUBLISHED AT THE LANCET OFFICE, 423, STRAND.

Lately published, Sixth Edition, foolscap, cloth, price 12s. 6d.

**Druitt's Surgeon's Vade-Mecum.**

A Manual of Modern Surgery. The Sixth Edition, re-written, enlarged, much improved, and illustrated by 200 Wood Engravings.

London: Henry Renshaw, 356, Strand; and John Churchill, New Burlington-street.

Lately published, in fcap. 8vo, cloth, price 12s. 6d.

**Hooper's Physician's Vade-Mecum ;**

or, a Manual of the Principles and Practice of Physic. Fourth Edition, much enlarged and improved. By Dr. GUY, of King's College.

London: Henry Renshaw; Whittaker and Co.; Simpkin and Co.; J. Churchill; S. Highley; Houlston and Co. Edinburgh: A. and C. Black; MacLachlan and Co. Dublin: Fannin and Co.

**Cholera, its Nature, Effects, and**

TREATMENT; being, with additional Notes, the substance of two Lectures delivered by the Guildhall, Worcester, by Dr. TURLEY, F.R.S., &amp;c.

Published at the request of the Sheriff, and sold by Renshaw, Strand, and all Booksellers, price 6d. Free by post for eight stamps.

ACTON'S COOKERY BOOK.

The Fourteenth Edition, in fcp. 8vo, price 7s. 6d.

**Eliza Acton's Modern Cookery re-**

duced to a System of Easy Practice: with Directions for Carving.

London: Longman, Brown, Green, and Longmans.

Just published, price 5s., illustrated with numerous Engravings on Wood.

**The Eye in Health and Disease.**

With a description of the Optometer, for the adaptation of Spectacles, for Impaired, Defective, or Aged Sight. Being the substance of Lectures delivered at the Central London Ophthalmic Hospital. By ALFRED SMEE, F.R.S., Surgeon to the Bank of England, Surgeon to the Central London Ophthalmic Hospital, &amp;c. Second Edition; to which is added a Paper on the Stereoscope and Binocular Perspective.

Longman and Co., Paternoster-row; Horne, Thornthwaite, and Wood, 123, Newgate-street.

**Judas Maccabæus.—The best Edition**

is that edited by JOHN BISHOP of Cheltenham, viz. ROBERT COCKS and Co.'s STANDARD OCTAVO EDITION OF JUDAS MACCABÆUS, with Book of Words complete, imperial 8vo, handsomely bound in cloth, gilt, 4s. 6d. (fello edition, 15s.)

May be had at the doors of St. Martin's Hall, or of Robert Cocks and Co. Order Robert Cocks and Co.'s Edition.—Specimen pages gratis.

**NEW PIANOFORTE MUSIC by W. VINCENT WALLACE.** The Old Hundredth Psalm, transcribed for the Pianoforte, 4s.; The Vesper Hymn, transcribed for the Pianoforte, 3s.; Haydn's Surprise (Andante from the Third Symphony), transcribed for the Pianoforte, 3s.; Il Sospiro, Etude de Salon, 3s. These are the most recent of Mr. W. Vincent Wallace's Pianoforte Works.**HAMILTON'S DICTIONARY OF 3500 MUSICAL TERMS.** 4th Edition. By JOHN BISHOP. Upwards of 200 pages, 1s. "One of the most perfect and efficient that has ever been published."—*EXA.***CLARKE'S CATECHISM OF THE RUDIMENTS OF MUSIC.** 33rd Edition, 107 pages, 1s. "This admirable work has long been a favourite with teachers and learners."—*EXA.***SPEAK GENTLY!**—Song, by Miss M. LINDSAY, the Composer of the popular song, "Excelsior!" **Mayall's Daguerreotype Portrait**

GALLERIES, 234, Regent-street, (corner of Argyle-place,) and 433, West Strand.

Mr. Mayall begs to invite inspection of his extensive collection of DAGUERRETYPE PORTRAITS OF EMINENT MEDICAL, SCIENTIFIC, and LITERARY MEN, Panoramas from Nature, and Views of the late Exhibition; together with specimens of every improvement in the art. The originals of THE LANCET PORTRAITS on view.

**H. Silverlock's Medical Label Ware-**

house, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-terrace, Doctors'-commons, London.

The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letterpress, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent per post on application.

**The Pen Superseded.**

The most elegant, easy, economical, and best method of MARKING LINEN, Silk, Books, &amp;c., without the ink spreading or fading, is with the INCORRODIBLE ARGENTINE PLATES. No Preparation required. Any person can use them with the greatest facility. Name-plate, any style, 2s. 6d.; Initials, ditto, 1s. 6d.; Numbers, per set, 2s. 6d.; Crest, 5s. Sent, post free, with directions, on receipt of stamps or post order.

FREDK. WHITEMAN, Inventor and Sole Maker, 19, Little Queen-street, Holborn.

# DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN  
ISLES, NORWAY,

AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

PRESCRIBED BY EMINENT MEDICAL MEN AS

*The most effectual Remedy for Consumption, Bronchitis, Asthma,  
Gout, Rheumatism, some Diseases of the Skin, Rickets, Infantine  
Wasting, General Debility, and all Scrofulous Affections.*

## PURE AND UNADULTERATED.

THE great difficulty of obtaining genuine and good Cod-liver Oil has long prevented a just appreciation of its acknowledged remedial virtues, and precluded many suffering invalids from realizing the beneficial effects of this truly valuable Medicine.

Dr. de Jongh's Light-brown Cod-liver Oil is of the best kind and finest quality, being extracted from the liver of the Dorse—*Gadus Callarias*, a species of Cod-fish caught at the Great Fishery of the Loffoden Isles—by a process yielding a much larger proportion of iodine, phosphate of lime, volatile acid, the elements of the bile, and other essential principles, than the Pale Oils manufactured in England and Newfoundland, which, by their mode of preparation, are deprived in a great measure of their active elements.

The well-merited celebrity of Dr. de Jongh's Oil is attested by its extensive use in France, Germany, Holland, Belgium, and Italy, by numerous spontaneous testimonials from eminent members of the Faculty and scientific Chemists of European reputation, and since its recent introduction into this country, by the marked confidence, as well as great success, with which it has been prescribed by Medical Practitioners.

### TESTIMONIAL FROM

*The late JONATHAN PERRIRA, M.D., F.R.S.E., F.L.S., Professor at the University of London, Author of "The Elements of Materia Medica and Therapeutics," &c. &c.*

"MY DEAR SIR,—I was very glad to find from you, when I had the pleasure of seeing you in London, that you were interested commercially in Cod-liver Oil. It was fitting that the Author of the best analysis and investigations into the properties of this Oil should himself be the Purveyor of this important Medicine.

"I feel, however, some diffidence in venturing to fulfil your request by giving you my opinion of the quality of the Oil of which you gave me a sample, because I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this Medicine as yourself, whom I regard as the highest authority on the subject.

"I can, however, have no hesitation about the propriety of responding to your application. The Oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer Oil can be procured.

"With my best wishes for your success, believe me, my dear Sir, to be very faithfully yours,

(Signed)

"JONATHAN PERRIRA.

"Finsbury-square, London, April 18th, 1861.

"To Dr. de Jongh."

Extract from "THE LANCET," July 29th, 1864.

"After a careful examination of the different kinds of Cod-liver Oil, Dr. de Jongh gives the preference to the Light-brown Oil over the Pale Oil, which contains scarcely any volatile fatty acid, a smaller quantity of iodine, phosphoric acid, and the elements of bile, and upon which ingredients the efficacy of Cod-liver Oil no doubt partly depends. Some of the deficiencies of the Pale Oil are attributable to the method of its preparation, and especially to its filtration through charcoal. In the preference of the light-brown over the pale Oil we fully concur.

"We have carefully tested a specimen of the Light-brown Cod-liver Oil, prepared for medical use under the direction of Dr. de Jongh, and obtained from the wholesale agents, Messrs. Ansar, Harford, and Co., 77, Strand. We find it to be genuine, and rich in iodine and the elements of bile."

Sold Wholesale and Retail, in bottles, labelled with DR. DE JONGH'S stamp and signature, by

**ANSAR, HARFORD, AND CO.,**  
77, STRAND, LONDON,

Sole Consignees and Agents for the United Kingdom and British Possessions, and may be obtained from respectable Chemists and Druggists in Town and Country, at the following prices:—

HALF-PINTS ... 2s. 6d. | PINTS ... 4s. 9d. | QUARTS ... 9s.

### IMPERIAL MEASURE.

\* Hospitals and other Charitable Institutions requiring large quantities may be supplied on considerably reduced terms.

## Drug Price Currents forwarded free

of Postage, on application, by Messrs. HEWLETT and GODDARD Wholesale Druggists, 6, Arthur-street West, Upper Thames-street, near London Bridge, removed from Hatton-garden; containing the ready Cash Prices for Drugs and Pharmaceutical Preparations of the purest quality. Messrs. H. and G. solicit the attention of the Medical Profession resident in the Provinces, Infirmary Committees, Dispensaries, &c. &c., to the advantages attendant upon the above Price Current.

## The Pulvis Jacobi Verus, prepared

by WILLIAM HOOPER, 24, Russell-street, Covent-garden, from its identity with the more costly preparations, and its acknowledged efficacy as an Antimonial, merits the patronage of those gentlemen who have not hitherto included Pulvis Jacobi in their daily Materia Medica. An extensive continuous demand for Public Institutions has satisfactorily verified the ancient character of this medicine. It is sold in 1 oz. and 4 oz. bottles, at 2s. 9d. and 10s. 6d.; and in packets for transmission by post.

## Dinneford's Pure Fluid Magnesia,

now greatly improved in purity and condensation.

"Mr. Dinneford's Solution may fairly be taken as a type of what the preparation ought to be."—PHARMACEUTICAL JOURNAL, May, 1846.

This excellent remedy, in addition to its extensive and increasing sale amongst the public, is now very largely employed in DISPENSING: for which the cheapest and most convenient form is in the STONE JARS; half-gallon, 5s. 6d.; gallon, 9s. 6d.; specially adapted for the use of Surgeons and Chemists. To be had from the manufacturers, DINNEFORD & CO., Chemists, 172, Bond-street, London; and all respectable Wholesale Druggists and Patent Medicine Houses.

## W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta. Its peculiar sedative properties being so beneficial where opiates are inadmissible: also to his MEDICINAL EXTRACTS, prepared from the fresh plants (*Hyoscyamus Niger*, *Conium Maculatum*, *Atropa*, *Belladonna*, *Cotyledon Umbilicus*, &c.) also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alternative), Liq. Parietarie (diuretic), and Liq. Bels (prepared from the Eggle Marmelos, or Indian Bael), for Dysentery and Diarrhoea.

W. T. has a large supply of INDIAN BARK on hand.

2, Edward's-street, Portman-square.

## Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1864.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 6s. 4d. per lb.

Inspissated Juice. Dose, half a drachm to a drachm; 16s. per lb.

Solid Extract. Dose, five to fifteen grains; 30s. per lb.

Taraxacum (Davenport's Liqueur, or Fluid Extract, prepared by Spontaneous Inspiration, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

## Mathey Caylus' Gluten Capsules

contain the purest Copaiba, either simple or combined with Citrate of Iron, Ratanhy, Cubebs, &c.; acknowledged by the London and Paris Hospitals; also by the Lock Hospital; M. Lequeur, chef de Travaux Chimiques à l'Académie de Médecine; Drs. Ricord, Cullerier, &c., who have granted written attestations, to be the best prepared Medicine for the cure of certain diseases.

Extract of a Letter from Dr. Cullerier:—

"I cannot induce you too much to extend the use of your preparations; by so doing you will render a valuable service to the therapeutic of hemorrhagic affections.

"I am, &c.,

"CULLERIER,

"Chirurgien de l'Hôpital de Lourcine."

Sold in Bottles, at 2s. 9d. and 4s. 6d., sealed and stamped with the Government stamp, bearing the name of the Patentee. To be had wholesale and retail of Robert King, French and English Pharmaceutical Chemist, 21, Princes-street, Hanover-square; and all respectable Chemists in the United Kingdom.—Country agents required.

## Hooper's Juice of Taraxacum,

Inspissated by dry air, can be obtained in the following forms:—

The EXTRACT; dose, a tea-spoonful.

The FLUID EXTRACT; dose, a dessert-spoonful.

The LIQUOR, with CORTICAL ESSENCE of SASSAPARILLA; dose, a dessert-spoonful.

With Seltzer Water, either of these preparations forms a pleasant draught, and with which their effects are greatly augmented.

"For emaciated constitutions, I know of no medicine equal to Hooper's Taraxacum and Sarsaparilla."—DR. JOHNSON.

For Affections of the Liver, Kidneys, Jaundice, Indigestion, Cutaneous Affections, and Constipation, these preparations have long been prescribed by the most eminent of the Faculty with the best results. The above Extracts of Taraxacum, when mixed with water, produce a milky appearance, similar to the juice in its fresh state.

"So valuable a preparation as your Taraxacum can need no recommendation from me; still I feel bound to say its beneficial effects have surpassed my most sanguine expectations. My mother, who is in her 78th year, and who through the greater part of her life has been a martyr to liver complaint, appears to have had ten years added to her life by a three months' use of it.

"I remain, yours truly,

"ARTHUR LEAPINGWELL.

"To Mr. Hooper, 7, Pall-mall East."

"Haydon Vicarage, Slanford.

BRIGHTON SELTZER WATER, 4s. per doz. Other factitious Mineral Waters, at a reduction of 25 per cent.

HOOPER, Operative Chemist, 55, Grosvenor-street, and 7, Pall Mall East, London. Laboratory, Great Scotland-yard.

TO THE MEDICAL PROFESSION.

## Fr. G. Ernst, Anatomical Machinist

and MANUFACTURER of SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF of BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages; Stockings; Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &c. Madam Ewer (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &c.

## New Spinal Support.—Fr. G. Ernst,

Lamb's Conduit-street, Foundling Hospital, begs to draw the attention of the Faculty to his recently-invented SPINAL APPARATUS, which, after some months of trial, has proved superior to any of the various kinds hitherto used, and produced the most satisfactory results. This appliance, being self-adjusting, free bodily motion is permitted; thus, while equal and necessary support is given to the wearer, all injurious or painful pressure is avoided, and a great amount of comfort and benefit consequently yielded. It can be modified so as to suit any FORM OF SPINAL DEFLECTION; its weight is comparatively trifling, and from its capacities for nice adaptation elicits no observation when on the body.

To be had only of the Inventor, 43, Lamb's Conduit-street.

## Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1.—MR. BOURJEAUD'S NEW SUSPENSORY BANDAGE, as applied to a patient.—Mr. Bourjeaud begs to state that the bag supporting the scrotum is made of a delicate webbing of silk and india-rubber; the bands running round the thighs consist of the most yielding elastic tissue, and will stretch to twice their length; a third band is adapted to the upper part of the bag, the former being intended to be fastened to the flannel waistcoat of the patient. The scrotum is thus kept raised and fixed *in situ*, without distressing the organ in the least, the suspensor allowing of the most varied movements of the body.

FIG. 2.—The same Suspensory Bandage taken off.

## Elastic Supporting Belts, of the same

beautiful fabric as Pope and Plante's Elastic Stockings for Varicose Veins. Those for ladies' use, before and after accouchement, are ADMIRABLY ADAPTED FOR GIVING ADEQUATE SUPPORT WITH EXTREME LIGHTNESS—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed.

Instructions for measurement and prices on application, and the articles sent by post from the manufacturers, POPE and PLANTE, 4, Waterloo-place Pall Mall, London.

## Henry Bigg, 9, St. Thomas's-street,

Borough, Surgical Instrument-maker to Guy's and St. Thomas's Hospitals, begs to call the attention of the Medical Profession to the following valuable Instruments, made from designs and suggestions kindly given by the Gentlemen whose names are attached—viz., Mr. Le Gros Clark's Talipes Instrument; Mr. Bransby Cooper's Ovarian Trocar; Mr. Cock's Recto-Vesical Trocar; Mr. Cooper Forster's Ear Speculum; Mr. Hilton's Speculum Ani; Dr. Lever's Midwifery Instruments; Mr. Solly's Elastic Catheter, with Catgut Director. These Instruments being constructed on the premises secure their excellence and perfect finish.

9, St. Thomas's-street, Borough, London.

## Application of

VULCANIZED INDIA-RUBBER TO THE CURE OF CLUB-FOET AND SPINAL CURVATURE.—A cord of Vulcanized India-rubber resembles more closely the action of LIVING MUSCULAR STRUCTURE than any other mechanical power, Mr. H. Bigg has therefore employed it to overcome the contraction existing in CLUB-FOET, and also for the purpose of yielding the support needed in cases of SPINAL DEFORMITY. The greatest advantage of this new principle consists in the treatment being pursued without the least interference with muscular motion, respiration, or anatomical development.

These apparatus, being PATENTED, can be procured only of

MR. H. BIGG,

Anatomical Machinist to the Admiralty; Chelsea, Greenwich, St. George's, Middlesex, University College, King's College, Guy's, and St. Thomas's Hospitals.

29, Leicester-square, and 9, St. Thomas's-street, Borough.

## CAUTION.

KNEE CAP AND ANKLE PIECE.

ABDOMINAL SUPPORTER.

SPINAL SUPPORTER.

STOCKING AND THIGH PIECE.

## Mr. Bourjeaud, in submitting the above four Engravings as illustrating

the nature and special design of his Apparatuses, most earnestly begs to call the attention of Professional Gentlemen to the gross and nefarious practices of unprincipled parties, who attempt to impose on the Public by advertising their spurious apparatuses, accompanied with the closest imitations of his diagrams, and with the use even of the same words and plan of measurement, in order to obtain, by these fraudulent means, a portion of the patronage with which he has been especially honoured by the Profession. Mr. Bourjeaud wishes, therefore, to caution Medical Gentlemen against the dishonest proceedings of his imitators, and hopes they will not accept any of the appliances put forward under the name of Spinal Supporter, except the articles come from his own Establishment, No. 11, Davies-street, Berkeley-square, (opposite Mivart's Hotel,) London; and No. 17, Rue des Beaux Arts, Paris.

**Mr. Edwin Osborne, of 24, Savile-ROW, LONDON,** the Sole Licensee and Maker of **PALMER'S PATENT LEG**, adapts this beautiful substitute to every form of amputation; and having had great experience in its manufacture, feels confident of giving comfort and satisfaction to those persons who may favour him with their patronage. References given, (if required.)

**The Respirator.—The assumption of** the name of Respirator for various discreditable and defective imitations of **MR. JEFFREYS' Instruments**, the value of which in medical practice has given a wide reputation to the name, can only mislead unwary persons not acting under professional advice.

City Office for the Respirator, 25, Bucklersbury: West-end Depot, 25, Holles-street, Oxford-street, London. In London and all Towns, the principal Chemists and Surgical Instrument Makers are Agents for Mr. Jeffreys' Respirators.

## M. Pillischer's Newly-Constructed

**STUDENT'S MICROSCOPE**, which, for solidity, portability, and reasonable price, surpasses any Microscope hitherto made by any English or Continental maker. The Student's Microscope, with coarse and fine adjustments, single mirror, one eye-piece, a one-inch and one-quarter-inch French achromatic object-glasses of best quality, the whole packed in mahogany case, 7 in. by 6 in., £5 10s.; or with M. Pillischer's own-made, 1 in. of 16 degs. angular aperture, and  $\frac{1}{4}$  in. of 60 degs., £7.

The above stand with lever stage, extra eye-piece, double mirrors, animalcule cage, &c., £8; or with Pillischer's glasses, £9 10s.

A list of prices will be sent free on application to M. Pillischer, 88, New Bond-street.

## Huxley's Fulcrum

**ABDOMINAL BELT** will be found, from its mechanical arrangement, (acting diagonally,) and producing the required support for the lower part of the Abdomen, to be the most complete and comfortable arrangement ever invented. It is extremely light, weighing only 4oz. Price 18s.

Measures required.—Circumference at A, B, and C; depth from A to C.

A discount of 20 per cent. to the profession.

**HUXLEY and CO.**, 8, Old Cavendish-street, late of 5, Vere-street, Oxford-street.

## Walters' India-rubber URINALS.

**F. WALTERS** having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

Made of Solid India-rubber, with Patent Valve and adapted for Ladies, Gentlemen, and Children.

Manufacturer also of the **PATENT HYDRO STATIC TRUSS**. One of the advantages of this Truss is, that the pad, being filled with water, adapts itself with perfect accuracy to the form of the body, thereby keeping up a firm but easy pressure on the internal ring.

**F. WALTERS,**  
16, MOORGATE-STREET,  
LONDON.

## The Eye Douche, for applying Lotion

to or bathing the Eye, is self-acting, simple, and portable. The immediate relief obtained from its use particularly recommends it to the notice of all who are much engaged in reading, writing, or designing; it has been employed with the most favourable results by patients under the care of **Haynes Walton, Esq.**, Surgeon to the Central London Ophthalmic Hospital. Price 20s.; carriage paid to any railway station.

Manufactured by **WILLIAM T. COOPER**, 26, Oxford-street, London.

**COOPER'S LAVEMENT APPARATUS** is the most perfect ever invented; the possibility of air entering the bowels is prevented, and the labour of pumping is avoided; being constructed entirely of metal, without valves, it cannot become out of order, which renders it particularly suitable for use in the country or in foreign climates. Price 35s. Enema Apparatus from 10s.; Superior Reservoir Apparatus from 27s.—Each instrument in mahogany box with lock and key.

Manufactured by **WILLIAM T. COOPER**, 26, Oxford-street, London.

**THE CORK RESPIRATOR** is the lightest cheapest, and most efficacious ever produced; allows free respiration, and from being easily applied and removed, is specially adapted for the use of Invalids, or Ladies attending evening meetings or places of amusement. Price 3s., free by post.

Wholesale only of **WILLIAM T. COOPER**, 26, Oxford-street, London.

Illustrated Catalogues free by post.

## Teeth.—Mr. Alfred Jones, of Gros-

venor-street, has recently completed a new and important improvement in the construction of **ARTIFICIAL TEETH**. The superiority of their appearance, and the unerring accuracy with which they are fitted to the mouth, without wires, springs, or ligatures, and the lightness of their construction, gives greater facility in mastication and freedom to the speech, and imparts a more youthful appearance to the countenance than has hitherto been attained; they support any teeth that may be loose, and have been tested by many of the first medical men, the nobility, and gentry, from whom he has received the most flattering acknowledgments of success. Supplied only by **MR. ALFRED JONES**, Surgeon-Dentist to Her Royal Highness the Duchess of Gloucester, her late Royal Highness the Princess Augusta, and his late Majesty Louis Philippe, the ex-King of the French, &c.—64, Grosvenor-street, Grosvenor-square.—At home from Eleven until Five.

## Aërated Waters of sufficient and

uniform strength. **BLAKE, SANDFORD, and BLAKE**, 47, Piccadilly, having given great attention to the manufacture of Mineral Waters, and feeling it important that medical men should be assured of the quantity of Alkali contained in each kind, beg to submit the following list of their preparations:—

**Potash Water**, 18 grains of the Bicarbonate in each bottle; Citrate of Potash, (a new and valuable auxiliary in Gout and Rheumatic affections,) 30 grains; Soda, 15 grains; Magnesia, 12 grains, and Ammonia, 10 grains.

**B. S. & B.** would especially recommend their Seltzer and Vichy Waters; the latter now bottled in half-pints as well as pints.

**BLAKE, SANDFORD, and BLAKE**, 47, Piccadilly.

## HYGIENIC BATHS.

**JENSON'S TONIC**

## CAPHNE MARINA SALT FOR BATHS

When dissolved in a Cold, Tepid, or Warm Bath, imparts so eminently strengthening and beneficial properties to the same, that, when once tried, a Bath will scarcely ever be taken without it. In the buoyancy and freshness it produces in the system, it is far superior to any known Sea Bath.

Sold at 6d. and 1s. per packet, by the Proprietor, **C. MENING**, 103, Leadenhall-street, and 213A, Piccadilly, (near Regent-circus,) and by all Chemists, and Bathing Establishments.

## Newfoundland Cod-Liver Oil.—

**Messrs. CHARLES FOX and CO.** beg to announce that they have just returned from their Sixth Voyage to Newfoundland, with a supply of **PURE COD-LIVER OIL**, the whole of which is now in the hands of the Wholesale Houses. They confidently recommend it to the Medical Profession and the Public generally, as the very best Oil offered in the Market. It has been most carefully prepared, without any other process but the slight application of heat, under their own immediate personal inspection, and its purity is fully guaranteed, as Newfoundland affords no other livers for the preparation of the Oil but those which are legitimate. References to houses of the highest respectability can be had on application to **Messrs. CHARLES FOX and CO.**, Cod-liver Oil Merchants, Scarborough.

November 24th, 1854.

TO PHYSICIANS, SURGEONS, AND DRUGGISTS.

## Brown's Cantharidine Blistering

**TISSUE**, prepared from pure Cantharidine. An elegant preparation vesicating in much less time than the Emp. Lytta P.L., easily applied and removed, and will not produce stranguary or troublesome after-sores. It has received the sanction and commendation of many of the most eminent Practitioners in the Kingdom.—In Tin Cases, containing ten square feet, 6s. 6d.; and small Cases of five square feet, 3s. 6d. each.

**BROWN'S TISSUE DRESSING**.—An elegant, economical, and cleanly substitute for all ointments as a dressing for Blisters, and may be called a Companion to the above.—In Tin Cases, containing ten square feet, 1s. 6d. each.

"10, Finsbury-place South, March 16th, 1852.

"**DEAR SIR**,—I beg to acknowledge the receipt of a case of your 'Cantharidine Tissue,' as well as a case of your 'Tissue Dressing,' for which I have to offer you my best thanks.

"I have given both preparations a thorough trial, and cannot refrain from speaking of them in the highest terms. The 'Cantharidine Plaster' is the most elegant and effective blistering agent with which I am acquainted, and only requires a trial or two to ensure its being preferred before those applications of a similar kind that are now in use.

"I am, dear Sir, yours faithfully,

"**JOHN GAY, F.R.C.S.,**

"Hon. Surgeon to the Royal Free Hospital, &c. &c. &c.

"To Mr. Brown."

"June 24th, 1850.

"**MR. DALRYMPLE** presents his compliments to Mr. Brown, and is much obliged to him by his kindness in sending Specimens of his Preparation for Blistering, &c. Mr. D. delayed answering this present until he had had an opportunity of testing it in practice, and is most happy to acknowledge its utility, elegance, and cheapness, and he has recommended it with great satisfaction.

"60, Grosvenor-street, London."

"Army Medical Department, Jan. 16, 1847.

"The principal Medical Officer of the General Hospital, Fort Pitt, Chatham, reports that **MR. BROWN'S BLISTERING TISSUE** has been used extensively in the Military Hospital,—has been found effective as a Vesicatory, when carefully applied, and has not been productive of any degree of Stranguary.

**ANDREW SMITH, M.D.**, Deputy Inspector-General of Hospitals.

"**MR. T. B. BROWN**, Druggist, Handsworth, Birmingham."

Prepared by **Thomas B. Brown**, Pharmaceutical Chemist, 42, Admiral-terrace, Vauxhall-bridge-road, London; and sold by the Sole Consignee, **MR. William Bailey**, Wolverhampton, and all wholesale and retail Druggists and Medicine Agents throughout the British Empire.

**Mr. G. Hind, F.R.C.S., resumed his**  
DEMONSTRATIONS on the morning of the 15th of September, at the usual hour.

Class-room, 29, Newman-street, Oxford-street. Private residence, 9, South-crescent, Bedford-square.

## Householders' and General Life

ASSURANCE COMPANY, 15 & 16, ADAM STREET, ADELPHI.

### TRUSTEES.

The Right Honourable Thomas Milner Gibson, M.P.

John Walbanke Childers, Esq.

William Bulkeley Glasse, Esq., Q.C.

15 & 16, Adam-street, Adelphi.

William Ashton, Esq.

Charles Hulce, Esq.

Richard Griffiths Welford, Esq.

Francis D. Bullock Webster, Esq.

R. Hodson, Secretary.

AGENTS (with references) may apply.

## Bank of Deposit, National Assurance,

and INVESTMENT ASSOCIATION, No. 3, PALL-MALL EAST LONDON.

Established A.D. 1844.

Empowered by Special Act of Parliament.

Parties desirous of investing Money are requested to examine the Plan of this Institution, by which a high rate of Interest may be obtained with perfect security.

The Interest is payable in January and July, at the Head Office in London; and may also be received at the various Branches, or through Country Bankers, without delay or expense.

PETER MORRISON, Managing Director.

Prospectuses and Forms for opening Accounts sent free on application.

## New Equitable Assurance Company,

(Incorporated by Act of Parliament, 7 and 8 Vict. cap. 110.)

CHIEF OFFICES—449, STRAND, LONDON.

BRANCH OFFICES.—SAVINGS BANK, WORCESTER.

CAPITAL, £100,000.

### TRUSTEES.

SIR JAMES DUKE, Bart., Ald., M.P.

WILLIAM FERGUSON, Esq., F.R.S.

SIR CHARLES HASTINGS, M.D., D.C.L.

GEORGE JAMES GUTHRIE, Esq., F.R.S.

### DIRECTORS.

SIR CHARLES HASTINGS, M.D., D.C.L., Chairman of the Board.

GEORGE BEAMAN, Esq., M.D., F.R.C.S., Deputy Chairman.

### MEDICAL PRACTITIONERS.

THE DIRECTORS ACKNOWLEDGE AND CONSULT ALL DULY-QUALIFIED MEDICAL PRACTITIONERS AS THE MEDICAL ADVISERS OF THE COMPANY, AND UNIFORMLY PAY A FEE OF TWO GUINEAS FOR EVERY MEDICAL REPORT, WHEN THE PROPOSAL FOR ASSURANCE IS FOR £200 AND UPWARDS, AND A PROPORTIONATE FEE FOR A SMALLER AMOUNT.

MEDICAL PRACTITIONERS ARE ALSO ENTITLED TO TEN PER CENT. COMMISSION ON FIRST-YEAR'S PREMIUMS, AND FIVE PER CENT. OF ALL SUBSEQUENT PAYMENTS, FOR ASSURANCES EFFECTED THROUGH THEIR INTERMEDIATION.

### EVERY DESCRIPTION OF LIFE ASSURANCE BUSINESS TRANSACTED.

Prospectuses, Forms for Proposals, and any further information, may be had on applying to the Resident Director, or Secretary, at either Office, or of the Company's Agents.

N.B.—Active and influential AGENTS wanted.

## PRELIMINARY ADVERTISEMENT.

# THE EMPIRE ASSURANCE COMPANY,

For Lives, Annuities, Subscriptions, Endowments, &c.

## FEATURES OF THE COMPANY.

**AGENTS.**—1st. The Agents of this Company will be entitled, beyond the ordinary Commissions, to a direct and substantial interest in the realized Profits. This important feature is expressly provided for under the Company's Deed of Settlement, and will be extended to all **SOLICITORS, MEDICAL MEN, AND OFFICIALLY-APPOINTED AGENTS.**—2nd. A provision has likewise been made to remunerate out of realized profits, **THOSE PERSONS WHO MAY INTRODUCE AGENTS TO THE COMPANY.**

**CAPITAL.**—More than one-half of the Deposits on Shares, or, upwards of £10,000 will be actually paid up before business is commenced.

**QUALIFICATION FOR DIRECTOR.**—Every Director will pay down £500, at least, on Shares, immediately upon the complete registration of the Company.

**BUSINESS.**—The Business of this Company will include the granting of Assurances on Lives and Survivorships, Annuities and Endowments; also, the purchase of Reversions, Loans on Securities, &c., and will be fully set forth in the detailed Prospectuses.

**AGENCIES.**—Application for Agencies and the remaining Shares are requested to be made to the Secretary at the Chief Office.

The preliminary Prospectuses, detailing the plan and principles of the Company, and every information, may be obtained post free, on application to

EDWIN H. GALSWORTHY, Secretary

# OBSERVATIONS ON THE GANGLIA AND NERVES OF THE UTERUS.

By ROBERT LEE, M.D., F.R.S.,

FELLOW OF THE ROYAL COLLEGE OF PHYSICIANS, LONDON; PHYSICIAN TO  
THE BRITISH LYING-IN HOSPITAL, AND OBSTETRIC PHYSICIAN TO ST.  
GEORGE'S HOSPITAL.

(Continued from p. 415.)

SINCE the publication of these papers "On the Nervous System of the Uterus," in the "Philosophical Transactions," many of the most distinguished British and foreign anatomists, physiologists, and medical practitioners have carefully examined all the dissections described and delineated in them, and have borne testimony to the correctness of my statements: Sir B. Brodie, Mr. Lawrence, Mr. Paget, Dr. Knox, Dr. J. Davy, Mr. Stanley, Mr. Skey, Mr. Gulliver, Dr. Montgomery, Dr. Every Kennedy, Dr. Collina, Mr. Edward Grainger, Mr. Liston, Mr. Hilton, Mr. Prescott Hewett, Dr. Herschfeld, M. Velpeau, M. Dubois, the Professors Retzius, Elliot, and Boech, of Stockholm; Professor Meigs, of Philadelphia; Mr. Fergusson, Mr. Erasmus Wilson, Mr. Gray, Mr. Simon, Dr. Chambers, Dr. Bright, Dr. Mantell, Sir Charles Clarke, Dr. Melville, Dr. Arnott, Dr. Baly, and many others. Some recorded their opinion in writing. A few of these are subjoined:—

"Molesworth-street, Dublin, April 22nd, 1842."

"MY DEAR SIR,—I received the paper 'On the Nerves of the Uterus' which you so kindly sent me, and beg to congratulate you on the triumphant success of your researches; and I rejoice exceedingly that what was begun in our own country by W. Hunter has been brought to perfection in our own country by your talent and perseverance; and as such I shall speak of it.

"Yours very sincerely,  
"W. F. MONTGOMERY, M.D."

"14, Savile-row, December 29th, 1843."

"MY DEAR SIR,—I have carefully inspected your preparations, exhibiting the nerves of the gravid uterus, and I can find no reason to doubt the correctness of the statements which you have published in the 'Philosophical Transactions.'

"Yours truly,  
"B. C. BRODIE, F.R.S."

"Brook-street, January 8th, 1843."

"MY DEAR SIR,—In reply to your question, with what impression I came from the examination of your dissections of the gravid uterus? I can have no hesitation in stating my opinion to be, that your dissections do satisfactorily display the uterine nerves and their ganglia. Looking to the arrangement, connexions, and relations with the bloodvessels which the filaments and intumescences present, I cannot think otherwise of them than that they are the uterine nerves and ganglia.

"Believe me to be, my dear Sir, yours sincerely,  
"Dr. R. Lee." "EDWARD STANLEY, F.R.S."

FIG. 2.

FIG. 2 Represents the left hypogastric and sacral nerves entering the hypogastric ganglion, and the blood-vessels, ganglia, and nerves of the virgin uterus, a portion of the neurilemma being removed, and the size of the ganglia and nerves thereby greatly reduced below the natural size.

FIG. 3.

FIG. 3 Represents the right hypogastric nerve and ganglion, and the ganglia and nerves of the same virgin uterus, with a great part of the neurilemma dissected off. The ganglia and nerves, in the natural state, are about four times the size here represented.

"Winchester House, St. James's-square. Friday.

"MON TRÈS HONORÉ CONFRÈRE,—Vous m'avez fait un cadeau bien précieux, en me croyant digne de posséder le résultat admirable de vos longs et difficiles travaux. Je vous en remercie bien sincèrement. Mes collègues de Genève, auxquels je ferai connaître cette *stupendous découverte* du développement des nerfs de l'utérus, partageront l'estime et l'admiration que son auteur m'a inspiré.—Agrées, dear Sir, l'expression de ma reconnaissance et de mon sincère dévouement,

"MAUNOIR, Prof."

"I have derived great pleasure from examining the dissections of the uterine, vaginal, and vesical nerves made by Dr. Lee. The trunk and branches of the sympathetic nerve being left, as well as the trunks of some of the sacral nerves, a satisfactory clue is afforded in the examination. The injection of the bloodvessels renders a further and valuable aid in testing what are, and what are not, nervous fibrils.

"After carefully inspecting and examining these beautiful dissections, I have no hesitation in expressing my conviction that they bear out, fully and entirely, the delineations and descriptions published by Dr. Lee.

"1. The preparations show an unequivocal continuity of fibres proceeding from undisputed nervous structures—the sympathetic and sacral nerves, to the newly-discovered ganglia of the uterus, vagina, and ureter.

"2. The nervous branches of the newly-discovered ganglia join, in various directions, with acknowledged nerves, such as those of the inferior mesenteric plexus, furnishing the hemorrhoidal nerves, and with the spermatic nerves, descending on the uterus from the folds of the broad ligaments.

"3. The occurrence of small ganglia and gangliform enlargements, on the newly-discovered nerves, are very characteristic, and corroborative of their real nature.

"4. The nerves are accompanied by injected bloodvessels, in a manner that is not seen in elastic tissue, although usual with the ganglionic nerves.

"5. The ganglia discovered by Dr. Lee present, in their form and disposition, and in the openings which they possess, a perfect and entire correspondence with the larger ganglia of the sympathetic.

"After the examination which I have made, it certainly appears to be impossible for any one to arrive at a just conclusion respecting the true character of Dr. Lee's description, without a careful inspection of his preparations. It is proper to add, that I have not yet had an opportunity of making a microscopical examination.

"Nov. 13th, 1843."

"R. D. GRAINGER, F.R.S.

"Merrion-square, Dublin, Jan. 17th, 1844.

"MY DEAR SIR,—I have a perfect recollection of the gratification I experienced at examining, along with you, your preparations of the nerves of the uterus. Most schoolmen admit the simplest of all sensible proofs to be *demonstration*, and where, as in your case, the fact at issue is capable of being tested by such proof, I am at a loss to know how a question can arise on the matter. For myself, I can only say that I was as satisfied what I saw was nerves and ganglionic structure, as I am of the existence of nervous structure in any other organ of the human body with which I am familiar.

"Believe me, yours very faithfully,

"EVERY KENNEDY, M.D."

FIG. 4.

FIG. 4 Exhibits an anterior and lateral view of the gravid uterus in the fourth month, and of the vagina and bladder.

- A. The right hypogastric nerve.
- B. The sacral nerve.
- C. The right hypogastric ganglion.
- D. Nerve from the hypogastric nerve to the ganglia on the bloodvessels of the uterus
- E. Ganglia surrounding the uterine artery and veins.
- F. Ganglionic plexus, under the peritoneum on the fore-part of the uterus.
- G. Filaments from this plexus passing out with the round ligament.
- H. The round ligament.
- I. The right ureter and trunk of the vaginal and vesical veins surrounded with nerves.
- J. Ganglia and nerves of the vagina.
- K. Nerves passing between the vagina and rectum.
- L. Ganglia and nerves of the bladder.
- M. Vaginal nerves passing into the bladder around the ureter.
- N. Bloodvessels and nerves of upper part of the bladder.
- O. Plexus of nerves under the peritoneum on the left side of the uterus, the bloodvessels of which have not been injected.
- P. Filaments from this plexus passing out with the round ligaments.
- Q. The peritoneum of the anterior part of the body and cervix of the uterus reflected upwards, to expose the ganglionic plexuses situated below.

FIG. 5.

[For description, see next page.]

"Grosvenor-street, Jan. 6th, 1844.

"MY DEAR SIR,—I have much pleasure in complying with your request that I would state the result of my impressions on viewing your dissections of the impregnated uterus.

"I see no reason to doubt the correctness of your views—viz., that the immense network which you have so industriously investigated on the surface of the uterus is composed of true nerves and nervous ganglia. To my judgment, they present all the visible characters of nerves, and appear to be in direct communication with the pelvic branches of the sympathetic.

"I am, my dear Sir, very truly yours,  
"To Dr. Robert Lee." "F. C. SKEY, F.R.S.

"Hyde-park Barracks, January 12th, 1844.

"MY DEAR SIR,—I have read your papers in the 'Philosophical Transactions' 'On the Ganglia, and on the other Nervous Structures of the Uterus,' and carefully examined the preparations which you exhibit as vouchers for the facts you have announced.

"Your descriptions and plates appear to me to be executed with remarkable fidelity.

"I cannot doubt but that the structures which you have shown by dissection are really nerves, and nervous ganglia, because their fibres are clearly shown to be continuous with the sympathetic, and with the sacral nerves, and because I do not believe that any ingenuity in the art of dissection could show such a regular continuity between the nerves and fibres of elastic tissue, or that this tissue could be made to imitate the nerves and nervous ganglia displayed in your preparations.

"I am, my dear Sir, very sincerely yours,  
"Dr. Robert Lee." "GEORGE GULLIVER, F.R.S.

"The Oaks, Ambleside, March 25th, 1844.

"MY DEAR SIR,—Now that I am at home, and have leisure, let me thank you for the gratification I had, when in town, in seeing your preparations, displaying the nerves of the uterus in its unimpregnated and pregnant states. I never witnessed any anatomical demonstration more satisfactory; indeed, I cannot but consider your dissections of these nerves as a perfect demonstration, &c. — I remain, my dear Sir, with much esteem, faithfully yours,

"J. DAVY, M.D., F.R.S."

"Edinburgh, Newington, June 29th, 1844.

"DEAR SIR,—Since my return to Scotland I have turned over in my mind the opinion I offered you in Savile-row whilst examining the very beautiful preparations you showed me of the nerves of the 'unimpregnated and of the gravid uterus.' The opinion amounted to this: that what you showed me as nerves, ganglia, and nervous filaments of communication, are really such, and can be nothing else; that the increase in size or bulk, to which so much importance has been attached, has been, upon the whole, somewhat exaggerated by those who have adopted a different view from that I now propose; that the preparations you showed me are, without exception, the most beautiful I have ever seen of any part of the nervous system; that, viewed simply as dissections of structures difficult to unravel, they merit the highest praise; but, taken in connexion with the physiology of the organs, they place the dissector in the foremost place of observers.

"Very faithfully yours,  
"R. KNOX, M.D., F.R.S.E."

"St. Bartholomew's Hospital, December 19th, 1848.

"MY DEAR SIR,—After the minute examination of your preparations of the nervous system of the gravid uterus which you permitted me to make, I examined your descriptions, and Mr. Perry's delineations of them. Both appear to me remarkable for their accuracy.

"With regard to any doubt whether the structures which you have dissected be, as you have described them, nerves and nervous ganglia, it is chiefly by these following facts that I feel convinced of the truth of your account:—

"1. That there is a visible and orderly continuity between the well-known hypogastric and sacral nerves, and the most minute and remote of the nervous cords which you have displayed.

"2. That these cords, like those of larger size, have such an appearance of being nerves as could not, I am sure, be imitated by dissections of any other known structure.

"3. That the ganglia which you have found are like those of other parts of the sympathetic system, and have distinct nervous cords passing to and from them.

"4. That many of the minutest, as well as of the larger nerves, are evidently associated with bloodvessels.

"5. That the nervous system displayed is such an one as the pregnant uterus, from its known structure and functions, might be expected to possess.

"I think that your statements are proved by all the evidence to which it is possible, in the present condition of science, to attain; and I beg to add my congratulations to those which you have already received, on your having, by a truly admirable perseverance and dexterity, made one of the most important anatomical discoveries of the century.

"Believe me, my dear Sir, very truly yours,  
"JAMES PAGET."

"Whitehall-place, December 28th, 1843.

"MY DEAR SIR,—I have carefully examined your dissections of the nerves of the gravid uterus on various occasions, and I continue to believe, as I did in the first instance, that the structures you have succeeded in displaying are ganglia and nerves; while I am satisfied that your figures and descriptions are perfectly correct. The extraordinary and interesting spectacle you have set before us is so entirely novel, that some hesitation might very probably be felt in arriving at a decided opinion on the subject. Yet this augmented size of nerves and ganglia is only analogous to the increased development of bloodvessels in the gravid uterus, with which we have been long familiar: probably a corresponding change might be found in the absorbing system, if it were submitted to the same kind of patient investigation which you have bestowed on the nerves.

"The considerations which have led me to form the conclusions above-mentioned, are exactly the same as those so clearly stated by my colleague, Mr. Paget. I have therefore only to add, that I entirely agree with what he has written to you on the subject.

"Remaining, my dear Sir, yours very faithfully,  
"Dr. Robert Lee." "WILLIAM LAWRENCE, F.R.S.

All the dissections here referred to have been preserved, and are now in the museum of St. George's Hospital, where they may be examined. These are the only dissections of the ganglia and nerves of the unimpregnated and gravid uterus now existing in Great Britain, except two mutilated specimens in which the neurilemma was intentionally removed, as stated in the following communication published by Dr. L. Herschfeld.

"Dr. Snow Beck has two specimens," says Dr. Herschfeld, "in the preparation of which he employed eight months, removing from day to day, with forceps and needles, (as he told me himself,) not merely the cellular tissue, but the neurilemma even, so that he has left only the fasciculi of the nervous tubes. It seems to me that the work of this anatomist ought not to be appealed to when the subject of the volume of the Nerves of the Uterus is agitated, for they only present the nerves deprived of one of their constituent tissues—the neurilemma."

In the preparation of these two mutilated specimens here referred to, Dr. Thomas Snow Beck employed eight months "removing from day to day, with forceps and needles, not merely the cellular tissue, but the neurilemma even, so that he has left only the fasciculi of the nervous tubes." This unprecedented process was carried on under the auspices of several eminent microscopical anatomists, especially Professor William Sharpey, of University College, and now secretary at the Royal Society. This proceeding is now commonly called "*skinning the nerves of the uterus*." This "*skinning*," so long concealed from men of science throughout the world, was hailed in 1845, by the Committee of Physiology and Council of the Royal Society, as one of the most original and sublime discoveries ever made in human anatomy, for which the immortality of Martin Horky has been his reward.

The proceedings of the Royal Society relative to the discovery of the nervous system of the uterus will form the subject of my next communication.

FIG. 5 Exhibits the ganglia and nerves on the posterior and left side of the gravid uterus at the end of the ninth month of pregnancy.

- The fundus and body of the uterus, having the peritonæum dissected off from the left side.
- The vagina covered with nerves proceeding from the inferior border of the left hypogastric ganglion.
- The rectum.
- The left ovary and Fallopian tube.

\* Note upon the Nerves of the Uterus, by Dr. L. Herschfeld, in the *Medical Times and Gazette*, July 23rd, 1863, p. 87.

- E. The trunk of the left spermatic vein and artery surrounded by the left spermatic ganglion.
- F. The sort divided a little above the origin of the right spermatic artery, and about three inches above its division into the two common iliac arteries.
- G. The vena cava.
- H. Trunk of the right spermatic vein entering the vena cava.
- I. Right ureter.
- K. The two cords of the great sympathetic nerve passing down along the front of the sort.
- L. Trunk of the inferior mesenteric artery, passing off from the sort, and covered with a great plexus of nerves sent off from the left and right cords of the great sympathetic.
- M. M. The two cords of the great sympathetic passing down below the bifurcation of the sort to the point where they separate into the right and left hypogastric nerves.
- N. The right hypogastric nerve, with its artery injected, proceeding to the neck of the uterus, to terminate in the right hypogastric ganglion.
- O. The left hypogastric nerve where it is entering the left hypogastric ganglion, and giving off branches to the left sub-peritoneal ganglion.
- P. Hemorrhoidal nerves accompanying the hemorrhoidal artery, and proceeding from the great plexus which surrounded the inferior mesenteric artery.
- Q. The sacral nerves entering the whole outer surface of the hypogastric ganglion.
- R. The left hypogastric ganglion, with its arteries injected.
- S. The nerves of the vagina.
- T. Nerves with an injected artery proceeding from the upper part of the left hypogastric ganglion along the body of the uterus, and terminating in the left spermatic ganglion.
- U. Continuation of these nerves and the branches which they give off to the sub-peritoneal plexuses.
- V. The same nerves passing upward beneath the sub-peritoneal plexuses, and anastomosing freely with them.
- W. The left spermatic ganglion, in which the nerves and artery from the hypogastric ganglion, and the branches of the left sub-peritoneal plexuses terminate, and from which the nerves of the fundus uteri are supplied.
- X. The left sub-peritoneal plexuses covering the body of the uterus.
- Y. The left sub-peritoneal ganglion, with numerous branches of nerves extending between it and the left hypogastric nerve and ganglion.
- Z. The left common iliac artery cut across and turned aside, that the left hypogastric nerve and ganglion might be traced and exposed.

(To be continued.)

## TREATMENT OF SLOUGHING SORES BY CHLORINE.

By THOMAS S. FLETCHER, Esq., M.R.C.S.

At the suggestion of the professor of surgery at the Queen's College, Birmingham, I beg to call the attention of the readers of THE LANCET to a simple and at the same time highly efficacious mode of treating sloughing wounds by means of chlorine. The first case in which I used this article as a curative agent fully illustrates how powerfully it possesses these properties.

A man, aged eighty-four, was in August last shot through the palm of the hand, and, in a few days, the wound becoming very offensive, each orifice was covered with large pads of tow, dipped in a weak solution of chloride of lime (two drachms of the powder to a pint of cold water,) and the dressing renewed about twice a day. The offensive odour was immediately destroyed, the wound became clean and healthy, the granulations sprung up with great rapidity, soon covering the ends of the fractured bones, and healing up the wound, and this without the use of any other remedy.

I have trusted to the sole use of chlorine in other cases with equal success, applying it not only where the wounds are become offensive, but in the earlier stages, where there was reason to apprehend there would be sloughing or offensive discharges. Various preparations of chlorine have long been used to remove the odour from wounds, and for this purpose they are applied over other dressings; but what I here wish to recommend is that it should be used alone, and as a curative remedy. The rationale of its action may perhaps be explained in the following manner:—Portions of the wounded parts are preserved from sloughing by means of the antiseptic properties possessed by chlorine; granulations are to a very remarkable extent promoted—first, by the stimulating power of chlorine, from its increasing the activity of the small vessels on the surface of the wound, and secondly, by the peculiar property it has of keeping the wound clean, and thus enabling the plastic cells formed from the liquor sanguinis to have immediate contact with, and adhere to, active living substance, and so form new healthy tissue, instead of their being thrown off in the form of pus. If chlorine has the power of increasing the process of granulation, it must, as a natural consequence, have in an equal ratio the property of suppressing the suppuration. Lastly, the formation of those noxious gases and larvae so detrimental to the parts themselves and injurious to the general health, is prevented by the chemical action of chlorine.

Poultices, ointments, and hot and cold water applications,

do not possess the above properties; and if they promote, as I fear they do, what is most favourable to sloughing, heat and moisture, and the confinement of the noxious gases and discharges to the parts, they must in these respects have a tendency to do harm.

I trust that this suggestion may be the means of materially adding to the comfort of the wounded in the East, and effectually preventing those loathsome scenes amongst them painfully recorded in many papers.

Bromsgrove, Nov. 1854.

## REPORT OF A CASE OF TRANSPOSITION OF THE VISCERA.

By THOMAS CHAPLIN, Esq., M.R.C.S. and L.S.A.

RESIDENT MEDICAL OFFICER TO THE BLOOMSBURY DISPENSARY.

SOPHIA H.—died on the 8th of July, 1854, aged one year and ten months. The body was examined forty-eight hours after death. On opening the abdomen, the liver was found to be placed upon the left side, and, from being enormously enlarged, extended downwards as far as the crest of the ilium, whilst the small lobe crossed the abdomen and occupied nearly the whole of the right hypochondriac region. The large end of the stomach was on the right side, the pylorus and duodenum being on the left. The pancreas was placed to the right of the duodenum. The spleen, which was very large, was situated in the right hypochondriac region, and reached as low as the iliac fossa. The left kidney was lower than the right. The cæcum was in the left iliac region; the sigmoid flexure in the right. On examining the chest, the heart was found with its apex pointing to the right side, and the aorta, which proceeded from the right ventricle, arching downwards towards the right side of the spine. The left lung had three lobes, the right lung only two.

The child had been delicate from its birth, and some time before its death had fallen into a very cachectic condition. The autopsy showed evidences of recent general peritonitis. Both lungs were partially emphysematous, and there were signs of rather severe bronchitis. The heart was large, and the pericardium roughened in several spots by an old deposition of lymph.

Great Russell-street, Dec. 1854.

## A Mirror OF THE PRACTICE OF MEDICINE AND SURGERY IN THE HOSPITALS OF LONDON.

Nulla est alia pro certo noscendi via, nisi quam plurimas et morborum et dissectionum historias, tam aliorum proprias, collectas habere et inter se comparare.—MORSEANI. *De Sed. et Caus. Morb.* lib. 14. Proœmium.

### ST. THOMAS'S AND UNIVERSITY COLLEGE HOSPITALS.

TWO CASES OF STRANGULATED INGUINAL HERNIA; OPERATION; OPENING OF THE SAC; RECOVERY.

(Under the care of Mr. LE GROS CLARK and Mr. QUAIN.)

ALTHOUGH there is some difference of opinion amongst surgeons as to the propriety of opening the sac in the operation for strangulated hernia, we are confident that the peritoneal investment is never laid open, except the surgeon conscientiously thinks the measure necessary. But even when this necessity is most manifest, there may be some apprehension in the mind of the operator, who is apt to ask himself whether he is not, by laying bare the intestine, jeopardizing his patient's life?

Now, it must be evident to those who see a great many of these operations, that the opening of the sac, and even the decidedly dark colour of the bowel, are, to say the least of it, pretty often followed by favourable results. Of course, we are only here stating a general impression, and know full well that

accurate statistics are indispensable for settling the question; but we are nevertheless anxious to select, from the numerous cases which come under our cognizance, a few, which may tend to allay certain fears which operators might experience. For ample information on the subject, we beg to refer to Mr. Hancock's excellent monograph "On Petit's Operation." Here follow Mr. Clark's cases, as noted down by Mr. Tyrrell, house-surgeon to the hospital.

**CASE 1.**—James B—, a railway porter, aged twenty-four years, was admitted into Henry's ward on October 11th, 1854. The patient states that he has always been subject to a small swelling in the right side of the scrotum, which caused him no pain or anxiety. The tumour was, at times, increased by another swelling, which appeared occasionally in his groin; but the hernia never stayed down long, and could always be returned without giving him any pain or inconvenience.

On the night before admission, his bowels were open freely, and the man retired to bed as usual, there being then no swelling in the groin beyond that which was constantly there. He was, however, woke rather earlier than usual by uneasiness in the abdomen, when he found the swelling in his groin larger than he had yet noticed it. It, however, did not arouse any fear in his mind; but, as the pain continued, he went to a surgeon, and, complaining only of abdominal pain, was ordered some simple purgative. This made him sick, but produced no motion; he therefore went again, and mentioned the tumour, which the surgeon tried in vain to return. He was then sent to the hospital, which he reached about one o'clock.

On admission, the patient was found to have a swelling, about the size of a turkey's egg, occupying the position of an inguinal hernia. He was complaining of great pain in the belly, there was sickness, his pulse was weak, and his tongue a good deal coated. Attempts were made, by taxis, to reduce the hernia, but without effect. Ice was then applied until half-past six P.M., when, after another attempt at reduction by taxis, Mr. Clark decided on immediate operation.

It was accordingly proceeded with in the usual manner. After dividing the integuments, some smart hæmorrhage took place, and three arteries required the ligature. On arriving at the peritoneal investment, an attempt was made to return the contents without opening the sac, but this was found to be impossible, from the stricture existing in the neck of the sac itself. The latter was accordingly opened, and a considerable quantity of fluid, not exactly resembling the serum usually found in hernial sacs, escaped. This was the fluid of a hydrocele. The gut was found to be of a dark claret colour; there was a large quantity in the sac, (five or six inches of intestine;) and it was, after some little delay, returned into the abdomen. The testicle was found in the sac, proving the hernia to have been of a congenital nature. The wound was now dressed, the patient returned to bed, and at half-past eight he was fast asleep with the chloroform; at twelve he woke, and, as he did not feel inclined to sleep, he had twenty drops of laudanum.

The next morning the patient was all the better for his sleep, though he had some little pain in the head. The bowels had not been opened in the course of the day; he had some slight pain in the abdomen, for which he was ordered to take, every sixth hour, two grains of calomel and a quarter of a grain of opium.

No evacuations took place until about half-past two the following day, forty-three hours after the operation. The man was now perfectly relieved, and suffered afterwards no pain. From this time he continued to improve, and went out of the hospital with the wound quite healed up.

**CASE 2.**—Richard B—, a paper-maker, aged thirty-nine, was admitted into Henry's ward, on October 10th, 1854, under the care of Mr. Clark. The patient gives the following account:—

He has had a rupture on the right side for twenty-five years, and on the left for fifteen years. Has worn a double truss for five years, previous to which time he had not used any apparatus. About a twelvemonth before admission here, the rupture on the left side came down, and he was unable to return it for some little time. Previous to, and after this, he had had no trouble with either rupture. His work is heavy, and he does a good deal of lifting, &c. In the afternoon of the day which preceded admission, while in bed and asleep, (he works at night,) the right rupture came down further than he had ever known it come before. This circumstance woke him up, though the swelling did not pain him much for about half an hour after its descent. At the expiration of that time, however, he had a great deal of pain in the region of the umbilicus, and felt after this very sick.

The straining consequent on his retching made, he says, the tumour become larger.

He now sent for a surgeon, who put him in a warm bath, and used taxis for some time, without success. He continued very ill all night, but his bowels were very slightly opened once this morning previous to his admission. Finding himself getting worse, in the morning he started for the hospital, and was admitted at ten A.M.

A tumour was seen in the right groin, the size of a large turkey's egg; it was very tender on pressure; and the man had also some little pain in the abdomen. Mr. Clark tried taxis for about a quarter of an hour, after which the patient was sent to bed, and ice applied to the tumour.

At three o'clock, Mr. Clark again applied taxis, without success; he therefore obtained the patient's consent to an immediate operation.

The latter was performed in the usual manner. Mr. Clark opened the sac, which was found to contain a large quantity of serum tinged with blood. The intestine, of which there were six or seven inches, was deeply congested, but otherwise unaltered. After the operation, the wound was dressed, and the patient removed to bed. He was ordered thirty drops of Battley's sedative.

The patient was a good deal troubled with flatus for some days, especially after the operation; it proved very annoying and painful, and resisted all methods of alleviation. The next day (Oct. 11th) the bowels were not open; Mr. Clark therefore ordered some castor oil with a little laudanum, and also an enema. No result was obtained, but three enemata were given in the space of forty-eight hours, to get the bowels open and relieve the flatus.

As these lesser means proved futile, he was ordered, on the third day, four grains of calomel and half a grain of opium, to be taken in the evening, and some castor oil in the morning, if necessary.

The calomel produced four evacuations in the course of the night; after this, however, the painful distension from flatus continued for some days, though in a less degree. The patient, however, continued steadily to improve, and was soon discharged in very good condition.

In making a few remarks on these cases, Mr. Clark stated that they presented certain points of contrast and others of resemblance. In each the hernia was large, and occupied the scrotum; the duration of strangulation was short, and the symptoms were urgent. In each case the internal ring seemed to be the seat of stricture, but really had little or nothing to do with it, the neck of the sac itself requiring division before the intestine could be returned. In both the gut was of a port-wine colour, and the relief, on division of the stricture, immediate. Further, in each case the chief suffering was referred to the umbilical region, and but little complaint was made when the tumour was handled. One other point of similarity is remarkable, because rare. In both instances the rupture descended whilst the patients were recumbent, and without any conscious efforts on their part.

As points of contrast it may be remarked, that in one case the hernia was an old one, and usually descended into the scrotum; in the other, which was congenital and complicated with hydrocele, it would appear that the rupture had not before protruded beyond the internal ring, or very slightly so. This fact accounts for another point of contrast observed during the operation. In the old rupture, the seat of stricture (the neck of the sac) was low down, dragged, as it were, to the mouth of the inguinal canal, whilst in the recent hernia it was high up, out of sight, and reached with difficulty. In neither case could any untoward symptom be referred to the opening of the sac and necessary exposure and handling of many inches of intestine.

#### UNIVERSITY COLLEGE HOSPITAL.

STRANGULATED CRURAL HERNIA; OPERATION; DISCOVERY OF TWO DISTINCT SACS.

(Under the care of Mr. QUAIN.)

THE patient was a woman, between fifty and sixty years of age, who presented some of the symptoms of hernia, of which vomiting was the principal. The femoral tumour did, however, not evince that tightness, tenderness, &c., which is characteristic of strangulation; but as the vomiting continued, Mr. Quain thought the time had come to operate, although the swelling was rather flaccid.

The first incision was made at the inner side of the tumour, so that the intestine might not be laid bare at once; and when

the sac was exposed and the stricture divided, Mr. Quain endeavoured to reduce without opening the former. This having been found impossible, he opened the sac, which was found to contain nothing but serum; and when the parts had been well examined, and explored with the finger, another sac was discovered up towards the abdomen. This was now divided also; a knuckle of intestine came into view, and was easily reduced.

Mr. Quain stated, after the patient had been removed, that the two sacs had very probably been formed at two distinct periods. The point of interest, and worthy of being remembered was, that there might be no tension whatever in a hernial tumour, and the latter be nevertheless composed of two distinct sacs. Had he (Mr. Quain) suspected the state of the parts, he would have operated the first day; and he remembered a case similar to the present, in which he had operated some years ago; the woman had done well. He considered these cases of very rare occurrence.\*

### LONDON HOSPITAL.

FOLLICULAR TUMOUR INVOLVING THE NASAL BONES, NASAL PROCESSES OF SUPERIOR MAXILLARY BONE, AND THE SEPTUM OF THE NOSE; REMOVAL; DEATH FROM PNEUMONIA; AUTOPSY.

(Under the care of Mr. WARD.)

(We had, a short time ago, the pleasure of putting upon record some cases illustrative of the recurrent fibroid tumour described by Mr. Paget; and we then dwelt at some length on the peculiar tendency of some tumours, especially the myeloid, or fibro-plastic, to assume malignant characters, (*THE LANCET*, vol. ii. 1854, p. 353;) that is to say, contaminate the economy, for the fact of recurrence is *no longer* a malignant character. Here is another of the class, which Dr. Andrew Clark, who examined the morbid product very carefully, is inclined to call follicular. It certainly evinced the tendency to recurrence very forcibly, as our readers may judge from the following details:—)

A postman, aged fifty-eight, a resident of Lowestoff, was admitted into the London Hospital on August 2nd, 1854.

The patient was a thin, spare man, of a determined character, and somewhat bilious temperament. His parents were perfectly healthy, his mother living to the age of eighty, and his father having died from an accident. He has two sisters living, and in good health.

The patient enjoyed very good health until a short time before his coming into the hospital, frequent bleedings from the nose having, however, somewhat weakened him. Twenty-four years before admission, he first observed a small swelling on the left side of the nose, just at a point which had been slightly lacerated when a boy. This swelling was about the size of a pea, hard, and devoid of pain. It gradually increased for four years, at the end of which time he applied to a medical man, who removed with the forceps a substance from the left nostril, which was pronounced to be a diseased cartilage.

Although the operation reduced the swelling considerably, the hardness on the nose still remained, and from it a tumour sprang. It gradually but slowly increased, but without causing pain, until four years before admission, when an operation for its removal was undertaken in the Lowestoff Infirmary.

For a period of two years after the operation, there was no appearance of the return of the disease. Shortly after this lapse of time, however, the tumour again formed, commencing at the original seat of injury, and has gradually increased up to the present time. Its re-formation was attended with interrupted attacks of epistaxis, occurring at intervals of two or three months; and these had reduced his strength so much that he had been prevented from following his ordinary avocation.

At the time of his admission, the patient appeared to be much weakened by the repeated hemorrhages, and it was considered necessary to improve his health, if possible, by diet and rest, before undertaking any operation for the removal of the disease.

The tumour presented an irregular, nodulated appearance, and caused considerable deformity of the nasal portion of the face. The left side was represented by three irregular spheroidal masses blending together, involving the left nasal bone and ascending plate of the superior maxillary. The integument was attenuated and shining, and stretched over them, without being adherent. Each mass was about the size of a hazel-nut.

On the right side the swelling was not so developed, there being but one irregular, nodulated mass, and the skin over it was less tense. The upper limit of the tumour, on either side, was represented by the nasal process of the frontal bone. The body of the tumour projected into the left nasal cavity, which it completely blocked up; for, on holding the flame of a candle in front of it, and requesting the man to expire, the right nostril and mouth being closed, no effect was produced on the flame. No projection of the tumour from the back of the nostril could be detected. The septum was displaced somewhat to the right side, and the tumour felt hard and slightly elastic.

Although there was some difference of opinion as to the propriety of interfering with the diseased mass, the anxious wish of the patient that something should be done, and the late rapid growth of the diseased structure, warranted surgical interference, and an operation was performed by Mr. Ward on the 22nd of September.

The patient was placed in a semi-recumbent position on a sofa, and when under the influence of chloroform, the soft parts superficial to the tumour were reflected in the following manner:—A curved incision, one inch and a half long, the concavity looking downwards, was carried across the root of the nose from one tendo oculi to the other. A pointed scalpel was inserted into the right nostril, and on transfixing the soft parts by a nearly vertical incision, the right side of the soft parts of the nose was separated from the septum. A prolongation upwards of the vertical line of transfixion was continued into the middle of the first incision. The left nostril was similarly divided, the upper extremity of the line of transfixion terminating in the commencement of the same line made in the right nostril. The transfixion of either nostril was so planned as to leave a small, wedge-shaped piece of the tip of the nose in contact with the columna.

The right flap, thus outlined, and with it the ala, was reflected to the right side of the face from over the right nasal bone and nasal process of superior maxilla. The left flap and left ala were similarly reflected from the tumour beneath; but on reaching the lower part of the anterior aperture of the nostril, there was not found sufficient exposure of the tumour for ulterior proceedings, and the upper lip was consequently divided through along the side of its vertical groove; a further reflection of this side of the lip in contact with the other soft parts was sufficient to expose the front of the tumour fully to view.

A small chisel and mallet easily divided the superior attachments of the diseased mass. The lateral and lower were, by the same instruments, separated, and the septum inferiorly detached. The upper attachment of the septum was cut through by a pair of long, strong, and slightly-curved scissors, and the mass of the disease was taken away, with the exception of a small part of the tumour, which involved the nasal process, and which was got rid of by a gouge.

At the end of the operation, a polypus was found in the middle chamber of the right nasal cavity, and this was snipped off.

The man was but very partially under the influence of chloroform during the latter stages of the proceeding.

Three hours and a half after the operation, all bleeding having ceased, the soft parts were carefully brought together by sutures and hare-lip pins; three of the latter having been used, one for the tip of the nose, and two for the upper lip, and fifteen of the former for the remainder. The patient was ordered a full dose of opium, with a little wine.

The sutures and hare-lip pins were removed on the fourth day. The whole of the soft parts had united by primary adhesion, with the exception of the upper part of the left flap, which to the extent of half an inch had sloughed away, and had become detached internally to the extent of an inch from above downwards, so that there was a small aperture left, leading to the common nasal cavity.

The patient appeared to be going on tolerably well till the fifth day, when he became gradually weaker, was irritable during the day, and restless at night-time. Mr. Ward ordered a generous diet, with from six to eight ounces of wine daily, and morphia at night-time; and as the man complained a good deal of soreness and dryness about the throat, he was prescribed ice.

On the tenth and eleventh days his countenance was particularly blanched; his intellect appeared somewhat to wander, and he died suddenly on the morning of the twelfth day.

A post-mortem examination, twenty-nine hours after death, found a good deal of oedematous infiltration in the cellular tissue of the scalp, and also in the ventricles of the brain and arachnoid cavity. On removing the larynx with the trachea

\* We are informed by Mr. McWhinnie, assistant-surgeon to St. Bartholomew's Hospital, that a preparation is preserved in the museum of that institution, illustrating the peculiarity observed in Mr. Quain's case.

and lungs, the common opening of the first was found filled up with muco-purulent fluid, so that the rima glottidis could not be seen. On removing the larynx, the same kind of fluid flowed in a full stream from the trachea. Both lungs were intimately united on their pleural surfaces with the costal pleura by old firm adhesions. The right lung had its upper and middle lobes united together by soft recent plastic exudation. The posterior four-fifths of the upper lobe were in a state of marked grey hepatization, and there exuded from it, on section, a muco-purulent-looking fluid. The middle and lowest lobes were highly congested, and here and there in a state of red hepatization. The left lung was remarkably emphysematous, and had, in different parts, patches of grey hepatization, intermixed with small irregular cavities; the latter, however, limited to the upper lobe.

Thus the post-mortem examination proved that an insidious but destructive form of pneumonia unfortunately led to a fatal result in this case, and in all probability had taken place in the period of twelve days that had occurred from the time of the operation, although none of the usual symptoms of inflammation of the lungs had marked its progress; the man had no characteristic expectoration, or observable dyspnoea, the symptoms having been those of nervous irritability from loss of blood, and shock to the system in consequence of the operation.

The tumour, which microscopically presented many points of interest, was carefully examined by Dr. Andrew Clark, and the following is his account of it:—

It was three inches and a half long, from above downwards. Its antero-posterior diameter two inches and a half, and its transverse one inch and a half. The principal mass of the tumour is on the left side of the nasal septum, with the mucous membrane of which it is incorporated. The same membrane on the right side of the septum is exposed, and appears thickened, highly vascular, and thrown into various sized nodular elevations. These increased in size towards the upper and back parts of the septum, till they became incorporated with the mass of the tumour projecting from the left side. The posterior and inferior parts of the tumour project downward from the general mass to the extent of half an inch, and are narrow and pointed. This portion is softer and looser than any other, of a cream colour, and mottled with patches of dark-red extravasated blood. The free surface of the tumour on the left side is nodulated, of a bright rose-colour, firm, and covered with a layer of condensed areolar tissue. The nodules are of various sizes, the largest being less than a hazel-nut. The upper portion of the right side of the tumour is overhung by the attenuated and flattened nasal bone. The lower half of the left side is closely embraced by the nasal process of the superior maxilla, in a similar state of thinness. The tumour appears to have been wholly removed.

A section of it having been made from before backwards, immediately to the left of the septum, the following appearances were presented:—Above, the cut surface is of a bright rose-colour, firm, slightly granular, and paler and firmer towards the centre, which is occupied by a rounded mass of opaque yellow matter, hard, friable, and yielding no juice, the centre of which is the hardest, and looks like withered tissue. The circumference blends gradually into the adjacent structures. Beneath this the structure is reticulated, broken up, soft, of a mottled red-colour, and studded with patches of extravasated blood. Scarcely any appearance of fibres is presented to the naked eye, and the pits and rougher excavations noticeable on the cut surface look as if they had resulted from disintegration. From the upper and lower parts of the tumour a milky juice can be squeezed out, which from the lower part is mixed with blood. The juice, in both cases, is rendered more opaque and milky by water, acetic acid, or spirit. Some of the nodules on the free surface of the left side of the tumour, when sliced, looked like similar sections of unhealthy lymphatic gland.

**Histological characters.**—In seeking to determine the nature of this tumour, it appeared desirable to commence the investigation on the right side of the septum, where the mucous membrane, from being simply thickened, became thrown into nodules, which finally merged into the general substance of the tumour. In this way, the gradual transitions from healthy to diseased structures could be observed, and the true origin and significance of the tumour more precisely ascertained.

I commenced, therefore, by making sections of the mucous membrane from below upwards, from where the mucous membrane appeared healthy, to where it evidently became incorporated with the general mass of the tumour.

For the proper understanding of these specimens, which I have put up in a permanent form, it is to be remembered that the mucous membrane of the nose is abundantly furnished with epithelial cells, ciliated at one part, squamous at another, with

papillae, the existence of which is satisfactorily demonstrated by the specimens, with infinitely numerous follicles or glands of three kinds, simple, racemous, and compound tubular; and lastly, with a thick layer of nuclear particles, lying immediately beneath the germinal membrane. Sections of the mucous membrane from the lower part of the septum exhibited accumulations of epithelial cells on the general surface and on the papillae, the follicles nearly filled with the spheroidal particles which line their walls, and the layer of nuclear particles more consistent and darker. As the mucous membrane became more thickened, and began to be projected into nodules, these changes became more marked, except that the epithelial cells lining the general surface gradually disappeared, a circumstance probably dependent on the increased nutritive activity going on in the follicles, and that the papillae became hypertrophied. Where the mucous membrane projected into nodules, sections of those exhibited—

FIG. 1.

Section of the thickened mucous membrane of the septum nasi, where it has merged into the general substance of the tumour. (Magnified 140 diameters.)

1. Absence of the epithelium of the general surface.
2. Increased hypertrophy of the papillae.
3. Enlargement of the follicles, which were packed full of spheroidal epithelial cells, many of them in a state of disintegration. Mixed with these cells were numerous fat-granules, and a few exudation corpuscles.
4. Great increase in the layer of nuclear particles, which exhibited various morphological changes. Some were disintegrating; others were shooting out into nuclear fibres; and a third class had become swollen, and appeared in the act of development into nucleated cells. The layer of particles, too, had become irregularly broken, and the vascular spaces, so abundant in the mucous membrane of this part, were infiltrated with the wandering nuclei.

In the section of another nodule, which communicated with the general mass of the tumour, but still lay partially on the right side of the septum, the changes above described were found still further advanced. The follicles, however, had burst, and their altered contents had become mingled confusedly with the free nuclear elements scattered about. Various changes, too, had occurred in the cellular contents of the follicles. Some had become enlarged and nucleated; others, also enlarged, had become studded with fat-granules, and represented exudation corpuscles. Blood-discs were present in great abundance; the nuclear fibres were increased in number, and a fine fibroid tissue had formed amongst the nuclear particles.

The surface of the section made through the mass of the tumour immediately to the left of the septum was now examined. The turbid milky juice squeezed from the upper part of the tumour exhibited blood-discs, moleculo-granular matter, fat globules, and granules, rounded corpuscles about  $\frac{1}{100}$  of an

inch in diameter, corresponding to the cellular elements of the follicles; oval corpuscles corresponding to the elements of the nuclear layer, a few exudation corpuscles, several delicate nucleated cells, shreds of fibroid tissue, and nuclear fibres.

The juice yielded by the inferior softer and partially disintegrated part of the tumour exhibited the same structural elements. The blood-discs, however, the nucleated cells, and the shreds of fibroid tissue were much more abundant.

Sections from the upper part of the tumour exhibited areolæ of various sizes. The largest were evidently vascular spaces; the smaller were transverse sections of follicles. Both these areolæ, but particularly the latter, contained numerous spheroidal corpuscles about  $\frac{1}{100}$  of an inch in diameter, some larger, and in various stages of development and disintegration. Their sections, when torn up with needles, exhibited all the structural elements already described from this part of the tumour.

The yellow central portion of the tumour also exhibited areolæ, but they were much compressed, and in some cases obliterated. It was infiltrated with the products of the retrograde metamorphosis of the growing parts of the tumour: shrunken blood-discs, shrivelled nuclei, broken fibres, disintegrated cells, and an abundance of moleculo-granular matter and fat.

The inferior soft and almost spongy part of the tumour exhibited no true areolæ similar to those already described.

FIG. 2.

Transverse and oblique section of soft portion of tumour.  
(Magnified 140 diameters.)

These were imperfect areolæ of a newly-formed fibrous tissue, infiltrated with blood-discs and structural elements, similar to those found in the juice of this part of the tumour.

It is proper to be observed, that in the course of this minute examination no part of the tumour was found connected with the adjoining cartilages or bones. The tumour approaches most nearly, in its general characters, to the albuminous sarcoma of Müller, the recurring fibroid of Paget, and the fibro-plastic of Lebert, particularly the last.

I do not think, however, that it can be justly classed with either of these. I consider it a member of a very common but generally overlooked class of tumours, to which the term follicular may be applied. The life of the tumour is presented to us in two aspects—first, as a general hypertrophy of the nuclear and cellular elements of the part affected; and secondly, as a process of pathomorphosis occurring in their elements when freed from their normal, and placed under new, conditions, in virtue of which they appear to have been struggling for an independent existence. This effort is illustrated by some of the spheroidal particles of the follicles which, destined to live, fulfil a certain function in the economy, and die as such, yet proceeded, as we have seen, to a higher stage of existence as cells, with vesicular nuclei probably capable of reproduction. It is from this partial assertion of an independent life by some of the elements of this tumour that I consider it one which is likely to have recurred.

#### GUY'S HOSPITAL.

##### DEATH FROM CHLOROFORM.

WE regret to state another death from chloroform took place on Tuesday last, at Guy's. The patient was a poor woman, aged fifty-four, with bad chronic fungous ulcer of the leg, which Mr. Birkett and the other surgeons recommended her to have removed. She had suffered very severely for some time with excessive pain in the limb. The disease, to Mr. Birkett, seemed cancerous, and as there was some enlargement of the inguinal glands it was thought better to have it removed. For

this purpose she was brought into the theatre, but had scarcely begun to inhale chloroform when Mr. Callaway found the femoral artery, on which he was pressing, suddenly stop. It did not seem to be caused by the amount of chloroform, for a very small quantity—a few drops on lint—only had been used. Artificial respiration was at once attempted: ammonia, fresh air, dashing with cold water, &c. Some sharp shocks of a galvanic battery were also passed through the region of the solar plexus, chest, and heart, but all to no avail.

Mr. Birkett's explanation we believe the best yet offered, in the present state of our knowledge—namely, that in this poor woman cancerous degeneration of the tissues to a large amount was going on, which is generally associated with similar degeneration or fattiness of the minute fibres of the heart; indeed M. Mandl, in the very interesting debate now going on in Paris as to cancer, recognises only two modes of degeneration—those of cells and fibres; the latter always in such cases responding badly to the stimulus of the circulating current, but here so diminished, by lessened stimulus, from chloroform, as to cease altogether. From seeing such cases we would say perhaps emotional influences or fright at operations may also aggravate matters, as emotion or alarm throws the heart into a state of palpitation.

Such cases necessarily suggest very great caution, more especially in older patients, and where cellular degeneration of tissues, cancerous, fatty, or otherwise, is going on; they indicate also the necessity of explaining the danger of chloroform to patients; and where ice or other anæsthetics, as recommended by Dr. Arnott, may be substituted, using them in place of chloroform. We have individually seen the best effects from ice and salt as a local anæsthetic. Possibly, even in this case of Mr. Birkett's it might have been used with advantage. It does not appear to us that chloroform should be abandoned or not studied; on the contrary, cases like the present should lead only to more caution in the selection of cases, where the effects of chloroform should be watched, or the chloroform diluted, or, in very emotional patients, tried first in the ward, away from the excitement of the operating theatre.

**ERRATUM.**—In a late "Mirror" (THE LANCET, November 26th, 1854, p. 485 foot-note,) it was erroneously stated that the patient whose case is reported had died of purulent deposit. The man is now doing pretty well, and his case was mistaken for that of Arthur W—, aged twenty years, who was admitted, under the care of Mr. Ferguson, October 25th, 1854, with stricture of the urethra, and who died November 18th, of purulent deposit, after having undergone the operation of external urethral incision on November 4th.

JAMES COPLAND, M.D., F.R.S., PRESIDENT.

ON THREE FORMS OF THE CHARCOAL RESPIRATOR, FOR PURIFYING THE AIR BY FILTRATION FROM THE VARIOUS KINDS OF EFFLUVIA, MIASMATA, AND NOXIOUS GASES AND VAPOURS.

BY JOHN STENHOUSE, LL.D., F.R.S.

(Communicated by Mr. HOLMES COOTE.)

ON the 22nd of February last, a paper was read by the author before the Society of Arts, "Upon the Deodorising and Disinfecting Properties of Charcoal;" and on the 9th of June, a communication from the same source appeared in the Journal of the Society, "On the Employment of Charcoal Ventilators to Purify the Air from Water-Closets, Sewers, &c." The great efficacy of freshly-burnt charcoal has long been known; but although it has been used to purify water, it has not been employed in removing noxious organic impurities floating in the rarer atmosphere which we breathe. Charcoal both absorbs and oxydizes gases and vapours, and resolves them into their simplest combinations—namely, water and carbonic acid. The greater number of effluvia and miasmata are highly organized, nitrogenous, and easily-alterable bodies. When absorbed by charcoal, they come into contact with highly-condensed oxygen existing within the pores of the charcoal. In this they are speedily oxydized and destroyed.

The first form of respirator is adapted for the mouth alone. The second is ori-nasal, and not much larger than the preceding, so as to be as little unsightly as possible. The third, also ori-nasal, is much larger, and includes the whole mouth and nose. It is fitted for workers in sewers and factories.

Dr. COPLAND remarked that he had employed charcoal with

great effect as a deodorizer. He had also employed it, in one-draohm doses, combined with camphor, in cases of putrid fever and dysentery. It was well known that the inside of water-casks were charred for the purpose of purifying water at sea.

Mr. NICHOLS observed, that charcoal, when administered in cases of disease, or applied externally to wounds, would be influenced by moisture. In the respirator exhibited it was dry.

Mr. HILLMAN remarked that charcoal, when used in the respirator, would contain condensed watery vapour.

Dr. O'CONNOR inquired if the respirator had been used in sewers and other unwholesome places, to test its effects upon noxious vapours?

Dr. STENHOUSE replied it had been extensively used in chemical works, both in England and Germany, with great success, as it destroyed the noxious effects of sulphuretted hydrogen, chlorine, and other dangerous gases.

Dr. SCHULHOFF suggested that the charcoal respirator should be employed in the hospitals of Turkey.

Dr. GARROD remarked that some years since he had made a series of experiments on charcoal as an antidote for poisons, and had found that when half a grain of aconitine or half a grain of strychnine was given, combined with half an ounce of animal charcoal, it was innocuous. This was not the case when the wood-charcoal was employed. Animal charcoal was also a more powerful decolorizer. Might it not be a better agent than the wood charcoal in the construction of the respirator?

Dr. STENHOUSE remarked that he had first employed animal charcoal, and had found it heavier and less manageable than the wood charcoal. Either, however, might be employed.

Dr. COPLAND said, as far back as 1810, Dr. Rowland, then at the head of the medical department of the army in Sicily, had used charcoal extensively as a deodorizer and disinfectant in fevers and dysentery.

A paper was read, entitled,

AN ANALYSIS OF THREE THOUSAND CASES OF VARIOUS KINDS OF DEFORMITIES ADMITTED AT THE ROYAL ORTHOPEDIC HOSPITAL, BLOOMSBURY SQUARE; WITH BRIEF REMARKS ON SOME OF THE MORE INTERESTING POINTS CONNECTED WITH THEIR NATURE AND TREATMENT.

BY EDWARD LONSDALE, F.R.C.S.,  
SURGEON TO THE HOSPITAL.

The table is arranged in six divisions:—

I. Deformities of the bones and joints of the lower extremities, arising from weakness either in the bones themselves, in the ligaments, or in the muscles—1663 cases.

II. Club-feet—495 cases.

III. Deformities of the spine—485 cases.

IV. Affections of the joints from paralysis—288 cases.

V. Deformities from badly-united fracture—63 cases.

VI. Deformities from arrest of development—16 cases.

Simple bow-legs, or outward curvature of the tibia and fibula, is the most common, amounting to 533. Simple knock-knees occur the next in frequency, being 481. Knock-knees and bow-legs may co-exist as rickets, and produce a very great amount of deformity. Bow-legs, with outward curvature of the femur, number only 23; bow-leg of one side, and knock-knees of the other, may be remedied in early life, but not after the bones have become firm.

Club-feet are divided into—1. Talipes varus; 2. Talipes valgus; 3. Talipes equinus; 4. Talipes calcaneus. To one form of talipes equinus he gives the name of rheumatic, because that disease causes contraction of the muscles of the calf.

All cases of varus require the division of tendons—viz., the tibialis anticus and posticus, the tendo Achillis and the plantar fascia. In talipes valgus, the extensor communis and the perones must be divided. In talipes equinus, the tendo Achillis offers the obstacle to replacement. In talipes calcaneus, the treatment is effectual only in those cases (congenital) where the deformity arises from spasm of the muscles in front of the leg. When paralysis of the muscles of the calf exist, the relief is partial.

Deformities of the spine are divided into—lateral curvature, 173; posterior curvature, 70; latero-posterior, 29. Abscesses form when carious disease attacks the lumbar vertebrae, but not in the higher regions of the spine. Lateral curvature may depend upon disease of the thoracic viscera. Joints may be permanently contracted by the action of surrounding muscles; the hip is most frequently affected. Wry-neck often causes alterations in the expression of the features. Deformities may arise from fractures badly united; the number amounted to 31. The author had seen some cases of spina bifida in the hospital; also some of curvature of the legs, from excessive development of the adipose tissue in young children.

Dr. COPLAND remarked that the causes of malformation appeared to be three—malposition of the fetus in utero, spasm, and paralysis; the cure to consist of the division of tendons, position, and cod-liver oil.

Mr. HALE THOMSON differed from the author in believing that the lateral curvature of the spine never occurred in utero. The deformity usually developed itself between the ages of four and seven, and went on with the growth of the person. He agreed in the main with the treatment employed by Mr. Lonsdale in deformities, but thought that it was a mistake to employ mechanical support in cases of lateral curvature in growing persons. Mechanical support did harm by interfering with the motions of the chest, and exerting improper pressure upon the hips. The deformity depended upon muscular causes, and the remedy must be looked for in that direction. To give a part its natural action and use, was to make it perfect.

Mr. LONSDALE observed that mechanical appliances were resorted to only when Nature had failed to effect a cure. The support was applied laterally, and did not interfere with the motions of the chest, nor with the growth of the pelvis, as it was placed around and not on that region. The careful and proper employment of mechanical support in his practice had been attended with the most beneficial results.

## MEDICAL SOCIETY OF LONDON.

SATURDAY, DECEMBER 2ND, 1854.

MR. HEADLAND, PRESIDENT.

### A BONE IN THE THROAT.

Dr. BURKE RYAN showed a piece of bone between an inch and a half and an inch and three quarters long, and as thick as a crowquill, with sharp extremities, which had remained across the lower part of the pharynx or upper part of the oesophagus during seven days, without any suspicion of a foreign substance being there. The patient had been seen during the summer, after an irregular bout of living, when he had foul and loaded tongue. Two days after, a severe attack of hæmatemesis ensued, a large quantity of blood having been vomited. The patient complained of some difficulty of swallowing, but nothing was seen on examination. On the seventh day he got up, partly by coughing, partly by vomiting, this piece of bone, and on showing it said he then knew the cause of his illness, as on eating from a breast of mutton this stuck in his throat. The sharp ends of the bone stuck no doubt in the pharynx on each side, and from this the blood trickled into the stomach, until by quantity it produced vomiting. The sulphuric acid administered in water always caused considerable scalding about the pharynx, owing to the raw surface, and the bone was acted on by its passing over it for so many days. The bone was partially broken in the centre, so as to allow it to yield as each morsel of food passed down.

Mr. I. B. BROWN read the following particulars of a case of INVERSION OF THE UTERUS AT SIXTH MONTHS' PREGNANCY, FOLLOWED BY REDUCTION AND RECOVERY,

that occurred in the practice of his former pupil, Mr. Ruck, of Cirencester:—"I had attended the poor woman, twenty-six years of age, in her previous labours, and was engaged to attend her in her third. When the inversion took place she was about six months gone, and when seized with labour pains sent for her mother, who is an experienced midwife, and lives a few miles from the daughter. When the mother arrived, (at eight o'clock, A.M.) she found the child lying in the bed, dead, her daughter flooding, and a tumour between the thighs. As she could not make out what the case was, she did not divide the cord, or in any way interfere, but sent off for me. I was from home, and did not arrive at the house till about three P.M., when I found the patient cold and clammy, gaping, occasionally bearing down, and apparently sinking. She had been suffering from vomiting and retching ever since the tumour appeared till she became exhausted. On turning aside the bedclothes, I found the child lying in a pool of blood, and, what puzzled me for a few seconds, the after-birth and something more. Directly I saw what the case was, I peeled off the after-birth, which was unusually hard and firmly attached, and placing two fingers against the inverted fundus, returned the uterus into the vagina. I found by pressure the fundus became bent in. Using gentle pressure for about a minute, and after the fundus was about half returned to its proper position, I found it recede from the ends of my fingers,

and with almost a pop take its proper position. Metritis and peritonitis followed, but in about ten days she began to mend, and all did well. The woman was suffering from frequent hysterical fits for some months before premature labour came on. I have attended her in two labours since; and in one, if not in both, have been obliged to introduce my hand, and bring away the placenta, considerable flooding having taken place." Mr. Brown remarked that it was clear from this case that inversion could occur at the sixth month of pregnancy, and that the rule laid down in books, that we should never reduce an inverted womb after the lapse of two or three hours, might, in some instances at least, be departed from with safety and advantage to the patient.

#### CONDITION OF A JOINT AFTER RE-SECTION.

Mr. HENRY SMITH exhibited the bones which had been removed from the lower extremity of a boy who had, two years previously, undergone excision of the knee-joint by Mr. Jones, of Jersey, had entirely recovered from the operation, and had died from disease of the liver a few weeks ago. A firm, bony ankylosis had taken place at the site of operation, between the extremity of the femur and the tibia, in nearly a straight position. The patella also, which had not been removed in the operation, was united to the anterior part of the femur, and its ligament was still attached to it, and to the tibia, so that altogether a very firm, compact mass of bony tissue occupied the situation of the knee-joint. This preparation demonstrated that bony union does take place between the ends of the bones after re-section of the knee, and that a most useful limb may be saved. In the instance of this boy, as in that of others he had seen and heard of, there was great facility of walking. The patient from whom this most instructive specimen was removed was the younger of the two boys who had a year ago been exhibited to the Society, and the fellows had seen for themselves how well he was enabled to use the limb. There was at that time some disease of the hip on the other side, and, since his death, it was discovered that dislocation upwards had occurred. This case was a sufficient answer to the objection that had been raised, of making the limb, by the operation, "like a flail."

Mr. JONES, upon being applied to, said that he had no remarks to make, except to strongly urge upon surgeons, in cases of operations for disease of the knee-joint, to save the patella, and not divide the ligament. When these parts were saved, there was less difficulty in walking than when they were removed.

In answer to a question, he said the boy from whom the preparation had been taken had not suffered from any tubercular disease, but had died from extensive disease of the liver, spleen, and kidneys. Two months before, he was quite well, and walked about with ease.

Dr. WINN read a paper

#### ON PUERPERAL MANIA.

He observed, that the prevalence of opinions with regard to the moral management of patients suffering from puerperal mania, which he held to be not only erroneous but dangerous, had induced him to bring the subject before the Society. He expressed his intention of passing briefly over the division of the subject which related to the physical treatment of the disease, in order that he might dwell at more length on its moral management—a question of far greater importance, and on which he considered the successful termination of a case more especially to depend. Dr. Winn remarked, that insanity might attack a patient at three periods during the puerperal state:—1, during gestation; 2, subsequent to delivery; and 3, during lactation, as a result of protracted suckling. The observations which he was about to offer had especial reference to the second form of the malady, to that maniacal excitement which supervenes during the first months after delivery, and appeared to be the result of extreme irritability of the brain, associated with great nervous exhaustion. Before entering upon the immediate subject of his paper, Dr. Winn took objection to the term "puerperal mania," used, as it commonly is, in a specific sense, and the use of which term had led to serious errors in practice. Adopted as an expression of a mere variety of insanity, it was sufficiently distinctive and appropriate; but a serious mistake was involved in the supposition that puerperal mania is a special form of insanity, requiring a treatment entirely different from that which is laid down for the cure of mania in general. No doubt the peculiar condition of blood and the excitable state of the nervous system which obtain after delivery, tended to modify a maniacal attack, and rendered it necessary that the treatment should be adapted to these qualifying circumstances. Nevertheless, the affection was

essentially mania, and was to be treated as such. He then took a review of the symptoms of puerperal insanity, to show that they were perfectly identical with those of an ordinary attack of mania. The importance of this generalization would be clearly shown when he came to consider the expediency of removing puerperal lunatics to an asylum. Dr. Winn proceeded next to determine, as far as the present state of mental pathology would permit, the condition of the system which gave rise to the puerperal mania. Careful observation had led him to infer that the disease was the result of cerebral irritation, combined with nervous exhaustion, a deteriorated condition of the blood, and an imperfect nutrition of the nervous tissue. Granting these facts, an antiphlogistic mode of treatment was decidedly objectionable. The classes of remedies most likely to prove beneficial were sedatives, depuratives, and tonics. A few leeches might occasionally be employed to allay the erythema of the brain, but on no account as a depleting measure. Venesection and blistering were positively injurious. A nourishing though not a stimulating diet was generally required; while opiates, aperients, and diuretics, would all be found more or less useful. It was, however, on the moral treatment that the recovery chiefly, if not wholly, depended. This should be precisely the same as that which is generally indicated in any variety of mania. An efficient nurse must be provided, capable of maintaining a kind but firm control over the patient. Every precaution must be adopted to prevent self-injury. The greatest tranquillity must be preserved, and the patient's friends and relatives rigorously removed from her presence. The great object was, to break the morbid current of thought by a seclusion more or less complete, and thus give rise to emotions and ideas entirely new. The most important point for consideration, however, was the question of the patient's removal to an asylum when the ordinary remedies had failed to afford relief. However inexpedient and culpable it might be to hurry a patient to an asylum at the outset of puerperal or any other form of mania, still a period might arrive when delay in having recourse to this measure would subject the patient's health and life to the greatest danger. Dr. Winn stated that the general opinion was opposed to the removal of a puerperal lunatic to an asylum. To combat a dogma fraught with such imminent peril was the principal object of his communication. Dr. Forbes Winslow had clearly established the fact, in his valuable treatise "On the Incubation of Insanity," that it was only during the earlier periods of an attack of mania that a cure could be expected from the use of appropriate remedies. By a strange perversion of a general principle, this important truth had been commonly lost sight of in the treatment of puerperal mania. In support of this assertion Dr. Winn quoted passages from the works of various authors who had condemned the removal of puerperal patients to an asylum. One of these authorities had made use of the very objectionable expression "mad-house." Dr. Winn commented very strongly on the use of such a term. It was appropriate enough for the asylums of the darker ages, when every description of cruel restraint was practised; but singularly inapplicable now, when humanity and science were alike enlisted to allay the sufferings and meliorate the condition of their inmates. It was to be hoped that ere long even the milder term of "lunatic asylum" would be abolished, and the far more appropriate title of "Hospital for the Cure of the Insane," as recommended by Dr. Winslow, be generally adopted. He next related cases from his practice to prove the truth of his views. One patient whom he attended with Mr. Meeres, proved in the most striking manner the advantage of an early removal. Although the patient had been only ill a week, Dr. Winn thought it advisable to send her to an asylum at once. Her recovery was rapid, and she has been confined again since her return to her home, but has fortunately had no recurrence of the disease. Another case which he mentioned showed, on the other hand, the bad effects of delay. This patient had been ill for many months before Dr. Winn saw her, and all the routine practice had been tried in vain. Had early removal been adopted, he thought the case would have speedily recovered. The returns of lunatic asylums showed, that the treatment of puerperal mania in these institutions was pre-eminently successful. Dr. Webster's tables proved, that more recoveries from puerperal insanity were reported than from any other form of lunacy. Dr. Boisragon, of the Cornwall Asylum, had kindly furnished Dr. Winn with the result of his experience. He (Dr. Boisragon) stated, that the majority of cases recover: he had not, in fact, discharged a single case that was not convalescent. Some, who admitted the efficacy of this plan of treatment, disapproved of it on the ground that the recollection of having been confined in an asylum would produce an injurious effect on the mind of the pa-

ment in a subsequent labour. Such an instance Dr. Winn had never witnessed. Another common prejudice, which interfered with the timely removal of a patient to an asylum, was the dread entertained by the friends of the individual lest some sort of opprobrium would be incurred by her having been the inmate of what they would call a "mad-house." This prejudice, the offspring of ignorance and mistaken delicacy, was fast passing away. The supposition that puerperal mania was generally a very transient affection was another erroneous opinion, which had occasionally interfered with the early removal of patients. In conclusion, Dr. Winn wished it to be clearly understood that he did not recommend the hasty and indiscriminate removal of patients; at the present time he had a patient, affected with insanity dependent on uterine derangement, under his care, and who had been ill for several months before he saw her. In this case, physical treatment had almost completed a cure, and removal to an asylum had not been had recourse to. In the humble walks of life, cases of insanity should be generally removed at an early period to an asylum. For rich patients this measure was not always necessary; they could obtain a quiet residence, all the comforts, and many of the advantages, of an asylum. Not so with the poor; confined, perhaps, to a close room in a narrow and noisy street, insufficiently nourished, and badly nursed, the poor patient was cut off from all hope of relief. For cases of this description an asylum offered the only chance of a cure.

Mr. HARDING opposed the removal of a woman affected with puerperal mania to an asylum, as it was attended with a lasting disadvantage to the patient and her children. Persons affected with the malady could be successfully treated without such removal. He could recognise no difference, in these cases, between the rich and the poor, the disadvantage to one being as great as to the other by removal to an asylum. When a poor person could not be properly treated at home, there were infirmaries and parochial houses to which she might be removed with as much benefit as to an asylum.

Dr. WEBSTER agreed with the author with respect to the nature and treatment of puerperal insanity, and spoke of the value of removal to a properly-regulated asylum, especially to poor persons. He showed, by the statistics of Bethlehem Hospital, that of 167 persons admitted into that institution with puerperal fever, 92 had recovered, 7 had died, and 68 were uncured. He spoke of the rare fatality of the disease, agreed with Dr. Winn that bleeding was seldom necessary, and attributed the great mortality which had accompanied it in times past to this remedy having been employed. The disease resembled delirium tremens, in depending mainly on great cerebral irritation, with nervous exhaustion. In the higher classes, the resort to an asylum might not be so necessary as to the poor, but they would often be benefited by removal from home.

Mr. I. B. BROWN regretted that the paper had not embraced the medical as well as the moral treatment of puerperal mania. When the disease occurred in poor persons, who could not procure proper nursing, pure air, &c., removal to a hospital or infirmary was desirable; but there were no advantages in these institutions which the rich could not obtain at home. One of the most important points of treatment was the substitution of other for the usual attendance, and the removal of the family. With respect to medical treatment, he spoke of the great importance of procuring sleep, and mentioned an instance in which, after various smaller doses of the different preparations of opium had been of no avail, four drachms of Battley's solution had been administered, with the effect of procuring sleep and curing the patient. He had never seen a fatal case of the disease.

Mr. HIRD differed in opinion with Dr. Winn and Dr. Webster, respecting removal to an asylum. The statistics advanced did not include one-tenth of the cases of the disease, and only such as were amongst the worst. It was fair to presume, then, that a vast majority of cases got well without removal. An asylum instead of being the first, should be the last place to which a patient should be consigned. In opposition to the author, he regarded the medical treatment as more effective in this than in any other form of insanity. In those cases of the affection accompanied by great excitement, rapid pulse, and great constitutional disturbance, he regarded the treatment by tartar emetic and opium, as recommended by Dr. Graves, as the best. Opium was also valuable in those cases in which the pulse was lower and the power less. He had in one case given five-grain doses of solid opium, and cases were recorded in which scruple doses had been administered. Bleeding was rarely necessary in this complaint. He had never seen a fatal case.

Dr. CHOWNZ remarked that the rule of practice was not to send a patient with puerperal mania to a lunatic asylum, as moral treatment could be resorted to at home. He did not agree that puerperal was like other forms of mania, as it had attached to it peculiar and special symptoms connected with the uterus and its functions, on which this peculiar kind of mania seemed to depend. Bleeding was rarely necessary in this disease, soothing remedies, such as henbane, opium, and camphor being indicated. He attached great importance also to the condition of the stomach and bowels in this disease, and to the necessity of purgatives in the advanced stages of pregnancy, as some of the worst evils which attended parturition were dependent on accumulation in the bowels.

Dr. TYLER SMITH observed there were several points of marked difference between puerperal mania and ordinary insanity. Puerperal mania occurred only during special periods of life, as at the end of pregnancy, after labour, and during lactation. A much higher proportion of recoveries took place in puerperal cases than in other forms of unsound mind. After recovery, the subjects of it were scarcely more liable than other persons to be attacked with common mania, nor were their children born with any strong hereditary tendency to disease of the brain. These were reasons for separating puerperal insanity, as far as possible, from other kinds of mania. As medicine and the treatment of insanity progressed, the tendency would probably be towards such a separation, until the subjects of puerperal mania would no more be placed in lunatic asylums than those suffering from delirium tremens. Amongst the poor, in such cases as those described by the author of the paper, if there should only be a choice between the misery of a confined home and a lunatic asylum, no doubt the moral and material comforts of such an institution offered great advantages. But this could seldom be the case. The proper places for the reception of poor puerperal patients in this metropolis were, either the special lying-in hospitals, or the wards in our general hospitals, which were devoted to the diseases of women. When cases of insanity had occurred amongst the maternity patients at St. Mary's, he had always taken them into the hospital, and no inconveniences had arisen from this course. If there were reasons as regards the poor, for not mixing puerperal maniacs with ordinary lunatics, these reasons were of still more weight in the case of the affluent. The rich could gain no advantages in an asylum which they could not obtain elsewhere. In several cases where it had been in contemplation to send such patients to asylums, he had seen reason to rejoice that it had not been carried into effect. No one, whether poor or rich, could be entered as a patient in a lunatic asylum without entailing a certain stigma upon themselves and their children. Professional men could, no doubt, distinguish between the mania of a puerperal patient and ordinary insanity, but the public made no such distinction. The mischief and absurdity of mixing puerperal patients and other insane persons together, were painfully exemplified at Bethlehem. Dr. Hood, in the very able work he has recently published, "On Criminal Lunacy," had, in the most humane manner, drawn attention to those lunatics confined at Bethlehem who had committed crimes while suffering under puerperal insanity. These poor creatures had perfectly recovered from their madness, and were able to feel their crimes, not unfrequently committed upon their own offspring, most acutely. There was in the nature of things no chance of their ever again passing through the puerperal state, and many of them had lived beyond the period of child-bearing, yet they were hopelessly confined during their miserable lives in the same building with criminal lunatics, who were many of them in a state of idiocy or continuous mania. It was difficult to conceive anything more horrible than the condition of these unhappy persons. As regards the causes of puerperal insanity, he believed they might be very simply stated. The disease came on after the exhausting effects of pregnancy, the shock and losses of parturition, and the drain of lactation. These causes were frequently aided by delicacy of the nervous system and ex-centric irritation, such as faecal accumulations, indigestible food, arrest of the lochia, or retention of the milk. He had never seen a case which was not accompanied by great vital exhaustion, and which did not require a supporting treatment. He had not been so fortunate as to have met with no fatal cases. One such he had seen during the past year, in which the cause of death appeared to have been a profuse venesection. While speaking of the causes of puerperal mania, he would venture to express an opinion in favour of a more liberal dietary for childbed women than was now the rule. Some of the most formidable disorders of this period arose out of debility. Not only many cases of puerperal mania,

but of phlegmasia dolens, phlebitis, milk-abscess, and perhaps puerperal fever, were greatly dependent upon an enfeebled and vitiated state of the blood. The prevention and treatment of disease under such circumstances should be tonic and eliminative. The disorders of the puerperal state would, he believed, be much diminished if women were supported more than they now were during the first few days after delivery. In this respect the modern practice of midwifery was capable of very considerable improvement. It would be of great benefit in practice if the diet of the lying-in woman, without being rendered stimulating to an undue degree, was habitually made more nourishing than it now was, except in cases where some special reason to the contrary might exist.

Dr. MACKENZIE said that each case of the disease would furnish special indications for treatment, dependent on the physical state of the patient. The recovery would bear relation to the extent to which this physical condition might be removable by treatment. It might depend on obstruction of the primæ viæ, irritation of the womb or mamma, or on the condition of the blood. Simple treatment in these cases was often most effective. In those cases in which tartar emetic and opium could not be resorted to, the steady use of digitalis was often of the greatest possible service in controlling the pulse.

Mr. HIRD mentioned that Dr. Simpson, in the case of a lady who had puerperal mania following delivery of her three first children, administered chloroform at the fourth, fifth, and sixth deliveries, and no mania followed.

Dr. RICHARDSON had kept a patient affected with puerperal mania under the influence of chloroform, with the best possible results, for ten hours.

Dr. WINN, in reply, remarked that he had not advocated the indiscriminate removal to an asylum, but only in such cases where proper moral and medical treatment could not be resorted to at home. If the patient could be removed to an hospital or infirmary, where suitable remedies could be applied, of course it would be preferable to an asylum.

### Reviews and Notices of Books.

*On the Topical Medication of the Larynx in Certain Diseases of the Respiratory and Vocal Organs.* By EMMETTER WATSON, A.M., M.D., &c. 8vo., pp. 183. London: Churchill. 1854.

It is often of advantage to the medical profession that an enthusiastic supporter of some special line of treatment should be encouraged to say all that he can in its favour. Dr. Watson will not be offended if he be ranked in this category. In fact, we consider him a far less dangerous enthusiast than Dr. Horace Green, of America. He gives a positive contradiction to the statement of Mr. Erichsen, that "a sponge probang has never yet been introduced through the rima glottidis in life." A melancholy confirmation of the opposite view is given by a case in which Dr. Peaselee, U.S., extracted, by tracheotomy, a large sponge, which had been thus introduced. The man died. Any one who wishes for a full and complete statement on the subject should read Dr. Watson's volume. We regard applications to the trachea and bronchi as not unattended with danger. For the sponging of the larynx with nitrate of silver, as advocated by our author, we do not believe that any case of true pulmonary disease would be even relieved by this additional source of irritation; and we should never advise it in a dangerous case of acute laryngitis. Simple chronic laryngitis, or cases of ulceration, unconnected with tuberculous disease, afford perhaps the most favourable opportunities for a trial of this plan.

*A Memoir on Strangulated Hernia, from Cases occurring in the London Hospital.* By NATHANIEL WARD, F.R.C.S., Assistant-Surgeon to the Hospital. London. 1854. pp. 33. (Read before the Hunterian Society.)

MR. WARD'S "Memoir" is sound and practical, and we select it as a good example of what publications of its size and origin should be. We have at last got to dread the sight of pamphlets in these days of cheap printing and professional advertising. As for criticizing the majority of them, the thing

is impossible; they are far beneath notice; but what is worse is, they frequently disgrace the honourable dignity of a scientific profession. They are too often only fit to be given away with the advertising almanacs of Messrs. Moses at the railway termini. Were the many professional brochures which are placed upon our table in the course of a month like the one now before us, both the practice and the science of Medicine would be surely advanced. As it is, however,—we must aver it,—they are constantly dishonoured. We deem Mr. Ward's "Memoir" worthy of very attentive perusal by every surgeon in public practice.

*A few Practical Observations on the Injuries Incidental to Warfare.* The substance of Three Lectures addressed to the Officers and Privates of the Royal London Militia. By G. BORLASE CHILDS, F.R.C.S., Surgeon to the Corps. pp. 48. London. 1854.

THOUGH we are not aware in what campaign Mr. Childs gleaned his "Practical Observations" in the department of military surgery, we can give our testimony that the "Lectures" before us contain hints and information worthy the remembrance of soldiers, whether of the militia or of the line.

### Foreign Department.

#### REMARKS ON SUDDEN DEATH.

SEVERAL physicians of eminence on the continent have, of late, paid special attention to the causes of sudden death. We would specially single out M. Aran, who, in his thesis, written for the Assistant-Professorship at the Paris Faculty, has given a masterly sketch of the state of our knowledge on the subject. More recently, a German physician, Dr. Kopp, has published new investigations respecting sudden death from internal causes, based upon his own labours, and those of his friend, the late Dr. Herrich. (It is rather remarkable that Herrich himself died suddenly from a heart affection.) Thirty cases, which came under the direct cognizance of the authors, are given, with very minute details, out of which we gather that two-thirds of the patients mentioned were men. Out of seventy-nine sudden deaths alluded to, fifty-five happened by day. The post-mortem examinations are described with much care, and the memoir concludes with the following summing up:—

I.—Sudden deaths by suppression of the heart's action. 1. By compression from without inwards, in consequence, a, of effusion of blood into the pericardium, as a consequence of a rupture of the walls of the heart or of the aorta, four cases; b, serous effusion into the pericardium, six cases; c, fibrinous effusion, two cases; d, effusion of serum into the pleura, four cases; e, effusion of purulent matter into the same sac, two cases. 2. By accumulation of blood in the heart, five cases. 3. The blood insufficiently exciting the heart to contract, owing to deficiency in quantity or quality of that fluid, ten cases. 4. Mechanical disturbance of the circulation, in consequence of the evolution of gas, five cases. 5. Lessening of thoracic capacity, from spinal curvature, two cases. 6. The same lessening from pulmonary induration, three cases. 7. Pathological changes in the parietes of the heart, or the aorta, &c., forty-five cases.

II.—Interruption in the power of conveyance of nervous power from the brain or medulla oblongata to the heart. 1. Swelling of the thymus gland, nine cases. 2. Swelling of the thyroid gland. 3. Tubercles on the larynx, six cases. 4. Suppuration in the cellular tissues of the neck, two cases.

III.—Rapid suppression of the functions of the medulla oblongata. 1. By direct external pressure, two cases. 2. By mediate external pressure, seven cases. By the influence of other cerebral affections, two cases.

#### A RADIO-ULNAR LIGAMENT LATELY DISCOVERED.

M. Denucé, in a thesis "On the Luxations of the Elbow-joint," lately published, mentions, amongst other things, that near the annular ligament, in which plays the head of the radius, he has, by his dissections, discovered another ligament of about four lines square, inserted on the one side, upon the neck of the radius, and, on the other, upon the inferior margin of the lesser sigmoid cavity of the ulna. He calls it, *ligamentum quadratum radio-ulnare*; it is supposed to limit the movements of pronation and supination.

## THE LANCET.

LONDON: SATURDAY, DECEMBER 9, 1954.

OUR English laughing-philosopher, SYDNEY SMITH, explains the special manifestations of courage in men of different professions by a reference to the influence of habit and the association of ideas.

"In the late attack upon Egypt," he says, "our soldiers behaved with the most distinguished courage; but a physician did what, I suppose, no soldier in the whole army would have dared to have done: he slept for three nights in the sheets of a patient who had died of the plague! If the question had been to encounter noisy, riotous death, he probably could not have done it; but when pus and miasm were concerned, he appears to have been a perfect hero."

We believe that the history of the present war will have to record many instances of army surgeons exhibiting the most lofty daring of the soldier, combined with the most self-denying professional devotion. Not in the present war alone, but in every war the history of which is written, many noble proofs will be found to show that the surgeon who has cast his lot in with the army scorns to restrict his sense of duty within those limits which are assigned to men belonging to civil professions. The army surgeon sees himself the companion of men whose habitual avocation and delight is to encounter danger. He feels himself irresistibly drawn into the most intimate participation of their sentiments. The surgeon becomes a soldier too.

Of this we are proud to have to record a brilliant example that occurred at the glorious but fatal battle of Inkermann; and we are still more gratified at being able to do this on the authority of a despatch of the Commander-in-Chief, who had not hitherto manifested publicly that appreciation of the labours and services of the medical staff which is justly their due. Lord RAGLAN says:—

"His Royal Highness (the Duke of Cambridge) speaks also in the highest terms of the spirited exertions of Assistant-Surgeon Wilson, of the 7th Hussars, who, at a critical moment, rallied a few men, which enabled them to hold the ground till reinforced."

If such be the services sometimes rendered by our assistant-surgeons, upon what principle of justice or of policy can medical officers be denied full and equal participation in those higher honorary rewards and distinctions which are almost exclusively reserved for their fellow-soldiers?

Neither does Lord RAGLAN confine himself on the present occasion to the well-earned praise of the military virtues of an assistant-surgeon; he thus records his sense of the purely professional merit of the medical staff:—

"It is due to the principal medical officers of the several divisions, Drs. Alexander, Cruickshank, Forest Linton, and Humfrey, to report that their able exertions have been strongly represented to me, and deserve to be most honourably mentioned; and the arrangements of the Inspector-General of Hospitals, Dr. Hall, for the care of the wounded, merit the expression of my entire approbation."

We fervently hope that this is the first token of the rise of a more cordial feeling on the part of the higher military authorities towards the medical service, and of a more correct and more useful appreciation of the aid it can contribute to the success of military expeditions. Certain it is that other indications are not wanting of a growing desire to increase the

usefulness of the medical staff, by placing more confidence in their zeal and knowledge, and by improving the organization of this department.

But whatever the desire manifested to improve the position and efficiency of the army surgeon, and however flattering the terms in which his services are acknowledged, we still remain unshaken in our conviction, that a thorough public inquiry into all the details of the medical arrangements of our armies and fleets is imperatively called for, in justice to our brethren engaged in the public service of the country, in the interest of our soldiers and sailors, and for the satisfaction of the public mind.

THE "Statement" issued by the Council of the Royal Medical and Chirurgical Society to the Fellows (which will be found at page 489,) is as well-timed, as it is convincing in its facts and arguments. It comes before the profession with all the weight and authority attaching to the deliberate expression of a body of men of standing and reputation, entrusted with the welfare of the highest professional Society which we possess. The "Statement" refers to the conduct of Mr. DE MORGAN in the Society, as regards THE LANCET, and tests his proceedings by the usages of gentlemen and by the bye-laws and organization of the Society, which latter are of course nothing more than a set of rules and arrangements framed to bind together a body of men of character in pursuit of a common object.

The document issued by the Council directs special attention to the circumstance that Mr. DE MORGAN's motion respecting THE LANCET, on the 1st of March last, was made "without previous notice." It also points out that it was made under false pretences, being "only nominally an amendment;" that it was "entirely irrelevant" to the motion it pretended to amend; and that it was in fact "a substantive resolution, moved without previous notice." By such a paltry manoeuvre Mr. DE MORGAN, and the forty-seven Fellows who voted with him, sought to bind the five hundred and fifty-seven Fellows constituting the Society. The Council observe that "on no occasion since the foundation of the Society in 1805, has a course like this been adopted. Excepting votes of a purely ceremonial or complimentary kind, the passing of which is without influence on the constitution of the Society, no resolution or amendment, WITHOUT PREVIOUS NOTICE, has ever been put from the Chair." But setting aside the question of notice or no notice, the Council appeal to the Fellows of the Society at large against the propriety of "obtruding on a general meeting any resolution partaking of a political character, and appealing to personal or party animosities, calculated to excite angry discussions on topics foreign to the business of the Society." There can be no doubt that this "Statement" contains as severe a censure upon the proceedings of Mr. DE MORGAN as could well be uttered; and it is an admission that his factious behaviour ought to have been peremptorily stopped on the 1st of March, and that neither his filibustering speech, nor the divisions upon his irregular motion, ought to have been permitted.

We will not further follow the Council in their exposition of the reasons which induced them not to act upon the recommendation made by the forty-seven Fellows, who constituted the accidental majority on the 1st of March. We may briefly state that the Council received a protest, signed by one hundred and four Fellows, against the vote of the general meeting.

Upon this they then called a "special meeting" of the Society at large, and at that meeting it was unanimously resolved, "That the matter in dispute be referred to the Council, to act on the question as they see fit." After this, a counter protest, urging what the Council considered "insufficient grounds," was handed in. The Council subsequently, in heroic phrase, "met, deliberated, and decided," their decision entirely setting aside the tyranny which Mr. DE MORGAN attempted to impose. We may remark, that after himself supporting the motion of Sir BENJAMIN BRODIE, which referred the matter in dispute to the Council for their sole decision, Mr. DE MORGAN, acting in the same unfair way as when, by a double trick, he brought forward, without notice, a substantive resolution in the disguise of an amendment, organized an opposition to the supposed wishes of the Council in the shape of the protest referred to, and after they had decided, using Dr. BARCLAY as a cat's-paw, sent to the Council a protest against the course pursued by the President and Council, as being unprecedented and injurious to the best interests of the Society. When Mr. DE MORGAN had placed himself in the hands of the Council at the special meeting on the 24th of March, we believe it will be agreed universally, by all honourable men, that there were but two courses open to Mr. DE MORGAN—namely, that of acquiescing in their decision, or of retiring from the Society. Instead of this, he acted in the way we have described, and we still hear of threats of renewed cabal and faction on the 1st of March, 1855, the ruin of the Medico-Chirurgical Society being, of course, a secondary matter as compared with the pleasure of venting an impotent spleen against this journal.

THE commencement of a very remarkable sanitary measure has recently taken place in India. In Lord DALHOUSIE's recent able and elaborate "Minute," addressed to the Home Government, on the subject of the permanent occupation of the kingdom of Pegu as a result of the recent war, he directs the construction of a town and sanitarium for the benefit of Eastern invalids on the island of Negrais, in the Indian Ocean; and steps have been already taken towards carrying this enterprise into effect, for we read, in a late number of the *Friend of India*, that, "Captain FYTCHE is founding on Negrais Island "a city which from its position must be richer than Akyab, "and, from the sea breezes which give it health, will probably "be the Brighton of Bengal." The history of this settlement is so remarkable, and so creditable to a respected member of our own profession, that we shall not apologize for placing it briefly before our readers.

Negrais was first formally taken possession of in 1687, but not actually occupied by the British till some years subsequently. It remained a British settlement, with forts and other public buildings on it, until 1759, when the British inhabitants were murdered during a sudden attack from the Burmese. The cession of Negrais Island, with a certain portion of land on the adjoining Bassein river, originally intended for the site of a town or fort, was made to the British in perpetuity by the Burmese conqueror and king, ALLAU PRAW; and the British right of possession has never been questioned, although, since the murder of its inhabitants in 1759, the island has never been held by the English.

It was in April, 1826, that Mr. J. R. MARTIN, then a mere

youth, and surgeon of the Governor-General's body-guard, passed the island of Negrais as a passenger to Calcutta, where he was proceeding in a state of exhaustion from jungle fever, after having gone through the two fatal campaigns of 1825-26 in Ava. In sailing along the coast, Mr. MARTIN got a passing glimpse of Negrais Island, and on the instant the idea struck him that such a position must possess great value in many ways. It was but a mere *coup d'œil*, yet the impression on the mind of this acute observer was retained with the greatest tenacity. On the recovery of his health, Mr. MARTIN made a careful, protracted, and persevering investigation, historical and political, into the merits of this ancient British possession; and the result was a "Memoir on the Advantages, Political, "Naval, Military, and Commercial, of the Re-occupation of "Negrais Island, and of Bassein; including their Advantages "as Places of Resort to the European Sick of Calcutta and "Madras." This Memoir Mr. MARTIN presented officially to the then Governor-General, Lord AUCKLAND, early in 1836. This was the first notice taken during a century by any British subject of our long-abandoned, but important, settlement on the coast of Pegu.

The Governor-General of that time, Lord AUCKLAND, was so struck with the circumstances related in the Memoir, that, in July, 1836, he directed an inquiry into the then condition of Negrais and Bassein, which had now, owing to our neglect, fallen for nearly a century into occupation by the Burmese. The results of the inquiry were altogether satisfactory; but, as stated by Mr. Martin in the third edition of his Memoir, "affairs, supposed to be of a more pressing nature, on our "north-western frontier, began to attract the notice of our "Indian rulers; and thus the matter herein referred to was, "for the time, put out of consideration."

Since the conclusion of the late Burmese war, Lord DALHOUSIE has devoted himself to the subject, making himself acquainted with the sanitary labours of Mr. MARTIN, of which this striking instance formed but a small part; and in the "Minute" we have alluded to, quotes Mr. MARTIN's Reports and Memoirs at large, and in the most complimentary manner, respecting the geological character and climate of Pegu; and concludes, as we have said, by decreeing the erection of a health-city upon the site pointed out thirty years ago by Mr. MARTIN. That the restored British settlement will realize the anticipations of the discoverer of its value we cannot doubt, but such an instance of foresight and realization are very remarkable. Lord DALHOUSIE justly speaks of Mr. MARTIN "as an officer of "eminence in the service of the East India Company, who "served in Burmah, and whose authority is high."

One necessary caution against what the French call the desperate enterprise of the English we would, however, here offer on Mr. MARTIN's authority: let not the authorities build their stores and warehouses until the settlement shall have been cleared, drained, and cultivated, otherwise they will suffer from fevers and other disorders. "The result of all observation "goes to prove," says Mr. MARTIN, "the climate, both local "and general, to be excellent. Doubtless, however, nearly a "century of utter neglect is sufficient to injure the best "locality; and Negrais must stand in need of that without "which no climate can ever be really salubrious—namely, the "labour of man. We seldom find that the best localities even "are healthy in the mere state of nature."

It is gratifying to observe a high official, like the Viceroy of

India, making medical knowledge the basis of important legislation. Not only in this matter relating to the public health, but in all others relating to the advancement of the medical service, Lord DALHOUSIE has shown a deep interest. While our brave and over-worked surgeons are treated, in the trenches and the camp of Sebastopol, with every species of neglect and injustice by their Commander, it is pleasing to look to the treatment of our brethren in the East Indies by a statesman of the highest order and of the most approved capacity. From all classes of medical officers we hear but one opinion as to their just and considerate treatment by the Marquis of DALHOUSIE.

It is not improbable that one of the results of the present war will be an improvement in the condition of the assistant-surgeons of the Navy. Convinced as we have been for a long period of the injustice to which these gentlemen have been exposed, by being placed amongst midshipmen, and without any separate cabin for study or reflection, we have urged upon the authorities the necessity of a change. Year after year we have addressed ourselves, on this subject, to those in power, and have hesitated not to state that the absurd regulation referred to kept many first-rate and good men from entering the naval service of the country. It would be difficult to find anything more insulting to the feelings of an educated professional man, having serious duties to perform, than to place him in the mess-room of the young gentlemen who come under the denomination of midshipmen in our vessels of war. It was easy to foresee that, whatever the evils might be during peace, when actual warfare existed they would be materially increased. And what is the fact? Why, that it is notorious that our fleets have gone out with a complement of medical officers totally inadequate even to the emergencies to which they have been hitherto exposed, and that great dissatisfaction has existed amongst them respecting the treatment to which they have been subjected by many of the officers in command. It will probably be beyond the daring of even a naval lord of the Admiralty to attempt, in the ensuing session of Parliament, to justify the wrongs inflicted upon our brethren, and to insist on pursuing a course so detrimental to the best interests of the country. That which could not be wrung from feelings of justice will be yielded to expedience. Fortified as the cause has been by a vote of the House of Commons, and supported by all except old-fashioned and obstinate commanders, we feel assured that it will not be long before the assistant-surgeons in the Navy will have shown to them the consideration to which they are justly entitled.

We are much gratified to perceive that the labours of the Analytical Sanitary Commission are appreciated by the medical profession and the public. That both have greatly benefited by those labours cannot be doubted.

It having now been shown that all articles of food and drink, as well as drugs, are liable to extensive and systematic adulteration, it rests with the profession and the public to take measures to protect themselves from the many evils, especially those affecting health, which result from that practice. This object may be accomplished by urging upon Parliament, first, the necessity which exists for a full inquiry into the subject, and, secondly, the adoption of some effective legislation.

Our readers may remember that a movement with this view

was set on foot some time since in Birmingham, under the able direction of Mr. POSTGATE; this movement has been recommenced, and has now extended to Wolverhampton. As will be seen by the letter of Mr. POSTGATE, and by the circular and resolutions which accompany it, printed elsewhere, the co-operation of the medical practitioners in other towns and cities is much to be desired. Mr. SCHOLEFIELD, M.P., one of the members for Birmingham, has announced his intention of bringing the matter early next session before the House of Commons, and of moving for a committee of inquiry. We know that the Secretary of State and the President of the General Board of Health are both fully alive to the importance of the subject.

### THE ROYAL MEDICAL AND CHIRURGICAL SOCIETY

53, BERNERS-STREET, November 15th, 1854.

SIR,—We are directed by the Council of the Royal Medical and Chirurgical Society to transmit to you the following Statement.—We have the honour to be, Sir, your obedient servants,  
W. R. BASHAM, } Secretaries.  
HOLMES COOTE, }

On the 27th of June last, the President and Council of the Royal Medical and Chirurgical Society received a parcel; wherein were contained a number of printed papers, each endorsed with a direction to Dr. Barclay, and representing apparently the return to some circular issued by that gentleman.

The contents of each printed paper ran as follows:—

“We, the undersigned Fellows of the Royal Medical and Chirurgical Society, feeling dissatisfaction at the recent proceedings of the President and Council of the Society, in first acknowledging their inability to come to any decision on the resolutions of the annual meeting held on the 1st of March, in any other way than by convening a special meeting of the fellows in order to ascertain the wishes of the majority; and, secondly, after having convened such special meeting, in not carrying out the opinion of the majority, both as it was expressed at the annual meeting, and as it was recorded in certain requisitions subsequently presented to the Council; do hereby, without offering any opinion on the merits of the said resolutions and requisitions, protest against the course pursued by the President and Council as unprecedented and injurious to the best interests of the Society.”

To these papers were attached the signatures of 61 out of the 338 resident, and 40 out of the 239 non-resident, fellows, of whom the Society consists. Contrary to what is usual with such communications, the parcel was not accompanied by any letter or message denoting from whom it came, or who might be able to authenticate its contents.

The Council might fairly claim the right of leaving unnoticed a protest so irregularly made. Waving this point, however, and admitting the signatures as genuine, the Council must express their unanimous opinion that the course adopted by the promoters of this protest—the course of canvassing the Society in printed circulars, by unauthorized persons, and on *ex-parte* statements, is one hostile to the constitution of the Society, and extremely dangerous to its best interests. Having regard to these interests, and to the great scientific objects for which the Society was established, the Council would earnestly deprecate the continuance or repetition of such irregular and injurious agitation.

In reference to the present case, it appears to the Council that the dissatisfaction expressed in the protest is founded partly on an imperfect knowledge of the occurrences adverted to, partly on a misconception of the functions of the Council as fixed by the charter and bye-laws of the Society; and they believe it may conduce to better information and fairer judgment that the facts of the case should be laid before the fellows of the Society as an explanation of the grounds on which the Council have proceeded.

At the anniversary meeting of the Society, 1st of March, it was moved, without previous notice, by Mr. de Morgan, and was carried, after discussion, by a majority of 47 to 19,—

“That this report be received; adopted, and circulated

amongst the fellows in the usual manner; and that, as the Society was established for the promotion of science, and to uphold the honour and dignity of the profession, it is of the highest importance that it should not in any way encourage the circulation of works the tendency of which is at variance with these objects; and that, inasmuch as the tone and spirit of *THE LANCET* have not been such as to entitle it to the confidence of the Society in these respects, the meeting recommends to the Council its withdrawal from the list of weekly periodicals."

Subsequently, and with similar absence of previous notice, a resolution to the same general effect was carried in respect of the *Medical Circular*.

Mr. de Morgan's resolution was nominally an amendment to the usual complimentary vote, "that the report of the Council be adopted;" but this so-called amendment, being entirely irrelevant to the subject-matter of the report, (which it did not pretend to negative or modify,) may justly be regarded, like the motion which followed it, as a substantive resolution moved without previous notice.

On no occasion, since the foundation of the Society in 1805, has a course like this been adopted. The annual general meeting is a *special general meeting* fixed by the charter and bye-laws solely for the election of the Council and officers; and according to every reasonable construction of the bye-laws, no other business than that for which this meeting is specially convoked can, without further special notice, thereat be entered on. Excepting votes of a purely ceremonial or complimentary kind, the passing of which is without influence on the constitution of the Society, no resolution or amendment without previous notice has ever been put from the chair. In the absence of this safeguard, no vote of the Society can fairly be regarded as the deliberate act of its majority; least of all, where so important a matter is concerned as the virtual suspension of that bye-law which places the selection of books in the hands of the Council. And especially, whether such notice be given or withheld, the Council appeal with confidence to the fellows of the Society against the inexpediency of obtruding on a general meeting any resolution partaking of a political character, and appealing to personal or party animosities, and calculated to excite angry discussions on topics foreign to the business of the Society.

The resolutions of the anniversary meeting embodied a "recommendation" which neither assumed the form of an *injunction* on the Council, nor could legally have the force of one. Within certain assigned limits, there is vested in the Council, during their term of office, the absolute management of the Society's affairs; and no such recommendation as that adverted to can release them from their responsibility of administering these affairs to the best of their own judgment. The arrangements under which books are purchased for the library, and the right of discretion now exercised in this respect by the Council and officers, are part of the constitution of the Society; and no resolution of a general meeting can avail to alter this, unless passed with all the forms and notices which are required for changing the bye-laws of the Society.

If that which the Council had to entertain was a "recommendation" from the Society, they were obliged to consider to what extent it represented the voice of that body; and with every disposition to pay proper respect to the gentlemen who had supported the two resolutions of the anniversary meeting, the Council could not regard their recommendation as more than a concurrent expression of opinion from 47 out of 577 fellows of the Society.

While the Council were thus on all grounds unable to regard the resolutions of the anniversary meeting as an authoritative decision of the question, their inevitable doubts as to the real wishes of the Society were increased at their first subsequent meeting, (March 14th,) when they received a requisition, in an opposite sense to those resolutions, signed by 89 resident, and 15 non-resident fellows.

Under these unusual circumstances, seeing that great difference of opinion prevailed in the Society, and that much importance was attached to the question at issue, the Council waived their right of deciding on the "recommendation" according to their own estimate of its merits; and, using the authority vested in them by the bye-law, cap. 16, sec. ii., they resolved,—

"That a special meeting of the Society should be called 'for the purpose of giving every fellow an opportunity of recording his opinion upon the question as to whether *THE LANCET* and *Medical Circular* should be withdrawn from the list of weekly periodicals subscribed for by the Society.'"

The following is the view under which this course was adopted. It is provided in the charter of the Society, "that it

shall be lawful for any three fellows, by writing under their hands, transmitted to the President, or such other officer or officers as may, by the bye-laws thereafter to be made, be designated for the purpose, to recommend to the Council any new bye-laws, or alteration or repeal of any existing bye-laws; and in case the Council shall not agree to such new bye-laws, or alteration or repeal of any existing bye-laws, that such propositions shall, if required by the said three fellows, be submitted to the consideration of the Society at large, and determined on by them." The endeavours made at the anniversary meeting, and subsequently by the requisition of March 14th, to bring the general opinion of the Society to bear upon the Council, corresponded so exactly in intention to the course here indicated, that although these endeavours were informal, the Council believed they would be acting most thoroughly in the spirit of the charter and bye-laws in convening a special general meeting to which the final decision might be referred.

This meeting was held on March 24th, and was attended by 189 fellows of the Society. It was moved by Sir Benjamin Brodie, was seconded by Dr. Webster, supported by Mr. de Morgan, and unanimously carried, "that the question sent to fellows be referred to Council to act on the question as they think fit."

For this resolution, or for anything else which occurred at the meeting, the Council are in no respect responsible. They are responsible solely for the manner in which they have since carried into effect the resolution then and there regularly and constitutionally made. The meeting was called to decide a specific question. It referred the decision of that question to the Council. The Council met, deliberated, and decided.

Endeavouring to act with the impartiality and justice which the Society has a right to expect from them, the Council have felt that specially to exclude from the reading room, on the grounds set forth in Mr. de Morgan's motion, one or both of the journals alluded to, would be inconsistent with their duty to the Society and to the profession. Serious breaches of the principles, on which the journalism of a scientific profession should be conducted, had not been charged only against the two journals named in the reference to the general meeting; and a censure pronounced exclusively on them would, in the judgment of the Council, have been a partial verdict. Nor was this the only fact which the Council, acting judicially in the matter, were bound to consider. All respectable members of the profession must concur in thinking it reason for very great regret, if scientific journals are perverted to the advocacy of private interests, or occupied with the vulgarity of personal recrimination.

But the Council have also reflected that if these faults be with justice imputed to medical periodical literature, the reproach of their existence cannot fall exclusively upon the press. Journals can have no separate interest in personal puffing or personal detraction; and the Council believe themselves sure of the general concurrence of their constituency, when they affirm that the prevention of these evils must depend, not on the exclusion of this or that journal from the reading-room of the Society, but on the cultivation of high self-respect in the profession, and a general contempt being shown for those successes which are gained by self-advertisement.

## THE PARISIAN AND LONDON HOSPITALS.

INVITATION FROM THE INTERNES OF PARIS TO THE RESIDENT MEDICAL AND SURGICAL OFFICERS OF THE LONDON HOSPITALS.

A MEETING was held on the 1st inst. at the residence of the senior house-surgeon of St. Bartholomew's Hospital, having been convoked by the following letter addressed to all the London Hospitals to which schools are attached.

[COPY.]

"St. Bartholomew's Hospital, Nov. 28th, 1864.

"GENTLEMEN,—I have the honour to inform you that a communication has been placed in my hands from the internes of the hospitals in Paris, containing an invitation to the internes of the various London hospitals to pay a friendly visit during the Exhibition, which is to take place the ensuing summer. May I therefore request that you will kindly depute one of

\* At this stage of their deliberations, the Council received a requisition signed by 100 resident and 51 non-resident fellows, urging (on what the Council considered insufficient grounds) that the resolution of the 1st of March should be adhered to.

your resident staff to attend a meeting to be held on Friday evening next, at eight o'clock, in my rooms, to take into consideration the manner in which this courteous invitation may be best responded to.

"I beg to remain your most obedient servant,  
"SAMUEL STRETTON,  
"House-Surgeon."

The whole number of representatives, with one or two exceptions, having assembled at the appointed time, Mr. Stretton was called upon to take the chair, and explain the objects for which the meeting had been convened, which he did as follows:—

GENTLEMEN,—We are met here to-night to take into consideration a very courteous and gratifying invitation from the internes of the Parisian hospitals, inviting you to visit them during the ensuing summer, and promising you on that occasion a warm and hearty reception. This document was placed in my hands by Mr. James Turle, late house-surgeon to University College Hospital, who can therefore give you a better account than myself of the manner in which it was entrusted to his charge. This hospital was selected as the site of our first conference on the subject, in preference to his own or any other, on the ground only of its being the most ancient. It will be our duty to-night, gentlemen, to decide upon the kind of answer to be returned to their polite invitation, on our acceptance or non-acceptance of it; and, if the former, on what further measures it may be necessary to take in the matter.

Mr. TURLE was most willing, from a sense both of duty and pleasure, to respond to Mr. Stretton's call on him to explain this unprecedented act of politeness on the part of our co-professionals on the other side of the Channel. The pleasure he felt in bringing this proposition before them was in the prospect of its leading to a lasting acquaintance between the medical bodies of the two countries. After dilating on the advantages which each must derive from this, and expressing the hope that that very meeting, the first of its kind in this country, might lead to some kind of organization amongst their hitherto unconnected number, he went on to describe the hospitality with which he was received by the internes of most of the hospitals during a recent short stay in Paris, and which he could only attribute to having been introduced to them as a London house-surgeon at a time when the interests of the two nations are bound by such close ties as they are at present. Those invited had the same claims, and would, he assured them, be received as welcome and expected guests. It was before a dinner at which he had the honour of being present, when a considerable number of internes, representing nearly all the hospitals of Paris, were assembled together, that the address which he was about to read to them was drawn up and signed.

#### [COPY OF INVITATION.]

"La Salpêtrière, Nov. 6th, 1864.

"Les internes des hôpitaux en Paris, heureux de voir parmi eux un représentant des internes en Londres, le chargent de présenter leurs amitiés à ses collègues, et de les inviter à venir à Paris voir l'Exposition de 1865, sur de trouver dans nos hôpitaux un accueil amical et cordial.

"Mr. James Turle, House-Surgeon  
University College Hospital."

[Nearly twenty signatures were attached, including the names of Forille, Bertholle, Garreau, Dupuy, Bourgeaud, &c.]

Mr. TURLE thought that these facts ought to be sufficient to induce those present to evince a feeling as "friendly and cordial" as their hosts. He concluded by testifying to the strong interest which every one he had consulted had taken in the subject, whatever their rank in the profession; and his obligation to Mr. Stretton especially, for his able co-operation and assistance. Having discharged his duty to the best of his ability, he called on them to deal with the subject as they thought it deserved.

Mr. ORMEROD (of St. Mary's) wished to know whether the honorary officers of the London hospitals could be fairly classed with the internes of Paris?

Dr. HILLIER (of University College Hospital) thought that, though there were great differences in the titles given to the resident surgical and medical officers at our hospitals, their duties, as well as their relations to the visiting staff, were the same as for the internes.

Mr. HOLMES (of St. George's Hospital) considered it to be quite unnecessary to enter into the exact definition of the word interne, if that meeting chose to consider itself as the party addressed, and to return an answer accordingly.

After some further discussion, it was proposed by Mr. TOWERS, and seconded by Dr. HILLIER, "That the members of this meeting accept the invitation on the part of their colleagues, and that a committee be formed to return a suitable answer." This was carried unanimously, as well as the following, proposed by Mr. TURLE, and seconded by Mr. TOWERS—"That this meeting resolve itself into a committee, which should consider itself permanent until the proper carrying out of the project." It was then determined on that the following answer should be immediately returned:—

#### [COPY OF ANSWER.]

"We, the undersigned representatives of the internes of the hospitals in London, have much pleasure in acknowledging the very courteous communication of the internes of Paris, containing an invitation to visit them during the Exhibition of 1865, and we feel such an instance of the good feeling of the medical profession in France towards ourselves to be particularly welcome at a time when our fellow-countrymen abroad are shedding their blood for one as much as the other country. We find it difficult to give expression to our appreciation of their kindness; but hope to prove, by our presence in their capital next year, that we are not insensible to the kind feeling which dictated an offer as unexpected as it is complimentary."

[This was signed for St. Bartholomew's Hospital by Messrs. Stretton and Towers; by Dr. Hillier for University College Hospital; Mr. Lawrence for the London; Mr. Arnold for Guy's; Mr. Holland for Charing-cross; Mr. Viguers for the Middlesex; Mr. Holmes for St. George's; Mr. Ormerod for St. Mary's; Mr. Kollason for the Westminster; and by Mr. Atkinson for King's College Hospital. From St. Thomas's no communication was received.]

Mr. LAWRENCE inquired whether those whose term of office would expire before next summer would form part of the visiting body?

Mr. TURLE thought such scarcely amongst the invited; but the committee could better decide on this point at the beginning of next year.

The committee then adjourned to that day two months, the place of meeting having been determined by lot to be the London Hospital.

At the close of the proceedings, Mr. ORMEROD, in making some remarks on the extreme rarity of such meetings, urged the propriety of founding on it a system of friendly visits to each other's hospitals, which should not cease with the immediate object of their meeting there that evening.

These feelings were generally participated in; but the discussion was deferred to a future occasion.

A vote of thanks to their host (who had kindly consented to perform the duties of secretary) having been proposed by Mr. TURLE, and carried by acclamation, the meeting separated.

"Audi alteram partem."

## MICROSCOPICAL RECOGNITION OF TUBERCULOUS MATTER.

To the Editor of THE LANCET.

SIR,—In the review of Jones and Sieveking's "Pathological Anatomy" in THE LANCET of November 25th, a doubt is expressed as to the possibility of discovering tuberculous matter by means of the microscope in early phthisical sputa.

Exception has been taken to this by Dr. A. Clark, who maintains "that the presence of the process of tubercularization can often be recognised during life by the characters of the sputum, when the physical signs and general symptoms are too obscure of themselves to justify that conclusion." Dr. Clark is of opinion that the products of tubercularization are often detached from the walls of the air-cells and ultimate bronchia at an early stage of phthisis, and may then be discovered in the sputa by means of the microscope. I have not the slightest wish to cast a slur upon the researches of Dr. Clark, which I believe to be highly important and interesting. If he can succeed in establishing his point to the satisfaction of all, I for one shall be much pleased. But for the present I must own myself unconvinced.

It is the opinion of Louis and other writers, that we may have extensive consolidation of the lung without any evolution of phthisical matter in the sputa. A bronchial excretion is

kept up by the irritation of the unsoftened tubercle. At later periods, also, there may be extensive cavities, but these instead of enlarging may acquire a soft vascular lining, from which a purulent mucus is continually poured out. In this again there might be no tuberculous matter. So that the non-existence of such matter in the sputa would be no proof at all of the non-existence of the pulmonary disease, of which the physical signs would convince us.

It is not of cretaceous masses and ragged tubercular formations expectorated in the latter stage of phthisis that question is made, although cases are recorded by Louis in which even these signs have proved fallacious. The question is, whether tuberculous matter can be positively diagnosed in sputa of ordinary appearance, there being at the same time no physical signs or other trustworthy symptoms of phthisis?

Now I think we are treading here on dangerous ground. Let any one examine, as I have done, the accounts of the microscopical characters of tubercle, in the works of Rokitsansky, Haase, Carswell, and others, and tell me if they are not uncertain and various in the extreme. On which will he place most reliance—on the *amorphous granular blastema* of one observer; on the *granule-cells* and *nucleated vesicles* of a second; on the *scattered oil-globules* of a third; or on the *irregular and eroded free nuclei* so much insisted on by a fourth? His patient may be suffering from bronchitis; he may be the victim of chronic pneumonia. On which microscopic character will he choose to rely as a ground for the melancholy assurance that he is destined ere long for the grave?

Tuberculous masses, even out of the body, and before our eyes, as seen in a post-mortem examination, are not always easy to recognise. What most authors call "chronic pneumonic consolidation," is considered by Dr. Walshe to be the same as *tubercular infiltration*. And the "albuminous raw blastema" of Rokitsansky, "bacony deposit" of other authors, though quite unconnected with the true tuberculous crasis, is *physically and microscopically identical with tubercle*.

It is needless to trouble your readers with the various opinions of authors on this subject. If we may learn any lesson from them—and I say this with all respect for Dr. Clark—it is that our best policy at present is to *doubt*. M. Lebert describes cells and other matters supposed to be characteristic of tubercle; so does Schröder von der Kolk. Vogel and Gerber describe three kinds of cells; Gruby speaks of cells of very large size; Simon affirms that the characteristic of tubercle is, that it contains no cells at all.

Most microscopical observers will, I think, agree with me in stating that tubercle and tuberculous formations do really differ so much in appearance, that they cannot often be distinguished satisfactorily from other very different matters.

Supposing I were to forward to Dr. Clark nine specimens of sputa, labelled, similar in appearance to the eye, but three produced by a patient labouring under pneumonia, three from a case of bronchitis, and three more from an attested early case of phthisis, will he then undertake to distinguish them?

It is possible that Dr. Andrew Clark's observations may have been more extensive and more careful than those of his predecessors: we are all open to conviction, and I amongst the rest. I observe that Dr. Thompson, in his valuable lectures "On Pulmonary Consumption," appears to be of the same opinion as Dr. Clark.

I should like to elicit the opinions and observations of others of your correspondents on this important subject.

I am, Sir, your obedient servant,

December, 1854.

THE REVIEWER.

## IS THE ASIATIC CHOLERA A CONTAGIOUS DISEASE?

To the Editor of THE LANCET.

SIR,—That most important of all medical inquiries, "Is the Asiatic cholera a contagious disease?" at this moment engages the attention of so many diligent, able, and impartial investigators in every quarter of the world, that we may daily expect to see the limits of our confined knowledge considerably extended. In the mean time we should neither be "too rash nor diffident."

Having had extensive opportunities of witnessing the fearful pestilence in 1831, 1832, and 1849, in addition to the sad experience of the last three months, I adhere to my former opinion respecting the scourge of the Eastern world, "Asiatic cholera is not contagious, nor infectious, either before or after death."

\* Vide THE LANCET, Nov. 1849.

Between the 22nd of August and the 19th of September, I was called to fourteen cases of decided Asiatic cholera, of which ten proved fatal, and at the end of very brief periods—average less than fifteen hours!

It is worthy of observation that only one death occurred in each house, and that no death, I believe, has occurred in the same house upon a second visitation! Thus, the Royal Sea-Bathing Infirmary, the Wilderness, the Metropolitan, (pauper establishments for invalids,) and the Union Workhouse, have escaped the dire disease during the late outbreak.

Again, I venture to say, to the best of my judgment and belief, "there are no premonitory symptoms of Asiatic cholera, that the late epidemic diarrhoea and Asiatic cholera are distinct diseases." During the same period of time I was consulted in more than one hundred cases of diarrhoea of the choleraic character, not one of which merged into developed cholera, and only one died, a man, aged eighty-four.

I am, Sir, your obedient servant,

JOSEPH WADDINGTON, F.R.C.S. Eng.

Margate, Dec. 1854.

## ADULTERATION OF FOOD AND DRUGS.

To the Editor of THE LANCET.

SIR,—Since I had the pleasure of communicating to you the proceedings of the Conference on Adulterations, held here in the spring of the year, the movement has progressed. A committee in aid has been formed at Wolverhampton, and it is now intended to obtain the co-operation of our profession in the work. A copy of a circular is enclosed, and, as it will be impossible for me to forward one to each member in all the large towns in the empire, I must ask you to give it publicity in THE LANCET, and thus bring it before the bulk of the medical profession.

I have only now to express a hope that the faculty will respond to the call, and that the time is not far distant when the elaborate researches of the Analytical Sanitary Commission of THE LANCET will be brought to bear directly on the social well-being of the people, and receive further acknowledgment from the public.—I am, Sir, your most obedient servant,

Birmingham, December, 1854.

JOHN POSTGATE.

"Birmingham, December, 1854.

"SIR,—On behalf of the Association formed in Birmingham and Committee at Wolverhampton, for the purpose of calling the attention of Parliament to the evils arising from the pernicious Adulterations in Food and Drugs, and of urging the necessity of legislative interference, we beg to request your earnest consideration of the annexed propositions. Several members of Parliament and other influential gentlemen accord their hearty concurrence on this important subject, and have promised an active co-operation in the cause.

"Acting in concert with the movement thus commenced, Mr. Scholefield, M.P., has already given notice of his intention, early in the next session, to bring the matter before the House of Commons; and if supported by petitions from the principal towns, there is good ground for believing that the movement will meet with a favourable reception.

"To this end we venture to request your assistance, and beg to inquire if the formation of a committee in your town would be practicable, to act independently or in conjunction with those represented by ourselves.

"We shall be glad to hear that you and your fellow-townsmen will join in this needful undertaking, and shall be happy to afford you any further information on being favoured with a communication.

"We have the honour to be, Sir,

"Your most obedient servants,

"JOHN POSTGATE, F.R.C.S.,

Birmingham,

"ALFRED HALL BROWNE,

Wolverhampton,

Hon.  
Secs.

### "ADULTERATIONS IN FOOD AND DRUGS.

"1. It is established upon ample and undoubted testimony, that fraudulent and deleterious adulterations in articles of food in general consumption have long been and are extensively and systematically carried on by manufacturers and dealers throughout the kingdom.

"2. That adulterations of a like character are well known to exist in drugs, whereby the evils arising from the consumption of impure and pernicious food are greatly aggravated, the prescriptions of medical practitioners being rendered uncertain and often ineffectual.

"3. That the evils resulting from these causes, which are alarmingly on the increase, press more directly and injuriously upon young children and the working classes, the alimentary constituents of the main articles of their consumption—flour, bread, milk, and sugar—being, by the adulterations employed, materially reduced in quantity and deteriorated in quality.

"4. That the whole subject demands the serious consideration of the community, as a question deeply concerning the public health, and urgently requires the interference of the Legislature to suppress practices which involves gross impositions on society, and especially the poorer classes."

### THE MEDICAL BENEVOLENT COLLEGE VERSUS THE ASSOCIATION JOURNAL.

To the Editor of THE LANCET.

SIR,—As an old member of the Provincial Medical and Surgical Association, I ask myself this question: For what do I pay my annual guinea, now that there is no bond of union amongst us, no "Transactions" published, and no fund for any but "Journal purposes"? Clearly enough, I think, to support a contemptible *Journal* and editor, whose sole object appears to be, to spread dissension in the profession, and to hand over the interests and influence of the great body of practitioners throughout the kingdom into the hands of an unscrupulous clique in London. Now, Sir, I find that this annual guinea, if handed over to that noble philanthropist, John Propert, the treasurer of the Medical Benevolent College, would constitute me a governor of that institution. For the future, then, my guinea will go in that direction; and I put it to my brethren throughout the country, whether it is not much better, now that, as Mr. Jeaffreson well says, "the Association is no longer what it was," to support such a college than such a *Journal*? Moreover, I strongly object to the "begging system" which you noticed in THE LANCET for November 25th: it is unworthy of a great association to canvas for "charitable contributions" towards the support of a wretched, imbecile, and contemptible print, one-half of which is twaddle, the other cant.

Pray do not refuse insertion to this letter. I shall not send it to the *Journal* of the Association, after the rejection of Mr. Sheppard's communication. I am most anxious to express the feelings, at least, of one

RETIRING MEMBER OF THE ONCE NOBLE, BUT  
NOW DEGRADED, PROVINCIAL MEDICAL AND  
SURGICAL ASSOCIATION.

Yorkshire, December, 1854.

P.S.—I enclose my card; I leave it for you to append my name, if you think it necessary. but I have no desire to thrust myself upon public notice.

### PROVINCIAL MEDICAL AND SURGICAL ASSOCIATION.

To the Editor of THE LANCET.

SIR,—I am desirous of calling the attention of my brother members to the following paragraph, which was printed amongst the notices to correspondents in the last number of our *Journal*:—

"EXPENSE OF THE 'JOURNAL'—We decline to insert any more letters upon this subject. The dispute is simply one of words. The income from the *Journal* is deducted from its expenses by Mr. Michael, and not by Sir Charles Hastings. If this be remembered, the apparent discrepancy is reconciled."

Dr. John Rose Cormack has made a display of some not very enviable qualities, but his impertinence, for audacity, presents a novelty. It certainly is new, for he dares plainly to tell us that he will not allow us to discuss the expenses of our *Journal* in our own work. The object of he and his London brother tricksters is obviously to sink us country practitioners into an abyss of disgrace. This extraordinary editor also states the dispute between Sir Charles Hastings and Mr. Michael is "simply one of words;" and then, by way of clearing up the difficulty, that Mr. Michael deducted the income from the expenses, and of course this arithmetical conjuror would make the balance of expenses a profit! If the thing were reversed, and we could obtain a balance after deducting the expenses from the income, then our affairs would present a far different aspect; but we are now called upon to pay nearly £3000 a year for publishing the dullest *Journal* in existence, and paying an annual salary to as incompetent an

editor as can be discovered. Only think that our Association has existed for upwards of twenty years, and has contributed nearly £40,000! And what have we got for that vast sum? Nothing but Cormack, a worthless *Journal*, and feelings of discontent prevailing throughout the whole Association. That we country practitioners are sacrificed to serve the purposes of the London clique is plain to every one; and I would suggest that a requisition be drawn up and signed by the members, and presented to Sir Charles Hastings, requesting him to resign forthwith, and appear at the head of a new Association, with an appropriate title, having for its immediate practical object the protection of every member of the Association from every kind of injustice and persecution. A subscription of 10s. a year will accomplish that great object, and provide for the annual publication of a splendid volume of "Transactions." At all events, not another guinea will I ever pay to the Provincial Association, as it is now constituted.

I am, Sir, your obedient servant,

Dec. 1854.

A. Z.

### ON THE CO-EXISTENCE OF TWO SPECIFIC DISEASES.

To the Editor of THE LANCET.

SIR,—I observe, in your report of the Medical Society of London (Nov. 25th), a discussion on the "Co-existence of Two Specific Diseases;" and Mr. Rogers Harrison mentioned a case in which measles supervened on an attack of gonorrhoea. This brings to my recollection two cases, the first of which occurred considerably more than twenty years ago. It was in the person of a grocer's assistant; he was about thirty years of age, and became my patient for a severe attack of gonorrhoea. During the course of treatment copaiba was prescribed, and, after he had taken it for a short period, the body became covered with a rash precisely similar to rubeola; but there was an absence of all catarrhal symptoms, and therefore I considered there must have been some peculiarity in my patient's constitution which caused the copaiba to act in this unusual way. The second case occurred some years after. On the administration of copaiba a rubeolar rash appeared over the whole surface of the body, with an injected condition of the vessels of the conjunctivæ, but no catarrhal symptoms. In neither of these cases had the patients been exposed to rubeola, nor did measles appear in either family of which these patients were members; and I was again induced to think that in both cases the eruption must be considered to arise from some idiosyncrasy of constitution.

I am, Sir, your obedient servant,

Minchinhampton, December, 1854.

C. W. TURNER.

### THE SURGERY OF THE WAR.

WE have been hitherto unwilling to give any unnecessary publicity to the medical movements of our army in the East. As Lord Raglan has, however, at length done full justice to the surgeons in the field, we find this reserve less called for. It is now feared, though another European power has sent in its adhesion to the allied forces, that Sebastopol cannot be taken till March. The medical department of the army, however, we are glad to find, has gained the unqualified approbation of the commander-in-chief. If we catch a spy in the English camp, we deal somewhat summarily with him; and we cannot help believing the very unnecessary notoriety given, amongst other things, to our medical and surgical deficiencies of late, has rather assisted the Russians than otherwise. "Our own correspondents," with the electric wires at the ends of their fingers, may understand diplomacy very well, but we doubt the importance or wisdom of their surgery. As we have no alternative but to be guided by their discoveries and revelations, some recent facts will prove interesting.

One of her Majesty's ships, the *Prince*, with a store of medical necessities for the wounded, we regret to find, has been lost at sea; Dr. Spence, Inspector of Hospitals in the East, sent out by Government, also drowned. Eight other ships also have foundered, and 300 lives were lost in the late equinoctial gales. It is gratifying to find, that out of all this evil some good will arise, and already several tons of lint and other necessities are on their way to the army, obtained by private benevolence.

History can scarcely parallel the eventful battle of Inkermann

on the 5th of November. Austerlitz or Leipsig, or the myriad hosts of Xerxes in the olden time, come nearest to it. Russia, it is now known, expected to have 200,000 men in the field! Dr. Smith, an hospital surgeon, riding out on hospital duty in the grey dawn of the morning of this eventful day, first descried through the fog the black columns of the Russians advancing, and gave the alarm. In a later part of the day, Mr. Wilson, surgeon of the 7th Hussars, perceiving the Duke of Cambridge's life in imminent peril, half-a-dozen Russians aiming at him, dashed at and routed them. The Duke called Mr. Wilson forward, and thanked him in the presence of the army. We say nothing of the surgical duties of our military surgeons; they speak for themselves.

Zoroaster, we are told, governed the world by two principles—Ormuzd and Arimanes—Good and Evil; and our great national poet speaks of a spirit of good in all things evil, could we but "willingly distil it out." The war, at least, out of its many evils, has shown the unflinching bravery of the army, and of none, perhaps, more than of our surgeons exposed to death and disease in endless shapes. Many of our younger medical men at Guy's, St. Thomas's, or other hospitals, may form somewhat gloomy impressions of surgery and amputations behind gables and batteries; but here we have surgeons at full work in view of the battle of the 25th of October, on which day twelve officers were killed, and 146 rank and file; while a still larger number, or fifteen officers and 163 soldiers, were brought in wounded,—629 wounded already in hospital. We give these figures, as they may be valuable as matters of reference.

We do not willingly create a comparison between French and English hospitals, but as there was evidently better organization in the former than in the latter, it may be useful hereafter to take a lesson from our allies. The French hospitals, eight in number, are situated at Pera. The scenery is described as most beautiful and exhilarating, part of the hospitals having been a palace. The total loss of the French army up to the date spoken of (October 25th) was 618 wounded; after the 25th, however, at the battle of Balaklava, 1200 to 1500 wounded arrived at Pera in one day! One hundred major operations were performed; more than one disarticulation of the shoulder; several amputations at the hip, above the trochanter; two coxo-femoral disarticulations. Three hundred Russian wounded furnished some dreadful operations, nine-tenths of the balls extracted being conical, which split the bones. Some of the French soldiers were wounded in the same way by the Russian rifles. One-seventh of the wounded at Pera were wounded by cannon-shot.

At Scutari, in the English hospital, at this time all was confusion and want of organization; a third of the wounded were carried elsewhere. It is only fair, however, to state that after the latest battle, that of Inkermann, everything had come right; "the medical men were exerting themselves nobly." According to a visitor at the hospital, who writes in the *Morning Chronicle*, "the medical department has been alighted, but most unjustly so, while praise is lavished on mere spectators or gentlemen of the staff of Lord Raglan, who, however accomplished or amiable, could lay claim to little military pretensions. The battle of Inkermann lasted till evening, yet by eight o'clock the wounded were all lying in comfortable beds of hay, and had their wounds dressed. Volunteers arrived in numbers to tend the suffering; the commissariat also furnished wine and other medical necessities. The entire loss after this battle was 2350 killed and wounded; the greater number of the latter were sent to Scutari. The Russians lost 4000. Previous to this engagement there were 1715 sick and wounded at the larger hospital at Scutari, and 600 in the smaller one. The mode of removing the wounded adopted by the French seems to have been quite admirable, while our ambulances and Greenwich pensioners were "nowhere." The mule ambulance of the French army is a simple iron frame attached to one of those animals, which can either be used as a single seat or unfolded into a bed for two. It has the advantage that the mule can be galloped to the most inaccessible places amongst trees and brushwood, and then walked down back with the wounded. The French have also large numbers of carriage ambulances; but neither these nor the English ambulances with a string of ten mules could reach to the trenches and fortifications. After the Alma, the Greenwich pensioners and mules are said to have been as fabulous as the horses of the Sun, or the fabled cock of Æsculapius. But for the assistance afforded by 500 seamen, who came to the rescue with oars and hammocks, the wounded would have laid on the beach; the oars and hammocks, however, formed a very good substitute. It is said that an absurd number of tourniquets and wooden legs were sent out to the Crimea; band-boys

and drummers were taught the use of the former, and in one of the ships in Balaklava bay a story was told of one of these neophytes, or a mate of the watch, where a marine or soldier had his carotid opened, applying a tourniquet round his throat! At the battle of Inkermann the wounds were observed to be simple and "clean," the effect of bayonet or bullet, while after the Alma the round shot gashes were terrible. These peculiarities it will be well to remember.

Miss Nightingale, with thirty-seven nurses from England, arrived on the 5th of November. There were then in the English hospitals 3000 wounded, according to various accounts; according to one recently promulgated as "official," about one-third this number. The Guards alone, who mustered 4000 men at Varna, are now reduced one half; other regiments and cavalry, we regret to find, almost in the same proportion. The loss at Inkermann alone, by the most correct accounts of this month, (December,) amounted in all to 2783 killed and wounded. In the second division of the army, thirty-three per cent. were put *hors de combat*. The gallant 88th lost, out of 400 men, 140 killed and wounded. Of the Russians, 3000 were killed, and for one killed the usual average in battle is three wounded. The French surgeons, we learn, assisted in amputations after Inkermann, and have tried conservative surgery to some extent.

## Medical News.

**ROYAL COLLEGE OF SURGEONS.**—The following gentlemen having undergone the necessary examinations, have just been admitted Fellows of the Royal College of Surgeons:—

AGNIS, JOHN CROWN, 3rd Light Dragoons, diploma of membership dated December 19th, 1851.

BROWN, JAMES DAVID, Haverfordwest, May 5th, 1841.

COLE, GEORGE, Hon. East India Company's Service, Bengal, November 11th, 1842.

POWER, HENRY, Baker-street, Pentonville, May 9th, 1851.

WEBB, ROBERT, East India-road, Poplar, March 26th, 1841.

**HONORARY FELLOWS.**—At a meeting of the Council, on the 1st inst., the following Members of the College were admitted Honorary Fellows:—

CLARK, THOMAS, Wellingborough, diploma of membership dated February 5th, 1819.

DALTON, WILLIAM, Cheltenham, May 14th, 1830.

DAYMAN, HENRY, Milbrook, Southampton, October 19th, 1832.

FURNER, EDMUND JOSEPH, Brighton, May 19th, 1829.

SOLOMON, JAMES VOSK, Birmingham, October 11th, 1839.

SOUTHWOOD, JOSHUA, Fore-street, Cripplegate, July 10th, 1835.

VALLANCE, BENJAMIN, Brighton, December 15th, 1826.

WEDDELL, THOMAS, Scarborough, January 2nd, 1818.

WILSON, HENRY, Runcorn, June 17th, 1836.

**LICENTIATES IN MIDWIFERY.**—The following Members of the College having undergone the necessary examinations, were admitted Licentiates in Midwifery at the meeting of the Board on the 5th inst.:—

DARBY, EDMUND, Bath, diploma of membership dated November 17th, 1854.

EDWARDS, JAMES, Tring, Herts, April 3rd, 1854.

GROWER, JOHN LAWRENCE, Bildistown, Suffolk, Nov. 24th, 1854.

LILLEY, JAMES HARVEY, Leicester, May 17th, 1850.

LAWTON, SAMUEL, Sheffield, November 24th, 1854.

MARRIOTT, ROBERT BUCHANAN, Sittingbourne, Kent, July 14th, 1854.

RUGG, GEORGE PHILIP, Clapham-road, August 2nd, 1850.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

Thursday, November 30th, 1854.

LOWE, EDGAR, Manchester.

M'CORMICK, RICHARD, Tuam, Ireland.

NORRIS, NATHANIEL, Liverpool.

PITTARD, SIMON RODD, Kingsbury Episcopi.

ROBERTS, JOHN SHEARWOOD, Sheffield.

RUDALL, JAMES THOMAS, Exeter, Devon.

**UNIVERSITY OF LONDON.**—EXAMINATION FOR HONOURS.—B.A. EXAMINATION, 1854.—*Mathematics and*

**Natural Philosophy.**—Thomas Savage, (University Scholarship,) University College; William Brittain Jones, University College; Alfred Bache, Queen's College, Birmingham; William F. Moulton, Wesley College, Sheffield, (Equal); Swinton Henry Boulton, Manchester New College, and University.—**Classics.** Michael Foster, (University Scholarship,) University College; William Brittain Jones, University College; Fred. C. J. Millar, University College, Rev. B. P. Pratten, Baptist College, Bristol, Rev. Jos. A. Temple, King's College, (Equal); Swinton Henry Boulton, Manchester New College and University; James Allanson Picton, Lancashire Independent College, and Owen's; Martin Luther Rule, Wesley College, Sheffield.—**Chemistry.** James H. Thornton, King's College, Christopher Wolston, Queen's College, Birmingham, (Equal).—**Animal Physiology.** James Howard Thornton, (Prize of Books,) King's College; Henry Charles Leonard, University College; Christopher Wolston, Queen's College, Birmingham; John Rankine Black, University College; Albert Buchanan, University College; Martin Luther Rule, Wesley College, Sheffield.

**UNIVERSITY COLLEGE, LONDON.**—At the Sessions of Council on Saturday last, the Longridge Prize of Forty Pounds for General Proficiency in Medicine and Surgery was awarded to Dr. F. G. Clarkson, lately a student of the College, and now of Paradise-row, Darlington.

**HUNTERIAN SOCIETY.**—On Wednesday next, a paper will be read by Mr. Curling, "On Several Cases of Hospital Gangrene."

**NUISANCE NEAR GUY'S HOSPITAL.**—At the Surrey Sessions, on Tuesday last, William Trower and Jacob Mass, extensive hop factors and dryers, were indicted for carrying on the business of drying and colouring hops in furnaces, or kilns, by means of sulphur, on the premises, Queen's Head-yard, High-street, Southwark; such being a public nuisance and injurious to the health of the inhabitants, more especially to the inmates of Guy's Hospital adjoining. The case lasted the whole day, and excited great interest. A great many eminent medical gentlemen were present, amongst whom were Drs. Taylor and Letheby. Several of the wards of the hospital adjoin the back of defendants' premises, and it was contended by the prosecution that the sulphuric acid from the defendants' factory affected the health of the patients, and indeed had caused the death of a child. Dr. Taylor was examined for the prosecution, and Dr. Letheby for the defence. The jury, after nearly an hour's deliberation, found the defendants guilty. The defendants were then bound over in their own recognisances in £500, to appear for judgment when called upon, they undertaking to abate the nuisance immediately.

**ROYAL MANCHESTER SCHOOL OF MEDICINE AND SURGERY.**—The annual distribution of prizes to the successful students in Medicine and Surgery at this school took place on Friday, December 1st, in the Town Hall, Manchester, the Mayor, B. Nicholls, Esq., presiding. There was a very large and fashionable attendance of both ladies and gentlemen to witness the interesting ceremony; amongst whom were the Right Rev. Lord Bishop of Manchester, together with the Very Rev. the Dean, and the Reverends the Canons Wray, Richson, M.A., Germon, M.A.; together with James Heywood, Esq., M.P.; James Brotherton, Esq., M.P.; William Ross, Esq., Mayor of Salford; and Drs. Lyon, Bell, Allan, Ainsworth, &c. &c. After a few observations from the chairman, the prizes were awarded to the several successful competitors, after which the proceedings terminated with a vote of thanks to the president of the day.

**THE WAR.**—The war, as might be expected, has given some new features to movements in the hospitals and medical schools. Several of our pupils are reading up hard for the new examination of the College of Surgeons. Seven out of nine navy candidates were recently rejected; but it is believed the ordeal at Lincoln's Inn-square will be less difficult. In some of the hospitals, the ladies intending to join Miss Nightingale in attendance on the sick and wounded at Constantinople are to be observed learning bandaging in the wards, and attending operations, to accustom themselves to the sight of blood. At St. Thomas's Hospital, notice has been given that the names of all pupils eligible to join the army as assistant-surgeons are to be sent in, to be forwarded to the Director-General. Mr. Fergusson performed lithotomy on a boy lately, under the amateur supervision of these lady nurses—a proceeding, it was generally remarked, not likely to be required at Scutari or Pera.

**SOUTHWARK COUNTY COURT, SURREY, NOVEMBER 29TH, 1854.**—THE SOCIETY OF APOTHECARIES v. DONAHOO.—This was an action brought by the Society of Apothecaries against Thomas Donahoo, druggist, of the Westminster-road, for having illegally practised as an apothecary. The defendant had for some time been engaged in illegal practice, and the case was taken up by the South London Medical Association, established for the purpose of suppressing illegal medical practice. The Society of Apothecaries obtained a verdict for the full amount of the penalty, £20, and costs.

\* \* \* If the medical practitioners of the South of London will do their duty, and join heartily in the objects of this Association, the number of illegal practitioners of all kinds that so abound in the neighbourhood would be materially diminished.

**CHOLERA.—PANIC AT ATHENS.**—The greatest terror has been caused at Athens by the cholera. Not only has a considerable part of the population taken to flight, but the Minister of War has been obliged to place on the retired list a number of officers who, on the first appearance of the malady, quitted their posts; the Minister of Public Instruction, M. Payllas, locked himself up in his cabinet, and refused to see any one, even on the business of his department.

**CHRIST'S HOSPITAL.**—Scarlet fever has broken out amongst the boys at this school. Thirty cases have occurred, five of which have proved fatal. In consequence of the outbreak of this fever, six hundred boys have quitted the school.

**SUICIDE OF DR. WIGSTRONE.**—Dr. Wigstrone, of her Majesty's 14th Light Dragoons, has committed suicide by taking prussic acid, in India. The unfortunate gentleman arrived at Bombay with his wife from Ceylon, on the 21st ult., having only been married a week previously, and took up his lodgings at the Hope Hall Hotel. He is represented to have lived rather freely, and although he seemed at times cheerful and gay, yet his conduct on other occasions at the hotel was such as to impress one with the belief that he was not quite in his senses. On the table in the room occupied by the deceased, Dr. Loftus found half a sheet of letter paper, having the following inscription in the deceased's handwriting:—"5 m. to 12. Time is come for all explanations—they are at an end. R. B. W." The coroner's jury returned the following verdict:—"Deceased committed suicide by poisoning whilst in a state of temporary insanity."

**TREATMENT OF THE WOUNDED.**—The following is an extract of a letter from Constantinople:—"With regard to the treatment of our wounded after the battle of the Alma, I think the accounts cannot be exaggerated. I have it from the lips of a senior officer on board the *Colombo*, with whom I am upon most intimate terms, that they alone had 600 wounded on board, and during the whole passage, occupying a space of time not less than sixty hours, to Scutari, including the time they were on board before starting, that the three surgeons never ceased their amputations, assisted by volunteers from the crew of the ship; that the decks were running with blood the whole time worse than shambles, and the exhalations were overpowering in the extreme."

**CARE IN THE USE OF CHLOROFORM.**—An American practitioner at Philadelphia was lately tried and found guilty of violating a young lady while under chloroform. The jury recommended the prisoner to mercy, as it seemed probable the young lady was labouring under mental hallucination from the chloroform. The case has created a great sensation in the hospitals and schools at the opposite side of the Atlantic, and suggests a word of caution to practitioners at home.

**UNIVERSITY COLLEGE HOSPITAL.**—Dr. Arnott read a paper on his mode of congelation by ice, lately, to the Society of this hospital. As an illustration, Mr. Erichsen removed the inverted toenail of a boy from the matrix while the toe was frozen—an operation in general most horribly agonizing, but in this instance unattended by pain.

**ST. BARTHOLOMEW'S.**—A very valuable gift has been conferred this month on the library of St. Bartholomew's—the medical library of the late Dr. Roupell, numbering about a thousand volumes. The books are chiefly interesting as associated with the memory and name of this physician; the latter with the autograph of the donor's college, "*Coll. Caius, Cam.*" in the fly-leaves. A tablet or testimonial is about to be placed in the School to the memory of Dr. Roupell; a list for the purpose is open, to which it is gratifying to find attached about seventy names, amongst which are many of old and all the renowned living men of St. Bartholomew's.

**KING'S COLLEGE HOSPITAL.**—At this hospital various good things have been offered of late, such as an assistant-surgeoncy to the Lock Hospital; but at present a full surgeoncy in the Royal Militia—7s. 6d. a day, coals and candles—is going begging. If any of our younger students are anxious to “march through Coventry” with the militia, they have no time to lose, and should at once apply to Mr. Partridge or Dr. Beale.

**ST. THOMAS'S SCHOOL.**—Much commotion has arisen in the secluded cloisters and monastic quiet of this School, caused by a communication to a periodical calling in question the efficiency of the medical staff, and the want of assistant-surgeons, more especially during the last summer. We do not agree with the strictures thus undeservedly passed on St. Thomas's; and though it might be desirable to add to the staff, we know no School, as represented to us, what with prizes, gold medals, surgeoncies in the army, and Board of Health, &c., that has less to complain about. The attendance of Mr. Solly, Mr. Simon, Mr. South, Mr. Le Gros Clarke, with the clinical lectures of these gentlemen, and Mr. Macmurdo's *Eye Clinique*, are all unexceptionable.

**LITHOTOMY AND LITHOTRITY INSTRUMENTS.**—Mr. Adams lately showed his class at the London Hospital some lithotritry instruments of French construction. The part which seizes the stone is more spoon-like or flat than the English instruments, which seems a great advantage. Mr. Fergusson has had two pairs of forceps made, the best yet procured, and copied from the plates in Cheselden's works.

**NEW REMEDIES.**—Amongst some remedial appliances we have lately noticed in hospitals, are Mr. Gamgee's plaster of Paris and starch bandages in fracture, tried by Mr. Erichsen. Turpentine inhalations in hæmoptysis! found useful by Dr. Todd, at King's College Hospital. A case of enlarged spleen cured by bromine; and tincture of sumbul tried in epilepsy, with some unimportant good effects; the curious results of salts of tellurium, as tried in Edinburgh, have been much talked about.

**SCUTARI HOSPITAL.**—It is said the sheriffs of London have sent a pipe of port wine to Scutari Hospital for the sick and wounded. Several individuals have also volunteered to collect and send porter, lint, sheetings, books, &c., to our gallant army before Sebastopol: some one public dépôt, such as the Guildhall or Exchange, is suggested for their reception. Already several tons (!) of lint have been collected, and sent out.

**“PUNCH” ON QUACKERY.**—Much amusement has been caused in hospital libraries by a witty but sensible article in *Punch* on the all-absorbing question of quacks and quackery. “A handbill has been forwarded to Mr. *Punch*, containing a rather choice specimen,” he says, “of the lies with which the quack medicine-mongers endeavour to improve the sale of their pernicious trash. It sets forth that an Indian captain's little girl, aged eight, was in such a state of disease, from dropsy, that she was given over by the doctors. Her face ‘a mass of complete ulceration;’ her teeth were so clenched that her affectionate father had to wrench her mouth open ‘with a wedge,’ in order ‘to force down a dozen of pills No. 2. The very next day she got up, dressed herself after the pills, and was ‘discovered sitting on a hard form before a plate of ham and beef.’ The rubbish,” says *Punch*, “which the bill in question is intended to puff, is sold, more shame to Mr. Gladstone, under a Government stamp. Government is not ashamed, for a consideration, to lend its influence to the quack. Some evening the Government, however, will be compelled to break up its partnership. In the very handbill to which we allude, and folded round the medicine, the Indian captain is made to say, ‘I attribute all my ailings, weakness, and diseases to having been bled once, and been vaccinated.’ Under the stamp of the same Government,” says *Punch*, “which introduced the Compulsory Vaccination Act, most properly enforced under Lord Palmerston's direction, is circulated a notice, that all a person's ailings, weakness, and diseases may be attributed to vaccination! Are the people to consider, then, the Government lancet their bane—Gladstone's pill-box their antidote? We do think at least one thing—they have a right to complain of what Mrs. Partington would call the vaccinating policy of the Government!”

**SURGERY AMONGST THE TURKS.**—“More bad news of our ally, Bono Johnny,” says *The Times'* correspondent amongst the ambulances on the field of Inkermann the day after the battle; “while the wounded were being removed by some Turkish soldiers, the Russians, in accordance with their

amiable custom, sent a few shell and round shot amongst them. The Turks instantly ran away.” “The Turkish soldiers,” says another letter, “are suffering intensely from diarrhoea and typhus. The houses at Balaklava were full of dead or dying Turks, who appear totally destitute of medical assistance. Our medical men have their hands too full with their own patients and wounded Russians to be able to afford any relief to the Ottomans. The Turkish troops by their uncleanly habits have rendered Balaklava almost uninhabitable, and should the typhus, which is raging amongst them, infect the allied troops, the consequences may be awful. Cholera marches with the Turkish troops, though allowing the allies to escape. A Turkish surgeon—an old correspondent of *THE LANCET*—visited the chief London hospitals lately, and has returned with the appointment of surgeon-major to the staff of Omar Pacha; we find his name, with that of Mr. Harvey Ludlow, amongst the last arrivals.

**MEDICAL STAFF OF THE ARMY.**—It appears that, from the lists from the hospitals, the Director-General has sent out this week twelve students of experience as good dressers. It is said twenty more are already engaged to be sent out, chiefly from Guy's, St. Thomas's, Bartholomew's, &c. They are to receive 6s. 6d. per day, and for the present temporary service to rank as assistant-surgeons: their names are—Messrs. Giles, Woodfall, Pavey, Kingsley, Ewart, Watta, Elliott, Tucker, Atkinson, Baines, Bennet, Bellingham; while a large number have sent in their names.

**HOSPITAL STAFF.**—To be Acting Assistant-Surgeons: Frederick George Poulden, Gent., vice Alder, appointed to the 62nd Foot; Francis Henry Macfadin, Gent., vice Wrench, appointed to the 34th Foot; William Fleming Cullen, Gent., vice Johnston, appointed to the 9th Foot; Andrew Spittal, M.D., vice Hyde, appointed to the 14th Foot; Thomas Mines, Gent., vice Sparke, appointed to the 39th Foot; Alexander Edwin Maraden, Gent., vice Macaulay, appointed to the 46th Foot; William Carden Roe, Gent., vice Poulden, appointed to the 82nd Foot.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, DEC. 2.**—The weekly table shows a high rate of mortality in London. In the week that ended on Saturday last 1350 deaths were registered. In the ten corresponding weeks of the years 1844-53 the average number was 1118, which, if raised in proportion to increase of population, becomes 1233. The present return therefore discovers an excess of 120 above the estimated amount. The zymotic class of diseases was fatal last week to 298 persons, whilst the corrected average of corresponding weeks is 277. Diseases of the respiratory organs carried off 307 persons, the average being 262. Amongst particular diseases, scarlatina destroyed 90 lives, bronchitis 149, pneumonia 119, and phthisis 129.

Last week the births of 806 boys and 804 girls, in all 1610 children were registered in London. In the nine corresponding weeks of the years 1845-53 the average number was 1393.

At the Royal Observatory, Greenwich, the mean reading of the barometer in the week was 29.519 in. The mean temperature of the week was 38.4°, which is 3.4° below the average of the same week in 38 years. The mean daily temperature fell to 28.5° on Monday, which is 13.4° below the average, and rose to 44.4° on Wednesday, which is 2.5° above it. The highest temperature occurred on Wednesday and Friday, and was about 51.0°; the lowest on Monday, and was 25.9°. The mean dew-point temperature was 34.0°; and the difference between that and the mean air temperature was 4.4°. The wind blew nearly all the week from the south-west. The amount of rain-fall was 0.48 in., which fell on Tuesday and two following days.

## Obituary.

On the 17th ult., ZEPHANIAH BARTON, M.D., of Market Rasen, Lincolnshire, member of the Royal College of Surgeons, aged seventy-four. In recording the death of this highly-respected practitioner, who was long and intimately known to us, we are naturally led to reflect on the fact that amongst the most valuable members of society are those members of our profession who are, it may be truly said, the very life of the provincial circles in which they move. Although many of them live far away from the busy and intellectual metropolis, to which their fame hardly reaches during their lives, and although to them, when their long career of laborious usefulness has closed, nor “storied urn” nor “animated bust” are

raised, they are in reality the most effectual instruments in effecting social progress in localities where, but for them, all would languish and stagnate. All the true glories of the medical profession are unostentatious. They are founded on duties performed under every variety of circumstance calculated to depress common minds; on virtues and energies displayed in scenes of poverty and pestilence at home, and of wounds, and pain, and privation, and complicated difficulty, amongst our gallant soldiers and sailors abroad. Guns are fired, and bells are rung, and gazettes confer immortality, after many a well-fought day; and whilst those sounds fill the air, and the Gazette excites the general heart of the public, the surgeon is toiling by night and by day, bringing relief and comfort to the maimed and the dying, and saving many lives; remaining himself obscure, his good deeds seldom recorded, and seldom rewarded. In civil life it is the same. The medical practitioner is the slave of all. His meals, his rest, all his social comforts, are perpetually interrupted. In country practice, especially, he endures fatigue, encounters darkness and storm, is sent for at all hours on every capricious impulse of the rich, and never refuses a summons from the poorest. If some fierce epidemic rages, and his wealthier neighbours fly for safety, he remains to encounter every danger. And yet of all men he is the most scantily and grudgingly remunerated, the least cared for, and the most forgotten or neglected by the community and by governments. His life is a continued struggle, and if he is enabled to bring up and educate a family of children, and to die solvent, he is looked upon as a fortunate exception. Wealth seldom rewards him, and honours more seldom fall upon him. But it is still the real glory of the medical profession that its members, going forth from the great schools of practical science, become the most important auxiliaries of our fleets and armies from "Nova Zembla to the Zone," and also the most useful of men in all our towns and villages, carrying with them varied acquirements, liberality of mind, and an activity which rouses all the sleeping energies of the provinces, and contributes to the civil advancement of all the corners of the empire. To the medical practitioners of large cities, and especially of the metropolis, these reflections may seem overstrained. Those who know what country life and country practice are will not think so.

Fifty years ago, or thereabouts, Mr. Barton commenced practice at Market Rasen, then a very small town, but of which the population has nearly doubled, if not more than doubled, within half a century. He had just finished his education as a surgeon under the great teachers in the Borough, and possessed advantages which the old-fashioned apothecaries to whom he succeeded could not in their day command. Extremely well-informed, active, zealous, and skilful, he soon acquired considerable local fame. His best patients were the richer tradespeople, the wealthier farmers of the district, the clergy, the gentry, and a few of the nobility residing in the north-eastern part of the county of Lincoln. For the most part, his patients were scattered far and wide, over moor and fen, and along the bleak wolds which alone diversify the Lincolnshire landscape; and to traverse such a district at that time required a practitioner to be well-mounted, and able to ride across a difficult country, where, indeed, a steeple-ride was often better than the deep and dangerous plodding of the roads. On this kind of practice Mr. Barton entered at the active age of twenty-five; and his manner and very appearance, as well as his qualifications of every kind, gave him an immediate advantage over many a good, easy-going, well-powdered apothecary who had previously been spoiled by universal rural sway, and had grown eccentric and pedantic amidst an unreading population, before magazines and illustrated papers carried light into every parlour. The writer of this sketch well remembers Mr. Barton about that period of social transition; his slight, compact figure; his well-devised and tasteful dress, as fit for the hunting-field as for a rough professional ride over Walsby-moor or Willingham-hill; and more than all, his intellectual face, and that clear, bright, dark eye, the lustre of which remained undimmed in long after years, and only yielded to death. From the day in which he commenced practice until within about six months of his decease, his life was one of daily exertion. His professional skill, his punctuality, his liberality, and his general kindness and disinterestedness, placed him in the gratifying position of a practitioner implicitly confided in by the inhabitants of a wide circuit of country, the claims of which brought daily and nightly toil upon him, borne with a singular cheerfulness, until his frame, slowly enfeebled by advancing years, at length seemed all at once to give way to suddenly-developed disease. These professional labours did not prevent his being

actively useful in the community in which he lived. Those who were born before this century began can alone appreciate the alterations effected in society in the last fifty years: and in this era of movement and improvement let us not forget that medical men have been, in many a dull county town and market town, and village obscure, the first in the great progress, and amongst the principal leaders in all mental and moral advancement. Such was Mr. Barton. In these eventful years the bigoted or dishonest monopoly of many an endowed and drowsy, but now useful, school in the provinces has been put an end to, and the deep slumber of the smaller towns broken up. Opportunities of education have been extended to the poor; savings banks, reading rooms, mechanics' institutes, and literary societies, have made knowledge familiar to thousands of young persons who thirsted for it when no fountains were accessible to them. Unhealthy towns have been drained, dark streets lighted with gas, damp churches warmed by stoves, and sanitary amendments introduced everywhere; and the obscurest localities kept from utterly falling behind in the great march of social improvement; whilst railroads have connected all the towns and villages of our island, and contributed to diffuse a thousand benefits in thousands of places, before unthought of, or unknown. In all these movements, and through all these years, Mr. Barton was amongst the first to move in the neighbourhood in which he lived. Similar exertions, we all know, have been made by members of our profession wherever communities have stirred at all: and we ought to cherish such memories amongst those which are most honourable to us. Like most busy country practitioners, Mr. Barton seldom allowed himself any holidays; but many of his surviving friends must remember their good doctor as rejoicing, once a-year for many years, in a week's laborious drill at Lincoln with the Yeomanry Cavalry, (in which he held a commission,) under their respected colonel, Lord Yarborough. In his military duties, Mr. Barton manifested his customary alacrity, order, and punctuality; and from these military recreations he always returned refreshed to the toils of his practice. One of his last pleasures of this kind was that of witnessing a grand sham fight at Chobham, on which occasion he inspected a great part of the camp minutely, and with great satisfaction. Even at that time there were no signs of decay or decline about him.

Two years before that time, Dr. Barton (he had then taken a degree, and partly retired from the most fatiguing parts of practice) had the gratification of receiving a tribute of respect from a large circle of friends, in the shape of a salver, and a handsome pecuniary present. It had been part of his earthly lot to sustain some family sorrows, sudden, and sharp, and peculiar; all of which were borne with manly resignation. One comfort he always possessed—a happy and a loving home. To the close of his life he abated not in heart or hope; he kept himself informed of the progress of medical and general science; he maintained liberal opinions in politics, when to do so was to incur the risk of persecution, or even of ruin; and from his earliest years to the close of his life he was unostentatiously devout, and, although earnest, yet most tolerant, and truly Christian in his religious views. When at length, about the month of April or May last, he became convinced that a fatal disease had attacked him, (the result of a slight accident neglected some years before,) he at once made every preparation for discontinuing the labours and occupations of this world. This was done without the smallest affectation, and with a calmness and method and steadiness equally heroic and affecting. He made such immediate arrangements as the welfare of those justly dear to him demanded, and wrote touching letters of simple farewell to many of his oldest friends and patients. He bore still increasing sufferings, and the entire inactivity to which they compelled him, with a fortitude beyond praise; his chief anxiety seeming to be to shield those who watched him and loved him from all unavailing grief.

On the day of Dr. Barton's funeral, the business of the little town, the interests of which he had so cherished, was quite suspended, and every shop was closed. Half of the population of the place were clustered along the line of the funeral procession. The ancient and venerable church was filled with respectful and mourning townspeople. His sorrowing family, following his remains to the grave, were accompanied by the friends of many years, and by several of the gentry and clergy of the neighbourhood, amongst whom his memory will long survive.

On November 29th, at Red Lion-street, Wapping, Mr. GEORGE BETSON, M.R.C.S. 1797, aged eighty-five. He was several years surgeon of Stepney Union, a man of strict integrity, and of highly-respectable family, his father having been a practitioner in the same parish an equal number of

years as himself. For several years past he has lived in great obscurity, in receipt of parochial relief, the bounty of a few neighbours, and latterly a small annuity from the Medical Benevolent Fund.

### BOOKS RECEIVED FOR REVIEW.

A Practical Treatise on the Choice and Cookery of Fish. Second Edition.

Mr. Thomas Hunt on Syphilitic Eruptions and Ulcerations. Second Edition.

Mr. D. Tod on the Blood.

Mr. Gamgee on the Advantages of the Starched Apparatus.

Mr. J. Swan on the Brain and Mind.

Dr. Meigs on Childbed Fevers.

Mr. Foote's Practitioners' Pharmacopœia.

Mr. Blundell on Painless Tooth Extraction.

Dr. Turley on Cholera.

Dr. Muspratt's Chemistry. Part XI.

Dublin Hospital Gazette.

American Journal of Insanity.

Dr. Aickin on Cholera.

### TERMS FOR ADVERTISING.

The following is the Scale of Charges for Advertisements:—

For 7 lines and under.....	£0 4 6	For half a page .....	£2 12 0
For every additional line ...	0 0 6	For a page .....	5 0 0

Advertisements which are intended to appear in *THE LANCET* of any particular week, should be delivered at the Office not later than on Wednesday in that week.

The circulation of *THE LANCET* far exceeds that of any other Medical Journal in the world.

### TERMS OF SUBSCRIPTION TO "THE LANCET."

One Year ... ..	£1 14 8
Six Months... ..	0 17 4
Three Months ... ..	0 8 8

To be paid in Advance.

Post-office Orders to be addressed to EDWARD THOMAS, THE LANCET OFFICE, 423, Strand, London, and made payable to him at the Strand Post Office.

### TO CORRESPONDENTS.

*A Poor-Law Surgeon, and Member of the Provincial Medical and Surgical Association.*—We regret the hardship to which our friend has been exposed, and strongly advise him to forward the particulars of the case to the council at Worcester. We fear, however, that, as the Association is heavily in debt, no assistance can be rendered from that quarter. It is undoubtedly necessary, for the proper protection of the interests of Poor-Law surgeons, that a fund should exist which would enable them to oppose successfully the tyranny and injustice to which they are so frequently exposed.

*Z. The Institution for Nurses is in Devonshire-square, Bishopsgate.*

*M.D., (Liverpool).*—The subject shall be noticed next week.

### BUSTS IN THE CRYSTAL PALACE.

To the Editor of *THE LANCET*.

SIR,—It strikes me to be hardly fair in your ghostly correspondent of last week to find fault with Mr. Skey for the presence of his bust in the Crystal Palace at Sydenham. No doubt this is simply an affair of the sculptor, not of Mr. Skey. Will you allow me to suggest, through the medium of your widely-read journal, that the directors of the Crystal Palace might, with great advantage, form collections of the busts of the living and the dead of our various professions, arranging them in classes. Such collections would form a very attractive feature of the Exhibition.

December, 1864.

Your obedient servant,

CHIRURGS.

*A Sufferer.*—Advertisements laudatory of particular secret remedies are never issued by respectable members of the medical profession. Such nostrums frequently contain most deleterious articles, and are calculated to do serious injury to the constitution. The name of the vendor or proprietor being placed upon the Government stamp is a mere catch-penny mode of puffing, and no proof, as "A Sufferer" innocently supposes, that the medicine is under special Government patronage.

*A. Z.*—Berners-street, Oxford-street.

*A Civilian.*—The number of deaths in the hospital at Scutari from all causes, from the 2nd to the 14th of November, was 56. Diarrhoea proved fatal in 26 instances.

*M. J.*—At the Stockport Police Court, a miller was fined £5 and costs, for having in his possession sulphate of lime and other ingredients that might be used in the adulteration of flour.

*An Assistant-Surgeon in the Navy.*—Attention shall be directed to the subject.

*Enquirer.*—It was Dr. Lettsom who presented to the Medical Society of London the bulk of the valuable library now in its possession. He also bequeathed to them the house in Bolt-court in which the Society held its meetings for about three-quarters of a century. It was Dr. Anthony Fothergill, and not Dr. John Fothergill, who founded the celebrated Fothergillian Medal. Medical Society of London during no period of its career was in so prosperous a condition, nor contained so many fellows on its roll, as at the present time. Admission is by a ballot, on the recommendation of not less than three fellows of the Society. The entrance-fee is one guinea; the annual subscription a like sum. The library of the Society is open daily from eleven to six, and the meetings are held on every Saturday evening from the third Saturday in October to the last one in May.

*A Candidate.*—Assistant-surgeons in the navy are still, in most instances, not provided with a separate cabin.

*M.D., (Manchester).*—Unless the person holds the diploma of the Apothecaries' Company, he could not recover.

*X. Y. Z.*—Is our correspondent surgeon to the union in which T— is situated?

*Omega.*—Full particulars on all the subjects required will be found in the Students' Number of *THE LANCET*. The preliminary examination is not compulsory. Hitherto no alteration has been made respecting the apprenticeship law, which, however, is construed by the Society in a very liberal sense.

*A Subscriber, (Manchester).*—Nothing better was to be expected under the present management of the miserable print. Two letters appear in the present number of *THE LANCET*, to which we direct the attention of our correspondent.

*One who knows all about it.*—The particulars respecting the "youngest surgeon in the navy," and the job by which he effected his purpose, must be given a little more in detail before any steps can be taken in the matter.

*A Reader.*—The Society was founded in 1806 by the secession of some of the fellows of the Medical Society of London. Dr. Marcet and Dr. Yelley were the chief movers in the matter.

*N.*—Search shall be made for the paper. It shall be inserted at the first opportunity.

### PUBLICITY OF PROCEEDINGS AT BETHLEHEM HOSPITAL.

To the Editor of *THE LANCET*.

SIR,—In your leading article respecting Bethlehem Hospital, contained in last week's number, it is said—"The *Daily News* informs us that a reporter presenting himself at the last quarterly meeting of governors, was excluded on the ground that the proceedings were strictly private." Having been present when this occurrence took place, permit me to state, in explanation, why a representative of the press was not permitted to remain during the transaction of business, that it arose in consequence of an old order of the court being still in force, whereby none but governors or officers are allowed to attend on these occasions, and which regulation could not be set aside until it was repealed in the usual way, after due notice. Various governors have no objection, I feel certain, to see an account of their corporate administration regularly reported, as they can have no wish to conceal any transaction, but the reverse; whilst I know the worthy president, Sir Peter Laurie, has always been an advocate of the fullest publicity being given to everything connected with this charity. However, in order to ascertain the opinions of existing governors in reference to such questions, an influential member gave notice, before the court of last Monday broke up, that "he would move, at the next quarterly meeting in January, a resolution to admit reporters." What the above motion comes under discussion, it shall have my humble but earnest support, and I confidently hope the gentleman who brings the subject forward will be successful; since many others, besides myself, sincerely believe in chartered corporations and charitable institutions, like Bethlehem Hospital, must benefit by greater notice being taken of their management, instead of being injured by the freest inquiry.

Trusting this statement may prove satisfactory in reference to the matter proceeding, which you have properly criticised, I shall be much obliged should my communication obtain a place in your columns.

I remain, Sir, yours respectfully,

Brook-street, December, 1864.

JOHN WARRER.

*Questioner.*—Militia surgeons are not entitled to half-pay on the disembodiment of the regiments to which they belong.

*Oppressor.*—We do not think any good would arise by the insertion of our correspondent's note. Such cases as the one narrated are hard; but there must be certain laws to regulate the admission of persons into the ranks of the medical profession.

COMMUNICATIONS, LETTERS, &c., have been received from—Dr. Webster; Dr. Hastings; Dr. E. Headlam Greenhow; Mr. E. A. Tazley, (Warrington); Mr. E. W. Furness, (Mineshampston); Mr. Waddington, (Margate); Mr. Langley; Mr. Postgate, (Birmingham); Dr. Dick; Mr. W. R. Kennet, (Shirley-place, Southampton); Mr. Bodington, (Sutton Coldfield); Dr. Jas. Morris; An Assistant-Surgeon, (the Crimea); Mr. Whitaker, (New York); Mr. Rodgers; An Old Army Surgeon; A Constant Reader, (Nottingham); N.; M.D., (Liverpool); M. Cortoux; Dr. Humble; Mr. Brownridge, (Oxford); Mr. Thos. Chaplin; M. J.; A Patient, (Scutari); Mr. Black, (Chatham); Questioner; Oppressor; A Visitor to the Crystal Palace at Sydenham; Mr. Ellis; Mr. N. C. Wood, (Sutton Coldfield); Mr. C. Morgan, (Hopton, with enclosure); Dr. Pierce, (Denbigh, with enclosure); Mr. R. W. Eve; Mr. E. Andrews, (with enclosure); Medicus; Mr. J. Vincent; Alpha; I.S.A.; Mr. H. Mathias, (Maryport, with enclosure); Dr. Gosse, (Jersey, with enclosure); Mr. Theodore Hook; A Poor-Law Surgeon, and Member of the Freehold Medical and Surgical Association; Z; A Sufferer; Enquirer; A Candidate; A. Z.; A Civilian; M.D., (Manchester); X. Y. Z.; Chirurgee; Omega; A Subscriber, (Manchester); An Assistant-Surgeon in the Navy; One who knows all about it; A Reader; &c. &c.

# MEDICAL BENEVOLENT COLLEGE.

OFFICE, 37, SOHO SQUARE.

President.

THE RIGHT HONOURABLE THE EARL MANVERS.

Trustees.

JAMES A. WILSON, M.D.

ROBERT LEE, M.D., F.R.S.

WILLIAM FERGUSSON, Esq., F.R.S.

JOHN BACOT, Esq.

BENJAMIN PHILLIPS, Esq., F.R.S.

Treasurer.

JOHN PROPERT, Esq., 6, New Cavendish-street.

The Council of the MEDICAL BENEVOLENT COLLEGE cannot issue the accompanying List of Donations and Subscriptions, received since May last, without recording their heartfelt gratitude to all those who, by word and deed, have seconded their endeavours. If the Council possessed no other evidence of the value and importance of the Institution than the present List, it would suffice to assure them of success. The Council can have no hesitation, therefore, in urging those members of the Profession who have not yet responded to the call, for their own sakes, and for the sake of future generations, to become contributors to an Institution which promises to be an enduring monument to the present age.

The little that is now required to enable the Council to open this much-needed Institution in JUNE next, they confidently anticipate will be made up by those of their brethren who have not contributed.

AMOUNT PREVIOUSLY ADVERTISED ... .. £23,670 17 0

Donors of TEN GUINEAS are Life Governors of the College; Subscribers of ONE GUINEA Annually are Governors during the continuance of their Subscription.

Gentlemen desirous of acting as Honorary Local Secretaries in behalf of the College would oblige by communicating with the Secretaries, at the Office, 37, Soho-square, where Subscriptions are received; and by the Treasurer, John Propert, Esq.; also by the following Bankers:—Goslings and Sharpe, 19, Fleet-street; Coutts and Co., 59, Strand; Drummonds, Charing-cross; Glyn and Co., 67, Lombard-street; Scott and Co., 1, Cavendish-square; Hoare and Co., Fleet-street; the Union Bank of London, Regent-street Branch; Messrs. Williams, Deacon, Labouchere, and Co., Birchin-lane; and by Cunliffe and Co., Manchester.

By order of the Council,

EDWARD HENRY SIEVEKING, M.D. *Hon. Sec.*  
HERBERT WILLIAMS, *Assistant-Secretary.*

Office, 37, Soho-square, Dec. 6th, 1854.

\* \* The THIRTEENTH LIST will be published early in MARCH next.

**Recherche Wines.—Sherry: A very**  
 fine Sherry, (Amontillado and Montilla, Brown and Pale, for Cash, at 4s. per dozen; 42s. per quarter-cask; 42s. per hoghead; 42s. per butt.  
 Port.—Very fine old dry Wine (Vintage 1827, 1830, 1832, 1834), lately imported: from the Wood at 4s. 5s., 6s., and 8s., per dozen.  
 First Class Champagne (Ay, Arise, Pierry, Verzenay, and Sillery,) Sparkling and Still Moselle, Sparkling, Still, and Red Hocks, and Bordeaux Wines, at very moderate prices.  
 These Wines are patronized and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples and List of Prices forwarded on application.  
 H. H. HAMMICK, Importer, 11, Pall-mall, London, opposite the Travellers' Club."

**Allsopp's Pale Ale in Bottle, as**  
 supplied to the CRYSTAL PALACE; also in casks of 18 gallons. Recommended by BARON LIEBIG.  
 Address, HARRINGTON PARKER and CO., 54, Pall-Mall, London.

**Pale India Ale and Stout, 4s. 6d.**  
 per dozen quarts; 2s. 6d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts. Delivered free within four miles of London, and carriage free to all railway stations in England at 6d. per dozen extra.  
 WOOD & WATSON, 16, Clement's-lane, City.

**Allsopp's Pale Ale.—Medical gentle-**  
 men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTY, wine and beer merchant, 132, Upper Thames-street.  
 The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1852, No. 20, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTY, 132, Upper Thames-street, London.

**Oysters.—Chaloner and Co., 43, Bell-**  
 yard, Temple-bar, still continue to supply the BEST NATIVE OYSTERS at 6s. per Barrel.—Established upwards of fifty years.—Fish of every description forwarded to order.

**Soyer's Aromatic Mustard.—"M."**  
 Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration.—THE LANCET.  
 Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

**Pure as well as Fine Tea.—**  
 Tea, when pure, is well-known to produce a most wholesome beverage; the impolicy of allowing it to be coloured by the Chinese is fully set forth by the Analytical Sanitary Commissioners, in THE LANCET, and also in THE TIMES, (October 6th, 1852.) The fact, therefore, is now familiar to most, that artificial colour is used to give the Spring crop and the spent Autumn gathering the same appearance. If this practice were discontinued, a twofold benefit would arise; first, the fine qualities would have all the fragrance and strength unimpaired; and, secondly, the inferior faded leaves could not then be passed off as good, causing the flat, insipid infusion, so frequently the subject of complaint. The uncoloured Tea imported from China, by HORNUMAN and CO., London, is perfectly pure; the Green, from the absence of the usual artificial colouring, is of a natural olive hue. The Black, and also the Green, are exclusively of the Spring product from young and vigorous plants, which yield not only more strength, but the full degree of fragrance which FINE TEA, when purely natural, and seasonably selected, alone possesses; ONE TRIAL induces a continued preference. The prices are REDUCED:—  
 Finest Congou, 3s. 8d. Finest Lapsang Souchoing, 4s. and 4s. 8d.  
 Fine and Pure Green, 3s. 8d., 4s., and 4s. 8d.

HORNMAN and CO., Wormwood-street, London, Importers of the most approved Tea in general use, but free from the objectionable artificial colour on the surface.

Agents in London, PRESSELL, 80, Cornhill; and ELPHINSTONE, 227, Regent-street, and 368, Oxford-street.  
 Sold by authorized Firms in all Towns, in 1 lb., ½ lb., and ¼ lb. packages only

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

**Robinson's Patent Barley, for making**  
 superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.  
 ROBINSON'S PATENT GROUTS, for more than thirty years, have been held in constant and increasing public estimation as the purest farinæ of the oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.

The proprietors of ROBINSON'S PATENT BARLEY and PATENT GROUTS, desiring that the public shall at all times purchase these preparations in a perfectly sweet and fresh condition, respectfully inform them that every packet is now completely enveloped in the purest Tin-foil, over which is the usual and well-known paper wrapper.

Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets at 6d. and 1s., and in Family Cansisters at 2s., 5s., and 10s. each.

**Water Filter for the Pocket, with**  
 DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.  
 J. SOLOMON, Wholesale Optician, and Photographic Depot, 22, Red Lion-square.

**Anatomical and Dental Repository,**  
 45, Museum-street, Bloomsbury, London.—JOHN HARNETT begs most respectfully to call the attention of Lecturers, Students, and Gentlemen connected with the Medical Profession, to his large and select Stock of Anatomical Preparations, consisting of Skeletons, loose and articulated Skulls, Hands and Feet, Vertebrae, and Loose Bones, at the lowest possible prices.

**Poultices superseded by the use of**  
 MARKWICK'S PATENT SPONGIO PILINE.  
 As a substitute for common poultices and fomentations, the superiority of this article is unquestionable. It is strongly recommended by the most eminent of the Faculty for its cleanliness, economy, lightness, and general efficacy, and is now used in several of the hospitals. Also Markwick's Patent Piline, for Cholera Belts, Rheumatism, Chest Protectors, Respirators, Lumbrago, &c.  
 Sold, retail, by Chemists and Druggists, and wholesale only by GEORGE TRIMBEY, 41, Queen-street, Chancery-lane.

**Ford's Eureka Shirts.—Patterns**  
 of the new Coloured SHIRTINGS in every variety of colours. Upwards of 200 different Patterns for making FORD'S EUREKA SHIRTS, sent post free on receipt of six postage stamps. Price 37s. the half-dozen.  
 FORD'S WHITE EUREKAS, best quality, Six for 40s.; second quality, Six for 31s.; if washed ready for use, 2s. extra.  
 CAUTION.—Ford's Eureka Shirts are stamped "38, POULTREY, LONDON," without which none are genuine.  
 Catalogues with particulars post free.  
 RICHARD FORD, 38, POULTREY, LONDON.

**The 16s. Trousers reduced to 14s.—**  
 Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

**R. T. Pigram, Practical Tailor, and**  
 Inventor of the Indicator of the Human Figure, whereby a perfect fit is secured, respectfully invites the attention of the public to his mode of art, since none can doubt the importance of an easy and exact adjustment of wearing apparel. Superior Trousers at 17s. 6d. per pair.  
 R. T. PIGRAM, 51, Lamb's Conduit-street, Foundling Hospital.

**Overcoats, Capes, &c., at W. Berdoo's,**  
 96, New Bond-street, and 69, Cornhill, one of the largest stocks in London. Superior garments at reduced charges. Shooting Jackets. Berdoo's well-known Light Overcoat, for all seasons, (price 46s.) Ladies' Cloaks, Mantles, Habits, &c., all made thoroughly impervious to rain, without obstructing free ventilation, and without extra charge; or made to order at a day's notice.

TO THE NOBILITY, CLERGY, AND GENTRY.  
**Walker Babb's Two-Guinea Coats,**  
 One-Guinea Trousers, and Half-Guinea Vests, made from Welsh, Scotch, and Irish Wools, in their pure state. Will stand any wear, and can be worn in any climate. For Fishing and Shooting nothing can equal them. The Black Tweed is well adapted for Clergymen's Riding Trousers. Waterproof Pocket Coats and Capes, Box Coats, Liveries, &c. &c.  
 DOYLEY'S SCOTCH WOOLLEN WAREHOUSE, 346, Strand, opposite Waterloo-bridge.

**Assistant-Surgeons.—Gentlemen**  
 receiving Medical Appointments in the Army, Navy, or H.E.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at  
 L. PHILLIPS, 28, WEST STRAND, LONDON,  
 the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, and every necessary information, may be obtained on application.

THE SYDENHAM TROUSERS.  
 17/6

**Samuel Brothers,**

29, LUDGATE-HILL,

Inventors and Sole Manufacturers of the

SYDENHAM TROUSERS, at 17s. 6d.,

Unequalled for superior style, fit, quality, perfect ease, and gracefulness, so requisite for gentlemanly appearance, and so rarely obtained.

Patterns sent free on application.

SAMUEL BROTHERS' Stock of OVERCOATS for the present Season is worthy of your inspection.

AT THE CRYSTAL PALACE.

**"The Duobus," a cheap close Carriage**  
for a "Country Practice," having all the comfort and convenience of a Broussam, with the weight of an ordinary Gig. Price £42. This Carriage can be seen at the new Crystal Palace, and sketch and particulars obtained on application to T. R. Starey, Coachmaker, Nottingham.

**Metcalf and Co.'s New Pattern**  
TOOTH-BRUSHES, PENETRATING HAIR BRUSHES, and SMYRNA SPONGES. The tooth-brush searches thoroughly between the divisions of the teeth, and cleanses them in the most effectual manner. The hair brushes are made of genuine unbleached Russian bristles, which do not soften like prepared hair. With every description of brush, comb, and perfumery for the toilet.—At METCALFE, BINGLEY, and CO.'S only establishment, 130 B and 131, Oxford-street, second and third doors west from Holles-street. Metcalfe's Alkaline Tooth Powder, 2s. per box.

**Metal Bed-Pan,**  
Price 6s.—Acknowledged to be the most convenient in form, and much more durable than any now in use.

To be had of the Manufacturer, J. LAWRENCE, 20, Great Charlotte-street, Blackfriars; of Messrs. Gale, Baker, Warde, and Oldfield, Bouverie-street, Fleet-street; and of Messrs. Leadbitter and Hollon, York.

Orders from the Country must be accompanied by a Remittance.

**Gas-heating Apparatus.—H. Mather**  
begs to call attention to his GAS-COOKING STOVES, which will cook dinner for Twenty Persons at a cost of Fourpence.—Gas Gridirons, Broiling and Boiling in Five minutes.—Small Stoves to Boil and Fry, which can be put anywhere, Eight Shillings each.—Gas Stoves for Operative Chemists, Jewellers, and all purposes where heat is required.—Manufactured on the premises at 76, GRAY'S-INN-LANE, LONDON.

N.B.—Gas-fitting done in all its branches.

**Ten Thousand Stoves.—The Tenth**  
Thousand of the PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, and CO., 46, King William-street, London-bridge, and may be obtained of most ironmongers. The Improved Patent Ventilating Stove, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded, post free.

**Exhibition Stove—Rettie's Patent**  
ECONOMIC.

CAUTION.—Several Medals were given for piracies on the above Stove. E. M. and M. BETTIE can forward to Scotland or Ireland, or any part of England, the above, suitable for CHURCHES, Hospitals, Private Buildings, Drying-rooms, Manufacturing purposes, Ships, Hot-houses, &c. Prices from £3 3s. to £20 each, burning only from two lbs. to eight lbs. of coal per day, and warming buildings from six to thirty rooms, and no pipes required throughout the building, nor risk of fire—giving a pure, warm air, and aiding the ventilation; as now used in Her Majesty's Treasury, Royal Mint, Tithe Commissioners, the Arctic Vessels, and in Churches, Prisons, Schools, Public and Private Buildings.

All communications, post-paid, to Mr. Bettie, Consulting Engineer, (by letter), 7, Brompton-road, (stamp enclosed,) when Circulars of the newest improvements for Curing damp Houses and Smokey Chimneys. Sanitary Inventions in Self-acting Sewer-traps, Kitchen-sinks for streets and buildings—the only means for preventing Cholera and Fevers.—The New "Nonpareil Gas Burners."

**Warming and Ventilating by Hot**  
AIR, CHURCHES, HOSPITALS, TOWN-HALLS, and other PUBLIC BUILDINGS.—J. BOILESSVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

4, Leadenhall-street, London, May 6, 1854.

DEAR SIR,—I have great pleasure in testifying to the value of your Calorifere, or Heating Apparatus, on the score of *economy and utility*; it combines *warmth and purity of atmosphere*, and is a vast improvement on our present absurd system of putting a current of cold air over our bodies, to be warmed in our fire-places, and then to be wasted up our chimneys.

No doubt your Calorifere will soon be used for our conservatories and green-houses, and most likely for *warming our cattle, and drying our corn*. I find no difficulty in warming our upper rooms by your Calorifere.

I am, dear Sir, your obedient servant,

To J. Boilessve, Esq.,  
55, King William-street, City, London.

J. MCHIE.

**Purification of Linen—Prevention of**  
DISEASE.—J. BOILESSVE, 55, King William-street, City, London, solicits the attention of the Nobility and Gentry to his CALORIFERE for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

69, Marylebone-lane, London, Feb. 2nd, 1854.

SIR,—I have much pleasure in informing you, that I am entirely satisfied with the performance of your No. 3 Calorifere, lately put up for *warming my manufactory*; it has been in operation for a month, and I believe it to be the *best and most economical* means of drying yet invented, and particularly suited to my business, as there is no dust arising from its use, as there is from the old stoves. The consumption of coke is about one basket per day.

I am, Sir, yours truly,

SAMUEL HUBERT,

To J. Boilessve, Esq. Firm of JOHN WOOLLANS and Co., Paper-stainers,

**Classics and Mathematics.—A**

Graduate of Oxford in Classical Honours, who has passed numerous Pupils for the different Medical Examinations, prepares Gentlemen in a short time for the Hall, Matriculations, Fellowships, &c. References kindly permitted to Dr. Power at Exeter-hall, and many old Pupils. Address, B. A., Somerset-house Chambers, 151, Strand.

**The following Works have been**

selected by the Examiners for the Examination in Logic and in Moral and Intellectual Philosophy, for the Degree of DOCTOR OF MEDICINE, in the year 1855.—

LOGIC.—Bacon's Novum Organum, Part I.

PHILOSOPHY OF THE MIND.—Cousin's Analysis of Locke's Essay (being the third volume of his Cours de Philosophie).

MORAL PHILOSOPHY.—Butler's Analogy, Part I. Stewart's Outlines of Moral Philosophy.

By order of the Senate,

Marlborough House, Dec. 1854.

R. W. BOWMAN, Registrar.

**Blenheim Street Free Dispensary.—**

Vacancies having occurred in the offices of PHYSICIAN and SURGEON at the above Institution, Candidates are requested to send their applications and testimonials, on or before the 1st of January, 1855, to N. Bennett, Esq., Honorary Secretary, No. 7, Finsbury Inn.

**Manchester Royal Infirmary and**  
DISPENSARY, LUNATIC HOSPITAL or ASYLUM.

In consequence of the Board having determined to appoint two House-Surgeons to these Charities in future, WANTED, an unmarried Gentleman to fill the office of one of the HOUSE-SURGEONS. Every candidate for the office will be required to produce a Diploma from the Royal College of Surgeons in London, Edinburgh, or Dublin, and a License from the Worshipful Society of Apothecaries in London. He must make an engagement for twelve or eighteen months. No salary is given, but the whole Medical and Surgical Practice of the house will be open to him; and he will be provided with board and lodging in the Infirmary.—Letters from candidates, together with the Diplomas and Testimonials, are to be sent free of postage, on or before Saturday, the 16th of December next, addressed to the Secretary. By order of the Board,

ROBERT THORPE RADFORD.

November 23rd.

**Northern Dispensary, No. 9, Somers'**

PLACE WEST, NEW ROAD.—At a Meeting of the Committee held at the Dispensary on the 6th December, 1854, it was resolved unanimously, that the Honorary Secretary should cause the following resolution, passed by the Committee on the 1st November last, to be published in *The Times*, *The Lancet*, and *The Medical Times*, and *Gazette*.

Moved by JOHN SAIT, Esquire, Chairman, and seconded by NATHANIEL WATHER, Esquire, and resolved unanimously,—

"That the Committee in accepting the resignation tendered by Dr. DOLTON, of the office of Resident Medical Officer, which he has so long and so meritoriously filled, desire to record the sense they entertain of the invaluable services which he has rendered to the Dispensary during the fifteen years that he has been connected with it. Having regard to those services, it is not too much to say that the extraordinary exertions, zeal, and ability which he has at all times displayed in executing the duties of his office have greatly contributed to the prosperity of the Institution, the successful carrying out of the benevolent intentions of its supporters, and the efficient relief of the physical suffering of the objects of its bounty.

"In the prosecution of his profession Dr. Dolton carries with him the best wishes of the Committee that the most eminent success may attend his exertions."

JOHN CABLEY, 31, Guildford-street, Russell-square,  
Honorary Secretary.

**School for the Sons of Medical Men,**

CLERGYMEN, OFFICERS OF HER MAJESTY'S ARMY, NAVY, AND CIVIL SERVICE, &c.

ST. JOHN'S FOUNDATION-SCHOOL, Greville-mount House, Kilburn, London. (The Foundation is confined to the Sons of Clergymen of limited income.)

Head Master—The Rev. Anthony F. Thomson, B.A. Lincoln College, Oxford, (eldest surviving son of the late Dr. Anthony Todd Thomson, of University College, London.)

Mathematics—Gowan Evans, Esq., M.A. Lincoln College, Oxford.

German—U. Green, Esq., (Neuwied College, Coblenz.)

French—Hy. Poltvein, Esq., (Paris.)

Music—Dr. Charles Steggall, Trinity College, Cambridge; Professor of the Royal Academy of Music, London.

The system of this School is particularly adapted to prepare Boys for the Medical Profession, the Army, whether Line or Artillery, the Navy, and Civil Service.

The Terms for the Sons of Medical Men are:—Boys under Fourteen years of age, £40 per annum. Above Fourteen, the terms vary with the age. The terms include everything except books.

A Prospectus, with full details, may be had on application to the Head Master, at the School.

**Microscope Wanted.—Any person**

having a modern MICROSCOPE by a good maker, adapted for Pathological Researches, may hear of a purchaser by addressing, A. Z. Mr. Benson's, Printer, 134, Fenchurch-street.

**Dissecting and Post-Mortem Instru-**

MENTS, New and Second-hand. Surgical Instruments of the best description; A. URE'S New Urethrotome for Stricture; New Uterine Compress; Newly Improved Pessary; Instruments for Army and Navy Surgeons; DARTNELL'S Patent Truss; Trusses for Union Surgeons; ENEMA SYRINGES; New Syphon Enema, as supplied to the Army; New Spinal Machine, pronounced the best ever invented.—at

PRATT'S, Surgical Instrument Maker, 420, Oxford-street.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS.

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.

Office hours from 12 till 4.

**Lunatic Asylum.—An immediate**

Purchaser required for an Establishment of excellent repute, without opposition, most advantageously situated in a Midland County. Time being an object to the vendor, £1000 will be accepted for goodwill and valuable lease, being considerably less than the estimated value, with furniture and fixtures at a valuation.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

**A General Practice, strictly private,**

only four years established, in a new Northern Suburb of London, but from which the cash receipts already exceed £400 per annum, may be purchased, with entire Profit from the day of entry, for £350. The necessary introduction given. Rent, £34.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

TO THE PROFESSION.

**Mr. Bowmer, M.R.C.S. Eng., 50,**  
LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendants from 11 till 4.

**An M.R.C.S. and L.S.A. of consider-**

able experience, aged thirty, is desirous of a Re-engagement as Out-door ASSISTANT to a Practitioner in London or the Suburbs.—Address H. O., Mr. Walker's, Chemist, 1, Harleyford-place, Kennington-common.

**Medical Practice.—A duly-qualified**

Medical Man may succeed to the Nucleus of a Country Practice by the outlay of £120 for furniture, drugs, &c.—For particulars address to L.S.A., THE LANCET Office, 423, Strand.

**Wanted immediately, by a General**

Practitioner, a Dispensing ASSISTANT. Satisfactory references required. A liberal salary will be given.—Apply to John Arthur, 164, High-street, Shadwell, London.

**Wanted, an Out-door Assistant, to**

Visit and attend Midwifery. One who is L.A.C. or M.R.C.S. preferred, but no objection to a Student who has attended two sessions, and has had experience in Midwifery. Salary, £80 or £100 per annum, according to the qualifications.—Address, Dr. Vincent, East Dereham, Norfolk.

MEDICAL.

**A Gentleman, aged 28, whose pre-**

sent Engagement as an Out-door Visiting and Dispensing ASSISTANT will shortly terminate, desires a similar Re-engagement.—Address, Alpha, Grendon House, Atherstone, Warwickshire.

MEDICAL.

**Wanted, a full qualified Assistant,**

to take charge of a Branch Practice in the country. One accustomed to Union Practice would be preferred.—Address, post-paid, Medicus, Post-office, Haverhill, Essex.

TO SURGEONS AND CHEMISTS.

**To be Sold, the Stock and Fixtures**

of a handsomely fitted-up CORNER SHOP, in one of the best neighbourhoods in the metropolis, conducted for many years by qualified practitioners. Price, £90, or if preferred, at a fair valuation.—Address, Medicus, Mr. Wettone's, 213, Oxford-street.

**A Medical Gentleman (married)**

residing in the Country, who has been engaged in General Practice for many years, at home and abroad, wishes for some active Employment. He would not object to engage as an ASSISTANT, in or out of doors, with a Medical Gentleman in full Practice in London or the Country. The salary required would be about £150 per annum. Unexceptionable testimonials and references will be given.—Apply to W. Markland, Esq., 2, Billiter-square, City.

**To the Medical Profession.—To be**

Disposed of immediately, by private treaty, at Northwich, Cheshire, in consequence of the decease of the Proprietor, the Stock, Surgical Instruments, Fixtures, &c., of a Surgeon, together with a large Collection of Valuable Surgical Books, if required. Any Gentleman wishing to Commence Business will find this well worthy his attention, the late proprietor having had an extensive Practice for the last eleven years.—For particulars, and to treat for the same, apply to Mrs. Weston, Northwich; or to Mr. Thompson, Chemist, 12, Church-street, Liverpool.

**Medical Transfer and Partnership.**

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**

and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to relinquish, (either wholly or in part,) and also to those about commencing practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

**Brighton.—A most favourable oppor-**

tunity is now presented (in consequence of the recent death of the proprietor) to a Surgeon wishing to combine the Retail in a densely populated neighbourhood. The Shop is prettily fitted-up, house comfortable and new, with private entrance. Rental very low. This is worthy the notice of an energetic man with small capital.—Apply, Mr. ORRIDGE, 30, Bucklersbury, London.

**An Assistant required by a Gentle-**

man in Private Practice, to Dispense and Visit in the absence of the Principal.—Apply to E. May, Esq., Mount-place, London Hospital.

TO MEDICAL GENTLEMEN.

**A Gentleman is desirous of placing**

his Son, of the age of eighteen, an Idiot, under the permanent Care of a Medical Gentleman.—Apply by letter, stating terms, to Z., at Mr. Salter's Library, New-street, Dorset-square.

**An M.R.C.S. Eng., L.A.C., aged 26,**

is desirous of obtaining a Situation as In-door ASSISTANT to a Practitioner in Town, or to take charge of an Open Surgery.—For testimonials and references address, O. P. Q., THE LANCET Office, 423, Strand, London.

TO SURGEONS, CHEMISTS, DRUGGISTS, &c.

**Saint John's Wood.—To be Let, a**

first-rate SHOP in the above populous and improving neighbourhood, suitable for the above Business, and where every facility for Opening will be given by the Landlord.—Apply at Mr. Thomas' House and Estate Agent 1A, Circus-road, St. John's-wood.

TO CHEMISTS, DRUGGISTS, AND STATIONERS.

**To be Disposed of immediately, upon**

very advantageous terms, a Business in the above line. Apply, either personally or by letter, pre-paid, to Mr. C. Foster, Draper, &c., Thaxted, Essex; and Messrs. Drew and Co., Bush-lane, Cannon-street, London.—N.B. Stamp Office and Newspaper Agency attached.

MEDICAL.

**A Married Medical Man, aged 40,**

qualified, wishes to meet with an Engagement as Out-door Visiting, or Visiting and Dispensing ASSISTANT, or to take the charge of a Branch Practice. Can produce high testimonials as to moral character and professional ability.—Address, by letter, stating salary, &c., to Medicus, Post-office, Dewsbury, Yorkshire.

MEDICAL.

**Wanted, by a Gentleman, 40 years**

of age, an in or Out-door Situation (in London or the Suburbs) as Visiting and Dispensing ASSISTANT; he is well acquainted with every branch of the Profession, and having lived many years with the first Practitioners, can produce excellent testimonials as to character and competency.—Address, D. L., Post-office, Erith, Kent.

TO SURGEONS AND CHEMISTS.

**A Young Gentleman wishes for an**

Engagement to Dispense for a Surgeon within about two miles of the Middlesex Hospital, and would consider board and lodging, with an hour or two to attend Lectures, as remuneration. Has been accustomed to Visit. An Engagement with a Chemist not objected to.—Address, E. C. B., Middlesex Hospital.

**Salisbury Infirmary.—Wanted, a**

DISPENSARY MAN, who will be required to make himself generally useful, under the direction of the House-Surgeon. Salary £20 per annum, with £5 gratuity, at the discretion of the Annual Court. He will be boarded with the other Servants, and provided with lodging and washing in the House. No Married Person need apply. All applications to be made, and Testimonials sent, to the House-Surgeon, on or before Saturday the 16th inst. December 2nd, 1854.

CHARLES H. RADCLIFFE, Secretary.

**House-Surgeon Wanted to the Car-**

DIFF INFIRMARY. He must be a Member of the College of Surgeons of London, Edinburgh, or Dublin, and a Licentiate of Apothecaries' Hall, London. Salary, £100 per annum, with apartments in the house, coal, and candles.—Testimonials and applications to be addressed to the Committee of the Glamorganshire and Monmouthshire Infirmary, care of Mr. Granger, at the Cardiff Infirmary. The Election will take place on Thursday, fourth day of January, 1855.

Now ready, on India paper, price 10s. 6d.

**Pathological and Surgical Observa-**  
TIONS: including an Essay on the Surgical Treatment of Hemorrhoidal Tumours. By HENRY LEE, F.R.C.S., Surgeon to the Lock Hospital.  
London: John Churchill, New Burlington-street.

Just published, 8vo, cloth, 12s. 6d.

## Aural Surgery, and the Nature and Treatment of Diseases of the Ear. By W. R. WILDE, F.R.C.S.I.

Surgeon to St. Mark's Hospital.  
"We have no hesitation in expressing our opinion, that the book is by far the best treatise on 'Aural Surgery' which has yet appeared in any language."—MEDICAL TIMES AND GAZETTE.

"A very excellent work, which we have placed on our shelves beside other standard treatises, the works of good, clear-headed, observing men, not 'specialists,' but sound, scientific practitioners, entitled to the confidence of the Profession."—ASSOCIATION MEDICAL JOURNAL.

"Of this valuable monograph we may most unhesitatingly say, that it will fill a void in our medical literature which has long been felt, and which no work published in this country has ever been adequate to fill. It is emphatically a good book."—PHILADELPHIA MEDICAL EXAMINER.

"Practitioners who occupy themselves with diseases of the Ear, will find here the most useful information on this branch of Pathology."—ANNALES D'OCCULTISME.

London: John Churchill, Dublin: Fennin and Co.

WORKS BY MR. COULSON,  
SURGEON TO ST. MARY'S HOSPITAL.

## On Lithotritry and Lithotomy; with Engravings on Wood. 8vo, cloth, 6s.

"The most complete monograph upon the subject which has yet appeared in our language."—ASSOCIATION MEDICAL JOURNAL.

II.

ON DISEASES OF THE BLADDER AND PROSTATE GLAND. The Fourth Edition, revised and enlarged. 8vo, cloth, 10s. 6d.

"Mr. Coulson's work may be stated to be full and practical, to fill a vacant space in medical literature, and to be highly valuable to both students and practitioners."—MEDICAL TIMES.

"The practical and comprehensive character of Mr. Coulson's volume claims for it a place in the library of every surgeon who desires to be on a level with modern improvements."—LONDON JOURNAL OF MEDICINE.

London: John Churchill, New Burlington-street.

WORKS ON CHEMISTRY.

## The Use of the Blowpipe. By Pro- fessors PLATTNER and MUSPRATT. Third Edition, 8vo, cloth, 10s. 6d.

HANDBOOK OF CHEMISTRY: Theoretical, Practical, and Technical. By F. A. ABEI, F.C.S., Chemist to the Board of Ordnance; and C. L. BLOXAM, Demonstrator of Practical Chemistry in King's College. 8vo, cloth, 15s.

FOWNES'S MANUAL OF CHEMISTRY. Edited by H. BENICE JONES, M.D., F.R.S.; and A. W. HOFMANN, Ph.D., F.R.S. Fifth Edition, fcap. 8vo, cloth, 12s. 6d.

CHEMISTRY, AS EXEMPLIFYING THE WISDOM AND BENEFICENCE OF GOD. By GEORGE FOWNES, F.R.S. Second Edition, fcap. 8vo, cloth, 4s. 6d.

PRACTICAL CHEMISTRY; INCLUDING ANALYSIS. With numerous Illustrations on Wood. By JOHN E. BOWMAN, Professor of Practical Chemistry in King's College, London. Second Edition, fcap. 8vo, cloth, 6s. 6d.

By the same Author,

MEDICAL CHEMISTRY. With Illustrations on Wood. Second Edition, fcap. 8vo, cloth, 6s. 6d.

INSTRUCTION IN CHEMICAL ANALYSIS. By C. REMEGIUS FRESENIUS. Edited by LLOYD BULLOCK.

QUALITATIVE. Third Edition, 8vo, cloth, 9s.

QUANTITATIVE. Second Edition, 8vo, cloth, 15s.

THE FIRST STEP IN CHEMISTRY. By ROBERT CALDWELL. Post 8vo, cloth, 3s.

By the same Author,

A MANUAL OF QUALITATIVE ANALYSIS. Post 8vo, cloth, 4s.

CHEMISTRY OF THE FOUR SEASONS: SPRING, SUMMER, AUTUMN, WINTER. Illustrated with Engravings on Wood. By THOMAS GRIFFITHS. Second Edition, fcap. 8vo, cloth, 7s. 6d.

London: John Churchill, New Burlington-street.

Just published, with Illustrative Woodcuts, 8vo, 19s. 6d.

## A Disquisition on Certain Parts and PROPERTIES OF THE BLOOD. By DAVID TOD, M.R.C.S.

London: John Churchill, New Burlington-street.

Just published, 8vo, cloth, 5s.

## Lettsomian Lectures on Insanity; delivered at the Medical Society of London, by FORBES WINLOW, M.D., D.C.L., late President of the Society.

"The Lectures are three in number, each being highly interesting and suggestive. The first is devoted to a treatise on the Psychological Vocation of the Physician, in which is vividly described how great is his responsibility; the second refers to the Medical Treatment of Insanity; and the third, to the all-important subject of Medico-Legal Evidence in cases of Insanity. This with the other two, contains an amount of matter invaluable of its kind, and well worthy of its eminent writer, whose untiring labours in promoting the increased well-being and welfare of the insane entitle him to hold a high rank amongst the philanthropists and bright lights of the age."—DUBLIN QUARTERLY JOURNAL OF MEDICAL SCIENCE for November.

London: John Churchill, New Burlington-street.

Just published, fcap. 8vo, cloth, 6s.

## Clinical Lectures on Paralysis, DISEASE OF THE BRAIN, and other AFFECTIONS OF THE NERVOUS SYSTEM. By ROBERT BENTLEY TODD, M.D., F.R.S., Physician to King's College Hospital.

"Every practitioner of medicine should make himself master of the present series of Lectures, which will render him more capable to understand and treat a formidable class of diseases of every-day occurrence."—ASSOCIATION MEDICAL JOURNAL.

London: John Churchill, New Burlington-street.

Just published, Second Edition, revised and enlarged, post 8vo, cloth, 6s.

## On the Physical Diagnosis of the DISEASES OF THE LUNGS AND HEART. By HERBERT DAVIES, M.D., Physician to the London Hospital; Senior Physician to the Royal Infirmary for Diseases of the Chest.

London: John Churchill, New Burlington-street.

Just published, 8vo, cloth, 5s.

## On the Examination of Recruits;

intended for the Use of Young Medical Officers on Entering the Army.

By H. H. MASSY, A.B., M.D., 4th Light Dragoons.

London: John Churchill, New Burlington-street.

Just published, Second Edition, price One Shilling.

## On Syphilitic Eruptions, Ulcerations, AND OTHER SECONDARY SYMPTOMS, WITH ESPECIAL REFERENCE TO THE USE AND ABUSE OF MERCURY. By THOMAS HUNT, F.R.C.S., Surgeon to the Western Dispensary for Diseases of the Skin.

London: John Churchill, New Burlington-street.

Just published, 8vo, price One Shilling.

## Painless Tooth-Extraction, without CHLOROFORM; with Observations on Local Anæsthesia by Conge- lation in General Surgery. By WALTER BLUNDELL, Surgeon-Dentist.

London: John Churchill, New Burlington-street.

On the 1st of December was published, No. 163, price One Shilling.

## The Pharmaceutical Journal,

Containing the

TRANSACTIONS OF THE PHARMACEUTICAL SOCIETY.

## HIGHLEY'S MICROSCOPICAL COLLECTIONS. ADAPTED FOR CHRISTMAS GIFTS.

Professor Quekett's Pocket

DISSECTING MICROSCOPE, with 1-inch,  $\frac{1}{2}$ -inch, and  $\frac{1}{4}$ -inch lenses, mirror, &c. Size,  $5\frac{1}{2}$  inches square by  $1\frac{1}{2}$  deep, when packed, price  $\pounds 11$  11s. 6d.

COMPOUND BODY for the above, in box, to render it a TRAVELLING Microscope,  $\pounds 2$  2s.

HIGHLEY'S HOSPITAL MICROSCOPE, on Tripod Stand, Inclined Body, large Double Sliding Stage with Daphragm, Plain and Concave Mirror, Fine and Sliding Coarse Adjustment to Body, Huyghenian Eyepiece, with Adapting-piece for Ross's, Smith and Bolk's, or Powell and Lealand's Object-glasses.  $\pounds 4$  4s. With Rackwork Coarse Adjustment, &c. With Rackwork MOVABLE STAGE, &c.,  $\pounds 7$  7s.

\*. This instrument combines economy with simplicity, elegance of form, and excellence of workmanship.

UPRIGHT MAHOGANY CABINET, with Fittings for Highley's Hospital Microscope, 16s. and 36s.

ACHROMATIC OBJECT-GLASSES for Highley's Hospital Microscope and Quekett's Travelling Microscope, in brass boxes, 1-inch,  $\frac{1}{2}$  1s.;  $\frac{1}{4}$ -inch,  $\pounds 1$  5s.;  $\frac{1}{8}$ -inch,  $\pounds 1$  11s.

HIGHLEY'S ACHROMATIC GAS MICROSCOPE LAMP, with Reading Shade and Mounting Apparatus. Constructed to correct the yellow, glaring, and injurious light of the ordinary Gas-Lamp, as described in the Quarterly Journal of Microscopical Science, Part II., p. 142, and Quekett on the Microscope, p. 499. In bronze,  $\pounds 2$  2s.

HIGHLEY'S CABINET OF APPARATUS AND REAGENTS, for EXAMINATIONS in MEDICAL CHEMISTRY, as selected by Dr. LIONEL BEALE.

## CONTENTS.

APPARATUS. Urinometer in Case—Graduated 2-oz. Measure—Pipette—Stirring rod—Microscopic Slides and Thin Glass—Watch-glasses—Test-tubes—Tube-holder—Brass Forceps—Platinum Foil—Spirit Lamp, with wire ring—Seven capped Dropping Bottles for the following Re-agents: Nitric Acid, Acetic Acid, Ammonia, Potash, Nitrate Barytes, Nitrate Silver, Oxalate Ammonia, Test-Papers. Price,  $\pounds 1$  11s. 6d.

HIGHLEY'S RE-AGENT CABINET FOR MICROSCOPICAL TESTING, containing 12 capped dropping bottles, 15s.

HIGHLEY'S MICROSCOPIC CAMERA, consisting of an Arrangement and Condenser fitted to a double Telescope Chamber having a range from 12 to 24 inches, with Focusing Glass 6 inches square, Plate and Bath Frames, Glass Bath, Box fitting inside Camera, containing all the necessary Chemicals and Apparatus. The whole contained in a Packing-case arranged for the adjustment of this instrument to any angle. Complete,  $\pounds 9$ .

STUDENTS' COLLECTION OF MICROSCOPICAL OBJECTS.  $\pounds 1$  5s. per Series of 24 slides. F.V. SERIES PUBLISHED.

London: SAMUEL HIGHLEY, 33, Fleet-street.

Now ready at all the Libraries, in Three Vols.,  
**A Physician's Tale.**  
By HEBERDEN MILFORD.

"A story full of incidents of the most extraordinary character, told in a vigorous and animated style, in which the human heart is exhibited in every variety of aspect. The reader will rise from it no less instructed than entertained. From first to last the interest never flags for a moment."—*JOHN BURN.*  
Hurst and Blackett, Publishers, Successors to Henry Colburn, 13, Great Marlborough-street.

Just published, in 8vo, with many Woodcuts, price 28s.  
**Pereira's Elements of Materia Medica**  
AND THERAPEUTICS. A New Edition of the First Volume. Edited by A. S. TAYLOR, M.D., &c., and G. O. REES, M.D., &c.  
London: Longman, Brown, Green, and Longmans.

MR. SWAN'S NEW WORK ON THE BRAIN.  
Just published, in One Volume, 8vo, price 5s.  
**The Brain in Relation to the Mind.**  
By JOSEPH SWAN, Esq., Author of various Works on the Brain and the Nervous System.  
London: Longman, Brown, Green, and Longmans.

DR. G. O. REES ON DISEASES OF THE KIDNEY.  
Lately published, in 8vo, price 5s.

**On the Nature and Treatment of**  
DISEASES of the KIDNEY connected with Albuminous Urine, (Morbus Brightii). By GEORGE OWEN REES, M.D., F.R.S.; Fellow Roy. Coll. of Physicians; one of the Examiners in the University of London; Assistant-Physician to and Lecturer on Materia Medica at Guy's Hospital.  
"This little work will add justly to Dr. Owen Rees's reputation. It is altogether practical, and may be said fairly to embrace, in a moderate compass, all that is at present known on the subject of which it treats."—*LANCET.*

By the same Author, 2nd Edition, 8vo, price 7s. 6d.  
**ON THE ANALYSIS OF THE BLOOD AND URINE**  
in Health and Disease; and on the TREATMENT OF URINARY DISEASES.  
London: Longman, Brown, Green, and Longmans.

Fourth edition, just published, illustrated, price 1s.

**Gilbert on the Extraction of Teeth;**  
being a work descriptive of a new and much less painful method of operating, by means of GILBERT'S PATENT FULCRUM. The jaw cannot be fractured, or the gums lacerated; there is less danger of breaking the diseased tooth, and of isehmorrhage, &c.

Mr. Gilbert invites the profession to inspect his invention from eleven till four, 3, Suffolk-street, Pall-mall.  
"We can confidently direct attention to it as a boon to the profession and the public."—*THE LANCET*, Dec. 2nd.

"It allows of the extraction of teeth in the most scientific and easy manner; and in performing certain other surgical operations the chair will prove of inestimable value to the surgeon."—*MEDICAL TIMES*, Feb. 10th.

London: Henry Bonshaw, 365, Strand.

**Illustrated London News.**

The year 1855 bids fair to be one of the most important and eventful of modern history. On the 6th of January, 1855, will be issued the first number of a New Volume of the **ILLUSTRATED LONDON NEWS**, and not merely a New Volume, but of a New Year—each Volume being perfect and complete in itself—containing, for the time, a faithful Record, Pictorial and Descriptive, of all events of interest in every part of the World. To that limited portion of the Public who do not subscribe to this Journal, it may be stated, that no period could be selected more opportune for commencing—the whole expense being but Twenty-six Shillings per annum, exclusive of Double Numbers, which are issued on rare occasions, when it would be impossible to crowd the important Events and Engravings into a single Number; for this small sum the Subscriber will receive twenty-four large Pages—seventy-two Columns—of the most interesting information, carefully selected from the News of the Week, interspersed with a variety of charming Articles on the chief topics of the day.

The **ILLUSTRATED LONDON NEWS** has, by its impartial and consistent advocacy of the welfare of the Public, secured for itself a Political influence scarcely second to any Newspaper in the Empire: and reference can, with some pride, be made to the support afforded to all beneficial measures proposed and adopted by the English Parliament.

Foreign Politics will ever command the attention which ought to be devoted to so important a feature of a Newspaper. On the question of the Russian War, during the year 1854, ONE THOUSAND ENGRAVINGS appeared in the **ILLUSTRATED LONDON NEWS**. Extensive arrangements, calculated to improve this popular Journal, and engagements, such as will greatly enrich its Literary, Scientific, and other departments, have been made, and will thus combine on this Paper the greatest talent of the day.

The **ILLUSTRATED LONDON NEWS** has been established thirteen years, during which period it has received a greater degree of encouragement and approbation than any Journal ever published. This is proved by the Returns of Subscriptions issued from time to time by order of Parliament. The Stamps applied for the first six months of 1854, were upwards of 2,734,000—showing a weekly circulation of ONE HUNDRED and THIRTY THOUSAND COPIES.

Terms (for payment in advance)—Half-year, 13s. 6d.; Year, 26s.  
Any of the Volumes of the **ILLUSTRATED LONDON NEWS**, from the commencement to the present time, may now be had, in paper or cloth. Covers for binding the Volumes, 6d. each.

All Numbers may be sent by Post to any part of the Kingdom and the Colonies.

Give an order for Six Months, to ensure all the gratuitous Prints and Supplements. Supplied by all Booksellers.

The **ILLUSTRATED LONDON NEWS** is published in London every Saturday, Stamped, to go free by Post, Sixpence per copy.

Office, 198, Strand, 4, London.

**NEW BOOKS, &c.**

**Elegant Gift-books.**

New Edition, with upwards of Fifty Illustrations by John Gilbert, Engraved in the first style of art by Dalziel Brothers. Imp. 8vo, enamelled boards, or cloth, gilt edges, price 21s.; morocco, elegant, 41 11s. 6d.

**THE SALAMANDRINE; or, Love and Immortality.** By CHARLES MACKAY, LL.D., Author of "Egeria," "Legends of the Isles," &c. &c.

"The Salamandrine"—full of simple beauty of thought and happy turn of fluent versification—at once attracts the attention of all admirers of imaginative verse. But it is in the illustrations that the new edition mainly shines. Of these there are no less than forty-six, all by Mr. Gilbert, and engraved by the Brothers Dalziel."—*MORNING CHRONICLE.*

**THE LIFE OF MARTIN LUTHER, the German Reformer.** In Fifty Pictures. To which is added, a Sketch of the Rise and Progress of the Reformation in Germany. Super-royal 8vo. Beautifully illustrated with Fifty Plates, in the highest style of German art. Handsomely bound in cloth, gilt, price 12s.; morocco, 21s.

**NINEVEH and its PALACES.** The Discoveries of Both and Laysard applied to the elucidation of Holy Writ. By JOSEPH BONOMI. Illustrated with above Two Hundred Engravings. 8vo, cloth, gilt, 6s.; morocco, elegant, 12s.

**THE THREE COLONIES of AUSTRALIA**—New South Wales, Victoria, and South Australia; their Pastures, Copper Mines, and Gold Fields. By SAMUEL SIDNEY, Author of "The Australian Handbook," &c. With numerous authentic Engravings. Cloth, gilt, 6s.; morocco, elegant, 12s.

**AN ILLUSTRATED LIFE OF FIELD-MARSHAL THE DUKE OF WELLINGTON,** the Commander-in-Chief of the British Army. By J. H. STOCQUELER, Esq., Author of "The British Officer," "The Handbook of British India," &c. &c. Two Volumes 8vo. Cloth, gilt, 12s.; morocco, elegant, 21 4s.

**THE THREE PRESIDENCIES OF INDIA:** their Rise, Progress, and Present Condition. A complete Review of the British Indian Possessions, from the earliest period to the year 1853. By JOHN CAPPER, Esq., F.R.A.S. Profusely illustrated, 8vo, cloth, gilt, 6s.; morocco elegant, 12s.

**ALGERIA:** the Topography and History, Political, Social, and Natural, of French Africa. By JOHN REYNELL MORELL. Profusely illustrated. 8vo, cloth, gilt, 6s.; morocco, elegant, 12s.

**HANDBOOK OF FOLIAGE and FOREGROUND PLANTS.** By GEORGE BARNARD, Esq., Author of "Sketches of Switzerland," "Drawing Book of Trees," &c. Post 8vo, cloth, 6s.; morocco, elegant, 12s.

This book is completely illustrated with Sixty progressive Plates, filled with various studies of the best style of lithography, and will be found peculiarly valuable as a text-book for Students.

**JOHN BARNETT'S New Edition of WADE'S HANDBOOK to the PIANOFORTE;** comprising an Easy Rudimental Introduction to the Study of that Instrument, and Music in general; the Art of Fingering according to the Modes of the best Masters, exemplified in various Exercises, Scales, &c. Demy 4to. Neatly bound in cloth, with Engravings and Diagrams. Price 6s.

**THE ILLUSTRATED NEW TESTAMENT,** (Authorised Version); with upwards of 120 Engravings, beautifully bound in cloth, embossed and gilt sides, gilt edges. The Illustrations are from drawings executed by eminent artists, expressly for this edition; with Notes, historical, explanatory, and descriptive; and embellished by a novel Panoramic Picture of the Holy Land, and a View of Lower Egypt. 4to. Cloth, gilt, 6s.

**THE PARABLES OF FRIEDRICH ADOLPH KRUM-MACHER.** Translated from the Eighth German Edition (the last revised by the Author.) Embellished with Forty beautiful Drawings by J. R. Clayton, Esq., Engraved by Dalziel Brothers. Small 4to, beautifully printed on the finest paper, and tastefully bound in cloth, gilt edges, 6s. These Parables by the Author of "Elijah the Tishbite," must be welcome to all readers, instructing, as they do, in an alluring form, the deepest truths of Christianity. Elegantly bound in morocco, 12s.

**CILICIA AND ITS GOVERNORS.** Being a short Historical Account of that Province, from the Earliest Times to the Present Day. Together with a Description of some Household Gods of the Ancient Cilicians, broken up by them on their Conversion to Christianity, and first discovered and brought to this country by the Author, WILLIAM BURKHARDT BAEKER, M.R.A.S., many years resident at Tarsus in an official capacity. Edited by WILLIAM FRANCIS AINSWORTH, F.R.G.S., F.G.S. 8vo. Cloth, gilt, 6s.; morocco, elegant, 12s.

**ENGLISH FORESTS and FOREST TREES.** Being an Account, Legendary, Historical, and Descriptive, of the Forests and Trees of England, and the associations and events connected with them. Profusely illustrated. 8vo. Cloth, gilt, 6s.; morocco, elegant, 12s.

**THE MICROSCOPE:** its History, Construction, and Applications. Being a familiar Introduction to the Use of the Instrument, and the Study of Microscopical Science. Illustrated by upwards of 600 Drawings of Objects. By JABEZ HOGG, M.R.C.S., &c. 8vo. Cloth, gilt, price 6s.

**THE PRACTICAL FARMER:** a Guide to Modern Husbandry: embracing the Art and Science of Agriculture; also Comprehensive Instructions on Breeding, Rearing, Grazing, and Fattening of Stock; on Drainage, Manures, &c. &c. By G. H. ANDREWS, Esq., late of Fleet and Brook Farm. Engravings of Plans, Views, Animals, and Agricultural Implements, by Duncan, Weir, Linton, Hare, &c. &c.

**A HOLIDAY BOOK FOR CHRISTMAS AND THE NEW YEAR.**—Amusement for Winter Evenings, containing Fairy Legends and Tales, Christmas Carols and Music, Poetry, Pictures of Christmas Sports, Manners, and Customs, &c. &c., specially adapted to the Season. Profusely and superbly illustrated, in elegant binding. But few copies remain, and it will not be reprinted. Pp. 10. In cloth, or embossed binding, 21 1s.

London: H. INGRAM and CO., Milford House, Milford-lane, Strand.

## THE LANCET OF JANUARY 6TH, 1855,

**Mayall's Daguerreotype Portrait**

GALLERIES, 224, Regent-street, (corner of Argyle-place,) and 433, West Strand.

Mr. Mayall begs to invite inspection of his extensive collection of DAGUERRETYPE PORTRAITS OF EMINENT MEDICAL, SCIENTIFIC, and LITERARY MEN, Panoramas from Nature, and Views of the late Exhibition; together with specimens of every improvement in the art. The originals of THE LANCET PORTRAITS on view.

**H. Silverlock's Medical Label Ware-**

HOUSE, LETTER-PRESS, COPPER-PLATE, and LITHOGRAPHIC PRINTING OFFICES, 3, Wardrobe-terrace, Doctors' Commons, London.

The members of the medical profession are respectfully informed that at H. Silverlock's establishment they will find every kind of Label they can possibly require; and also that every description of Engraving, Letterpress, Copper-plate, and Lithographic Printing is executed by competent workmen, and at the lowest charges.

Catalogues of each sort of Labels are published separately, and will be sent per post on application.

**If you require Family**

ARMS, send Name and County to the HERALDIC OFFICE. Fee for Search and Sketch, 3s. 6d., or postage-stamps; Crest Engraved on Seals, Signet Rings, &amp;c., 8s. 6d.; Arms, with Name, on plate, for books, £1 1s.; Arms Painted, Empanelled, and Quartered.

TESTIMONIALS, Memorials, Addresses, and Votes of Thanks written, illuminated, and Emblazoned on Vellum.

H. SALT, Lincoln's Inn Heraldic Office, Great Turnstile, Lincoln's Inn-fields.

TO THE MEDICAL PROFESSION.

**Fr. G. Ernst, Anatomical Machinist**

and MANUFACTURER OF SURGICAL INSTRUMENTS, 43, Lamb's Conduit-street, Foundling Hospital, begs to inform the Faculty that he makes every kind of APPARATUS for the CURE and RELIEF OF BODILY DEFORMITIES, and all Diseases requiring Mechanical Assistance; Trusses of every description upon the newest principles; Elastic Bandages, Stockings, Knee-caps, and Riding-belts; Artificial Legs, Arms, and Hands, Crutches, &amp;c. Every article warranted of the best materials and at moderate prices. Surgical Instruments supplied to order, repaired, &amp;c. Madam Ernst (late Miss Hunt), who has been for many years engaged in the business, waits upon Ladies, and begs to recommend her improved Utero-abdominal Bandages, adapted to every kind of weakness or relaxation; Accouchment-belts, &amp;c.

**New Spinal Support.—Fr. G. Ernst,**

Lamb's Conduit-street, Foundling Hospital, begs to draw the attention of the Faculty to his recently-invented SPINAL APPARATUS, which, after some months of trial, has proved superior to any of the various kinds hitherto used, and produced the most satisfactory results. This appliance, being self-adjusting, free bodily motion is permitted; thus, while equal and necessary support is given to the wearer, all injurious or painful pressure is avoided, and a great amount of comfort and benefit consequently yielded. It can be modified so as to suit any FORM OF SPINAL DEFLECTION; its weight is comparatively trifling, and from its capacities for nice adaptation elicits no observation when on the body.

To be had only of the Inventor, 43, Lamb's Conduit-street.

**Funeral Extortion avoided, by Exe-**

cutors and bereaved Relatives of deceased Noblemen, Gentlemen, Tradesmen, and others, sending in the first instance to SHILLIBEE'S OFFICE, CITY ROAD, near Finsbury-square, or to 12, NORTH STREET, QUADRANT, BRIGHTON, instead of employing their Upholsterer, or the nearest Undertaker, who, not possessing the needful requirements, resort to the Funeral Furnishers, to hire them, and consequently inflict twofold profits.

Shillibee's Establishment combines under one charge, to any scale of pomp and humility desired.

Funerals of every class, and the most varied description of conveyances, old and new styles, and first-rate equipments, at charges so moderate as to defy competition. Catholic Fittings from Paris. No extra charge within ten miles. A Nobleman's Funeral, Thirty Guineas; Gentleman's, from Ten Guineas; Tradesman's, £8; Artisan's, £4 and upwards. Originated in 1842.

## Brighton Sea-side Preparatory School

FOR YOUNG GENTLEMEN. Conducted by the Widow of a Medical Practitioner.—The usual elementary branches of Education are taught, and all the comforts of a home are carefully provided, while special attention is paid to the physical well-being of the Pupils.

Prospectuses forwarded on application to Mrs. Thomson, 46, Grand-parade, Brighton.

## Householders' and General Life

ASSURANCE COMPANY, 15 & 16, ADAM STREET, ADELPHI.

### TRUSTEES.

The Right Honourable Thomas Milner Gibson, M.P.	William Ashton, Esq.
John Walbanke Childers, Esq.	Charles Hulse, Esq.
William Bulkeley Glassey, Esq., Q.C.	Richard Griffiths Welford, Esq.
	Francis D. Bullock Webster, Esq.

15 & 16, Adam-street, Adelphi.

R. HODSON, Secretary.

AGENTS (with references) may apply.

## Bank of Deposit, National Assurance, and INVESTMENT ASSOCIATION, No. 3, PALL-MALL EAST LONDON.

Established A.D. 1844.

Empowered by Special Act of Parliament.

Parties desirous of investing Money are requested to examine the Plan of this Institution, by which a high rate of Interest may be obtained with perfect security.

The Interest is payable in January and July, at the Head Office in London; and may also be received at the various Branches, or through Country Bankers, without delay or expense.

PETER MORRISON, Managing Director.

Prospectuses and Forms for opening Accounts sent free on application.

## The Respirator.—The assumption of

the name of Respirator for various discreditable and defective imitations of MR. JEFFREY'S Instruments, the value of which in medical practice has given a wide reputation to the name, can only mislead unwary persons not acting under professional advice.

City Office for the Respirator, 25, Bucklersbury; West-end Depot, 25, Holles-street, Oxford-street, London. In London and all Towns, the principal Chemists and Surgical Instrument Makers are Agents for Mr. Jeffrey's Respirators.

## Hooper's Waterproof Sheeting, for

protecting Bedding from Sloughing Sores, Incontinence of Urine, Hemorrhage, &c.

MR. HOOPER has succeeded in obtaining Waterproof Sheeting, at a great reduction in price, soft, and inodorous; it is not affected by Urine, Heat, nor Cold, Acids, nor Alkalies, and may be washed as family linen.

Also, IMPROVED INVALID URINALS, with Valves, for sitting, lying, or travelling, in any position.

### FOR EPILEPSY.

COTYLEDON UMBILICUS.—The introduction of this valuable agent has proved a valuable discovery. The satisfactory accounts Mr. HOOPER has received have induced him to pay great attention to its collection and preparation. He cautions medical men against the use of worthless preparations, passed off for his, and as prepared for Mr. Salter, &c. Mr. Hooper has instructions to state that Mr. Salter has never used any but that obtained from him. A copy of Mr. Salter's reports in the "Medical Gazette" sent free by post.

GALUM APARINE (HOOPER'S) FOR CUTANEOUS DISEASES, PSORIASIS, &c.—Dr. Winn, of Finsbury-square, having published in "The Medical Gazette," October 4th, 1851, an account of the peculiar properties of the Galium Aparine in Cutaneous Diseases, Lepra, Psoriasis, &c. Mr. Hooper has given his attention to preparing it in various forms. Dr. Winn finds the inspissated juice the most efficient preparation, which can be had from Mr. Hooper, or direct through the Wholesale Houses.

HOOPER, Operative Chemist, Pall Mall East, and Grosvenor-street.

# Lectures ON DISEASES OF THE JOINTS.

*Delivered at St. Mary's Hospital.*

By WILLIAM COULSON, Esq.

SURGEON TO THE HOSPITAL.

## LECTURE IX.

### CHRONIC INFLAMMATION OF THE HIP-JOINT.

GENTLEMEN,—The disease to which I propose directing your attention to-day, is perhaps the most important of all articular affections. It has been denominated *morbus coxarius*, or hip-disease, *coxalgia*, &c.; but I prefer the term “chronic inflammation,” as one more significant of its nature, and more in accordance with the nomenclature now generally adopted. Chronic inflammation of the hip-joint occurs most frequently in young subjects, in whom it usually assumes a scrofulous character. It may also occur in adults or persons advanced in life, without any apparent connexion with the scrofulous diathesis. The inflammation, likewise, may commence in, and for some time be confined to, any of the tissues of the joint, and its early symptoms may thus present certain peculiarities. To these I shall presently allude, after having given you a general description of the complaint, such as we ordinarily find it in practice. It has been customary to distinguish chronic inflammation of the hip-joint into three stages, which are for the most part sufficiently well marked, and correspond with certain periods in the progress of the disease.

The first or incipient stage extends from the appearance of the earliest symptoms to the period when elongation of the limb and lameness manifest themselves. During this stage, then, we have merely a protracted, and often very low, inflammation, without any secondary lesions, at least to any extent, and hence the symptoms are often obscure, or so slight that they may be overlooked altogether. They chiefly consist in some impediment of the functions of the joint, and slight modifications in the natural sensibility of the limb; in other words, in stiffness, impeded motion, and pain. These may continue for a length of time without being accompanied by any other symptoms. The earliest symptom by which the patient's attention is directed to the state of his limb is a sensation of stiffness, impeding perfect motion. This stiffness is often most perceptible in the morning, or the patient does not complain of it until after having taken some exercise, when he experiences an unusual degree of fatigue, with an undefined sensation of uneasiness in the limb. He now soon perceives that he is unable to set his foot firmly on the ground, and that certain positions, especially stooping forwards on a single leg, are attended with difficulty, perhaps with slight pain. The stiffness and weakness of the limb are also soon succeeded by a limping gait, or a slight degree of lameness, but the period at which actual lameness becomes visible is very uncertain, depending on the more or less rapid progress of the malady, and probably, likewise, on the tissue in which the disease may have commenced. Pain is a very constant and early symptom of chronic inflammation of the hip-joint. In some cases it even precedes the lameness. From the seat of the disease, you would naturally be inclined to look for the seat of the pain in the hip-joint itself, but this is an error which must be carefully avoided. There are often some wandering pains along the thigh, resembling those of rheumatism; but the severe, fixed pain of which the patient complains in the early stage of this disease is almost always confined to the knee, or at least is so intense there that it masks the uneasy sensations about the hip. No particular seat can be assigned to this pain in the knee, nor are surgeons agreed as to the real nature of its cause. In some cases, the whole joint is painful; in others, the pain is felt just behind the patella, or on either side, on the condyles of the femur; it may extend along the leg, and in a few cases has been noticed to occupy the ankle-joint, instead of the knee. The pain is of the kind denominated sympathetic, for the most careful examination, and, indeed, the subsequent progress of the malady, proves that the knee-joint is free from organic disease, yet it is occasionally swollen, and sometimes painful to the touch. No satisfactory explanation has, as yet, been given of this symptom. It has been referred to the branches of the anterior crural or obturator nerves, but the pain does not always coincide with the points to which the cutaneous branches of these nerves are distributed; and if inflammation of the trunk of a nerve in the vicinity of a diseased joint were

No. 1633.

likely to be followed by pain in the peripheral branches, we might expect to observe this in cases of disease of the elbow-joint, over which the ulnar nerve is so closely applied, yet this complaint is hardly ever attended by pain in the wrist or in the cutaneous branches of the ulnar nerve. Lastly, I may observe that the same sympathetic pain in the knee-joint has been found to coincide with chronic inflammation of the sacro-iliac articulation, a disease overlooked by most writers on surgery, though carefully described by Boyer, and noticed in the clinical surgery of Larrey.

At this stage, then, the only symptoms essentially connected with the disease are, pain and impeded motion, and these become modified or of greater intensity as the complaint progresses towards the second stage. The general health is frequently unaffected, though this, of course, will depend upon the state of the patient at the moment of attack, while the presence or absence of constitutional disturbance will mainly depend on the low or active nature of the inflammation at the onset. At this period we do not discover any deviation from the natural condition of the affected limb; it is of the same length as the other; the nates are not altered in form, except under circumstances which I shall presently notice, and the spine is perfectly straight. Still, after some time, it will be observed that the patient, while walking, has a tendency to carry his limb straight, as if there were no joint in the knee, and to incline the foot either inwards or outwards. These are slight symptoms, but they should always awaken attention, and if a careful examination of the joint be now made, we shall rarely fail in discovering that it is the seat of disease.

I have already explained to you the best mode of conducting your examination in cases of suspected hip disease. Abduction of the limb generally excites more or less pain in the affected joint; but to avoid all source of error, you should examine the patient in an horizontal position, on a flat, hard surface, as a table, &c. Grasping the foot of the affected limb in one hand, and placing the other hand on the knee, you rotate the head of the femur against the acetabulum, and the increased pain which the patient experiences will apprise you of the mischief going on within the joint. Pressure should also be made with the hand on and behind the trochanter major, and in front, where the *peas* and *iliacus* muscles pass over the articulation.

From the structure of the hip-joint, and the difficulty of avoiding undue pressure between the articular surfaces of the bones, you can readily understand how, as the disease progresses, the patient employs every effort to diminish the pain and distress arising from the necessity of throwing the weight of his body on an inflamed and, perhaps, ulcerated surface. The greater part of the symptoms attending the second stage of hip disease are connected with this constant effort to keep the limb as free from motion as possible, and various physical signs are now added to the functional derangements just described. The whole limb becomes flabby and diminished in size, from the constrained state of repose of its muscles; but the diminution is best seen in the *glutei* muscles, which are so intimately connected with the joint. On looking at the patient from behind, you will at once be struck by the appearance of the nates. The affected buttock always becomes flatter and more wasted than the one on the sound side; the marked division between the buttock and thigh is lost; the buttock on the affected side is lower by an inch or more than is natural, and the whole limb appears to be longer than the one which is free from disease. The wasting and altered form of the nates are easily explained by the forced inactivity of the *glutei* muscles; but the real or apparent lengthening of the limb does not admit of such ready explanation, and has given rise to considerable discussion; some surgeons contend that the limb is actually longer than the other, while some affirm that the lengthening is merely apparent. The truth appears to be, that, in the greater number of cases, the affected limb presents an appearance of elongation; that in a few cases it is really elongated to a slight degree; and, finally, that the second stage may pass over without any change whatever taking place, either in the real or apparent length of the limb.

An actual lengthening of the limb may be produced by effusion of fluid into the cavity of the joint. I have no doubt in my own mind of this sometimes taking place, but it is not of frequent occurrence, and the elongation thus produced seldom exceeds one-third of an inch; the head of the bone cannot be depressed more than an inch without destruction of the round ligament. To understand the nature and causes of the apparent elongation of the limb, which so often characterizes the second stage of hip-disease, we must examine the patient in the erect and recumbent posture, and take into account the influence exercised on the limb by the positions which he

▲ ▲

voluntarily assumes. I have already discussed the different points of this interesting question, but a brief notice of them here may be useful. If we examine the patient in the erect posture, we shall perceive at once that he supports the whole weight of the body on the sound limb; the thigh is flexed on the pelvis; the leg on the thigh; the limb is commonly rotated outwards; the pelvis is inclined, that is to say, depressed, towards the affected side, and at the same time carried forwards, the anterior spinous process being more or less in advance of that on the opposite side. Now, all these circumstances tend to give an appearance of elongation to the limb, which can be produced at will in the healthy body, and which, during hip disease, often makes the affected limb appear from three to three inches and a half longer than the sound one. Indeed, in some cases of disease of the knee-joint, where the hip is unaffected, but where the patient assumes the position just described, the limb has been found apparently elongated to the extent of two inches—a fact which clearly proves that apparent lengthening may take place independently of any change in the articulation of the hip. The lateral inclination of the pelvis brings with it a corresponding depression of the fold of the buttock; and if you are curious enough to examine female patients more closely than is the custom, you will discover another effect of the same cause. One of the labia—that of course corresponding to the affected side—is much lower than the other. This is very remarkable in young subjects, from the close juxta-position of the parts. The other symptoms which accompany this second stage of hip disease are little more than aggravated states of the pain and impaired functions already noticed.

In the third stage the pain gradually increases in intensity, becomes very severe, and impedes every motion of the limb, particularly that of extension. The effect of a constrained and uneasy position may probably contribute to increase the original pain in the knee-joint, and from some recent dissections it would appear that the articulation itself is more frequently involved in the disease than we had formerly been led to think. The pain in the hip is also often violent during the night, preventing rest; the slightest movement of the joint causes agony, and the patient is either confined to bed or hobbles along with difficulty upon crutches. In many cases, however, even at this advanced period, the pain in the hip is often masked until the precursory symptoms of suppuration make their appearance. Constitutional disturbance is now observed, perhaps for the first time, and ushering in this stage of the disease. The pain in the joint becomes aggravated, and the febrile symptoms continued; there are frequent shiverings, with painful startings of the limb; the rest is greatly disturbed, and the patient experiences great distress from starting and catching during sleep. Suppuration now takes place, sometimes in the cellular tissue external to the joint, sometimes within the joint itself, in which latter case the capsular ligament soon gives way, and the effused matter gradually works its way to the surface. It is not always easy to distinguish whether the suppuration has commenced in the cellular tissue or in the joint; but, however this may be, it sooner or later comes to the surface, and is either discharged by a natural opening or with the aid of art. In many cases inflammation attacks the cellular tissue interposed between the glutei muscles; and the nates, which were formerly wasted, become tumefied and painful; at a particular point the skin now inflames, fluctuation can be distinguished, and if an opening be not made, the abscess discharges itself by ulceration. In other cases it descends along the outer and back part of the thigh, or an intra-articular abscess, having perforated the capsule of the joint, may take one of the various directions which I have pointed out in a former lecture. From the abundance of cellular tissue in the neighbourhood of the hip-joint, the quantity of matter discharged is always considerable at first, and it may soon give rise to hectic symptoms; but it is astonishing to what an extent patients are sometimes reduced, and yet recover. Arrived at this stage, the disease may terminate in one of two ways: the symptoms may gradually decline; the discharge of matter becomes less and less, until it ceases altogether, the fistulae heal up, the patient's health is slowly restored, and a cure is at length effected by ankylosis of the diseased joint. Or the symptoms may become aggravated, and signs of destruction of the joint then set in. During this period the various lesions which I have described in a former lecture succeed each other with greater or less rapidity, and by reflecting on their nature and extent you can understand without any difficulty many of the symptoms by which they are accompanied. In order to avoid repetition, I may briefly state the different changes of structure now alluded to. The ligamentum teres is ulcerated and gradually destroyed by

absorption. The capsular ligament also is thickened or softened, relaxed in some places, perforated in others, and at an advanced stage of the disease often almost entirely destroyed. Ulceration of the cartilages sometimes precedes effusion of pus into the joint, sometimes appears to be the effect of purulent inflammation of the other tissues. However this may be, the articular surfaces of the acetabulum and head of the femur are in all cases more or less damaged by ulcerative absorption, the extent of the destruction varying in nearly every case. Thus only small portions of the cartilaginous lining of the joint may have been removed, or the acetabulum is rendered deeper and wider by ulceration, while the transverse and cotyloid ligaments have likewise given way. In the head and neck of the femur every degree of destruction may be observed. The cartilage, for example, is either partially or wholly absorbed, loose portions of cartilage may be found in the cavity of the joint; or the head, and even the neck, of the femur may be more or less destroyed by ulceration and caries, with or without scrofulous deposit in the cancellous tissue of the bone.

(To be continued.)

## LETTSOMIAN LECTURES

On Surgery.

DELIVERED BEFORE THE FELLOWS OF THE  
MEDICAL SOCIETY OF LONDON,

DURING THE SESSION 1853-54.

By JOHN BISHOP, Esq., F.R.S.

### LECTURE II.

DISEASES OF THE BONES.

(Concluded from p. 493.)

HAVING now given a somewhat detailed view of the nature of the processes which are observed in necrosis, I next propose to enter into the consideration of those hard osseous tumours which have received the name of *exostosis*.

The osseous tumours in *exostosis* may be formed either on the external or internal surface of a bone. These tumours often take place spontaneously, without any assignable cause, but they are supposed to be more frequently associated with a syphilitic taint in the system. It appears that they may be developed at any period of life, and may occur on any of the bones of the skeleton, and very frequently on the cranial bones. These osseous tumours present a variety of differences in structure, and may arise either from the compact or the spongy tissues of the bone; and it is found that their structure (as may be expected) partakes almost always of the nature or structure of the base from which they take their origin. Those tumours which are situated immediately under the periosteum, and are at first disconnected with the bone, will nevertheless, after having been formed for some time, become sooner or later firmly united with the contiguous bone. They vary in size, from that of a hemp-seed to that of a walnut, and in some cases these tumours acquire much larger dimensions. *Exostoses* are most commonly formed of compact structure, and, as might be expected from what has been said of their partaking of the nature of the part on which they are situated, they are found on the compact surface of the bones, and more particularly on the internal table of the bones of the head.

A tumour of this kind presents to the eye the appearance, and to the touch the form, of a nodule, with an abrupt margin, and is frequently separated at its base from the subjacent bone by a furrow of variable thickness; and sometimes there is a deep fissure between the nodule and the bone lying beneath. The density of these compact nodules is very great, and in this state the disease is termed the *ivory exostosis*. These *ivory* tumours are of greater density and specific gravity than the normal bone with which they are associated, unless they happen to be connected with bone already in a state of induration. They are always composed of laminae, and seem never to be intermixed with spongy tissue. The density of the tumour is owing to the greater number of laminae contained in a given space, when compared with the number of laminae found in the same space in normal bone. The Haversian canals are small, and few in number, but a well-defined lamellar system is found surrounding them. The bone corpuscles are

irregularly scattered in the substance of the tumour, and in some places they are clustered together, while in other parts larger tracts are found entirely destitute of them. The colour of these exostoses is a yellowish-white, and they are of a lighter hue than the bone to which they are attached.

Rokitansky appears opposed to the hypothesis that the origin of these tumours has any relation to syphilis, and he believes the cause of their appearance to be entirely unknown. When the exostoses are of a spongy texture, they are connected with a rarefaction or expansion of the spongy bones, termed by the German pathologists *osteo-porosis*. They present many varieties in their structure, and may arise either from the spongy or from the laminated structure, or from both together: they are then compounded of an internal spongy, and an external laminated layer of the compact tissue. These mixed osseous tumours are not unfrequently found near the joints, at the head of the tibia, or on the shin, and on any of the other long bones of the skeleton. In the skull, the disease is accompanied with an expansion of the diploe, in which case there may be an exostosis on both the external and internal tables corresponding in situation with each other. In the spongy forms of exostosis, the structure may remain permanent after its development; but more commonly new matter is formed in the interior, and the structure of the bone is more or less condensed; but this altered structure is often succeeded by the bone being again rarefied, and thus the growth of the spongy exostosis outwards may be affected, and may increase to a considerable size. When this disease affects the spongy bones of the face, it has been known to produce the most hideous appearance. Some examples of these cases are to be seen in the Hunterian Museum. When the exostoses have acquired a certain magnitude, they usually continue through life unchanged. The ivory texture of the excrescence, in this disease, sometimes diminishes in size by condensation, or it may become necrosed, and be thrown off.

The spongy exostoses sometimes degenerate into caries, and in this way disappear. These appear to be the processes by which the system may be spontaneously released from the osseous growths of exostosis. Independently of exostosis, the bones during inflammation exude a fluid which ossifies, and forms a layer on their compact surface, this substance has received the name of *osteophyte*. At the commencement of this process the exudation is soft and gelatinous; it afterwards becomes tough and elastic, resembling cartilage, and in the end it ossifies. It appears that this exudation is associated with nearly all inflammatory conditions, whether of abscess or necrosis of the bones. There are many variations of form assumed by these osteophytes, as well as differences in structure.

They sometimes appear to be composed of "delicate fibrils and lamellæ, which are fixed at acute angles on the surface of the bone, and give it the appearance of velvet, or felt with a very fine nap." Though these osteophytes are at first in contact with the bone, yet they may be easily raised from it in large pieces, and although for some time separated by a layer of cellular substance, they become fixed to the bone when this membrane disappears.

The exudations which terminate in osteophytes sometimes form plates, and often anchylose some of the vertebrae by the ossification of the anterior common ligament. They occur also on the inner table of the skull, and, indeed, wherever inflammatory processes are going on in the bones.

Osteophytes have been known in a few cases to cover large portions, or nearly the whole of the skeleton; they are sometimes associated with atrophy, and at others with hypertrophy, of the bones. Although we generally find the exudations accompanied with an inflammatory condition of the bones and periosteum, the precise condition of the system that gives rise to the inflammation and exudation is not yet determined. In the imperfect union of fracture, these plates then constitute the union of the ends of the bone. To give a minute detail of the structure of all the forms of osteophytes would occupy too much of your attention in this short course, I have therefore merely touched on the subject to show the distinction in their character which has led to their separation from exostosis.

The bones of the skeleton are likewise liable to anomalies in number, size, and form. The absence or addition to the number is not very common, but is coincident with conditions of the system in a state of perfect health, and not referable to any pathological conditions: it is not, therefore, my purpose to give any detail of cases of variations of number. With regard to variations in size depending on pathological states of the bones, the case is quite different, and deserves a few remarks. In hypertrophy of the bones, they may increase in size by the addition of new osseous matter deposited on their surface

beneath the periosteum, without any change taking place in their density or specific gravity; the size of the medullary canal remains the same, but the compact substance acquires a considerable augmentation of thickness. When the increase of substance takes place in the interior of the bone proceeding from the Haversian canals, and involving the whole of the medullary system, the bone becomes more dense, both in the compact and cancellous tissues. In the latter, the walls of the cells increase in thickness, and the medullary cavity diminishes in size; the diploe disappears, and the whole bone becomes indurated. When the hypertrophy takes place both internally and externally, the bulk and density of the bone are both increased. The increase of the bones, both internally and externally, is preceded by the deposition of a superabundance of cartilaginous matter, in which the salts of lime are deposited, as in normal bone.

When the disease attacks the bones of the skull, or when it affects considerable portions of the skeleton, it becomes a serious disorder. It is a remarkable circumstance, that when the bones of the skull become hypertrophied, those of the face often diminish, so that there are actions opposite in their effects—namely, hypertrophy and atrophy, going on in the system at the same time.

The conditions of the system that give rise to these changes in the bone are not yet determined, nor do the bones themselves give any premonitory signs of the advent of the disease. The surface of the bone continues smooth, and the periosteum natural, even when the bone has acquired the compactness of ivory. In other cases, the increase in the volume of the bone is preceded by an inflammatory condition. The seat of the inflammation may be either the periosteum and the compact tissue, or the medullary membrane. When the external surface is affected, an exudation takes place on the surface of the bone, which becomes ossified into laminae; this forms a layer, which is sometimes separated from the surface of the bone by a layer of spongy tissue. When the inflammatory process has its seat in the medullary membrane, it leads to increased density either of the compact or of the spongy tissue, or of both these structures. It may be easily imagined that these organic changes cannot take place without affecting the texture of the diseased bone; and it is found accordingly, that the substance of the bone becomes hypertrophied in consequence of the expansion and infiltration of the tissue connecting the capillaries of the medullary canals and cells. The result of these organic changes is a thickening at the affected portions, the other sections of the bone remaining free, so that the surface often presents a rough and uneven appearance. The inflammatory states of the bones under consideration are frequently experienced by persons labouring under a rheumatic, syphilitic, or gouty constitution, and the treatment must depend on the nature of the causes that are associated in the production of the disease; the local treatment is that common to other organs affected with chronic inflammation.

The opposite state to that of hypertrophy, is atrophy of the bones. Whatever causes lead to the undue nutrition of bone, tend at the same time to diminish its volume. There are, consequently, many states of the system which may lead to atrophy, such as indifferent diet, want of action, exhausting diseases, palsies, fractures, ankylosis, and, indeed, anything which tends to impede the flow of blood to the bones, are all accompanied with atrophy. From the nature of the various causes just mentioned, any of the bones of the skeleton may be affected. In many cases, the bones diminish both in length and thickness, and the medullary canal becomes contracted: this condition of the bone is termed *con-centric atrophy*.

Independently of special causes, the bones of aged persons often become atrophied; they are then brittle, and break with a comparatively slight force. It appears that atrophy always begins in the medullary canals and in the diploetic structure, the cells of which enlarge, and the walls and lamellæ of the cancellous structure become attenuated, and finally disappear. The compact tissue becomes changed, and resembles the spongy diploetic structure; and the outer layer only remains unaffected, but almost as thin as paper. As the atrophy of the spongy substance advances, the external layer only remains, and incloses a cavity, with mere traces of spongy tissue at its periphery, or a soft substance with large cells. When the spongy substance is entirely removed, the thin external walls of the bones approach each other, and form a single plate. When the cavity within the bone is enlarged, it is called by Mr. Curling *ex-centric atrophy*.

The concentric form of atrophy occurs in the larger medullary canals, the ex-centric in the bones of the pelvis, ribs, and vertebrae. It will be easily imagined, that when such great organic changes take place in the bones, their physical charac-

ters alter in proportion; and accordingly, the bones thus affected become flexible, and crack when they are bent. As the loss of the internal portion of the bone proceeds, the external portion becomes diminished, and hence the skeleton in *senile* atrophy, together with the whole weight of the body, is less than in the normal state. The volume of the bones may be also diminished by continual pressure, such as that produced by tumours and aneurisms; but to these purely mechanical causes I do not wish to engage your attention.

The following proportions were found to exist between the inorganic and organic matter, in a healthy, thickened portion, and in an exostosis formed on the same bone, analyzed by Lassaigne:—

	Healthy.	Hypertrophy.	Exostosis.
Inorganic ... ..	57·	58·4	54·
Organic... ..	43·	41·6	46·

Having now given a description of the nature and growth of osseous tumours, I shall occupy the few spare minutes of your time with some very brief remarks on the nature and diagnosis of the soft tumours affecting the bones. Perhaps there is no subject in which the microscope has been of greater utility to the practical surgeon, than in determining the structure of the soft tumours of the osseous system. Up to a very recent period, tumours of the bones of the most heterogeneous and diversified character have been assembled together, and no distinction has been made between those of the mildest and those of the most malignant tendency. Thus, the older writers grouped together, under the term "*osteo-sarcoma*," the cartilaginous and osseous, the osteoid, the myeloid, and the enchondromatous tumours, and confounded these non-malignant with the scirrhous, medullary, and aveolar tumours. Under these circumstances, we cannot wonder that much discussion should arise amongst surgeons on the propriety of, and the varied success resulting from, the removal of these mixed forms of tumours.

When we look into authors on osteo-sarcoma, we find that they had no very precise idea of the real nature of the tumours comprised under this term. Some wished to restrict the term to those which are decidedly scirrhous, whilst others describe them to be of a cartilaginous texture, and none seem to have satisfactorily determined whether they are or are not wholly malignant. With such a state of confusion and complication, we need not be surprised that some operations have been attended with complete success, while in other cases the diseases have returned and destroyed the patient. To give an idea of the complete difference in the views entertained by surgeons on this subject, it is only necessary to refer to one or two of those who have confounded together the malignant tumours with those of the non-malignant character.

Thus, according to Callisen, osteo-sarcoma is a disease by which the texture of the bones is converted into a lardaceous substance, having a tendency to carcinoma. Boyer considers it a disease analogous to cancer. Dr. Cuming, of Glasgow, considers that though all varieties of osteo-sarcomatous tumours are highly formidable, yet he says "they are not all really cancerous." Mr. Mayo observed of these tumours, that they have not "much malignity;" so that if all the portion of the bone involved, with part of the adjacent sound bone, be removed by amputation, the complaint seldom reappears, either in the part, or in another bone. It would be an almost endless task to enumerate the different opinions, with the various results of these tumours; but we see how little dependence can be placed on the results respecting the cases that have been detailed, unless we could be secure of the real nature of the tumour removed. But the diagnosis of the character of the tumour is in some cases by no means easily made, and I have occasionally been in consultation with the most distinguished surgeons of the metropolis without arriving at anything like a satisfactory result.

The diagnosis of the nature of many tumours connected with the bones is one of the problems in surgery most difficult to solve; the data apparently in many cases are not sufficient for the purpose. The hereditary tendency to diseases of an organic type, the aspect of the patient, the situation of the tumour, its character to the touch, and the history of its formation, are all circumstances to aid in the research; but all these are often insufficient to enable the surgeon to arrive at more than an hypothetical conclusion. An example will suffice to show the truth of these remarks.

A few years ago, I was solicited by a gentleman to remove a tumour situated at the back of the thigh. On examination, I found it was deep-seated, soft to the touch, and apparently movable on the bone; it was of a considerable size, and had only been recently detected by the patient. Having some

suspicion of its character, I advised his having another opinion before its removal, and Mr. Guthrie was consulted; but that gentleman being of the same opinion as myself—namely, that it presented a formidable aspect, it was agreed to take the opinion of the late Sir Astley Cooper. In this consultation, Sir Astley stated, that although he was of opinion it was very likely to turn out malignant, yet that its removal would give the patient a greater chance of a prolonged life. However, considerable alarm having been excited in the minds of the patient and his family by these consultations, he was advised to take the opinion of Mr. Lawrence, and subsequently that of the late Mr. Earle. The result of their several opinions was, that it was a tumour of an uncertain character, but all agreed on the propriety of its removal.

At length the family decided that Mr. Earle should be selected to perform the operation. On cutting down on the tumour, it was found to be a medullary cancer connected with the bone, with ramifications so extensive that its complete removal could not be accomplished. The consequence was that the wound did not heal, and the patient sunk from exhaustion at the end of about three months. In this case it will be observed some of the best surgeons in London were consulted, notwithstanding which nothing but an uncertain knowledge could be formed of the character and connexions of the tumour, and it was, as the result proved, a case which required either amputation at the hip-joint, or to be left unmolested.

In order to assist us in forming a correct diagnosis of the nature of tumours, it has been suggested, and attempts have been made, to ascertain their character by means of a grooved or hooked probe, but with what success this plan has been attended I am not prepared to state; still it seems to hold out a feasible prospect of enabling us to form a better opinion of such cases before operating for their removal. It is the opinion of many surgeons that malignant diseases in the bones are not so liable to return after operation, as those of the soft parts; but as these opinions were given when the real nature of tumours was less understood, it will require further investigation to determine this question. Myeloid and enchondromatous tumours were, until very lately, considered malignant; and this may have given rise to many of the opinions formed of the curability of the patient suffering under malignant tumours of the bones by means of their removal.

## ON THE EMPLOYMENT OF COD-LIVER OIL IN PHTHISIS.

WITH CASES.  
BY E. HEADLAM GREENHOW, M.D.,  
PHYSICIAN TO THE BLENHEIM-STREET DISPENSARY.

THE following cases are mainly interesting from the circumstance of so long a period having elapsed since they were under treatment, and of my acquaintance with the subsequent medical history of most of them. The frequent temporary arrestment of the course of phthisis, and its occasional cure, even in a comparatively advanced stage, have for long been recognised, although the latter must still be considered rather as an exceptional event. Many of the former, and a few of the latter, description of cases had fallen under my own observation prior to the date of those which form the subject of this communication; and at the present time I recollect some ten or twelve persons who, after apparently entering on that course of gradual decline which characterizes this disease, accompanied by the ordinary physical signs of early phthisis, have unexpectedly experienced a cessation of the symptoms, followed by a gradual return of comparative health. Two of these, and they are remarkable instances of recovery from an almost hopeless condition, were seen by me a few months since. Both of them are now middle-aged men, who, as long ago as twelve and fourteen years respectively, had repeated attacks of hæmoptysis, followed by purulent expectoration of many months' continuance, and, in one of the two, by diarrhoea and night-sweats as well. The recovery has in both proved so perfect, that they are now in the enjoyment of tolerable health, and able to pursue their usual avocations, which are of an active description, and chiefly conducted in the open air.

The introduction of cod-liver oil has furnished a remedy which appears to exert an almost specific influence over the tubercular diathesis. The very surprising results of its employment in the earlier cases for which I prescribed it, indeed me, some years ago, to preserve more accurate notes than usual

of such cases as were likely to be under my personal observation for some time. Some of these, after an apparent recovery, have succumbed to a relapse of indisposition. In others, the cure having stood the test of several years, may practically be considered as complete. Taken altogether, they indicate pretty fairly the amount and kind of benefit to be expected from the employment of this remedy. In addition to the cases which follow, I have recommended the employment of the oil to several hundred persons suffering from pulmonary disease, and in a great many of them with the happiest result, so far, at least, as the temporary but very decided alleviation of the symptoms can be considered as such. Most of them were only temporarily under observation, and of the final result I am entirely ignorant; whilst the pressure of other engagements prevented me from keeping sufficiently careful records of others, the detail of whose cases would have formed an interesting and valuable addition to the present series. Few practitioners now doubt the efficacy of cod-liver oil in the treatment of consumption and other strumous diseases, the many recorded instances of its successful employment in such cases, resting upon the most indisputable evidence, being sufficient to convince the most sceptical. The question of the permanency of the cure must nevertheless frequently arise, and it is to aid in its resolution that I have arranged the following cases for publication. Although I attribute to cod-liver oil the very decided relief which so frequently follows its employment in phthisical patients, I do not depend upon it alone, but employ in conjunction with it such other remedial measures as the circumstances of each patient seem to indicate. From chalybeates and counter-irritation great benefit is often derived, independently of the oil, and I continue to employ them, and sometimes even depletion, where the nature of the symptoms renders it necessary. In every instance the strictest attention to the general hygienic management of the patient is indispensable, and, indeed, without it, no permanent benefit is to be expected from any mere medicinal treatment.

In the relation of the cases, whilst I shall abbreviate them as much as possible by the omission of all unnecessary details, the identical language in which they were hastily noted at the time of observation shall be employed. This, and the circumstance that I had no intention of publishing them, will account for many slighter deficiencies and inaccuracies of description. The cases may be very conveniently classified, according to the result, into—

1. Such as were not at all, or but very slightly, benefited by the treatment.
2. Those in which great relief, and, for a time, an apparent cure, was effected, but in which, after an interval of health, a recurrence of disease, resulting fatally, occurred.
3. Those in which the cure appears to be perfect.

1. *Such as were not at all, or but very slightly, benefited by the treatment.*

CASE 1.—J. R.—, aged sixty-four, after suffering from obstinate dyspepsia, accompanied by much hepatic derangement, had diabetes in 1845, followed by diarrhoea, and, in the spring of 1847, by chronic cough and expectoration. I saw him a few times in 1845, but not again until June, 1848, at which time I found him much emaciated and extremely feeble; pulse 100; slightly hectic; expectoration copious, puriform, globular; extensive dulness on right side of chest, and corresponding absence of respiratory murmur. Ordered, infusion of cusparia, six ounces; nitric acid, eighteen minims; spirit of cinnamon, three drachms; mix, and take two spoonfuls three times a day, with one spoonful of cod-liver oil.

June 17th.—Appears rather stronger, and has had better nights; appetite improved; expectoration diminished in quantity and improved in character. Continue.

July 1st.—Very stationary, but is at least not losing ground. From this date he ceased to benefit by the treatment, and the complaint, which at first seemed to be checked, ran on very rapidly to a fatal termination.

CASE 2.—Mr. C.—, aged thirty-three, has been ill for several months, but persevered in his usual pursuits until June, 1848. Suffered a good deal at the outset of his illness from wandering pains in the chest, especially in the sub-clavian regions, between the shoulders and at the margin of the ribs. Dyspnoea, colliquative diarrhoea, and night sweats; ankles rather oedematous; considerable emaciation; tongue clean; pulse ninety to one hundred; cavernous rhonchus in the apices of both lungs, extensively in the left; pectoriloquy; expectoration copious, purulent.

The oil was perseveringly tried in various ways and in very small doses, but so decidedly disagreed with the stomach, that

after three weeks' trial it was abandoned. He sunk in the course of the autumn.

CASE 3.—Miss B.—, aged twenty-one—February 24th, 1851—has twice suffered from pleurisy, the last attack having occurred in April last; has had cough and expectoration for three months; much emaciated; hectic flush on cheeks, but is free from rigors or chilliness; pulse from eighty-six to one hundred; tongue furred; bowels irregular, diarrhoea alternating with constipation; night sweats; expectoration purulent; the catamenia have not appeared for eight weeks; cavernous rhonchus and pectoriloquy on left side; respiratory murmur puerile and somewhat harsh on right side, the expiratory sound being also prolonged. Ordered, half an ounce of cod-liver oil three times a day; iodide of iron, powdered liquorice root, of each two grains; extract of gentian, half a grain: mix; a pill to be taken three times a day. Constant counter-irritation to be maintained on the surface of the chest by means of a lotion, composed of acet. cantharides, half an ounce, and acetic acid, half an ounce.

March 12th.—Decidedly better; appetite improved; cough diminished; feels stronger, and both her mother and self think she has gained flesh. Weight this day, 6 st. 8½ lbs. Continue.

27th.—Still improving. Weight, 6 st. 10 lbs.

April 7th.—Her complaint appears checked, but there is no improvement since I last saw her. There is no return of the catamenia as yet, and the dulness on percussion, cavernous rhonchus, and pectoriloquy, are quite as evident as when I first examined her. Continue.

May 10th.—Has remained stationary until to-day, when slight diarrhoea, from which she had been free since commencing the treatment, supervened. Her weight, which has scarcely, if at all, varied from week to week, is just under seven stone. I now advised a removal into the country, desiring her to persevere steadily in taking the oil, &c. At first she was benefited by the change, but early in July she began rapidly to retrograde, and died in August.

CASE 4.—Mrs. J.—, aged thirty-eight—March 12th, 1851—is a most delicate person, having been for long in delicate health; extremely feeble and thin, and very liable to catarrhal affections; has for several weeks suffered from pain in the left shoulder and at the edge of the ribs; hacking cough, accompanied by scanty muco-purulent expectoration; bowels costive; pulse feeble, thready, 96; tongue foul; much emaciated; entire loss of appetite, and great prostration of strength; no catamenia for several months; chest flattened below the right clavicle; slight dulness on both sides, but most decided on the right; bronchophony; abnormal distinctness of heart sounds; expiratory murmur prolonged. Ordered, half an ounce of cod-liver oil, three times a day; counter-irritation to be maintained by means of the lotion with acet. cantharides and acetic acid.\*

May 9th.—Has persevered steadily in the treatment, and thinks herself much better. The cough and expectoration are decidedly less; and although still very thin, her aspect is improved. Physical signs as before. Continue.

From this date, she varied but little for several months. In the autumn, she had several attacks of hæmoptysis; was subsequently rather benefited by change of climate, but never improved decidedly or permanently, and died in June, 1852.

CASE 5.—Mrs. S.—, aged thirty-six—March 29th, 1849—has been in bad health for several months, having suffered much from dyspeptic symptoms, accompanied by profuse leucorrhœa, to which cough and expectoration have latterly been superadded; pulse 96, small; skin rather hot and dry; no appetite; tongue clean; bowels regular; complains of pain between the shoulders; left side of chest rather flattened anteriorly, and less expansible than the right; deficient resonance on percussion of both sides, but most so of right; bronchophony and tubular respiration on right side; sibilant rhonchus on both sides. Ordered, half an ounce of cod-liver oil, three times a day, followed by syrup of oranges, six drachms; nitric acid, eighteen minims; water, five ounces and a half: mix. One ounce three times a day. Counter-irritation to chest.

This lady very decidedly benefited from the treatment, and got at one time into such tolerable health as led me to anticipate a perfect recovery. Her complaints, which never entirely left her, became aggravated in the spring of 1851, and she died phthisical during the course of that year.

CASE 6.—Mr. H. W.—, aged fifty. Had this man under my care several years ago, for symptoms of incipient phthisis, which appeared to be entirely removed by counter-irritation, the ioduret of iron, and, as soon as convalescence had com-

\* See Case 3, Miss B.—.

menced, change of air. I at that time advised him, as he was well off, to discontinue or change his occupation, which exposed him to considerable and sudden alternations of temperature, and obliged him to pass many hours a day in the highly-heated and dry atmosphere of a manufactory.

Feb. 8th, 1849.—Much emaciation; considerable dyspnoea, accompanied by a short, hacking cough, and scanty expectoration; dulness below both clavicles, but most evident on the left side; tubular respiration; bronchophony; pain at the margin of the ribs on the left side; bowels regular; tongue clean; pulse upwards of 100, and thready; appetite good; the dyspnoea is increased by exertion, but he is nevertheless able to walk out daily.

Having benefited so decidedly on the former occasion from the ioduret of iron, he was again put upon its use, in combination with ipecacuanha and extract of hyoscyamus; but it induced gastrodynia and other dyspeptic symptoms. These being removed by the trisnitrate of bismuth, &c., he commenced taking cod-liver oil in March, and continued it until the month of May, when it sickened him, and his stomach again becoming much deranged and his tongue loaded, he was obliged to discontinue it. No sensible benefit arose from its employment, and being very much in the same condition as when first seen, I again sent him from home with temporary benefit. His complaint made slow progress, but eventually excavations, accompanied by hectic, diarrhoea, &c., took place, and he died consumptive in 1850.

CASE 7.—W. N.—, aged thirty-three, had influenza in the autumn of 1847; but, as was often the case in that epidemic, with comparatively little cough or pulmonary affection, the throat and digestive organs having been more especially the seat of the disorder. A few weeks subsequently, but before he had recovered from the debility induced by the attack of influenza, he lost his voice, still, however, remaining free from cough and expectoration. This continued, together with more or less of debility and general delicacy, until March, 1849, when he again came under my care. Unequivocal signs of early phthisis had now become developed. Counter-irritation was perseveringly employed, and cod-liver oil, in full doses, was taken in conjunction with nitric acid for three months. The oil did not disagree, and he made no objection to its use, but it produced no permanent benefit. He died in August, 1849, his complaint having latterly run a very rapid course.

CASE 8.—G. W. A.—, aged thirty-two—March 1850—has for several months laboured under chronic cough and expectoration; has occasional slight hæmoptysis; dulness in left infra-clavicular region; diminished vesicular murmur; bronchophony, and dry crackling, but confined to a small space on same side; slight sibilant rhonchus on right side; slight emaciation. With various alternations, this patient went on for nearly a year, but at length died, the cod-liver oil having, although well tried, produced no favourable result either on the general health or local symptoms.

CASE 9.—S. R.—, aged thirty-five, has often suffered from chronic catarrh, and has now for many weeks had morning cough, accompanied by scanty expectoration, dyspnoea, slight emaciation; is very sickly-looking; pulse 80; tongue clean; appetite good; moderate dulness on percussion of right upper part of thorax; sibilant rhonchus and sub-crepitation on same side. Counter-irritation to chest; cod-liver oil, half an ounce three times a day. The oil agreed very well, and for a brief space he seemed to benefit from its employment. He then became rapidly worse, and in the end of May went to Dublin, of which place he was a native, where he died within four months.

2. *Those in whom great relief, and, for a time, an apparent cure was effected, but in whom, after an interval of health, a recurrence of disease resulting fatally occurred.*

CASE 10.—The Rev. C. E.—, aged thirty-two, had a bronchitic attack ten years ago, which was extremely obstinate, since which, with few and brief intermissions, he has had more or less of habitual cough. When aged nineteen, he had morbus coxarius, from which, after an illness of two years' continuance, he recovered with ankylosis and shortening of the limb.

March 15th, 1848.—Dyspnoea, especially on ascending an eminence; frequent short cough, with scanty expectoration; slight dulness on percussion of left clavicular region; diminished expansibility of same side; weight, eleven stone six pounds. No note of treatment. Did not see him again until June.

June 8th.—Shortness of breath on quick motion, going up stairs, &c.; dulness on percussion of left upper part of chest,

with diminished expansibility and slight flattening; imperfect pectoriloquy; cavernous rhonchus; slight mucous rhonchus on right side; has felt uneasiness, amounting at times to pain, beneath the left clavicle for several months; expectoration mucopurulent, and occasionally streaked with blood; pulse 86; tongue coated with a slimy-looking, adherent fur. A blister the size of a crown-piece to be applied to the left side of the chest every third day. Ordered, iodide of iron, two grains; liquorice powder, two grains; powdered ipecacuanha, a quarter of a grain; extract of gentian, half a grain; make into a pill, and take three times a day. Diet, plain meat and vegetables, without wine or beer, for dinner. Milk morning and evening.

July 14th.—No change in the physical signs; cough, expectoration and shortness of breath as before. To continue the counter-irritation, and omit the pills. To take half an ounce of cod-liver oil three times a day.

August 11th.—Cough and expectoration much diminished; subclavian pain entirely gone; bowels rather costive; pulse 82, soft and of good volume; weight 12st. 3lbs. Continue.

30th.—Distinct pectoriloquy at the left infra-clavicular region, and also posteriorly over the scapula; cough greatly diminished, but still expectorates a good deal; tongue, which has for long been habitually foul, is decidedly cleaner; pulse 84; weight, 12st. 5lbs. Continue.

December 8th.—Has steadily improved in health, having continued the cod-liver oil to this date. Cough and expectoration are now both inconsiderable; breathing very much improved; pulse 80, which is in him about the natural standard. Has resumed his duty, and for several weeks taken two full services on the Sunday.

10th.—After unusual exertion of his voice and a fall, hæmoptysis to the extent of eight ounces, as I am informed by his medical attendant.

11th.—Pulse 78; skin cool; entire absence of cough and expectoration; great dulness and entire absence of respiratory murmur over a large portion of left lung. Ordered, compound infusion of roses, six ounces; sulphate of magnesia, two drachms; dilute sulphuric acid, one drachm; ipecacuanha wine, two drachms: mix, and take an ounce every third hour. Milk diet.

16th.—Is cheerful; pulse 84, steady; tongue cleaning; cough moderate; is expectorating mucus mixed with coagula; skin cool; appetite good. Milk diet. Ordered, infusion of Calumba, six ounces; nitro-muriatic acid, eighteen minims; tincture of hyoscyamus, two drachms: mix, and take one ounce three times a day.

17th.—Slight return of hæmoptysis; pulse 95, jerking. Ordered, infusion of roses, six ounces; dilute sulphuric acid, one drachm; ipecacuanha powder, three grains: mix, and take one ounce every two hours.

20th.—Pulse 84, soft; expectoration moderate in amount, but still mixed with dark clots of blood. Several small portions of tubercle have been expectorated; one, about the size of a pea, and of the consistence and appearance of friable white cheese, was surrounded, when voided, by a tenacious sanguinolent mucus.

23rd.—Pulse 80; general dulness on percussion over the left side of chest, with deficiency of respiratory murmur; distinct cavernous rhonchus below left clavicle. Resonance on right side normal; respiration easy, and scarcely accelerated; cough in paroxysms, and not very frequent; expectoration continues to be generally tinged with dark or grumous-looking, but occasionally also florid, blood.

25th.—Still improving; was up in an adjoining room for two hours to-day; pulse whilst up, 78, soft.

31st.—All tinge of blood in the expectoration has ceased for several days; pulse 78; improved resonance on left side; cavernous rhonchus.

Jan. 13th, 1849.—Cough and expectoration moderate; appetite good; tongue furred; bowels regular; pulse 76 whilst still, rises to 90 on slight exertion. To have a little chicken, and to resume the mixture with Calumba and nitro-muriatic acid prescribed on the 16th ult.

17th.—Pulse 90 to 100, small, thready; has had slight sweating for a night or two; bowels rather loose; cough much diminished, and there is now but little expectoration; tongue much cleaner; is emaciating, but fancies himself better; decided sinking under left clavicle; very evident loss of expansibility on same side; dulness below clavicle quite across from sternum, and extending as low as the nipple, but with a more resonant space in the centre; pectoriloquy and cavernous rhonchus; right side resonant; breath sounds rather exaggerated; entire absence of mucous or other rhonchus. To have good diet, and take half an ounce of cod-liver oil three times a day.

19th.—Expectoration slightly streaked with blood; pulse 90. To maintain constant counter-irritation by means of the lotion with acet. cantharides and acetic acid. Continue.

26th.—Improving in all respects; pulse 90; tendency to diarrhoea and night-sweats has entirely ceased; appetite good; tongue cleaner. Is gaining flesh. Continue.

Feb. 26th.—Continues to gain flesh and strength; walks out daily whenever the weather will admit. Continue.

March 1st.—Was perfectly well this morning, and walked out, the wind being cold and E.N.E. On his return there was a slight return of hæmoptysis; the blood, about a tablespoonful in quantity and florid, was mixed with mucus, and frothy; pulse 100, full and thrilling. Percussion sound better than for many weeks past; remarkably distinct pectoriloquy and cavernous respiration; entire absence of gurgling. Bleeding from the arm to twelve ounces. Ordered, infusion of roses, one ounce; dilute sulphuric acid, ten minims; ipecacuanha powder, one-third of a grain, every two hours. Milk diet. Blood buffed and cupped. There was no recurrence of hæmoptysis.

24th.—Much improved; is looking well; pulse 78; dulness of resonance on left side as before; resonance normal on right side. Has resumed the oil since the 10th inst.

He continued to improve daily from this date, and on April 11th is reported as very well; voice firm and natural; is in good condition, and rather disposed to be stout; appetite and digestion good; has scarcely any cough, and merely a little mucous expectoration in the morning; there are dulness of resonance and pectoriloquy in the old situation, but no gurgling rhonchus. Respiration is accompanied by a kind of creaking noise in the left lung, as though folds of leather were being expanded. He left about this time for the south of England, with directions to continue the oil.

May 19th, 1851.—Came again under my care for slight catarrh, with dyspepsia. Breathing tolerably good; left side deficient in expansibility, and much flattened; decided dulness of resonance on percussion; pectoriloquy and cavernous breathing, but entire absence of rhonchus; there is still the same creaking sound as when last seen, but I think in a diminished degree. He continued to improve, and to enjoy very tolerable health, being even able to resume his duty for a time. He wintered in the south again in 1851-2, where he had pleurisy, with effusion into the left pleura. I again saw him in the autumn of 1852, at which time there was uniform dulness over the left side of thorax, with dilation. The heart was pushed over to the right side, and there was very considerable dyspnoea. By strict attention to diet and regimen, by the employment of counter-irritation, and iodine with tonics, his general health improved, and he was gradually brought into a much more comfortable condition; but he had slight occasional illnesses, and sunk rapidly under a recurrence of an attack of pleurisy in July, 1853.

(To be continued.)

## ON CHARCOAL AS A DISINFECTANT.

By G. J. BARFORD, Esq., St. Bartholomew's Hospital.

THE substances with which we are acquainted as disinfectants or deodorizers are, chlorine, chloride of lime, lime, charcoal, &c., each of which possess this power to a certain degree, but not all acting in the same manner. The disinfecting power of chlorine depends on its affinity for hydrogen; thus, decomposing water or aqueous vapour, by uniting with the hydrogen, while the nascent oxygen oxidizes the organic matter, so that unless aqueous vapour is present, chlorine loses a great part of its disinfecting powers, and simply disguises the noxious effluvia, and is itself an irritating, offensive, and corrosive substance. Chloride of lime acts by the oxidation of the putrescent matter; but to do this effectually it requires the presence of an acid; thus, unless a considerable quantity of carbonic acid is present to decompose the hypochlorite of lime, and give rise to the evolution of hypochlorous acid, the chloride of lime will do but little as a disinfectant. Lime acts by the absorption of carbonic acid and sulphuretted hydrogen, leaving other noxious gases unaltered; thus they are all open to serious objections; but the one which practically will be found the most effectual, I believe, has received the least patronage—this is charcoal, a body whose disinfecting powers has long been known, but its mode of application has been quite neglected.

Dr. Stenhouse lately called attention to his very ingenious ori-nasal respirator, which depends on charcoal for its efficacy, the action of which is given in the *Journal of the Society of Arts* for February, 1854; the respirator having been noticed in

THE LANCET of November 25th, I need only mention it as an instance of the powerful disinfecting power of charcoal; but at once call attention to the plan I have adopted in the application of this agent as a disinfectant, bearing in mind the results of Dr. Stenhouse's experiments, which prove that charcoal not only absorbs noxious vapours and putrescent odours, but at the same time oxidizes them; or, in other words, makes them undergo a slow but sure combustion, which must have its end in the conversion of deleterious gases into compounds, whose physical and chemical properties would admit of an easy separation or removal from their bed of formation, and which on evolution would not be the least deleterious. I therefore, previous to its use, heated the charcoal thoroughly in a covered crucible, with a small hole in its lid, to allow any oxidized material which it might contain to escape, taking care not to have the hole sufficiently large to allow the charcoal to undergo combustion; when thoroughly heated it was allowed to cool, so that on exposure to the air it should not oxidize; in this state it was put into shallow vessels, and placed wherever putrescent odours existed, and in a few minutes the whole of the smell disappeared; but in a day or two the charcoal lost its power. I then thoroughly heated it again, with the same precautions as before, and placed it to perform its duties a second time, which it did with as much efficacy as on the first application; thus, by the repeated cleansing of the charcoal every or every other day, it does not deteriorate, but the same quantity will effectually remove noxious gases for an indefinite period of time.

With Mr. Holden's permission I was enabled to give it a most perfect trial in the dissecting-rooms of St. Bartholomew's Hospital, which at this time of the year must abound in noxious gases and putrescent odours, thoroughly heating the charcoal, and placing it in shallow vessels about the rooms. It acted so promptly, that in ten minutes not the least diffused smell could be detected. So quick and effectual was its action, that arrangements are being made for its constant use. It answers just as well as a purifier of water-closets, drains, wards of hospitals, and sick rooms. As a purifier of hospital wards, both civil and military, it might be applied with great advantage, saving patients from the unpleasant smells and effluvia from gangrenous sores, and for this purpose a wire gauze construction, containing the charcoal, might be made to surround the affected part at some distance from the dressing; thus the patient himself, and those in adjacent beds, would not be subjected to the influence of the putrescent odours. All these the charcoal would effectually absorb, doubtless with advantage to the patient and his neighbours also. Other quantities of charcoal might be placed in shallow vessels about the wards, and purified every morning as above mentioned. Being at the command of the poor as well as the rich, it admits of universal use; and though it may be objected to as a purifier of the wards of hospitals and chambers of the sick, under the fallacious notion that it would emit carbonic acid, and also on undergoing its daily cleansing would again give off the absorbed gases, yet this notion can never enter the minds of those who understand its action, seeing that carbonic acid cannot be generated unless the charcoal is heated in free contact with the air. This is prevented by having a covered crucible, in which it can be heated to any temperature without undergoing combustion; and the supposition that the absorbed gases are given off again when the charcoal is heated, will be removed by the fact, that they are all oxidized and converted into sulphuric, nitric, carbonic acids, and water, &c., and the heating of the charcoal is for the whole and sole purposes of removing these bodies, which exist in so small a quantity that they could not be the least prejudicial, even if driven off in the centre of an inhabited room, but, of course, they all pass up the chimney. Thus charcoal is more efficacious than any other disinfectant, when applied as above described, absorbing gases of whatsoever kind not requiring the presence of any other substance to resist its action, but without stint or scruple collecting noxious vapours from every source, not disguising, but condensing and oxidizing the most offensive gases and poisonous effluvia, converting them into simple, inert, stable compounds; it is simple and economical, coming within the reach of the poorest, and can safely be placed in the hands of the most ignorant, thus combining advantages not possessed by any other disinfectant.

December, 1854.

ARMY MEDICAL DEPARTMENT.—The Director-General has appointed nearly twenty gentlemen as dispensers of medicines to the army in the East. Amongst others are the names of Messrs. Brewer, Allenby, Fitzo, Arthy, Beechey, Rickards, Peachey, Davis, &c. They will receive 7s. 6d. per diem, with the allowance of an assistant-surgeon.

## OF THE PRACTICE OF MEDICINE AND SURGERY IN THE HOSPITALS OF LONDON.

Nulla est alia pro certo noscendi via, nisi quam plurimas et morborum et dissectionum historias, tam aliorum proprias, collectas habere et inter se comparare.—MORCAEUS. *De Sed. et Caus. Morb.* lib. 14. Proœmium.

### ST. BARTHOLOMEW'S HOSPITAL.

#### DIAGNOSIS OF FRACTURE.

(Cases under the care of Mr. STANLEY.)

GOING through St. Bartholomew's lately, with Mr. Stanley, we were struck with some very practical and useful observations made by this eminent surgeon in conversation with Mr. Paget and his class. A child has been in the hospital now for some weeks with the rather rare form of affection—*both* hip-joints diseased. At one side the coxo-femoral articulation is completely ankylosed, while the other hip-joint, though diseased, still enjoys some little motion. Three weeks ago, Mr. Stanley opened an abscess in one hip, last week another in the opposite one. There would not seem to be any specific form or stage of cachexia present, as there are evidently two different diseases in both hips, inflammation of the ligaments and parts adjacent to the joints in both, but not, perhaps, in the joints. The case afforded Mr. Stanley a text for some singular remarks as to the general obscurity of injuries of the heads of long bones; when the disease of morbus coxarius is more advanced, Mr. Stanley believes the apparent shortening arises from obliquity of the pelvis; or, on the other hand, the head of the thigh-bone may be absorbed; or the acetabulum may be destroyed; or, again, the head of the diseased bone and new acetabulum, as remarked by Cloquet, may both "travel" up together on the dorsum illi. If the head of the bone be thrown up on the dorsum illi in ordinary dislocation of healthy bones, the limb is turned in; if, on the contrary, the bones are diseased, he believes, with Mr. Skey, the rotator muscles become stronger, and turn the limb out. Mr. Stanley has found some peculiarities in children's bones: in the broken legs of children it is always, or almost always, as four cases of thigh broken to one of the leg below the knee. The periosteum of the bones of children is also exceedingly thick. Mr. Stanley seems to have an instinctive dread of fractures of the long bones in children, more especially near the joints. In adults also he has found much difficulty and trouble in such cases. We prefer giving Mr. Stanley's desultory remarks on these cases, as we agree with him and Mr. Paget, who observed that the points are not generally recognised in books, the ends of the long bones are more vascular, and even in children take on ulcerative disease quicker than the other parts of the bone; necrosis or fracture, on the other hand, occurs more frequently in the middle of the long bones. A man lately, in Kenton's ward, had fracture of the shaft of the thigh-bone. He merely slipped off the fourth or fifth rail of a ladder, coming on the foot, the bone snapping in the centre.

Another case in St. Bartholomew's, was that of a man settling a sheep hurdle in Smithfield, who kicked his foot against a stone, and broke his leg also. The diagnosis of fractures is a subject of very great interest. A man will fall in this way off a ladder, or into a gravel-pit, perhaps, as in another case also some time since in St. Bartholomew's. There was no pain, mobility or crepitus, to mark it out as fracture, and not till five weeks after was it detected. This arises, according to Mr. Stanley, from the fracture occurring in the cancellous head of the bone, in the femur for instance, and always going right through between the condyles, with extensive hæmorrhage taking place, and swelling all round the joint. Absence of crepitus, Mr. Stanley impressed on his class, is no sign of absence of fracture; if present, it is of course a very reliable indication of such injury. Fracture of the cancellous texture of the head of the tibia is almost impossible to make out. In obscure injury of the shoulder, again, he has found a dozen times what might be called *crepitus* from effusion into the synovial capsule, or, possibly, escape of synovia, and yet no fracture. These are practical points, which it is very useful

to note. "If this man falling into a gravel-pit happen to be a person in the higher walks of life," Mr. Stanley very properly remarked, "it would be an awkward mistake to find the fracture five weeks too late."

"I think 'Pott's fracture,'" said Mr. Stanley, much to the amusement of the class, "is the only one well understood by candidates coming up to the College. Those industrious gentlemen, the grinders, make them have Pott's fracture quite pat. Now, every broken leg is not Pott's fracture; it is, in fact, a rather insignificant accident, fracture of the lower third of the fibula, with dislocation of the tibia and eversion of the foot; it is rather a dislocation of a bad and troublesome kind, first explained very admirably by Mr. Pott, than an injury of such startling and very momentous importance as generally believed. A man jumps from a height, the foot twists outwardly, the foot is drawn up by the peronei, and you have an injury easily recognised; but take care, when you are called to what may or may not be fracture of the upper end of the same bone and tibia, near the knee, with hæmorrhage into the cancellous structure of the bone, or fracture without crepitus of the lower end of the femur, or what is nearly the same, swelling of the elbow, and a fracture not to be made out in the humerus,—in all these cases, I would advise you to act with great caution, and as if there were fracture really present. You will have, in fact, hæmorrhage of the bone, and effusion into the joint, which, I would repeat again, is one of the most untoward complications of these injuries, leading, possibly, very often to false joints or ununited fractures, and reflecting no very conspicuous credit on whoever has the fortune to meet with such cases."

### GUY'S HOSPITAL.

#### ANOMALOUS EFFECTS OF PHLEBITIS.

(Under the care of Dr. ADDISON.)

It is interesting and instructive sometimes to seize the dicta of our older physicians; that "older experience" which now and again, perhaps to students a little prosy, yet not less frequently we might say, with one of the poets, amounts

"To something of prophetic strain."

We were very much impressed in this way, a few days since, on going through Guy's.

A very puzzling case has been lately in one of Dr. Addison's beds, and as we have recently seen this disease in every possible shape, we give this one, almost impossible, variety or case.

A. B—, a poor man, complained of what seemed abscess in the head of the left rectus muscle, or it might be—as once suggested itself to Dr. Gull, Mr. Cock, and Dr. Addison—abscess of the liver itself, or the purulent matter of an empyema, pointing in this position. Some time previously he had inflammation of the chest on the left side. It seemed also a wheel had gone over his chest. The interval was very long, something like seven years; yet from the weak, typhoid state of the patient nothing further could be learned of his history. The case was one of those on the frontier line, separating medicine and surgery. The man was placed under Dr. Addison, but Mr. Cock suggested to open the abscess, which was accordingly done. The man was a perfect, almost exquisite, instance of the scrofulous diathesis; struma was written in every lineament and fibre of his system. He was weakly, and evidently about to die, though why could not be told. Now came the remarkable symptom; he was seized with paralysis of the face at the right side. Here was a man, then, with an abscess in his rectus muscle, tremors, shiverings, typhoid symptoms, and paralysis of the face. He had also, as if to fill up the list of incongruities, coagulable urine! At first, Dr. Addison could scarcely believe this when read out of the book, and, accordingly, going round, called for the spirit-lamp and test tubes. The urine was muddy, with urates, cleared first under heat, and then became quite opaque.

Dr. Addison readily recognised the nature of the case, first limiting himself to two things, either of which it looked likely to be: either phlebotic mischief going on for some time, or renal dropsy, with uræmia; the latter is more likely to lead to coma, convulsions, or other bad brain symptoms, not paralysis, so he was inclined to leave it out. While, under the view of its being phlebotic absorption, the nature of the case was more easily understood. How this abscess of the rectus muscle arose was very difficult to make out on the post-mortem examination, as nothing seemed to do the man good. An extensive suppurating deposit was found in the right lobe of the brain, near the surfaces, engaging the arachnoid, with an old-standing abscess in the cerebellum, at its left side. This, then, was no

doubt the cause of the paralysis, as the latter is connected with the thalamus, and what is known as the meso-cephalon, the shiverings and tremblings in this disease, and delirium tremens, depending on irritation of the arachnoid. The case has evidently a very extended bearing on the subject of phlebitis and pyæmia, showing how this disease may occur under circumstances not at all to be suspected. A case, apparently of traumatic fever, under the care of Mr. Lloyd, we watched also, last month, at Bartholomew's; which, as feared, ended in purulent deposits in various organs. More than one fatal case lately, at the London Hospital, has also commenced in this insidious manner; but we should be very slow, indeed, to believe that any possible amount of skill or prevision could prevent such results. In this point of view, indeed, we deem Dr. Addison's case peculiarly instructive.

#### POST-MORTEM APPEARANCES IN THE CASE OF DEATH FROM CHLOROFORM.

(Under the care of Mr. BIRKETT.)

As very unusual interest attaches to deaths from chloroform, referred to elsewhere, we give the post-mortem appearances, kindly furnished us by Mr. Birkett.

Hannah B—, aged fifty-six, was admitted into Guy's Hospital on the 15th of November, 1854, under the care of Mr. Birkett. She described herself as in good health, but presented a most cachectic appearance, edentulous, and appeared perhaps ten years older than the age assigned. She complained of chronic ulceration of her left leg for the last two years, the ulceration appearing to surround the leg at about the junction of the middle and lower thirds. Two months before admission into Guy's, the ulcer assumed a sprouting, fungating aspect, became very painful, and during the last month it bled frequently and profusely. In the left groin there was an enlarged gland. Various means having been ineffectually employed to destroy the cancer, amputation below the knee was proposed and agreed to by the patient. The woman had a little wine-and-water, according to a recent suggestion, before taking the chloroform. And here we may remark that the fatality of chloroform would seem to be greater at some hospitals than at others, while in Edinburgh it has been said no deaths have occurred.

At one o'clock P.M. on the 5th, she was brought into the operating theatre, and chloroform administered in the usual method at Guy's, on folds of lint. During the inhalation of the vapour, the tourniquet was adjusted to the femoral artery; it was screwed tightly for a few seconds, to ascertain if it commanded the artery, but, we observed, was immediately after slackened. The inhalation had been continued a minute or two, when considerable muscular movements, so frequent in this stage, took place; these were followed by rigidity. Mr. Birkett was about to operate, when Mr. Callaway, in the capacity of assistant at the operation, called attention to the only remarkable circumstances noted, the pulse stopped at the wrist, swelling of the veins of the neck, expirations performed also with considerable sufflation of the cheeks and sudden opening of the lips. The poor woman was less than five minutes under the action of the vapour; there had been no vomiting, and particular care was taken there should be no solid food in the stomach. We give these particulars, as we think the working out of the problem of the cause of death after chloroform inhalation one of the most interesting perhaps which can engage the profession at present.

The post-mortem, conducted with great care and skill by Dr. Wilkes, revealed a very large amount of organic disease. The external appearance was that of a woman at least ten years older than her real age; hair quite grey; *arcus senilis* of the eyes; body spare, the skin presenting the smooth, yellow appearance too often indicative of senile fatty degeneration. A chronic ulcer, of very bad kind, existed on the right leg, and on the left a large fungating mass. There was the usual amount of blood in the brain; the membranes healthy; the subarachnoid fluid greatly increased in quantity, due perhaps to wasting of the brain; the convolutions were shrunken, but healthy; the ventricles contained an increased amount of serum; one choroid plexus vesicular; the cerebral arteries contained atheromatous matter and bony patches; the medulla oblongata did not exhibit any morbid appearance. The larynx, trachea, and pleura were all healthy; the lungs were very much congested with blood, bleeding very freely when cut. The heart was of usual size; *all its cavities empty*; the endocardial membrane of the left ventricle had various patches and streaks of fibroid degeneration; the heart-fibres presented zig-zag lines of fatty degeneration; they were slightly granular,

and contained fat, as seen under the microscope; this was more in the right ventricle than in the left; the fleshy columns of the mitral valve were also diseased in the same way. The liver was also diseased. On examining the ulcer on the leg, it was found to be full of cancer-cells, large and nucleated.

#### KING'S COLLEGE HOSPITAL.

##### THE CAUSES OF SCURVY IN ARMIES.

(Under the care of Dr. BUDD.)

A CASE of scurvy in this hospital has given Dr. Budd an opportunity to make some practical bed-side remarks on this disease, which he feared will attack our English army in the spring if timely precaution be not taken to avert such an evil. The causes of scurvy, or at least the causes popularly conceived to produce scurvy, are singular instances of bad reasoning—the *post hoc* put for the *propter hoc*. At one time, and not long ago, it was thought it was the cold of winter produced this disease; then on board ship it was believed it was salt meat, as it occurs after long voyages, and chiefly in spring or in the end of winter. These are not the causes, but they run parallel with the cause—namely, want of vegetable food. This Dr. Budd believes to be the great, if not the one only, specific cause of scurvy. Scurvy is often mistaken for purpura; but the latter, we need hardly remark, is more of the nature of a hæmorrhage, and often met with where there is plenty of vegetable food. In scurvy the gums are soft and swelled, spongy, and bleeding readily. It is a disease marked by excessive debility, but readily cured by lemon-juice, fresh vegetables, or fruits; the latter supplying something which bread or meat or other kinds of food fail to supply to the blood. The farinaceous seeds, wheat, barley, oats, rye, are found to be deficient in those principles; while potatoes, according to Vauquelin and Erichoff, though paradoxical it may appear, possess the same acid as lemons. The Turkish army, according to some work quoted by Dr. Budd, suffered severely from scurvy last spring under Omar Pacha. Dr. Budd rather gravely remarked, without premeditation, they might prove with scurvy under Lord Raglan, which raised considerable laughter in the class, always attentive to this excellent lecturer's addresses—an interruption he turned to account by remarking that we, too, might have our own poor troops destroyed by it if timely care were not taken. The class seemed to think the Turks our defenders, rather deserved scurvy for running away so often—a feeling too sad when applied to our own troops; but fixing the matter painfully in the recollection, as, by the last accounts from the seat of war, scurvy was already making its appearance.

##### THE VALUE OF THE MICROSCOPE IN CANCER

(Under the care of Mr. PARTRIDGE.)

MR. PARTRIDGE removed a breast some days ago, or rather a scirrhous mass from the region of the mammary gland—an operation in itself of little moment, but a subject which has caused considerable speculation, and gained no little importance of late in clinical conversation in hospitals, from the recent singular statement of Velpeau, that, in spite of our microscopes and micrology, he has cured twenty cases of cancer. Some of our London surgeons agree with the Paris school, or rather the section headed by this eminent writer, in believing that there is no specific cell characteristic of malignant growth, and the so-called specific cells are too often visible in growths apparently benignant. Mandl, Virchow, Bennet, and Mr. Paget, have, it is true, brought their learning to bear against the plain common sense of Velpeau; but it seems the latter is right, and on repeating his observations in London, it is found these so-called malignant cells are very often secondary products or formations, even at best, sometimes of no very marked character. There has been seldom so much wit and learning brought into a discussion as in this on the value of the microscope in the diagnosis of malignant growths. We should be sorry to find the microscope lose any of its *prestige* as almost an additional sense conferred on the practical man. Witness only the singular revelations of adulterations of food and medicine in the pages of the "Analytical Sanitary Commission" of THE LANCET; or in the works of Peyer or Pereira; yet we cannot help believing that in hospitals, more especially in the practice of older men, like Mr. Lawrence, Mr. Green, Mr. Luke, &c., there has been for some time growing up considerable doubt, not as to the value of the microscope, for these gentlemen are rather amiably ignorant of its value, but as to the regularity of return or repulsive character of what are otherwise deemed malignant

growths. Even Mr. Paget has lately addressed his Abernethian Society friends on what he calls the *degeneration* of cancer. The final result of all this may possibly be to put more faith in nature, and less in lenses. At an operation last Saturday at St. Bartholomew's for what proved a malignant growth, opinions seemed about equally divided as to its removal; the microscope told nothing. In the present case of Mr. Partridge's there was no doubt at all, the tumour was growing rather in the gland. Where we have no cancer-cells we have fibro-plastic tissue, but what the exact connexion between these may be, seems still open to doubt. Velpeau was called to see a polypus-like growth on the nose of a private patient, which Lebert, a microscopist *pur sang*, declared non-malignant. It was removed, but returned again, and the man died. In another case, according to the verdict of the microscope, a tumour in one breast of a woman was malignant, as being full of cells, but a similar tumour in the other breast non-malignant, being free from cells! The malignancy of epithelial cancer by this test alone of cells or heteromorphic elements, must remain very unsatisfactory and dubious. A case, published by Mr. Paget, was operated upon as fibro-plastic tumour in 1836, and once again, but remained cured. Malignant, indeed, gives the rather inspiring opinion, that operation, notwithstanding the school of Mr. John Simon, of London, and others, does in reality cure cancer; nay more, from the experience of French hospitals, he is quite satisfied a patient may have *two* cancers, so to call them, in his life, one quite independent and unconnected, except by the histologists, with the other. Were the microscope less exacting in its verdicts, we might obviously be more correct. One speaker said he could bring thirty cases to prove the existence of malignant cancer where there were no cells, and cells where there was no cancer. A good deal of the discussion has taken place between the old and new schools of physic. Very possibly, on one side we may have prejudices as strong as on the other; for in the later parts of the discussion some of Velpeau's facts have been a little staggered. The microscope cannot, any more than the stethoscope, lay claim to infallibility. We may or may not be able to tell the existence of tubercles at their first dawn in the lungs, but we may from the previous history of the case. There are subtle differences or degrees in cancer, epithelial growths, fibro-plastic tumours, &c. We should not wish, however, for any divorce between medicine and the microscope; but a closer, more rational, and perhaps less exacting, union of the two.

### Medical Societies.

#### MEDICAL SOCIETY OF LONDON.

SATURDAY, DECEMBER 9TH, 1854.

MR. HEADLAND, PRESIDENT.

##### ARREST OF DEVELOPMENT.

A CHILD, thirteen months old, was exhibited by Mr. YEARSLEY, which had been born at the full period, without either the upper or the lower extremities. The scapula and clavicle were present, with the rudiment of the head of the humerus. There was no trace of a hip-joint.

##### AN EGG-CUP IN THE ILIUM.

An egg-cup was exhibited which had been removed from the ilium of a man who died from strangulated hernia. The case occurred in the practice of Mr. DENDY, and was reported in THE LANCET upwards of twenty years since. The patient would not consent to an operation to relieve the strangulated intestine, and the cup was discovered in the position stated. All the small intestines were diseased. No previous history of the case could be obtained.

##### POISONING BY ESSENCE OF ALMONDS.

MR. STREETER related the case of a child, about six years of age, who had swallowed a few drops of "essence of almonds," which had been obtained from a chemist's for the purpose of flavouring a custard. The symptoms developed themselves about half an hour after the poison was swallowed, and consisted of vomiting, with tetanic convulsions. Sulphate of zinc was administered as an emetic, and the child placed in a warm bath, cold being applied to the head at the same time. The child recovered.

DR. THUDICUM exhibited a

##### NEW BROTH FOR THE SICK.

To prepare this broth, half a pound of the flesh of a recently-killed animal (beef, or the flesh of a fowl) is chopped fine, and

well mixed with a pound and an eighth of distilled water, to which four drops of pure muriatic acid, and from half to a drachm of common salt, have been added. After an hour, the whole is thrown on a common hair sieve, and the fluid is allowed to run off without pressure. The first portion, which is turbid, is poured back, until the fluid runs off quite clear. On to the fleshy residue in the sieve half a pound of distilled water is thrown in small portions. In this way a pound of fluid (cold extract of meat) is obtained, of a red colour, and an agreeable taste of broth. The sick are allowed to drink a cupful cold at pleasure. It must not be heated, as it then becomes turbid, and deposits a thick coagulum of animal albumen and hematin. The broth possessed great advantages over other preparations of meat, from containing albumen, and being remarkably easy of digestion. Cases were referred to in which its efficacy in this respect had been tested. Some conversation took place on the advantages which this broth possessed over concentrated beef-tea, &c.

MR. JABEZ HOGG exhibited—

##### A PLACENTA WITH DOUBLE MEMBRANES, ETC.

It was thrown off by a patient during her ninth pregnancy, four of which had been healthy, and she has now living as many children. At intervals, she had miscarried, and the three last pregnancies in succession, extending over a period of twenty-seven months, had been of the same character as the one now described. The patient is a fine, healthy woman, thirty-three years of age. Her pregnancy proceeded well up to the sixth month, when she complained of a rapid increase in size, and, during the next fortnight, was unable to move about without causing pain, which was accompanied by a slight hæmorrhage. Treatment was of no avail; and at the seventh month she was seized with labour pains, and in about two hours from this time the membranes were ruptured, and the bed and bedding saturated with the amniotic fluid; this continued to flow for some minutes into a footbath which was at hand; another pain quickly followed, and another stream of fluid, which in all amounted to upwards of a gallon, caught in the bath. The child was brought down at the same moment, and the placenta, with membranes of an unusually large size. The child was, as on the former occasions, still-born, and covered thickly over with the *vernix caseosa*. The substance of the placenta when examined under the microscope appeared to be made up of hypertrophied or dilated tubules of fibrous tissue, enclosing within them granular matter. Upon digesting a small portion of this in dilute hydrochloric acid the greater part dissolved out with effervescence. Another portion, after drying upon bibulous paper, was digested in ether; this was carefully decanted and evaporated, and found to consist wholly of fat-globules.

DR. COTTON read a paper

##### ON A PREVAILING FORM OF CHRONIC PNEUMONIA.

After a brief comment on the increasing frequency of chronic diseases within the last few years, the author entered upon the description of a peculiar form of low or chronic pneumonia which has fallen under his notice at the Consumption Hospital. The old and the young, the strong and the feeble, are, with nearly equal frequency, the subjects of the disease. There is, at the commencement of the attack, very seldom any local pain; neither is there dyspnoea nor much cough. The expectoration is scanty, or perhaps entirely wanting, the rust-coloured sputa so characteristic of active pneumonia being but rarely observed. The pulse is at first very slightly affected, seldom exceeding eighty or ninety in the minute. There is little symptomatic fever. Every symptom of the disease, indeed, is of a passive character, scarcely exciting the apprehension even of the medical attendant. It may thus continue for weeks or even months, until a little local pain or slight dyspnoea, or a severe and intractable cough, with perhaps emaciation and night perspirations, lead to a suspicion of something more formidable than the dyspepsia or the bronchitis, to which hitherto the symptoms had probably been referred. The author was of opinion that, under early and judicious treatment, the great majority of cases may recover; but that the disease too often either degenerated into true pulmonary tuberculosis, or ended in a fatal softening and breaking up of the pulmonary structure. He dwelt particularly on the importance of an early and careful examination of the chest, stating that dulness on percussion, with weak and harsh, but not bronchial, respiration, and little if any change in the external form of the chest, were the characteristics of the early stage, the breathing becoming weaker, and marked by sub-crepitant rhonchi, and the thoracic parietes undergoing contraction, as the disease advances. He had very rarely, indeed, heard the

fine crepitation of more acute pneumonia. Dr. Cotton considered that in the early stage the lung was simply engorged; that at a later period it was the seat of an albuminous or fibrinous exudation, which, in cases still further advanced, had undergone the softening process. He illustrated these statements by briefly narrating cases in point. He was anxious to distinguish the disease he was describing from *pleuro-pneumonia*, which he considered was usually a more severe and acute seizure, although he believed that now and then the one may pass into the other. When the attack was of recent date, cupping or leeching were recommended; but if, as generally happened, the state of engorgement were passing away before the case came under treatment, counter-irritation with blisters, and subsequently with stimulating and iodine liniments, were specially advised; the author, indeed, considered this practice of equal or even greater importance than any other part of the general treatment. Mercury, in moderate doses, (except in cases evidently associated with phthisis,) with (in some instances) antimony and general expectorants and sedatives, were the appropriate remedies for the early periods of the disease; slight mercurial action, together with tonics, being suited to the more advanced and chronic stages. Amongst the latter class of medicines, the author particularly spoke of the iodide of iron and cod-liver oil, either separately or in conjunction, the iodide of potassium, quinine, and steel. Whatever medical means were resorted to, he insisted upon the great importance of hygiene, stating his conviction that healthful and happy associations, with thorough physical and mental relaxation, together with a liberal and nourishing diet, should ever form a part of the physician's prescription.

Dr. GLOVER thought the cases related were analogous to those instances of disease recorded in "Guy's Hospital Reports," by Dr. Addison, under the title of "Albuminous Infiltration of the Lung"—a disease neither tuberculous nor inflammatory. It attacked the middle portion of the lung, whilst pneumonia attacked the lower, and phthisis the upper portions. The effusion was more organized than that of scrofula, and less than that of pneumonia.

Dr. CAMPS thought the cases detailed were not new, but had been overlooked formerly from our imperfect means of diagnosis.

Mr. ROSS had seen cases similar to those detailed by Dr. Cotton, and which, though of a chronic kind, presented all the marks of acute pneumonia. He had noticed that the occurrence of diarrhoea was a critical and favourable symptom in these cases. The same kind of disease had been prevalent in Edinburgh, and had been described by Dr. Hughes Bennet.

Dr. ANDREW CLARK said there were several points of great scientific, as well as practical, importance in Dr. Cotton's valuable paper. He was of opinion, however, that the term pneumonia could not be correctly applied to the cases detailed. This seemed proved by the symptoms during life, and particularly by the appearances found after death. The general symptoms, auscultatory signs, long duration of the disease, and results of treatment, went, on the whole, to show that the disease described was not a true pneumonia. This inference was rendered almost certain by what was found in the two cases examined after death. In the first, the lung was contracted and carnified. The state of carnification had no direct relation to pneumonia, and rarely led to it. The condition of lung termed *splenization* had such a relation, and was usually considered as the first stage of pneumonia. But between these two states there was great difference. The carnified lung was tough, firm, fleshy, diminished in volume, collapsed, devoid of air, rather dry, free from exudation, and rolling between the fingers like a piece of muscle. In splenization the lung was of full volume, soft, friable, of a bright red colour, not devoid of air, and loaded with sero-sanguinolent or viscid fluid. For these reasons he considered the state of lung resembled collapse more than any other. Exclusive of abscess, the only form of pneumonia leading to contraction was the interlobular, that which attacked the investing areolar tissue of the lobules. In the second case there were small abscesses. These, he did not think, proved the existence of pneumonia. Abscess, and particularly small abscesses, were rare as the result of pneumonia. The state of lung described was probably owing to some other cause, to capillary phlebitis perhaps, or some blood disease. In any case he did not consider it probable that a state of inflammatory stasis would continue for three months without advancing to exudation or subsiding into resolution. Dr. Clark agreed with Dr. Cotton in his treatment, and concluded with some remarks on the presence of hæmoptysis, and its practical value as an indication of disease.

Dr. THEOPHILUS THOMPSON considered the diarrhoea in these cases was neither critical nor useful, but a dangerous complication. When it occurred, it was usually in weak constitutions,

and produced by the same cause as the chest affection. In these cases only the mildest remedies could be employed. The diarrhoea should not be controlled by opium, and was best treated by mild doses of mercury and chalk, followed by the trinitrate of bismuth. Dr. Cotton, he thought, had grouped together a variety of conditions in his paper. The remedies he had employed, with the exception of mercury, appeared to have been given, rather to remove the results of diseased action than to combat disease itself. He doubted the value of counter-irritation in acute cases of chest affection, such as those described; but it was valuable in pleurisy and bronchial irritation. In the cases detailed, when curable, mercury, antimony, and iodine were the chief remedies. Mercury combined with antimony must be used cautiously, with the avoidance of ptialism. If he used iodine in these cases, he did it in the form of iodide of potassium, combined with small doses of antimony. In certain cases in which debility was early developed, he gave iron, combined with citrate of ammonia or antimony, from the first.

Dr. GIBB mentioned a case of chronic pneumonia terminating in tuberculosis.

Dr. RADCLIFFE agreed mainly with the remarks of Dr. Clark. During the last six or eight months there had been no lack of affections of the chest, but they were usually of the asthenic character, the middle lobe of the lung being that which was affected. In no case scarcely could the disease be treated as inflammatory. Support must be given from the first. Blisters in some cases could be applied with advantage.

Dr. O'CONNOR did not regard the disease described by Dr. Cotton as pneumonia, but allied to that condition of the lung which was an accompaniment or sequela of some other disease, such as fever. When exudation was present, the cautious use of mercury was useful. The treatment recommended in the paper was that suggested by Drs. Stokes and Graves.

Mr. HINTON suggested that the condition described by Dr. Cotton was rather one of degeneration than inflammation, and analogous to cirrhosis of the liver, which had been classed by Dr. Jones under the head of degeneration.

Dr. BURKE RYAN had seen cases in St. Mary's Hospital similar to those described by Dr. Cotton, the lower part of the upper and the middle lobes of the lung being the parts affected.

Dr. COTTON in reply, stated his belief that the increasing frequency with which we now recognised the disease was not owing to improved diagnosis, as he could show that year by year more cases were actually occurring, where the same pains had long been taken in the examination of patients; the disease he had been describing being, in this respect, comparable to the furuncular inflammation which has lately become so common. He could not regard the diarrhoea said to be in such cases of a critical character in that light, but agreed with his colleague, Dr. Thompson, in always looking upon this symptom with extreme dread, as being too generally the precursor of dissolution. In answer to some objections, as to the disease he had been describing deserving the name of pneumonia, and which he confessed he had anticipated, he knew not what else to call it, as it resembled acute inflammation of the lung in everything but its acuteness, being attended with the same pathological changes, and giving rise, indeed, to very many of the same symptoms, modified simply by a different type of the disease. The pneumonia of typhus was a disease of a different nature, both as to its cause and its results. Although hæmoptysis had occurred in three cases he had seen, Dr. Cotton regarded this symptom as far from being a common one, and in every case warranting the suspicion of phthisis, although he had known it occur in cases which afterwards proved not to have been tuberculous. Altogether, he must regard the form of pneumonia he had been describing, and which he was pleased to hear other fellows had seen likewise, of no little importance, both from its own character and from the ease with which it may be overlooked.

## Reviews and Notices of Books.

*Transactions of the Pathological Society of London.* Vol. V. Including the Report of the Proceedings for the Session 1853-54. pp. 371.

(Concluded from p. 422.)

*Diseases, &c., of the Urinary and Generative Organs.*

UNDER this head, twenty-four communications, with reports upon some of them, are arranged.

Dr. SEMPLE exhibited the kidneys of a man who had died from Bright's disease. They were large, striated, and

granular. A microscopic examination discovered many epithelial cells, with the *débris* of tubercles, a few fat globules, and mineral matter, probably phosphates. The patient had suffered from scrofulous abscesses for five years, and after an attack of fever became anasarous, with albuminous urine of low specific gravity. The anasarca gave way to treatment by warm baths, Dover's powder, antimony, and diuretics, but the patient died suddenly and unexpectedly.

Dr. BRISTOWE is the author of two papers. One had reference to the kidney of an intemperate man, aged thirty-one, who had died comatose, after an illness of more than four months, with a pectoral affection and general exhaustion, and whose urine was very albuminous and loaded with phosphates. It was small and lobulated, and contained abscesses, which were filled with a substance resembling fine, moistened plaster of Paris. This substance consisted of imperfect, broken-down cells, of a puriform appearance, with free granular matter, oil-globules, and cholesterine. It did not effervesce on the addition of acid. The author was of opinion that it was not tuberculous matter, but concrete pus. We should hesitate to adopt his conclusion. The ureter was impervious at a point about one inch from the hilum. The second case was of ovarian tumour, accompanied by internal effusion, the result either of an escape of fluid through perforations of the external walls of the tumour, or of peritonitis. The remarkable points in the communication were the great length of the cervix uteri—viz., three inches and a half, (the uterus being atrophied,) and the explanation which the author gives of its production. He conceived it to result from traction exerted by the peritoneal fluid acting upon the vaginal walls. "The presence of the ovarian tumour, and its adaptation in form to the abdominal walls, probably diverted the dilating force of the peritoneal effusion into an unusual direction. Thus the recto-vaginal pouch became distended, and gradually protruded the posterior wall of the vagina before it. The protrusion of this exerted a certain amount of traction on the os uteri, and through the latter on the anterior walls of the vagina, and by the long continuance, rather than by the actual amount of force, ultimately caused the excessive elongation of the cervix before noticed." The author very properly goes on to state: "It might *à priori* have been supposed that traction excited in this way would have produced prolapsus of the uterus; that the round ligaments, Fallopian tubes, &c., would have yielded more readily than the cervix."

Dr. QUAIN presented an interesting communication on a case of abscess of the left kidney, emptying itself behind the colon, so as to form a cavity extending from the diaphragm to the pelvis. It ultimately pointed in the left groin, and on being opened emitted four pints of ill-conditioned pus, the sudden removal of which led to a mechanical obstruction of the colon, and death from constipation and its effects in twelve days. The kidney was atrophied, and on its back part presented an opening which communicated with internal cysts, and through this the original abscess had been discharged. The lady, aged fifty-three, had, two years before, suffered and recovered from an attack of nephritis. The fatal attack was ushered in by violent pain, vomiting, and severe general disturbance. Afterwards subcutaneous oedema and a deeper-lying solid tumour were discovered over the left kidney, which ultimately proved to be the abscess between the colon and the integuments. The urine was scanty, and presented a brownish-yellow deposit of pus globules. In reference to diagnosis, Dr. Quain refers to the history of the case and the condition of the urine, and remarks that it was distinguished from lumbar abscess by the absence of any symptom referable to the vertebral axis, and by the facility of movement of the legs; and from ovarian tumour or enlarged spleen, by position, form, and immobility.

Mr. CONWAY EVANS has described a cystic condition of the left kidney of a man who died suddenly, after an illness, and without having presented albuminous urine. The cysts were very numerous, and varied in size from that of a pin's head to

larger than a pea, and contained a glutinous material, consisting merely of finely granular, unorganized matter, probably albumen.

Mr. PART is the author of two communications. The first (illustrated) has reference to an extensive deposit of small, round, or oval non-nucleated cells, which contained in their interior very finely granular matter, and, on the whole, were not unlike pus globules, only smaller, less constant in shape, and uninfluenced by acetic acid; or, according to the reporter, Dr. Bristowe, of small, round, or oval unenclosed nuclei. The latter gentleman hesitates, whilst he expresses an opinion that the disease was cancerous. It was widely distributed. In the kidneys it appeared as white nodules, in the lateral portion exclusively. On the diaphragm the same kind of lumps were observed, sessile or pedunculated, whilst a very large mass occupied both the anterior and posterior mediastinum, the pleura, thymus gland, trachea, and bronchial tubes, and, with the aid of a large quantity of fluid, compressed the lungs and the heart, and greatly dilated the intercostal spaces. The patient was a fast liver, and had had syphilis for a long period. He never suffered from pain in the chest, but died from pectoral affections. The diagnosis was very obscure during life. The second case, presented through Mr. COUSINS, was one of non-malignant ovarium, and tubular enlargement of the size of an ostrich egg, occupying the right iliac fossa, and consisting of a cystic mass containing pus. There was great distension of the right ureter at the top, and of the pelvis of the kidney, and the ovary and Fallopian tube could not be found. The right iliac vein and anterior iliac artery were obliterated, and the ganglion of the sympathetic nerve enlarged and vascular.

Mr. PARTRIDGE exhibited the bladder of a boy, aged sixteen, which presented a rupture through all its coats, about a quarter of an inch in length, and which, together with fracture of the pelvis, was the result of violence. It illustrated two points amongst others—viz., first, that bloody urine is not an essential symptom of ruptured bladder, and that it may recur after the first effusion; secondly, that the bladder may soon resume its power of retaining a certain quantity of urine.

Dr. SEPTIMUS GIBBON described a rare case of medullary cancer, in which the bladder was greatly distended, and completely filled with the mass, and was also firmly attached to the pelvis by the same malignant growth. The neighbouring parts on the prostate and urethra were also infiltrated, and the mesenteric glands were much enlarged. The same substance was also found in the dura mater, and in the skin. No hæmaturia had been observed, and the destructive process had commenced in the centre of the growth.

Mr. SHAW also exhibited a fungous tumour of the size of a walnut, in the bladder, which occurred in a woman, aged eighteen; but in this case there was constant stillidium of urine loaded with blood, or of pure blood. The pain was excruciating over the pubis, and at the lower part of the back. The tumour was said to be composed of fibrous tissue, a fact which does not well comport with the fungous character which has been ascribed to it. He also relates the particulars of a case in which sloughing of the sub-perineal cellular membrane appeared to have resulted from extravasation into the cellular membrane surrounding the fundus of the bladder sacculated at that part. Mr. Shaw was of opinion that the contractions of the viscus had led to the extravasation.

Another instance of malignant disease of the bladder is furnished by Mr. HOLT. It accompanied and followed stricture of the urethra, and was of an ulcerative, tuberculous character. The urine was offensive, and loaded with pus, mucus, and blood.

Dr. RAMSBOTHAM has also communicated two cases of malignant disease, in one of which the bladder, rectum, and vagina were implicated, and in both the os and cervix uteri were the primary seats of the deposit.

Mr. HENRY THOMPSON has described a case in which a malignant deposit was found in the prostate gland, and also in the spinal column, inducing a loss of sensation and motion, the former as far as the arm-pits, and both up to the hips.

The same gentleman also communicated the particulars of a case in which long-continued stricture had led to extravasation of urine, (which called for incision,) extreme dilation of the bladder, ureter, and kidneys. The right pelvis measured seven inches and a half in its long diameter, and the corresponding ureter two inches and a half. He further describes a case of chronic inflammation of the bladder, accompanied by a large abscess of the prostate and vesicula seminalis; and also another case of obliteration of the urethra consequent upon a stricture which followed a severe blow on the perineum.

Two cases of urinary calculus are detailed: one was by Mr. S. WELLS, which was emitted from the rectum after the opening of an abscess in the neighbourhood of the prostate. No urine followed the operation, and he was of opinion that the calculus either passed directly from the ureter behind, without entering the bladder, or that it passed through the prostatic portion by an opening which became closed before the pus was evacuated externally. It consisted of phosphate and oxalate of lime, with a little uric acid at the centre. The other was by Mr. JAMES SALTER, and was peculiar in that three stalactite-like projections of ammonia-magnesian phosphates started out from a central, large, oval mass of lithic acid or lithate of ammonia. These three prolongations had occupied the three openings into the bladder. He conceived that the central mass of lithic acid had fallen into an ulcerous spot in front of the trigone vesicale, and had become coated with phosphates, from the alkaline state of the urine, resulting from the ulceration of the mucous membrane.

Mr. HAYNES WALTON exhibited the testis of a gentleman of a consumptive diathesis, in which a deposit of fibroid matter was found amongst the wasted tube-tissue. The disease had commenced whilst the patient was seeking to improve his health in Egypt; and having at length, by ulceration, passed without the scrotum, the testis was amputated by the author. Dr. Handfield Jones considers the fibroid deposit to be owing to something more than chronic inflammation. Mr. Harvey Ludlow has also some remarks upon a fibro-cystic formation in a testis extirpated by Mr. Ferguson; and Mr. John Wood exhibited an atrophied state of that organ.

Dr. O. WARD related some particulars of a case of rupture of the uterus, from obstruction to labour offered by an ovarian cyst capable of holding a pint. The patient was one of six sisters, who had all died of dropsy at about thirty-two years of age, and one of them in labour, and the author inferred that there was some hereditary condition which caused the obstruction and consequent laceration. The rent was from near the os uteri to the attachment of the placenta, a distance of about four inches, and the placenta itself was detached for about three inches along its edge.

Dr. SIMPSON, on the part of Dr. Gibb, exhibited thirty-one calculi, varying in size from that of a pin's head to that of a pea, taken from between the middle and external coats of the vagina of a coloured woman in Canada, who had died from chronic peritonitis. They consisted of an organic meshwork, inclosing carbonate and phosphate of lime, and phosphate of magnesia, and hence closely resembled phlebotites.

Thus we have made manifest the interest which we take in the proceedings of this Society, and the favour with which we regard this volume of its "Transactions," by the unusual length to which we have protracted our remarks; but we have now attained our limits, and must dismiss the remaining part of the record in a few words.

There yet remain upwards of one hundred pages, containing forty-seven communications, of equal value and interest with those which have preceded them. They are divided into *Diseases of the Osseous System*, ten communications, and *Diseases, &c., of the Ear*, three communications, by Messrs. Pilcher and Toynbee; whilst twenty-five are of a miscellaneous character, and nine are arranged under the heading *Specimens of Disease from the Lower Animals*, of which the indefatigable Dr. Crisp is the contributor of more than one-half.

In concluding our review, we beg to propose two questions to the attention of the fellows.

First. Our observations have been rather in the nature of a literary than a critical analysis, since we were of opinion that, by so doing, we should further the interests both of the Society and the profession, more than by selecting a few cases only for critical consideration; but we now seriously put it to the Council, if in future volumes it would not be wiser to use the pruning-knife with less reserve? We think it quite possible that a communication, with a specimen, may not be unworthy the attention of the fellows assembled at their periodical meetings, which might not be worthy of a permanent place in any volume of "Transactions." With the present profusion of publications we have no need for cases which illustrate points beyond which science has already passed; nor, with few exceptions, do we require illustrations of those points to which our profession has now attained; but we do want those which shall tend to establish science on the points to which she is eagerly stretching forward, and which will, in their turn, lead to others as yet altogether unseen by us. Let us have an abundance of such cases, and such only as will answer affirmatively to the inquiry, "Will this case, irrespective of the name of its author, or the popularity of its subject, really help science onward?"

Second.—Here we have a goodly volume, of nearly 400 pages, got up most carefully, and in a handsome manner. How much time do the fellows think one or both of the hon. secretaries must have given to its preparation? We have no doubt of its having required the labour of many weeks to collect together so large a mass of cases, to analyze and arrange them, and to do all the tiresome work which belongs to the correction of the press. We have no doubt, further, that these gentlemen are in a similar position to our own—viz., that of being required to convert their brains and available moments into guineas or some lesser coin. Is it right, therefore, that whilst the fellows and members of the Council of the Society quietly enjoy themselves, and "sit at home at ease," they should permit the editorship of such a work to be an honorary office? We complain justly that the non-medical committees and governors of our public charities engage our services, without seeking to reward them, but here, within ourselves, the very same evil is rampant, and contrary to the old adage, dog is eating dog. We put it to the Pathological, the Royal Medical and Chirurgical, and all other Societies which publish "Transactions," whether this ought to continue?

## Fine Arts.

### PORTRAIT OF PROFESSOR SIMPSON.

THE likeness of this distinguished physician-accoucheur is in many respects an excellent and admirable one. The world-wide celebrity of Dr. Simpson will render the portrait an acquisition to a large number of professional gentlemen—friends, patients, and pupils. It is executed in the best style of lithography by Messrs. Schenck and Macfarlane, of Edinburgh, from a drawing made by Mr. Hahnisch, during the present year. To those who know Dr. Simpson, the present likeness will bring his features vividly before them. If we were inclined to be critical, we might, perhaps, say that it is smoother in outline than the original, and somewhat fails of conveying a true impression of the great mental energy and incessant action of this remarkable man. He certainly does not find time to sacrifice to the Graces. His hair, in particular, is almost leonine in its arrangement, and somewhat hides the large development of the anterior cerebral lobes. The portrait is nearly full-faced, and one of the great peculiarities in the head of Dr. Simpson is its powerful depth from the forehead to the occiput, so that the contour of the engraving is less massive and striking than the original. Still, as we have already observed, the likeness is an admirable one, and the execution of the engraving in every way worthy of praise.

# THE LANCET.

LONDON: SATURDAY, DECEMBER 16, 1854.

IN addressing a letter to the President of the Board of Control, on the constitution of the New India Medical Examining Board, Dr. JAMES BIRD has performed an act of great courage and utility. The criticisms upon the recent appointments are manly and straightforward, and at the same time so powerful in facts and arguments, that Sir CHARLES WOOD must, we should imagine, see reason to regret, if not to retrace, the steps he has been induced to take. It is, we believe, the intention of Dr. JAMES BIRD to place his letter in the hands of every member of the Houses of Lords and Commons, and we have no doubt that early in the session public attention will be directed to this important matter. In the mean time we proceed to put our readers in possession of the opinions advanced by the author of this excellent Letter.

Dr. BIRD directs attention to the hopes excited amongst the medical officers of the Indian service by the Bill of last session, which seemed to promise that in future the medical patronage of India would be distributed, not amongst the most favoured, but the most competent. It was also a satisfaction to the entire profession to see a principle of right and justice thus advanced to the first rank, and much good was expected to accrue to Medicine by the adoption of the same principle in the distribution of places of honour and profit in our hospitals and public institutions. It was, in fact, the first great recognition in this country of the system of the *concours*. But it was also stated by the Ministers that the India Medical Examining Board was an experiment which, if found to answer, should be applied to the other departments of the public service in India. This, moreover, must be taken in connexion with the plan broached by the present Government, of arranging a system of examinations for the vast number of places now at the disposal of Ministers in the civil service of the whole country and our forty colonies throughout the globe. It may well therefore be matter of chagrin and regret that the first tentative step of this vast and comprehensive reform should, in medical hands, have been converted into a paltry and discreditable job.

As Dr. BIRD very forcibly points out, the miseries of the sick and wounded in our military hospitals in tropical or European climates, originate not so much from want of civil medical knowledge, as the comprehension of the varied and intricate causes which lead to sickness wherever masses of men are congregated together for purposes of war. It is not by the pleurisy, or the fever of peace; or by the wounds of the bullet or the sabre, (though these require special knowledge,) that an army is decimated, but the men fall by hundreds or thousands—as we have recently seen in the ranks of our army and those of its allies at Varna, Balaklava, and Scutari—from hospital gangrene, dysentery, camp fever, cholera, and other army epidemics. Into the causes of these things the army surgeon must enter; but they have little or no place in the civil medical education of this metropolis. The conditions of climate, the seasons, the massing of men together, the supply of food, clothing, hospital arrangements for the sick and wounded, and

many other special points, require special study on the part of candidates for military medical service. These things being so, Dr. BIRD very properly asks—“Can a Board of Examiners, selected from two medical scholastic establishments of this metropolis, possessing comparatively little practical acquaintance with the diseases incident to tropical climates or to military life, be best prepared to judge of the knowledge and practical efficiency of assistant-surgeons for India?”

It is dwelt upon that the selection of men from the junior staffs of University College and St. Bartholomew's Hospitals conveys an unmerited obloquy to the distinguished physicians and surgeons of the Indian army, and affords little encouragement to them to prosecute studies that may be useful to the armies and people of India, or to advance medical education in the British empire in the East. Already, as we may see by a Memorial published at page 515, and to which Dr. BIRD refers, the medical service of India labours under serious disadvantages; and now, when an opportunity of doing a great substantial good offered itself, an additional stigma is cast upon this meritorious class of public servants. In the appointment of the new India Medical Board, the President of the Board of Control, no doubt misled by others, has followed exactly the principle formerly adopted by the Court of Directors—a principle which was one of the chief reasons advanced for the reform of the Company. The Court of Directors selected their “examining physician” without any reference to knowledge relating to medical affairs in India, and Sir CHARLES WOOD appoints his Medical Examining Board upon precisely the same principle?

As the matter is now arranged, the Medical Examiner, who has probably never attended a case of Labour, or seen a case of difficult parturition, will have to examine in midwifery and the diseases of women. The midwifery of India may well be expected to improve under such auspices! Every military surgeon in India, be it remembered, has to undertake the care of women in childbirth, and to treat the diseases of women and children. The military surgery of India will be under the care of an assistant-surgeon of St. Bartholomew's, who has not, we believe, the care of a single bed in his own hospital! Need we add a word more? In botany and the use of the microscope, the new Board is admirably represented by Mr. BUSK and Dr. HOOKER, and probably, under the new régime, botany and histology will be the points of the greatest consequence in relation to the military health of our Indian armies, and the qualifications of candidates for assistant-surgeons in the East India Company's Service. The scheme of the proposed examination is as faulty as the constitution of the Examining Board. No certificate of moral character is required of the candidates. All restraint in this matter is removed. Candidates are required to have attended lectures on Botany and Zoology, but they may attend or not, as they choose, lectures on Military Surgery. Indeed, with such a Board of Examiners, to have required attendance upon such lectures would have been a censure upon the constitution of the Board itself.

We agree with Dr. BIRD, and there is, and can be, but one opinion upon the subject in the profession, “That the objects of the new India Bill are likely to be defeated by the impaction and insufficiency of the Examining Medical Board as now constituted;” and that “the nominations of examiners which exclude from the Board the advice and practical experience of intelligent army medical officers from India” cannot give satisfaction in this country or in India.

With Dr. BIRD's proposals for the amendment of the Board we heartily agree, and we trust Sir CHARLES WOOD, who can have in view no other object than the increased qualification of the medical officers of the East India Company, and the welfare of our armies in the East, may take them into his most serious consideration.

Dr. BIRD's advice is,—

"First, that certificates of each candidate's moral character and general conduct while a student should be adduced in his favour before the Board shall proceed to his examination.

"Secondly, that on the subjects of examination it shall be imperative on the candidate to possess a knowledge of military surgery and tropical medicine.

"Thirdly, that a special examination be appointed to test the candidate as to his knowledge of midwifery, and of the diseases of women and children.

"And, fourthly, that in the composition of the Examining Medical Board for India some constitutional check should be provided to prevent the undue preponderance of particular medical interests."

To these we may add, that there should be upon the Board at least one examiner having some experience in military surgery and the diseases of tropical climates.

OUR impression of this day contains the details of another death by chloroform! Guy's Hospital is the scene of the catastrophe, and the victim an unhappy female, whose leg it was proposed to amputate for chronic or malignant ulceration. Our reporter graphically tells us that this poor woman had suffered for two years or more from unhealthy painful hæmorrhagic ulcers of both legs: how, edentulous, attenuated, and cachectic, grey or rather white-haired, with a marked *arcus senilis*, she presented an appearance of age more akin to that of seventy than of fifty-four, which she was stated to be: that on being brought into the operating theatre a limited quantity of chloroform was administered to her in the usual manner; and that in five minutes afterwards she was a corpse. The surgeon having used his best skill to restore animation, with wonderful pre- (or rather post-) science declaring his conviction that "the heart would be found fatty." The post-mortem examination showed the accuracy of his judgment. He had performed an *experimentum crucis*: the heart was fatty throughout.

Probably it may not be forgotten that, a few weeks ago, we made some remarks on this subject. We showed that the indiscriminate use of chloroform had led to the most fearful results; that deaths had, over and over again, occurred from the administration of this agent in cases in which there did not exist the slightest occasion for its use; and we concluded by saying:—

"In the first instance, then, chloroform must not be administered almost *ad libitum*, as has hitherto been done. Its use must be reserved for those cases in which the intensity or duration of the pain in an operation constitute serious complications, or where insensibility is essential for the success of the surgeon's proceedings. To this the practice must come at last. The sooner it does so, the less will be the expenditure of life."

Had these words been acted on, the life of a human being would not have been sacrificed. Was the intensity or duration of the pain in an amputation of the leg sufficient to justify the fatal risk in such a subject? Or can it be said that insensibility was essential to the surgeon's proceedings? Surely not. There are those who will agree with us in thinking that it were better that a thousand individuals should each bear, when necessary,

the momentary pain of amputation, than that one of the thousand should die in an attempt to remove this momentary suffering. On the occasion referred to we felt it right, not only to point out the necessity of limiting the use of chloroform, and of care in its administration, but we also endeavoured to show the risk of the practice under any circumstances in certain cases. We discussed then, more particularly, the subject of fatty degeneration of the heart in its relation to death by this agent, and, amongst other observations, remarked, in speaking of the symptoms of this state of heart—

"We may expect to find such features in those whose vigour has yielded beneath the influence of want or chronic disease, in the aged, or the young grown prematurely old by over-application or constitutional decay, and in the dissipated, whose physical constitution is as degraded as their moral attributes. In all such cases, the paralyzing influence of this agent on a fatty, feeble heart may be feared, and its use should be avoided."

Had these words been written after the event above related, they could not have more pointedly illustrated the event itself. Here, in fact, is the case itself—the "prematurely old" subject, with a "degraded physical constitution," suffering from "chronic disease" and "anxiety," falls a victim to "the paralyzing influence of this agent on a fatty, feeble heart." Once more, then, we raise a voice of warning against the indiscriminate use of chloroform. It is a dangerous agent; its effects have painfully reached the consciences of some; it may so happen that they may affect others in a more tangible form, and that regret will come when there is no remedy. Our observations must not be misunderstood. We fully appreciate the value of chloroform: we more fully appreciate the dangers attending its use, or rather its abuse. It is that abuse, now become general, we seek to arrest; we do so for the sake of humanity and for the character of our profession, which should not risk the loss of its reputation for prudence, and for its high estimate of the value of human life.

Of all the methods of imparting practical knowledge and skill in Medicine and Surgery, there is certainly none that can surpass Clinical Instruction by a master in the art. There are some branches of knowledge that can be prosecuted with success by the solitary student in his closet: Medicine is not one of them. There is no art, no handicraft, that more imperatively requires daily and hourly oral and manual illustration. No didactic systematic works, no lectures delivered away from the hospital wards, and not seeking for examples amongst recent cases which the student can witness for himself, can compare with the clinical lectures of the experienced physician or surgeon drawing his illustrations from living Pathology, and exemplifying by his own manipulations and appliances the principles of treatment. The greatest of our modern physicians and surgeons have also been the most renowned as clinical teachers. It demands but ordinary acquirements and corresponding confidence to expound in a college theatre a course of dogmatic lectures on the Theory and Practice of Medicine and Surgery. If, by the delivery of such a course, a man may fail to earn or to extend a reputation, he is at any rate secure from the risk of exposing to his pupils and to the world his own incompetency to carry those principles into action which he has inculcated as the rule of practice. But it requires courage of no common order, such courage as can only be engendered in a vigorous mind by a long experience of success, to put the accuracy of his theory and the soundness of his practice daily to

the test of crucial experiment and the criticism of numerous observers. The man who boldly encounters this ordeal not only renders the greatest possible service to the students of his time, but evinces in himself the possession of that confidence which shrinks from no public observation. But there is a degree of merit and courage, if possible, greater than this. It is that of a man who, placed by private fortune above the usual incentives to professional exertion, who having long acquired, by his practice, his clinical instruction, and his writings, a foremost place amongst the scientific celebrities of the age, who already seems in the possession of that for which men strive, both in present fortune and future fame, is still willing to devote himself to the toil of instruction, to expend time that might without reproach be given up to the enjoyments of an honourable retreat from the anxieties of practice, in giving health to thousands of the poorest of mankind; still to challenge the criticism—not always fair or friendly—of the world upon those doctrines and methods of practice which are the basis of his reputation. Such is the courage of Professor SYME. With nothing to gain, and fearless to lose, the great surgeon of the northern capital, still animated by the love of his art, the desire to prolong his career of public usefulness, and nobly confident in the truth of those principles which he has long earnestly taught, is still anxious to afford the world ample opportunity of confirming or of refuting them, by placing before it the results of those principles as carried into practice in the clinical wards of the Edinburgh Infirmary. But we doubt not that by the course which Professor SYME has adopted, of publishing his clinical lectures in *THE LANCET*, he will add to his well-established fame. That, indeed, scarcely needs an increase, but that which the world will always want is the example of men careless about personal toil, and capable of devoting themselves, without the hope of adequate reward, to the public service.

In thus referring to the conduct of Professor SYME, we may be permitted to observe, that there is a peculiar fitness in the publication of his course of clinical lectures in this journal. The great and living principle of *THE LANCET* has, from the day of its first issue, been the diffusion of hospital clinical instruction. The present development of clinical teaching in the London hospitals is largely owing to our unwearied exertions. No clinical teaching, deserving of the name, had ever been pursued in London until after the establishment of *THE LANCET*. And we still feel a just pride in the reflection that, while clinical teaching has grown up in this metropolis to be an integral part of the system of medical education, under our observation, and greatly through our aid, the usefulness of this great means of instructing young men, and enlarging the sphere of medical knowledge, is not confined to the arena of the hospitals, but is, through these widely-journeying pages, felt by the most distant practitioners, whose information is thus increased, and whose resources are enlarged; and benefits suffering mankind in every quarter of the globe where the English language is read.

AMONGST the worst hardships to which the practitioner of medicine is exposed must be classed the injury to which he is subjected by boards of guardians. He is placed between two classes, often, it is to be regretted, antagonistic to each other. On one side are those appointed by law to protect and succour the pauper population, on the other the poor themselves. To

ours of our brethren be it said that, with rare excep-

tions, they have stood forward as the defenders of the poor persons committed to their care. The sacrifices which the noble union surgeons of this country have made, pecuniary and otherwise, in the cause of humanity, are seldom acknowledged, and too frequently mistaken and ignored. The "village HAMPDENS," who have stood forward as the champions of those who have "no friend beside," have often been marked out for destruction by those whose tyranny they have had the virtue and manliness to oppose. The pages of this journal, for thirty years past, have abounded in instances of this kind. Unfortunately, the enemies of right and justice have been too frequently successful. The list of those who fall in this holy warfare is, notwithstanding these fearful results, not yet filled up.

True to the honourable calling which they have been destined to follow, the union medical officers of this kingdom still occupy with undaunted courage the position of being the friends of the poor. Even in what would be regarded an enlightened and philanthropic locality, the honest and humane surgeon occasionally falls a victim to the jealousies and ignorance of those who appoint him to his office. At the present moment, the guardians of the populous and important parish of Islington are placed in the unenviable position of having dismissed their medical officer for having endeavoured to procure for the inmates of their overcrowded workhouse such improvements in their sanitary condition as were absolutely necessary, and therefore imperatively demanded.

The workhouse of that district was built at a time when the inhabitants numbered about 10,000. Since then the population has increased tenfold, whilst no additional accommodation has been afforded to the unfortunate paupers who have to become inmates of the building. It became too painfully evident to the parochial surgeon, Dr. SEMPLE, that the insufficient accommodation of crowded wards, and the bad management generally of the poor-house, were fertile in the production of sickness and death. Acting under this impression, and fortified by the directions which had been issued by the Board of Health, Dr. SEMPLE represented to his employers the absolute necessity of better accommodation for the inmates, of the improvement of the imperfect drainage and ventilation of the house, of greater space for its inmates, and a systematic classification of those affected with disease. These recommendations were duly forwarded to the Board of Health, and also to the Poor-Law Board, and we cannot believe that the authorities of these two important establishments could regard the recommendations of Dr. SEMPLE with anything but approval.

We perceive that a public meeting of the medical practitioners residing in Islington is announced to take place at Baker's Rooms, Upper-street, on Friday evening next, the 22nd inst., at eight P.M., "to consider the dismissal of Dr. SEMPLE, and to take such steps thereon as may be deemed expedient."

If boards of guardians do not always evince a scrupulous anxiety to obtain a reputation for fair dealing and honour, they can seldom be accused of prodigality in the administration of the funds committed to their charge. They adhere with unswerving tenacity to the great commercial principle, of getting the most they can for the money. Those who would see many interesting examples of the art of exaction carried to the point of robbery, cannot study in a richer history than in

that of the dealings of boards of guardians with medical practitioners! We purpose on the present occasion to refer to one example of this kind. The parochial medical officers are occasionally called upon to examine and report upon the mental soundness or unsoundness of paupers, with a view to their removal to an asylum. The mode in which this important duty is to be performed is clearly stated by the Lunacy Acts; and the remuneration for it is likewise indicated. Boards of guardians, acting on the assumption that the union surgeon, being in their pay for the performance of other specified duties, is bound, or may be compelled, to perform this extraordinary duty likewise, not seldom refuse to pay the fee provided by the Act of Parliament. There appears to be no question that the fee must be paid when the surgeon certifying to the insanity of a pauper is not the union surgeon. But boards of guardians, availing themselves of a presumed authority over their medical officers, sometimes contend that they are not bound to pay a fee when the certifying surgeon happens to be the union surgeon. We will not indulge in the superfluous discussion of the equitable claim the union surgeon has to a moderate fee for the discharge of an anxious and responsible duty, for which he does not receive payment in any other form. It is more profitable to set in a clear light his legal right to the fee in question. It is, then, expressly provided by 16 and 17 VICT., ch. xcvii., sect. 69, relating to pauper lunatic asylums, that the justices may order payment of a fee to any medical man called on to examine a "neglected" or "wandering" lunatic. A pauper lunatic is almost invariably sent to an asylum under the certificate of a justice of the peace, who has to call to his assistance a medical man; such justice can in every such case direct a proper fee to be paid. But then some boards of guardians pretend that the signing of these lunacy certificates is part of the ordinary duty of the medical officer, for which he is paid his salary. That is an assertion which they are bound to prove. We at least find nothing to support such a conclusion. If we could imagine a case in which it was especially inserted into the contract between a board of guardians and a medical officer as a part of his ordinary engagements, then there would be a voluntary surrender of the right, and the question could not arise. But the fact that the question does arise, and give occasion to altercations, proves that this duty is not a specified part of the contract.

The course we advise Poor-law medical officers to adopt is, on every occasion of their attending before a justice, to ask him for an order for payment of a fee. We do not believe the auditor of the Poor-law Board would think it his duty to refuse such order in the union accounts.

### SURGICAL PENSIONS IN THE EAST INDIA COMPANY'S SERVICE.

*To the Honourable the Chairman, Deputy-Chairman, and the Honourable the Court of Directors of the Honourable East India Company.*

The humble Memorial of MATTHEW STOVELL, Surgeon, Bombay Army, most respectfully sheweth,—

THAT on the appointment of your Memorialist, in 1828, to the medical service of your Bombay Presidency, medical (in common with military) officers were permitted, in accordance with the retiring regulations of 1796, to retire from the service on the pension of the rank to which they had attained.

2ndly.—That this principle of granting pensions to your medical servants according to rank was abolished by the rules

of 1842 and 1844, which substituted a scale of pensions according to length of service.

3rdly.—That this departure from the principle of granting pensions according to rank is a grievous blow to your Memorialist, and likely to prove most injurious to his interests.

4thly.—That while this principle was departed from in the case of your medical servants, it was inviolably maintained in behalf of your military servants, for, in 1837, when your

Honourable Court's Letter, dated 20th of September, 1837, paragraph 4.

honourable Court granted to your military servants the boon of pensions according to length of service, it was at the same time expressly stated that such boon was to be "without prejudice to any claims arising out of the retiring regulations, as established in the year 1796,"—viz., pensions according to rank.

5thly.—That the principle of protecting the financial interests of all classes of your servants, by never giving other than prospective effect to rules prejudicially affecting them, has ever, until now, been held sacred and inviolable by your honourable Court, and, as one of many illustrations, your Memorialist would beg to remind your honourable Court that, when the pension of a chaplain was reduced from the pay of a lieutenant-colonel to that of a major, such reduction was ruled to have only prospective effect, and was not made to affect injuriously the interests of chaplains then actually in

your service. Again, when an alteration was made in the pay and pensions of veterinary surgeons, it was ruled, that those then in the service "should not be deprived of the benefit of the present regulations."

6thly.—That the same principle of protecting the interests of public servants has ever been held, and is still held, equally sacred and inviolable by her Majesty's Government, and, as a recent illustration in proof of this assertion, your Memorialist begs to quote the following extract from a despatch from Earl Grey, Secretary of State for the Colonies, to the Governor of the Cape of Good Hope:—"The interests of existing office-holders must be protected, because they accepted those offices with expectations which cannot justly be disappointed. But, subject to these interests, there is no objection to the

Legislature fixing whatever scale of emoluments they may think fit for public servants to be hereafter appointed."

7thly.—That the scale of pensions laid down for your medical servants according to length of service is wholly incommensurate with the corresponding scale previously laid down for your military servants, and that the latter is as follows:—

To every officer of twenty-three years' service (three years furlough included) the pay of a captain—viz., £191 2s. 6d. per annum.

To every officer of twenty-seven years' service (three years' furlough included) the pay of a major—viz., £292 per annum.

To every officer of thirty-one years' service (three years' furlough included) the pay of a lieutenant-colonel—viz., £365 per annum.

To every officer of thirty-five years' service (three years' furlough included) the pay of a colonel—viz., £456 5s. per annum.

8thly.—That while your military servants are thus enabled to retire on the pay of a major four years after being entitled to that of a captain, and on the pay of a lieutenant-colonel four years after being entitled to that of a major, your medical servants, previously deprived of their privilege of retiring according to rank, are compelled to serve eight years after being entitled to the pension of a captain before they can retire on the equivalent of that of a major, (instead of four,) and twelve years before they can retire on the pension of a lieutenant-colonel (instead of eight.)

9thly.—That by the operation of these rules, military officers, entering your service at the average age of seventeen, become entitled to the pension of a lieutenant-colonel at the age of forty-eight, while medical officers, entering your service at the average age of twenty-four, do not become entitled to the same pension till the age of fifty-six.

10thly.—That thirty-one years ago, your honourable Court formally recognised and admitted the just and gracious principle that your medical servants were entitled to equal consideration, in all things affecting their interests, with your military servants, and distinctly stated your opinion that the provision then made "for the comfort and advantage of the

Medical Retiring Regulations of 1844.

Honourable Court's Letter,  
5th of February, 1823.

officers of your medical establishment" was "fully commensurate with the advantages of your military servants."

11thly.—That the facts stated by your Memorialist in paragraphs 2, 4, 8 and 9, prove how completely this principle was lost sight of in framing the medical retiring regulations of 1842 and 1844.

12thly.—That your Memorialist has served your honourable Court upwards of a quarter of a century, and he believes with fidelity and zeal as in duty bound, and he now most respectfully and earnestly prays—

1. That he may not be deprived of the benefit of the retiring regulations which were in existence when he received his appointment of assistant-surgeon, and on the faith of the permanence of which he entered your service.

2. That he may be allowed the option, in common with your military servants, of retiring on the pension of a major *four* years from the date on which he became entitled by existing regulations to the pension of a captain, and on the pension of a lieutenant-colonel *four* years from the date on which he would thus become entitled to the pension of a major. And your Memorialist feels confident that your honourable Court, guided by the principles of justice and equity, will graciously sanction his prayer.

And your Memorialist, as in duty bound, will ever pray.

M. STOVELL,  
Surgeon, Bombay Army  
Bombay, July 31st, 1854.

"*And aliter partem.*"

## TREATMENT OF GUN-SHOT AND INCISED WOUNDS RECEIVED IN BATTLE.

To the Editor of THE LANCET.

SIR,—Will you kindly afford me a little space in your valuable journal to express an opinion upon the importance of depletion by venesection in the treatment of wounds received in warfare? such as those occurring from puncture, especially *bayonet wounds*; from laceration, as by bullet or any other missile; incised wounds; and in cases of severe contusions, as from spent balls, fragments of shell, &c. &c., and adopted at a time when the system has fully recovered from the shock of such a casualty, and before severe inflammatory action has set in; and particularly in those cases where the nature of the injury has not involved any serious hæmorrhage, which that oracular military surgeon, Mr. Guthrie, states seldom to be the case. It must be ceded to me, that the danger of every wound is enhanced in proportion to the extent and severity of the supervening inflammation; and when terminating fatally, the event is attributable almost solely to the failure in the subduction of that most serious condition; most wounds assuming a benign character before inflammatory reaction occurs, and in many instances are subjects of a favourable prognosis; to anticipate and control which morbid state is my object in advocating timely and sufficient depletion. In a conversation I had with the late memorable Mr. Liston upon the subject of bloodletting, he and a surgeon who was present, I believe Mr. Johnston, both fully concurred with me in the propriety of its adoption in all acute inflammations, and Mr. Liston stated to me emphatically that "he never found the loss of blood any impediment to the success of his operations."

A corroborative case, which occurred in the practice of the late Sir Astley Cooper, many years since, which from its extraordinary character and the miraculous recovery of the patient became a matter of great notoriety, is one of the innumerable instances supporting my theory. It was that of a man who was impaled by the shaft of a carriage passing through his body, upon the retraction of which an unprecedented hæmorrhage ensued, and which was no doubt the proximate cause of his recovery. For what more could Sir Astley do in such a case than cover the external wounds, to ward off the approach of the irritating atmosphere, and attend to the general health of his patient, and leave the *vis medicatrix nature* to complete the cure? Another case more apposite to this subject occurred to a gentleman of the name of Ponsonby, who was lying wounded on the field of Waterloo, when a French lancer riding by perceived him, and exclaimed, "Vous n'êtes pas encore mort, coquin," piercing him at the same time with his lance, which wound bled profusely, and his recovery was attributed to that accidental circumstance. Heurnius,\* in his "Com-

\* *Lazarismus talem habitum copiosæ evacuatione, maximeque Phlebotomia,*

mentary upon the third Aphorism of Hippocrates," strongly advocates and confirms the propriety of depletory treatment by the example of the Prince of Orange, who, being wounded in the neck, lost pounds of blood daily without any fatal diminution of strength; which, if, as I think does not admit a doubt, it is in the slightest degree competent to mitigate the sufferings and enhance the chances of recovery of the brave fellows engaged in war, more especially our gallant Crimean band, should not be neglected and lost sight of amidst the vulgar prejudices to the use of the lancet, amongst those who are ignorant of its value, from a perfect incompetence to form an opinion, never having properly tested it.

I am, Sir, yours respectfully,

JOHN LANGLEY.

Upper Albany-street, Regent's-park, December, 1854.

## IS THE ASIATIC CHOLERA CONTAGIOUS?

To the Editor of THE LANCET.

SIR,—My attention was drawn to a letter, in last week's LANCET, from Mr. Waddington, headed "Is the Asiatic Cholera a Contagious Disease?" I for one quite agree with the sentiments he expresses, that the Asiatic cholera is neither "contagious nor infectious." I had ample opportunities of witnessing the disease in all its forms when it was raging in 1849, and the conclusions I then formed were, that the cholera did not spread by contagion, but the greater number who fell victims to its ravages were influenced by fright and a dread of the disease, which, acting upon the weak, the ill-fed, and the ill-clothed, rendered the body predisposed to receive the complaint. I have no hesitation in affirming that the disease spreads from place to place from some unknown atmospheric cause acting upon the nervous system, and not from infection. It is a well-known fact, that lunatic asylums are exempt from this direful enemy.\* During last year, when the disease made such havoc in Newcastle and the neighbourhood around, the inmates of the lunatic asylum did not suffer; whilst workhouses, prisons, and barracks, are always visited by this unwelcome guest, simply because they are informed that the disease is making great havoc on the outside of their domiciles, which produces an alarm and shock to the nervous system. But the inmates of lunatic asylums are in that state of mental derangement as to be incapable of receiving an impression or shock upon the nervous system. I am not aware that the disease has ever entered any of the lunatic asylums. Now, if it is a contagious disease, why are these places exempt? and why are so few medical men and nurses taken off by the disease? Those medical gentlemen who have fallen a sacrifice to this affection are those who have been in constant attendance upon the sick, producing thereby an enervated state of the system, and rendering the body predisposed to receive the disease. The first case, which occurred at Jessore, could not have arisen from contagion, neither did it spread by contagion. Could the vessel which arrived at Sunderland, in 1832, containing cholera cases, have been the cause of the outbreak in that town? Certainly not: the few cases of cholera which occurred on board that vessel could not have contaminated the whole atmosphere of Sunderland. The disease broke out in parts of the town a long distance from where the vessel touched, and where no communication had taken place between the healthy and those suffering from the affection. The landing from the vessel happened to be a coincident, but the medical men referred the cause and the contagious nature of the disease to that event.

I am, Sir, your obedient servant,

Brynmaur, Breconshire, December, 1854. HENRY HANCOX, M.D.

## THE JOURNAL OF THE PROVINCIAL MEDICAL AND SURGICAL ASSOCIATION.

To the Editor of THE LANCET.

SIR,—If I address the following replies to the Editor of the Association Journal, who does me the honour to ask my

hoc est, largæ sanguinis emissione. Videmus ex corporibus bene habitis, per vulnera, incredibiles interdum sanguinis copiam efflari sine noxa. Illustrissimus Auranthius Princeps Guilielmus Nassovius Antverpiæ à latrone laqueo sclopeto in collo, ita ut iugularis vena magnam maximam copiam sanguinis funderet, per plurimos dies, cum cottidie plures libras sanguinis emitteret, salvis verbis evasit. Non enim potuit fastidia surio. Tandem quidam strepto digestivo illito se involuto coelestis perfecti.—HEURNIUS, Comment. Hip. p. 32.

This is not correct. The inmates of the lunatic asylum at Fekham, amongst others, were visited severely by cholera.—Sub-Ed. LANCET.

opinion, I am afraid they will not be published. I hope you will pardon the infliction.

I am, Sir, your obedient servant,

A TRUE FRIEND TO COERMACK.

Q.—1. Can the plan and manner of the *Journal* be improved?

A.—The plan *might* be improved in all those points in which *THE LANCET* has not yet been copied; but I do not hope you will succeed beyond the imitation of type and printers' work. Dulness cannot imitate genius. What you mean by the "manner" of the *Journal* requires to be explained. If you mean "manners," there is room for great improvement.

Q.—2. State in a condensed form the manner in which you think the *Journal* may be improved.

A.—By infusing a little vigour and originality, and by writing in *English*.

Q.—3. Leading Articles: Ought the leading articles to be continued or discontinued? Have you any remarks to make on the nature of the subjects selected for discussion in the leading articles, and on the general manner in which they are handled? Specify some of the leading articles which you specially approve or disapprove since January, 1853.

A.—It matters very little whether the leaders be continued or discontinued, as nobody reads them, except to economise a dose of morphia. The few I had resolution enough to read left so severe a headache, after recovering from the primary narcotism, that I very much disapprove of them. I fear they were a fair sample of the rest, so that I cannot go wrong in disapproving all.

Q.—4. Original Communications: Can you make any suggestions for the improvement of this department? Ought it to be continued, discontinued, curtailed, or extended?

A.—You should certainly try to get a few original communications that are worth something more than the cost of paper and print.

Q.—5. Bibliographical Notices: Can you make any suggestions for the improvement of this department? Ought it to be continued, discontinued, curtailed, or extended? Do you like a preponderance of analytical or of critical notices of books?

A.—As to "analytical or critical" notices, I preponderate towards the analytical. You handle the scissors and paste very industriously.

Q.—6. Editor's Letter Box: What do you think of this department?

A.—It is a compound of dulness and cant. Publish *all* your answers, and I shall have my opinion strongly confirmed.

Q.—7. Enumerate the departments which ought to be continued, discontinued, curtailed, extended, or modified.

A.—Drop the whole thing. This can be done; but do you think *you* can be improved? I am sure you don't, or you would have added a fourteenth question, which I hope you will pardon me for suggesting—namely: *Do you think the Editor of the Journal can be changed for a worse?*

## SURGERY OF THE WAR.

NAPOLEON, at Eylau, taking a diamond star from his breast, placed it on that of a young medical officer. In a deadly charge the day before, we are told, thousands were wounded; at last the serried lines of the French gave way, and retreated by a series of manoeuvres, in one of which, amongst dead and dying, a surgeon was seen, suddenly called to a general terribly wounded. A large artery was open; cold and harassed, the surgeon knelt by his patient; shouts were raised on all sides for him to save himself. The battalions of the enemy literally rode over him; the bullets of the opposing army whistled in hundreds by his ears; still he pressed on the artery, and ultimately saved the life of the young officer. A bitter cold night followed a more frightful day. The surgeon crunched the snow in his hand, and applied it to the wound. Something little short of a miracle had occurred, but the surgeon never deserted his post; and on Napoleon seeing him next day the diamond cross was placed on his breast. A few months ago a tourist in France saw this cross on the coffin of an old village surgeon, and heard the story.

All honour to our military surgeons! The French can boast of this old Dr. Becourt, and Pontier, the Larrey of their present

hospitals at Sebastopol; we can feel a pride also in the names of Mackenzie, Williams, and Thomson. It is too true we have no decorations or honours for our medical men, but their names and deeds live enshrined in the hearts of all who esteem a manly appreciation of duty, of truth, and Christian bravery; for who is it in the dread field of death and battle, though wearied and worn in spirit himself, that can carry such hope and animation to the mind of the wounded soldier, if it be not the surgeon? Who is it that is expected to be awake at all hours, while others sleep,—who is it, while night falls drearily on tent and camp and field, as Homer delights to tell us, still works and watches, and inspires hope and confidence? If accident had not led this tourist into one of the little villages of France lately, we should not have had this anecdote, (to be found in one of the French daily newspapers.) Far from the noise of the outer world, neglected and forgotten, this poor surgeon died; and yet this rare devotion, this true heroism, this life of mental thought and overwhelming work, do not attract the crowd. The great general or diplomatist, the Minister of the War-office, &c., have all or each a peerage or a pension; but the surgeon is,—we will not say forgotten; for here, at least, in the medical journal, we must take note of such generous deeds, such noble devotedness, while in their writings will Larrey, Guthrie, and Ambrose Père be never forgotten. Parliament has now assembled, and we trust a better feeling will be apparent towards our Navy and Army medical officers. Five hundred wounded more are added to the hospital at Scutari, rescued from the ambulances and tents all blown down in the storm of last month. We learn, however, that an hospital ship, the *New York*, has been despatched with seventy-five ambulance carriages, vegetables to prevent scurvy, and various medical necessities.

The charge, the rout, the flying squadrons, the glittering colours, and other "pomp and circumstances" of war, are no doubt very grand. The martial music of the marching army; the kings and generals and their staff; the surgeon meanwhile, perhaps on foot, unnoticed. But a day comes when the surgeon takes the place of all this popular display; that is, the day after the battle. It is for him now a peculiar glory to be calm when all others are excited. There is more of interest and beauty then for him in the resources of anatomy, and in the wise arrangements of nature in healing wounds. He may have galloped with cavalry, as Dr. Wilson, lately, into the thickest of the enemy; but in his hospital no emotion must influence his hand in operating. Russian, French, and English patients are all alike; he must know what to say to the poorest soldier, as well as to the greatest general. We know few men, in fact, that require to be so much masters of general knowledge. We have said that he will find much of beauty in his art and in the arrangements of nature in healing wounds; he will find also much to influence him in the parting words of the dying—secrets confided to his keeping, and last words to be conveyed to the loved ones far away. The surgeon must decline no office. The younger military surgeon must be a thorough man of thought and feeling; the joyous companions of former times, officers he has joked with perhaps in former regiments, are dying, and require one manly, Christian word of a religious kind. He must control his emotions as a surgeon; he must feel deeply as a friend. One tear betrays the man, but less than a tear takes away the *prestige* of the soldier. There is a country and a cause to be fought for, above every other consideration. At the plague of Jaffa, it is told, the soldiers all refused to fight, fearing the contagion of this disease. In vain the generals harangued. The skeleton figures of those soldiers who had caught the plague terrified the entire army, till Desgenettes, a surgeon, offered to sleep with those stricken with the plague, and inoculated himself with it, even under the bullets of the enemy! Taken prisoner afterwards, this noble act was even respected by the enemy, and his life saved. Here is a man, then, all but sacrificing himself to a sense of duty. Yes, the military surgeon has much of moral grandeur in his quieter conquests, superior even to that of the battle-field; kneeling by the straw bed of the ambulance, bent double to reach the ground, he has myriad thoughts to engross his mind, a crowd of contending emotions to regulate; he has to inspire hope, and yet feel as one without hope; his unbroken moral courage must do many things for the poor soldier, struck down and dying, which the world never hears about; he is the great repository of the farewell secrets of the wounded, of a favourite ring, or note, or seal, great things or small; he is expected to manage everything. Like a sentry, the surgeon watches at all hours, and when the morrow arrives he has still to keep watch and ward in the trenches, or on the grim battle-field itself; he has to improvise all sorts of resources; he is at once

carpenter and nurse, secretary and soldier, physician and friend.

On the 21st of September the surgeon of the *Vulcan*, quite unexpectedly, received on board his small ship 500 wounded from the battle of Alma. Dressings, lint, calico, &c., were wanted; but the sailors and officers gave all their sheets, shirts, &c., to the wounded, so great was the moral influence of the surgeon over them. The surgeon of the *Agamemnon* came on board, but it was midnight before they were all dressed. Another surgeon had to operate several times without chloroform, amputate thighs, his orderly or servant alone assisting him. The Minié rifle bullet splits and smashes the bone, while the old bullet bored holes in it. A dozen instances are given of surgeons left to shift as best they can, without ambulances, without wine, without lint or bandages; yet the moral courage of such men beats down all difficulties; the character of the true surgeon wins all hearts, triumphs over every disaster.

A very general impression seems to prevail, in and out of Parliament, that at home, perhaps, everything that the Director-General, Dr. A. Smith, could do, has been done. Our severest want, a deficiency of ORGANIZATION on the field of battle and at Scutari; the contrast at the hospitals of our French allies in the war, is curious, and eminently instructive; already the French have had 9538 sick and wounded in the hospitals previously alluded to, and 472 deaths. In our own hospitals there were this month 4000 sick and wounded. A very large proportion of the deaths, it is to be regretted, occurring from diarrhoea, while "cholera, gangrene, typhus, and erysipelas," are said to be prevailing to a great extent. As we only pretend to give a few passing glimpses at this immense field of action, and, if possible, to mix the darker and lighter shades of the picture,—to mix, according to the good old Horatian maxim, the *utile et dulce*, we give a "Diary," kept by a surgeon in the trenches. Amongst other things, we learn the French wounded soldiers have already "sheep-skin jackets." His various experiences in the trenches are worth recording.

DIARY.—October 23rd.—Lieutenant Ruthven has had his shoulder-blade out—an operation only once before done. Poor O'Leary, the surgeon who performed it, was killed a little while afterwards himself by a round shot.

24th.—Dressing shattered limbs to-day, and popping, *pro re nata*, occasionally at Russians in the Inkermann valley—extreme Minié range 1000 feet—no go! I took a shot, and made one Muscovite fellow look round, but that was all, save that he raised my ire a little bit by politely bowing. Got my horse shod. Heavy showers; sky as umbrageous as the surgery; B—looking a little "shady." I met at the "diggins" (trenches) a man of ours who shattered his left arm to-day; settled it all square again.

25th.—Lovely morning. Russians forced the Turks redoubts, and in return we drove them from them. A regular "mill" then commenced; the Greys got into a battalion of Russians, and committed fearful slaughter.—*Vespere*, as we used to say at the hospital. Large meet of officers round bivouack fire. Every one had heard a different story as to the engagement of the morning; the only deduction to be drawn that we are in "queer street," for the Russians hold one of our redoubts, and have captured in it some guns. By the way, the Turks—bono Johnnies—behaved very badly; bolted into Balaklava, and only came out when forced to do so by Britishers. (Bravo Britishers! this in a parenthesis.)

26th.—Lovely day. Returned to camp. Dense column of infantry crown the hills, and four guns. I returned to the hospital, where I was soon at work. The first division supported us; the enemy advanced.

(This was the day succeeding the terrible engagement at Balaklava, after which, 1200 to 1500 wounded of the French alone were transmitted to Pera, and 100 capital operations performed. The serious character of these engagements may be best learned, perhaps, by contrast with the hospitals of Brussels after Waterloo, where there were only about twice as many wounded. It is curious Mr. Guthrie describes the same confusion and want of organization at Waterloo in the medical department. The "assistant-surgeons," he says, "were doing everything they should not have done; they were overwhelmed with work, and half dead. The result was, that the great battle of Waterloo, with its host of wounded, and its almost wonderful opportunities, added but little to surgical science. The same result has followed the four great battles in India, the same loss to science, and solely because the surgeons of the Royal and Indian armies were overwhelmed by the extent of their labours." The total treated in the hospitals of Brussels, after Waterloo, was only 3959; operations, 387; deaths, 146. About twice this number (8000) were wounded. At Waterloo, simple

incised wounds were stuffed with lint, which bred a bad fever. Lock-jaw was also fearfully prevalent, Larrey using the actual cautery as a cure! Mr. Wardrop stated that the wounded left on the field of Waterloo, not taken to hospital—it was then, however, midsummer—recovered much better, *ceteris paribus*, than those exposed to the bad air and pyæmia of the hospitals. A good deal of confusion is described as occurring the day after the Alma. It is pleasant to find, however, there was some chloroform—eight ounces for each regiment. "One surgeon, however, was borrowing from another's small pannier stock, when he could ill spare the loan. There was no general canteen for general purposes. The rations of the wounded (raw meat, &c.) were brought down, uncooked, from their regiments; it was disgusting to see these meat rations, which they had no means of turning to use, if they wished, laid down and left at their side. A good deal of this, of course, in battle, is unavoidable, and Larrey, Guthrie, Hennen, &c., tell us of their similar disasters. There was no distinguishing mark to point to the General Hospital; no flag to show this celebrated prison-yard, described as the hospital "on the right of the road down the little river Alma," where, from morning till sunset, surgical operations were proceeding on all sides. The soldier who had just had a limb amputated lay next the one who was the subject of a similar operation. Every operation was performed on the ground, and the postures of the operators almost as much, as their labours were a source of serious irksomeness and fatigue. Active as the surgeons were, it was impossible they could keep pace with the demand on their exertions, for when the time came that those who had been dressed could be removed to the ships, their places were at once occupied by others who were only then brought in from the field. Thus it went on till darkness came, and so it continued the following day, till about five p.m." The same writer says: "The Director-General sent out a numerous body of surgeons. Many succumbed to climate, disease, and hard labour in Bulgaria. Enough, however, remained, with proper organization, more especially if the offer of assistance from the fleet had been frankly accepted; but organization there was none." The regimental surgeon who had four or five wounded, when they were attended to, went away, perhaps, or remained with them; while another surgeon had five times as much as he could attend to. This is all interesting, as the contrast with the French surgery, where all was organization, is described as most remarkable.)

27th.—Up at half-past six o'clock. Got most of our wounded off for board ship, but detained some Russians for operations. "*Fiat experimentum*," &c. &c.; in fact they can't be moved without it. Had breakfast. Surgeon —, now in charge of the — Regiment, not having had an operation yet, I let him amputate one of my Russian's thighs, and —, his assistant, another. Work begins to be dreadfully hard; I find my back very achy—*vide* Guthrie *passim*. Total loss yesterday: killed, ten; wounded, sixty-six; officers, two. Took a look from the top of the hill. As I was returning, I met an extraordinary friend—an old acquaintance, an officer of the Royal Navy, on the outside of an immense lubber-fiend-of-what?—a horse! with literally a rope from his hammock-strings for bridle, and sitting flat like a Turk on a pad pack saddle! Dinner; evenings lovely; moon again of service; bed at eight; two turns out during the night to heavy firing from picquets, but we did not move our ground.

28th.—Here I am as usual, early in the morning, writing in the open air; and pretty cool it is, too, *recubans*, without the *tegmine fagi*. I can say nothing of the siege. I know nothing at my hospital, save that we go on firing all day, and popping all night, the Russians replying, but not with the vigour of old. The 30th picquet brought in just now seven fine horses, the riders (Cossacks) shot last night; yet, with all our fine horse-flesh, what would I not give to be sitting in the old arm-chair, waiting for the dear ones at home to come down to breakfast; and that jolly bread, and, above all, the Tipperary butter—oh! murder! as they say; but here the post-office is closing—*Valc*.

THE WOUNDED ENGLISH AT SCUTARI.—A committee of ladies has just been constituted in Leeds to devise means for the relief of our brave fellow-countrymen wounded in the war, and already an active canvas for linen and other articles has been begun. The first day's contributions include 81 drawers and shirts, 103 pillow-cases, 120 linen sheets, 1 bale of old linen, 276 linen shirts, 11 dozen linen bandages, 7 cases of lint, 248 stockings and socks, 1 bundle of slippers, 30 towels, and a great number of miscellaneous articles, newspapers, caps, muffs, pincushions, dressing-gowns, writing-paper, &c.

## House of Commons.

WEDNESDAY, DEC. 13TH.

## BOARD OF HEALTH ACTS.

SIR B. HALL said, that after the Christmas recess he should propose to repeal the Health of Towns Act of 1848, and the Nuisances Removal Acts, and to introduce two entirely new Bills upon the same subjects. He gave that early intimation of his intentions, because he was aware that notices had appeared for several local Bills. He would venture to suggest to the local authorities that it would be advisable to incur as little expense as possible in the first instance, as the provisions of the Bills which he hoped to introduce might perhaps supersede the necessity of prosecuting the applications of which notices had appeared.

## Medical News.

**ROYAL COLLEGE OF SURGEONS.**—The following gentlemen having undergone the necessary examinations for the diploma, were admitted Members of the College at the meeting of the Court of Examiners on the 8th inst.:—

BEERE, WILLIAM HENRY, Banbury, Oxfordshire.  
BIRCH, JOHN PARRY, Cheshire.  
CORBETT, WILLIAM HENRY, Kingston, Canada West.  
DEVILLE, JEAN CHARLES AMEDEE ERNEST, Gerrard-street, Soho.  
ELKINGTON, THOMAS, Fenny Compton, Warwickshire.  
GILBORNE, JOHN HENRY, Army.  
O'CONNELL, PETER, Waterford, Ireland.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

*Thursday, December 7th, 1854.*

ATWELL, JAMES BUCKLEY FALCONER, Wilmington-square.  
BOOTH, JOHN GREGORY, Haslingden, Lancashire.  
BROWN, THOMAS EDWIN BURTON, St. Mary-Axe.  
CROFT, JOHN.  
DOUGLAS, THOMAS SADLER, Whitehaven, Cumberland.  
HODGSON, JOSEPH WALLY, Leeds, Yorks.  
RAYMOND, LEWIS ROBERT.

**UNIVERSITY OF LONDON.**—**DOCTOR OF MEDICINE.**—*First Division:* Henry Briggs, University College; Richard Neale, University College; William Roberts, University College; Charles Brodie Sewell, University College; Thomas Buchanan Washbourn, Guy's Hospital.

**SECOND EXAMINATION FOR THE DEGREE OF BACHELOR OF MEDICINE.**—*First Division:* John Crown Agnis, B.A., University College; George Buchanan, B.A., University College; Henry Vandyke Carter, St. George's Hospital; Wilson Fox, B.A., University College; Frederick William Headland, B.A., King's College; Thomas Hillier, B.A., University College; James Champion Penny, St. George's Hospital; Henry Robert Silvester, B.A., King's College; Julius Woldemar von Tunzelmann, University College.—*Second Division:* Alfred Playne, King's College; Henry Stevens, King's College; Richard Wilkinson, King's College.

**EXAMINATION FOR HONOURS.**—*Physiology and Comparative Anatomy:* George Buchanan, B.A., gold medal, University College, F. W. Headland, B.A., gold medal, King's College, equal; Henry Vandyke Carter, St. George's Hospital, Thomas Hillier, B.A., University College, equal.—*Surgery:* George Buchanan, B.A., scholarship and gold medal, University College; Thomas Hillier, B.A., gold medal, University College; Henry Robert Silvester, B.A., King's College; Henry Vandyke Carter, St. George's Hospital; Julius Woldemar von Tunzelmann, University College.—*Medicine:* George Buchanan, B.A., scholarship and gold medal, University College; Thomas Hillier, B.A., gold medal, University College; Frederick William Headland, B.A., King's College; Wilson Fox, B.A., University College.—*Midwifery:* Henry Robert Silvester, B.A., King's College; George Buchanan, B.A., University College.

**FRENCH PATRIOTISM.**—Dr. Jules Cloquet, inspired by a generous feeling, has proposed to the Emperor to lend his country house, situated on the sea-shore, near Toulon, for the reception of officers of the army or navy wounded in the East. Louis Napoleon has written to Dr. Cloquet to say that he willingly accepts his offer, and congratulates him on the patriotic and charitable manner in which he has proposed to employ his villa.

**ABERNETHIAN SOCIETY, ST. BARTHOLOMEW'S HOSPITAL.**

—We regret to learn that this debating Society, which was founded in 1797, and remodelled in 1823, exhibits symptoms of very rapid decline. Several officers of the hospital are, however, taking active steps, with the concurrence of the senior members, in an attempt to raise the Society to something like its former prosperity. On Friday, December 8th, a special general meeting assembled, in order to investigate, if possible, the causes which have led to the prolonged non-attendance of the more distinguished members during the whole of the present session. The two presidents of the Society for the current year, Dr. Kirkes and Mr. Hutchinson, attended; and other senior members and officers, such as Dr. Baly, Mr. Chalmers Miles, and Dr. Edwards, were energetic and assiduous in their endeavours to incite the majority of those present to do everything in each one's power to improve the forlorn condition of the Society. After considerable and animated discussion, the meeting did not arrive at any unanimous conclusion upon the object of their assemblage, and therefore another special general meeting is summoned in the library of the hospital at eight P.M. this day, and the "attendance of members is earnestly requested."

**BOROUGH OF MARYLEBONE.**—MR. JACOB BELL, one of the candidates for this important borough, has always acted with the greatest honour towards the medical profession. He is opposed to "counter-practice" on the part of chemists and druggists, and deserves the support of the medical practitioners of Marylebone.

**COMFORTS FOR THE WOUNDED IN THE CRIMEA.**—Our readers will be glad to learn that Mr. Hooper, of Pall Mall East, had the honour of receiving an order on Wednesday to submit his water-cushions and mattresses to the Queen and Prince Albert, and that her Majesty was pleased to make a selection of different sizes, to be sent to Miss Nightingale to relieve the suffering of our wounded soldiers who have so nobly shed their blood for their Queen and country. These excellent appliances have been in general use in H. M. Navy Hospitals, Infirmarys, Asylums, and Unions for some time, as well as by the H.E.I. Co. and the emigrant-ships; and we confess we cannot understand why the army alone should be denied the comfort they afford, and which we learn from our chief medical authorities is greater than can be well conceived. We hope such medical men as have had personal experience of their usefulness will, we trust, urge on their wealthy patients to follow the example of our excellent Queen.

**GROSVENOR-PLACE SCHOOL OF MEDICINE.**—In a paragraph respecting St. Mary's, which we inserted a week or two ago, we made an observation that might be construed into an injury to the School in Grosvenor-place, a matter which was far from our intention. We mentioned that some of the preparations belonging to Mr. Lane had been removed to St. Mary's, but we did not mean to imply that the museum of the Grosvenor-place School had been damaged thereby. We believe the very fine surgical collection of Mr. Pilcher, and the anatomical and obstetric museums of Mr. Blenkins and Mr. Bloxam, are perfect of their kind, and that the materials for teaching belonging to this School are altogether of a high order.

**MEDICAL LIBRARY, OXFORD.**—The "Radcliffe," at Oxford, the medical library of the University, was favoured with something new on the 9th inst. Dr. Acland, the successor of Dr. Kidd, entertained about 500 of the *élite* of the colleges, to arrange the new museum shortly to be erected in this city. The Radcliffe, usually as cold as St. Petersburg, was brilliantly lighted up, and warm from apparatus lately introduced for that purpose by Dr. Acland. The Vice-Chancellor, the head of the University residents at Oxford, was quite complimentary to the medical faculty and medical gentlemen invited. "The improved warmth of the library now in winter," he said, was "only emblematical of Dr. Acland's own enlightened mind and warm heart." The recent regulations for lectures on Medicine by the College of Surgeons have given very general dissatisfaction.

**THE WOUNDED IN TURKEY.**—Most of the Russians were shot low down in the legs or in the back, our troops all in front; several shot through the chest were doing well; more than one had the bullet split in two by the sharp edge of the shin-bone. At one time the deaths were fifteen daily, and the dead were merely sewed in sacks and placed in one grave. About a dozen wounded Russian officers were in one room, the great difficulty with whom seemed to be to prevent them moving their bandages, as they thought the English surgeons had poisoned them. Of sixty deaths, by the latest accounts up to November 25th, not less than twenty-seven had died of

dysentery and diarrhoea, twenty of their wounds. One surgeon was called to see 127 wounded, while sixty-six of his men were killed. Fifty-one more nurses, accompanied by a physician, had arrived.

**DUBLIN HOSPITALS.**—A large deputation of medical and surgical practitioners waited on the Lord-Lieutenant of Ireland, last week, to gain his support for these institutions. We believe the grants will be continued in a modified shape, and would never be disturbed but for the popularity-hunting agitation of the matter by certain census writers and other functionaries.

**THE HOSPITALS IN THE CRIMEA.**—The English steamer *New York* has been despatched, and is to be stationed off Balaklava, for the conveyance of sick and wounded to and from that port to Scutari. She has taken out for the French army seventy-five ambulance carriages, medical and surgical necessaries, biscuit, vegetables, flour, &c.; everything necessary, in fact, to guard against scurvy or other diseases in the army.

**APPOINTMENT.**—Mr. Andrew Bolton has been appointed house-surgeon to the Newcastle-on-Tyne Infirmary.

**SURGEONS FOR THE ARMY.**—In consequence of the great number of medical men required for our army, the Court of Examiners of the College of Surgeons find it necessary to meet three times a week to examine gentlemen, producing the Director-General's warrant to proceed to the East. We understand the Court meets on the 18th, 20th, and 22nd, and on each occasion with the full complement.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, DEC. 9.**—The weekly return continues to exhibit a rather high rate of mortality, the number of deaths registered in London last week having been 1331. That class of the population which suffered most appears to have been the young, 656 deaths, or nearly a half of the total number, having occurred to children under 15 years of age. Of these children 98 were carried off by scarlatina, and 103 by pneumonia, the effect to some extent of recent lowness of the temperature. Small-pox is also making progress, and was fatal in the week to 19 children and 11 adults. 323 deaths were caused by diseases of the zymotic class, and 303 by affections of the respiratory organs, exclusive of 131 by phthisis.

Last week the births of 777 boys and 769 girls, in all 1546 children, were registered in London.

## Obituary.

**JOHN MORGAN SALTER**, wrecked in *H.M.S. Prince*, off Balaklava, aged twenty-one. Though so young, the deceased was a B.A. of the London University, and was admitted a member of the College of Surgeons so recently as the 15th May last. The death of Mr. Salter has cast quite a gloom over King's College, of which institution he was a most promising pupil, and from his quiet, gentlemanly deportment, had secured the affection of professors, pupils, and all who had the pleasure of his acquaintance. Mr. Salter leaves two brothers in the profession to deplore the loss all have sustained in his death. He was a nephew of Thomas Bell, Esq., F.R.S.

## TO CORRESPONDENTS.

- A Subscriber, (Margate).**—The letter has escaped our notice. Communications of the description named are of the most objectionable character. Very little benefit is derived by the party making them, and an incalculable amount of mischief is done to the profession at large. We cannot believe that the gentleman who wrote the letter was actuated by self-interest, but that he imagined he was rendering a service to the public. If our correspondent will forward to us the paper that contains the letter complained of, we will give it our attention.
- A. F.**—Application should be made to the Parving Board of the parish. If the nuisance is not remedied by that means, the matter should be placed before the Secretary of State.
- X. Y. Z.**—Under the circumstances, no extra charge can be made for treating a case of fractured patella.
- Mr. H. W.**—As yet no authentic report of the trial has been published; the plaintiff held a licence from the Society of Apothecaries. As soon as we can procure an account of the trial, we shall make some observations on the subject. Our opinion remains unaltered respecting our correspondent's legal right to recover.
- A Young Surgeon.**—We do not recommend particular works. There are several recent publications on the subject, embracing all that is known up to the present period.

**A Rejected Candidate for the Diploma of the College of Surgeons.**—The following are the arrangements for the examination of candidates, and we can scarcely imagine any fairer mode of testing the qualification of students, as far as a verbal examination is concerned.—In the examining-room, the examiners sit at four tables, and the candidate is examined at each in succession. No candidate can be entirely rejected unless the whole of the four tables decide against him. Two examiners sit at each table, and both of them must agree in their opinion of the merits or demerits of those who come before them. No student can ever, therefore, be rejected by any one of the examiners. Many unsuccessful candidates fall into a misapprehension upon this point. If three of the tables pronounce in favour of a candidate, although the fourth may be against him, he obtains the diploma. If two tables should be against him, and two in his favour, he is not rejected, but is allowed to have a written examination on the following Friday after the oral examination. Many good men are sent back for the written examination, owing to not being able, from nervousness, &c., to answer satisfactorily when before the Examining Board. We agree with our correspondent, that many students who really understand their profession can place their ideas and the knowledge they possess upon paper with more facility and correctness than they can when stationed before their judges.

**F.R.C.S.**—The list appeared at the proper time. We cannot re-publish it.

**M.D.**—The Universities are now united. We agree with our correspondent that the union will be of advantage to both institutions.

**Obituary.**—It is impossible. Still the evidence of the girl, if reliance could be placed upon it, might lead to the formation of a tolerably rational conjecture on the subject.

**A. M.**—The facts were published when the trial took place.

**Aspic Finem** will find the subject noticed in *THE LANCET* of December 2nd.

**Macdon.**—The subjects are not yet announced, but will appear in due time in the columns of *THE LANCET*. Whatever changes may take place, it is desirable that the examination should be passed. Labour expended upon preparation will certainly not be lost.

**J. T.** had better consult some respectable practitioner. The disease is simple, and easy of removal. The postage-stamps, which were enclosed in the letter forwarded to *THE LANCET* Office, will be returned on a notification being made as to where they may be sent.

**M.D. (Liverpool).**—Whatever laws may be passed to regulate the profession, regard will be had to the vested rights and privileges of those gentlemen in practice who hold degrees or diplomas from recognised universities or colleges. Our correspondent must not suppose that the Bill, to the draught of which he has directed our attention, will, in its present form, pass either House of Parliament.

**R. W.**—We shall be happy to receive the communication.

**M.R.C.S. and L.A.C.**—In addition to the possession of the diploma of a College of Surgeons, the candidate must undergo an examination by the Army Medical Board.

**An Old Subscriber, (Maidstone).**—Alfred-place, Bedford-square.

**Surgicus.**—1. By examination.—2. A member of the College of fifteen years' standing, who was a member on the 14th of September, 1843, will be admitted for ballot on presenting a certificate, signed by six fellows of the College, of his respectability, and a declaration from himself that he does not sell drugs, and dispenses medicines only for his own patients.

**One who knows all about it.**—Thanks for the information. It may be of essential service at the proper time. The letter marked for "return" shall be preserved.

## QUEEN'S COLLEGE, BIRMINGHAM.

To the Editor of *THE LANCET*.

SIR,—In your journal of December 2nd, mention is made of a testimonial presented to me by the students of the Queen's College upon my retirement from the surgery of the hospital. This, allow me to say, is an error. It should have been the resident surgeon. Mr. B. W. Hall, I beg to observe, was vice-president at the dinner, and not of the College, that distinguished position being held by the Right Hon. the Earl Howe.

I have the honour to be, Sir, your obedient servant,

Suffolk-street, Birmingham, Dec. 1854.

BENJAMIN HUNT.

**An Old Subscriber** shall receive a private note, if he will send his address.

**THE** reports of the Harvelas, the Western Medical, and Epidemiological Societies, are unavoidably postponed.

**ERRATA.**—In the article on "The Parisian and London Hospitals," in last week's *LANCET*, p. 401, first col., line 23 from bottom, for *Forville*, read *Forville*; also, second col., same page, line 6 from top, for *Towers*, read *Jowers*.—Amongst the Communications, &c., p. 406, for *Mr. E. W. Furness*, read *Mr. C. W. Turner*.

**COMMUNICATIONS, LETTERS, &c.**, have been received from—Mr. Coulson; Dr. Henry Hancox, (Brynawr, Dreconahire); Mr. Howard; Dr. Collier; Mr. W. N. Chipperfield, (Margate); Mr. Southam; Mr. Day; Mr. Richard Haughton, (South-end, Croydon); A Young Surgeon; Clericus; A. N.; Aspic Finem; Mr. Wilkinson, (Rotherham); An Army Surgeon; Surgicus; Mr. R. W.; R. M.; An Old Subscriber, (Maidstone); Mr. G. Hopkins, (Chapel-en-le-Frith); Mr. J. Somerville, (University of Edinburgh); Mr. J. Turle; Dr. Andrew Clark; Mr. C. W. Turner; Mr. A. Bolton, (Newcastle); Miss Master; Mr. E. W. Hall, (Birmingham); Mr. B. Hunt, (Birmingham); Mr. C. Hugo, (Plymouth, with enclosure); Alpha, (with enclosure); Mr. A. K. Maybury, (Emsworth); Mr. Langford, (St. Clements); Mr. E. A. Watson, (South Somerset, with enclosure); A Rejected Candidate for the Diploma of the College of Surgeons; A Subscriber, (Margate); A. F.; F.R.C.S.; M.D.; Mr. Geo. Bodington; Macdon; J. T.; M.R.C.S. and L.A.C.; One who knows all about it; An Old Subscriber; &c. &c.

# MEDICAL BENEVOLENT COLLEGE.

The Treasurer has the satisfaction to announce the following Donations and Subscriptions, which were received too late for publication in the Medical Journals of the 9th inst., and to publish those that were inadvertently omitted, or incorrectly entered, in the last Advertisement.

Haldenand, Mrs., Upper Galton House, Reigate											
Dunroch, Mr., New st. St. Thomas st.											

Donors of TEN GUINEAS are Life Governors of the College; Subscribers of ONE GUINEA Annually are Governors during the continuance of their Subscription.

Gentlemen desirous of acting as Honorary Local Secretaries in behalf of the College would oblige by communicating with the Secretaries, at the Office, 37, Soho-square, where Subscriptions are received; and by the Treasurer, John Propert, Esq.; also by the following Bankers:—Goslings and Sharpe, 19, Fleet-street; Coutts and Co., 59, Strand; Drummonds, Charing-cross; Glyn and Co., 67, Lombard-street; Scott and Co., 1, Cavendish-square; Hoare and Co., Fleet-street; the Union Bank of London, Regent-street Branch; Messrs. Williams, Deacon, Labouchere, and Co., Birchin-lane; and by Cunliffe and Co., Manchester.

By order of the Council,

EDWARD HENRY SIEVEKING, M.D. Hon. Sec.  
HERBERT WILLIAMS, Assistant-Secretary.

Office, 37, Soho-square, Dec. 13th, 1854.

\* \* The THIRTEENTH LIST will be published early in MARCH next.

## Mr. Hooper's Water Mattresses or

BEDS, and CUSHIONS for AIR or WATER, for placing on an ordinary Bedstead. Being made of India-rubber, without the admixture of cloth materials, leakage is avoided. (Extract from THE LANCET, Jan. 25, 1851.)

CUSHIONS FOR BED-SORES.—Whether threatened with Sloughing, or in which Sloughing has taken place, Fractures, Diseased Joints, Spasms, Lascitudo, Typhoid and other Fevers, Rheumatic Affections, Dropsy, Coldness of the Stomach and Feet, Consumptive and all Bed-ridden Patients. They are simply to be placed on an ordinary bedstead. These Cushions and Beds are not affected by Heat or Cold, and will bear water at any temperature.

Finchbury-square, February 27, 1852.

I have in several instances employed Mr. Hooper's Water Cushions and Mattresses; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water Bed.

JON. PARRISH, M.D., Physician to the London Hospital.

Infirmary, Chichester, March 21, 1852.

Sir,—We are all much pleased with your Cushions, and still more so with the Mattresses.

Yours truly,

THOS. NEWHAM, House-Surgeon.

HOOPER, 7, Pall Mall East, and 65, Grosvenor-street.

## Anatomical and Dental Repository,

45, Museum-street, Bloomsbury, London.—JOHN HARNETT begs most respectfully to call the attention of Lecturers, Students, and Gentlemen connected with the Medical Profession, to his large and select Stock of Anatomical Preparations, consisting of Skeletons, loose and articulated Skulls, Hands and Feet, Vertebrae, and Loose Bones, at the lowest possible prices.

## Poultices superseded by the use of

MARKWICK'S PATENT SPONGIO PILINE.

As a substitute for common poultices and fomentations, the superiority of this article is unquestionable. It is strongly recommended by the most eminent of the Faculty for its cleanliness, economy, lightness, and general efficacy, and is now used in several of the hospitals. Also Markwick's Patent Piline, for Cholera Belts, Rheumatism, Chest Protectors, Respirators, Lumbar, &c.

Sold, retail, by Chemists and Druggists, and wholesale only by GEORGE TRIMBEY, 41, Queen-street, Chancery.

## The Eye Douche, for applying Lotion

to or bathing the Eye, is self-acting, simple, and portable. The immediate relief obtained from its use particularly recommends it to the notice of all who are much engaged in reading, writing, or designing; it has been employed with the most favourable results by patients under the care of Haynes Walton, Esq., Surgeon to the Central London Ophthalmic Hospital. Price 20s.; carriage paid to any railway station.

Manufactured by WILLIAM T. COOPER, 26, Oxford-street, London.

COOPER'S LAVEMENT APPARATUS is the most perfect ever invented; the possibility of air entering the bowels is prevented, and the labour of pumping is avoided; being constructed entirely of metal, without valves, it cannot become out of order, which renders it particularly suitable for use in the country or in foreign climates. Price 35s. Enema Apparatus from 10s.; Superior Reservoir Apparatus from 27s.—Each instrument in mahogany box with lock and key.

Manufactured by WILLIAM T. COOPER, 26, Oxford-street, London.

THE CORK RESPIRATOR is the lightest cheapest, and most efficacious ever produced; allows free respiration, and from being easily applied and removed, is specially adapted for the use of Invalids, or Ladies attending evening meetings or places of amusement. Price 3s., free by post.

Wholesale only of WILLIAM T. COOPER, 26, Oxford-street, London. Illustrated Catalogues free by post.

**Mr. Edwin Osborne, of 24, Savile-**  
ROW, LONDON, the Sole Licencee and Maker of PALMER'S PATENT LEG, adapts this beautiful substitute to every form of amputation; and having had great experience in its manufacture, feels confident of giving comfort and satisfaction to those persons who may favour him with their patronage. References given, (if required.)

**Army and Navy Surgeons can be**  
supplied with the best SURGICAL INSTRUMENTS cheaper than any other house in the trade, at PRATT'S, 420, Oxford-street. Travelling Urinals, from 12s.; Brass Enema Syringe in Case, 7s. 6d.; Elastic Stockings, 6s.; Case of Amputating Instruments, £3 15s.; Pocket Case, 30s.; Tooth Instruments, from 25s.

PRATT, Surgical Instrument Maker, 420, Oxford-street.

**Second-Hand Surgical and Optical**  
INSTRUMENTS.—C. BAKER, 244, High Holborn (opposite Day and Martin's), begs to call the attention of the Profession to his extensive Stock of SECOND-HAND SURGICAL INSTRUMENTS, suitable for Emigration, Military, and Private Practice; also, to his large assortment of OPTICAL, PHILOSOPHICAL, AND SCIENTIFIC INSTRUMENTS, at extremely low prices. Every description of Instruments Purchased or taken in Exchange. Established 1765.

TO THE SURGICAL AND MEDICAL PROFESSION.

**W. F. Dürroch, late Smith, begs to**  
inform the Profession, that he continues to MANUFACTURE SURGICAL INSTRUMENTS of every description, and that he has attained the highest reputation by the approval and patronage of the most eminent practitioners and lecturers for the improvements made in various articles. Gentlemen favouring him with their orders may rely on having their instruments finished in the best and most modern style. Surgical and Medical Instruments made to drawings, and kept in repair. Established 1798. No. 2, New-street, St. Thomas's-street, (near the Hospital), in Southwark.

Superior dissecting instruments and equally moderate in price, well worth the inspection of the student.

SPECULUM ANI, made by W. Dürroch, for John Hilton, Esq., may be had at a moderate price.

**M. Pillischer's Newly-Constructed**  
STUDENT'S MICROSCOPE, which, for solidity, portability, and reasonable price, surpasses any Microscope hitherto made by any English or Continental maker. The Student's Microscope, with coarse and fine adjustments, single mirror, one eye-piece, a one-inch and one-quarter-inch French achromatic object-glasses of best quality, the whole packed in mahogany case, 7in. by 6in., £5 10s.; or with M. Pillischer's own-made, 1in. of 16 degs. angular aperture, and 4in. of 60 degs., £7.

The above stand with lever stage, extra eye-piece, double mirrors, animalcule cage, &c., £8; or with Pillischer's glasses, £9 10s.

A list of prices will be sent free on application to M. Pillischer, 88, New Bond-street.

**Henry Bigg, 9, St. Thomas's-street,**  
Borough, Surgical Instrument-maker to Guy's and St. Thomas's Hospitals, begs to call the attention of the Medical Profession to the following valuable instruments, made from designs and suggestions kindly given by the Gentlemen whose names are attached—viz., Mr. Le Gros Clark's Talipes Instrument; Mr. Bransby Cooper's Ovarian Trocar; Mr. Cock's Recto-Vesical Trocar; Mr. Cooper Forster's Ear Speculum; Mr. Hilton's Speculum Ani; Dr. Lever's Midwifery Instruments; Mr. Solly's Elastic Catheter, with Catgut Director. These instruments being constructed on the premises secure their excellence and perfect finish.

9, St. Thomas's-street, Borough, London.

**Application of**  
VULCANIZED INDIA-RUBBER TO THE CURE OF CLUB-FOOT AND SPINAL CURVATURE.—A cord of Vulcanized India-rubber resembles more closely the action of LIVING MUSCULAR STRUCTURE than any other mechanical power, Mr. H. Bigg has therefore employed it to overcome the contraction existing in CLUB-FOOT, and also for the purpose of yielding the support needed in cases of SPINAL CURVATURE. The greatest advantage of this new principle consists in the treatment being pursued without the least interference with muscular motion, respiration, or anatomical development.

These apparatus, being PATENTED, can be procured only of

MR. H. BIGG,

Anatomical Machinist to the Admiralty; Chelsea, Greenwich, St. George's, Middlesex, University College, King's College, Guy's, and St. Thomas's Hospitals.

20, Leicester-square, and 9, St. Thomas's-street, Borough.

## Infants' New Feeding Bottles.—These

celebrated Nursing Bottles, the best Artificial Mother ever invented, enabling the most delicate infant to feed from its birth with the greatest comfort and ease, are adapted to milk, biscuits, and all kinds of food. The Nipple, of novel material, is elastic, soft, durable, very cleanly, and so beautiful an imitation of nature, that no infant ever refuses it.—BENJAMIN ELIAM, 196, Oxford-street.—7s. 6d.—Each is stamped with my name and address.

TO SURGEONS, APOTHECARIES, AND DRUGGISTS.

## Important Saving, by Pre-payment,

in the PURCHASE of

NEW WHITE MOULDED VIALS.

APSLEY PELLATT AND CO. submit the following PRICES of VIALS, for PRE-PAYMENT only:—

1/2 oz., 1 oz., and 1 1/2 oz. per Gross, 6s.	
3 oz. " 7s.	
4 oz. " 8s.	
6 oz. " 10s.	
8 oz. " 15s.	
10 oz. " 18s.	
4 1/2 oz. graduated in 3 doses 12s. 6d.	

In quantities of not less than Six Gross, assorted to suit the convenience of the purchaser, delivered to carriers in London. No charge for Package. Breakage at risk of Purchaser.

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—Orders and remittances to be addressed,

APSLEY PELLATT & CO.,  
FALCON GLASS WORKS, LONDON.

## Surgical Instruments, and every

Implement necessary for Surgeons and Druggists, can be had (warranted best quality and moderate prices), Retail as well as Wholesale, from the Manufacturer, JAMES ARNOLD, 35, WEST SMITHFIELD, St. Bartholomew's Hospital, London.

## Every excellence which the

Surgeon can require—viz., Lightness, Durability, Strength, and Economy—is realized by HUXLEY'S SURGICAL STOCKINGS, KNEE-CAPS, ANKLETS, &c.

H. and Co. have much pleasure in informing the Profession that they have perfected an ABDOMINAL BELT of new construction, which, acting diagonally, is not liable to displacement; its weight is only four ounces. Price 18s. Diagrams and particulars forwarded by post. Every kind of Surgical Stocking made. Spiral Stockings at a great reduction. Measure required for Stockings: Circumference at A, B, C, D, and E; length from A to D, and D to E.

HUXLEY and CO., 8, Old Cavendish-street, late 5, Vere-street, Oxford-street.

## Mr. Bourjeaud's Registered Elastic

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BERKELEY-SQUARE, opposite Mirat's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five.

FIG. 1. THE THIGH AND KNEE-PIECE.—Mr. Bourjeaud begs to state that these are combined to answer certain purposes of compression when oedema or distension of the thigh and knee exist together.

FIG. 2. SPIRAL STOCKING MADE TO FIT FROM THE TOES TO ABOVE THE KNEES.—This appliance is one of the most valuable, and gives such support to the whole limb that the venous blood is returned with great ease. Patients affected with varicose veins should generally resort to this stocking, which, like the other appliances, is made of varying compressing force to suit every shade of difference among patients. All the above spiral apparatus may be put on with the greatest ease, as they will stretch to almost double the size, and the force is so managed that support is given without creating the least uneasiness.

# CAUTION.—Have the QUALITY of the GOLD STATED on the INVOICE, and

REDRESS is OBTAINABLE in a COUNTY COURT.—WATHERSTON and BROGDEN beg to announce that they have TAKEN SPACE in the CRYSTAL PALACE, with the view of giving universal publicity to the principle of SELLING GOLD CHAINS by weight and workmanship. To those who have not yet tested its value, the following examples will be found useful, showing the relative prices paid for Labour in the purchase of a genuine and of a spurious Gold Chain:—

Genuine Gold Chain.		
Assumed cost of gold chain, of equal weight...	£10	0 0
Intrinsic value, if the gold is of 15 carats .....	7	0 0
Left, for labour and profit.....	£3	0 0

Electro-Gilt, or Polished Zinc Gold Chain.		
Assumed cost of gold chain, of equal Weight ..	£10	0 0
Intrinsic value, if the gold is of 7½ carats .....	3	10 0
Left, for labour and profit .....	£6	10 0

Difference, 115 per cent.

WATHERSTON and BROGDEN, Goldsmiths, Crystal Palace, Central Transept, No. 23, Gallery of Precious Metals.—Manufactory, No. 16, Henrietta-street, Covent-garden, London. Established A. D. 1798. N.B. Assays made of Chains and Jewellery for 1s. each.

## Water Filter for the Pocket, with

DRINKING-CUP and INSTRUCTIONS, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.  
J. SOLOMON, Wholesale Optician, and Photographic Depot, 22, Red Lion-square.

## Carriages.—A very light Double-

seated Brougham, suitable for a Country Practitioner, Twenty-five guineas; also several others; one little used, and quite equal to new, at WHITE'S Coach Manufactory, Westminster-road, opposite the Asylum, where may be seen a variety of New and Second-hand Carriages.

## Patent Mincing and Sausage-making

MACHINE.—Price, £2 2s., is particularly adapted for Private Families. Its recommendations are, cleanliness, simplicity, durability, and great saving of time. It will mince two pounds per minute, and, being all metal, is easily cleaned; neither heat nor cold will injure it. Medical Gentlemen will find the above Machine worthy of their notice and recommendation for the use of Invalids. Already it has been patronized by several members of the Profession, and has given the greatest satisfaction. Post-office order to Samuel Nye for £2 2s., and 1s. for packing-case, will receive immediate attention.

79, Wardour-street, Soho.—Prospectus sent free.

## Ford's Eureka Shirts.—Patterns

of the new Coloured SHIRTINGS in every variety of colours. Upwards of 200 different Patterns for making FORD'S EUREKA SHIRTS, sent per post free on receipt of six postage stamps. Price 27s. the half-dozen.

FORD'S WHITE EUREKA'S, best quality, Six for 40s.; second quality, Six for 31s.; if washed ready for use, 2s. extra.

CAUTION.—Ford's Eureka Shirts are stamped "38, POULTRY, LONDON," without which none are genuine.

\* Catalogues with particulars post free.

RICHARD FORD, 38, POULTRY, LONDON.

## The 16s. Trousers reduced to 14s.—

Trousers and Waistcoat, 22s.—Coat, Waistcoat, and Trousers, 47s., made to order from Scotch Tweeds, all wool, by B. BENJAMIN, Merchant Tailor, 74, Regent-street.—A perfect fit guaranteed.

## To Professional Men and others.—

The Oxford Mixed Dockskin Trousers, price 21s. The Striatus Cloth Vest, price 10s. 6d. Stock for choice, or to measure.

S. BATTAM, Coat and Trousers Maker, 160, Tottenham-court-road, four doors south of Schoolbred and Co's.

Patterns of the material and Directions for Measuring sent free per post.

## R. T. Pigram, Practical Tailor, and

Inventor of the Indicator of the Human Figure, whereby a perfect fit is secured, respectfully invites the attention of the public to his mode of art, since none can doubt the importance of an easy and exact adjustment of wearing apparel. Superior Trousers at 17s. 6d. per pair.

R. T. PIGRAM, 51, Lamb's Conduit-street, Foundling Hospital.

## Abstract regarding Economy in

CLOTHES.—From *The Times* of October 30th, 1864.

"Every yard of Cloth sold at THE LONDON CLOTH ESTABLISHMENT is sold at the WHOLESALE PRICE, and Gentlemen purchasing Cloth at the London Cloth Establishment (if they wish) have it made up on the premises at the expense only of the workmen's wages, in addition to the price of the trimmings."

### THE ECONOMY OF THIS SYSTEM

Is Proved by the saving of from thirty to fifty per cent. in the price of every garment; besides the very obvious advantage of selection from such a stock, with the guarantee of a superior fit, good taste, and the best work. The Proprietors refer with satisfaction to the high character which their "Tyrian Dye" Black Cloths and Dockskins have obtained; they never change colour, and will (without injury) bear the application of the strongest acids.

LONDON CLOTH ESTABLISHMENT, No. 16, Coventry-street.

## Metal Bed-Pan,

Price 6s.—Acknowledged to be the most convenient in form, and much more durable than any now in use.

To be had of the Manufacturer, J. LAWRENCE, 20, Great Charlotte-street, Blackfriars; of Messrs. Gale, Baker, Warde, and Oldfield, Bouverie-street, Fleet-street; and of Messrs. Leadbitter and Hollon, York.

Orders from the Country must be accompanied by a Remittance.

## Royal Polytechnic Gas Fire.—

BACHHOFFNER and DEFRIES'S PATENT.—The Public is respectfully informed that arrangements have now been made for the supply of this unique and beautiful mode of Warming Private Houses, Shops, Public Buildings, &c. Smoke, dust, ashes, and accidents from fire are effectually prevented by its use, while it presents all the comfort and appearance of an open coal fire, securing, at the same time, perfect ventilation. To be seen in action at DEFRIES'S Office, 145, Regent-street, London.

## Ten Thousand Stoves.—The Tenth

Thousand of the PATENT PORTABLE SUSPENSION STOVE is now on sale. These Stoves, so justly celebrated for preserving a pure and healthy atmosphere, and for their extraordinary economy in the consumption of fuel, are sold, wholesale and retail, by DEANE, DRAY, and CO., 46, King William-street, London-bridge, and may be obtained of most Ironmongers. The Improved Patent Ventilating Stove, which is strongly recommended, may also be seen at the above establishment. Prospectuses, &c., forwarded, post free.

## Exhibition Stove—Rettie's Patent

ECONOMIC.

CAUTION.—Several Medals were given for piracies on the above Stove. E. M. and M. RETTIE can forward to Scotland or Ireland, or any part of England, the above, suitable for CHURCHES, Hospitals, Private Buildings, Drying-rooms, Manufacturing purposes, Ships, Hot-houses, &c. Prices from £3 3s. to £20 each, burning only from two lbs. to eight lbs. of coal per day, and warming buildings from six to thirty rooms, and no pipes required throughout the building, nor risk of fire—giving a pure, warm air, and aiding the ventilation; as now used in Her Majesty's Treasury, Royal Mint, Tithe Commissioners, the Arctic Vessels, and in Churches, Prisons, Schools, Public and Private Buildings.

All communications, post-paid, to Mr. Rettie, Consulting Engineer, (by letter,) 7, Brompton-road, (stamp enclosed), when Circulars of the newest improvements for Curing damp Houses and Smokey Chimneys. Sanitary Inventions in Self-acting Sewer-traps, Kitchen-sinks for streets and buildings—the only means for preventing Cholera and Fevers.—The New "Nonpareil Gas Burners."

## Purification of Linen.—Prevention of

Disease.—J. BOILESSVE, 55, King William-street, City, London, solicits the attention of the nobility and gentry to his CALORIFERE, for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

From his Grace the DUKE OF BEDFORD, Woburn Abbey, Sept. 24th, 1853.

SIR,—His Grace the Duke of Bedford has desired me to say, his Grace has received your letter inquiring about the Calorifere (drying machine) put up in the Laundry at Woburn Abbey in May, 1852, by Mr. Boilessve. In answer to that inquiry, I have to state, that nothing can exceed it in effect and economy. I sent to the Laundry for the man who has the management of it, and he says, that they can dry off the linen in much less time than they could with the old stove, without dust or dirt of any kind in the Laundry. They can obtain any degree of heat they wish for, and that at a great saving of fuel.

I am, Sir, your obedient servant,

J. Boilessve, Esq.

J. PALFREMAN, House Steward.

## Warming and Ventilating, by Hot

AIR, CHURCHES, HOSPITALS, TOWN HALLS, and other PUBLIC BUILDINGS.—J. BOILESSVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

Highfield, Berkhamstead, Herts., January 24th, 1864.

SIR,—I read some time ago in your valuable paper, an article advocating the need in this climate of warming dwellings with some simple apparatus, giving ventilation, combined with the healthiest temperature, at a great saving of fuel. I am very glad to give you the result of my experience of a new kind of stove, named "Calorifere," erected some months ago at this residence by Mr. J. Boilessve, London; it answers its purpose perfectly; the house and every room to which the ventilation is adapted, is kept at an agreeable temperature, with an *after* absence of the oppressive atmosphere usually experienced by all other methods of warming dwellings; that I have seen several persons, some of them highly scientific, who have examined the apparatus and have expressed themselves satisfied, and consider it a most perfect application of warm air and ventilation combined. The cost of warming the house and conservatory attached, has been *Eightpence per twenty-four hours*, during the late cold weather, and the trouble of attendance is very little. The economy of fuel will cause this stove to be generally adopted. I have no doubt, more especially as the charge for coals is constantly on the increase. The stove in operation should be seen to be appreciated, and I can add, from my experience of its effects during this winter, that it is invaluable for any invalid in so variable a climate as ours, and no one can be aware of the comfort until it is tried.

I am, Sir, yours obediently, a Subscriber,

The Editor of the Times.

E. W. FERRIS.

## Recherché Wines.—Sherry: A very

fine Sherry, (Amontillado and Montilla.) Brown and Pale, for Cash, at 42s. per dozen; 42l. per quarter-cask; 24s. per hogshead; 24s. per butt.

Post.—Very fine old dry Wine (Vintage 1827, 1830, 1832, 1834), lately imported: from the Wood at 42s., 54s., 63s., and 68s. per dozen.

First Class Champagne, (Ay, Avize, Pierry, Verzenay, and Sillery.) Sparkling and Still Moselle, Sparkling, Still, and Red Hocks, and Bordeaux Wines, at very moderate prices.

These Wines are patronized and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples and List of Prices forwarded on application.

H. H. HAMMICK, Importer, 11, Pall-mall, London, opposite the "Travellers' Club."

## Allsopp's Pale Ale in Bottle, as

supplied to the CRYSTAL PALACE; also in casks of 18 gallons. Recommended by BARON LIEBIG.

Address, HARRINGTON PARKER and CO., 54, Pall-Mall, London.

## Pale India Ale and Stout, 4s. 6d.

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts. Delivered free within four miles of London, and carriage free to all railway stations in England at 6d. per dozen extra.

WOOD & WATSON, 18, Clement's-lane, City.

## Oysters.—Chaloner and Co., 43, Bell-

yard, Temple-bar, still continue to supply the BEST NATIVE OYSTERS at 6s. per Barrel.—Established upwards of fifty years.—Fish of every description forwarded to order.

## Soyer's Aromatic Mustard.—"M."

Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration."—THE LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

## To Invalids and those desirous of

PRESERVING HEALTH.—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO.'S HOMEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

## Pure as well as Fine Tea.—

Tea, when pure, is well-known to produce a most wholesome beverage; the impolicy of allowing it to be coloured by the Chinese is fully set forth by the Analytical Sanitary Commissioners, in THE LANCET, and also in THE TIMES, (October 8th, 1852.) The fact, therefore, is now familiar to most, that artificial colour is used to give the Spring crop and the spent Autumn gathering the same appearance. If this practice were discontinued, a twofold benefit would arise; first, the fine qualities would have all the fragrance and strength unimpaired; and, secondly, the inferior faded leaves could not then be passed off as good, causing the flat, insipid infusion, so frequently the subject of complaint. The uncoloured Tea imported from China, by HORNIMAN and CO., London, is perfectly pure; the Green, from the absence of the usual artificial colouring, is of a natural olive hue. The Black, and also the Green, are exclusively of the Spring product from young and vigorous plants, which yield not only more strength, but the full degree of fragrance which FINE Tea, when purely natural, and seasonably selected, alone possesses; ONE TRIAL induces a continued preference. The prices are REDUCED:—

Finest Congou, 3s. 8d. Finest Lapchee Souehong, 4s. and 4s. 6d.  
Fine and Pure Green, 3s. 8d., 4s., and 4s. 6d.

HORNIMAN and CO., Wormwood-street, London, Importers of the most approved Teas in general use, but free from the objectionable artificial colour on the surface.

Agents in London, PURSELL, 80, Cornhill; and ELPHINSTONE, 227, Regent-street, and 368, Oxford-street.

Sold by authorized Firms in all Towns, 1 lb., ½ lb., and ¼ lb. packages only.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

## Robinson's Patent Barley, for making

superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than thirty years, have been held in constant and increasing public estimation as the purest farina of the oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.

The proprietors of ROBINSON'S PATENT BARLEY and PATENT GROATS, desirous that the public shall at all times purchase these preparations in a perfectly sweet and fresh condition, respectfully inform them that every packet is now completely enveloped in the purest Tin-foil, over which is the usual and well-known paper wrapper.

Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets at 6d. and 1s., and in Family Canisters at 2s., 5s., and 10s. each.

## Aërated Waters of sufficient and

uniform strength. BLAKE, SANDFORD, and BLAKE, 47, Piccadilly, having given great attention to the manufacture of Mineral Waters, and feeling it important that medical men should be assured of the quantity of Alkali contained in each kind, beg to submit the following list of their preparations:—

Potash Water, 18 grains of the Bicarbonate in each bottle; Citrate of Potash, (a new and valuable auxiliary in Gout and Rheumatic affections,) 30 grains; Soda, 15 grains; Magnesia, 18 grains, and Ammonia, 10 grains.

B. S. & B. would especially recommend their Seltzer and Vichy Waters; the latter now bottled in half-pints as well as pints.

BLAKE, SANDFORD, and BLAKE, 47, Piccadilly.

## W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible: also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyocymus Niger, Conium Maculatum, Atropo, Belladonna, Cytiledon Umbilicus, &c.); also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alternative), Liq. Fariolantæ (diuretic), and Liq. Belæ (prepared from the Eggle Marmelos, or Indian Bael), for Dysentery and Diarrhea.

W. T. has a large supply of INDIAN BARK on hand.

2, Edward's-street, Portman-square.

## Cotyledon Umbilicus. — Epilepsy

successfully treated with this medicinal agent by Dr. JOSEPH WILLIAMS, (vide THE LANCET, Feb. 4th, and March 25th, 1854.) Davenport's Preparations specially referred to are as under:—

Preserved Juice. Dose, one to three drachms; 6s. 6d. per lb.

Insipiated Juice. Dose, half a drachm to a drachm; 10s. per lb.

Solid Extract. Dose, five to fifteen grains; 30s. per lb.

Taraxacum (Davenport's) Liqueur, or Fluid Extract, prepared by Spontaneous Insipation, possesses every characteristic of the Fresh Juice, and has proved highly efficacious where the ordinary Extracts have proved inert. Dose, a liquid drachm; 6s. per lb.

J. T. DAVENPORT, Operative Chemist to H.R.H. the Duke of Cambridge, 33, Great Russell-street, Bloomsbury.

## Matthey Caylus' Gluten Capsules

contain the purest Copaliba, either simple or combined with Citrate of Iron, Ratanhy, Cubebs, &c.; acknowledged by the London and Paris Hospitals; also by the Lock Hospital; M. Lesueur, chef de Travaux Chimiques à l'Académie de Médecine; Drs. Riord, Cullerier, &c., who have granted written attestations, to be the best prepared Medicine for the cure of certain diseases.

Extract of a Letter from Dr. Cullerier:—

"I cannot induce you too much to extend the use of your preparations; by so doing you will render a valuable service to the therapeutic of hemorrhagic affections."

"I am, &c.,

"CULLERIER,  
"Chirurgien de l'Hôpital de Lourcine."

Sold in Bottles, at 2s. 9d. and 4s. 6d., sealed and stamped with the Government stamp, bearing the name of the Patentee. To be had wholesale and retail of Robert King, French and English Pharmaceutical Chemist, 11, Princes-street, Hanover-square; and all respectable Chemists in the United Kingdom.—Country agents required.

## Newfoundland Cod-Liver Oil.—

Messrs. CHARLES FOX and CO. beg to announce that they have just returned from their Sixth Voyage to Newfoundland, with a supply of PURE COD-LIVER OIL, the whole of which is now in the hands of the Wholesale Houses. They confidently recommend it to the Medical Profession and the Public generally, as the very best Oil offered in the Market. It has been most carefully prepared, without any other process but the slight application of heat, under their own immediate personal inspection, and its purity is fully guaranteed, as Newfoundland affords no other livers for the preparation of the Oil but those which are legitimate. References to houses of the highest respectability can be had on application to Messrs. CHARLES FOX and CO., Cod-liver Oil Merchants, Scarborough.

November 24th, 1854.

## Tarratt's Bandage and Strengthening

PLASTER.—This Plaster, from the nature of the composition and the material on which it is spread, is adapted for a permanent bandage, as it neither produces irritation of the skin, nor, when applied, does heat cause it to lose its adaptation to the part. Having these qualities, it is peculiarly valuable in the treatment of ulcerated legs, varicose veins, &c., where equal and constant support is required. Several of the most eminent surgeons continue to use this Plaster in their practice, preferring it in certain cases to any other. It is well suited for exportation and use in warm climates, the high temperature having less effect on it than on any other plaster.

The profession are referred to Messrs. Westwoods and Hopkins, Wholesale Druggists, Newgate-street, where the plaster may be had in packets containing three yards, for 2s. 6d., or spread upon skins of chamois leather, at 3s. 6d.

Westwoods and Hopkins also call attention to their Compound Adhesive Plaster for fractures and wounds, as likewise to their concentrated preparations, essences, &c.

## A New Discovery.—Mr. Howard,

Surgeon-Dentist, 52, Fleet-street, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without springs, wires, or ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will never change colour or decay, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed teeth rendered sound and useful in mastication.

52, Fleet-street. At home from Ten till Five.

**Messrs. Lane and Lara,**  
MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC  
ASYLUM REGISTRARS,

14, JOHN STREET, ADELPHI.  
(Established A.D. 1828.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.

Office hours from 12 till 4.

TO THE PROFESSION.

**Mr. Bowmer, M.R.C.S. Eng., 50,**  
LINCOLN'S-INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms.

Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense.

Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

**Fixtures, &c., Wanted.—Any Gentle-**  
man having for Disposal Fixtures, Fittings, Bottles, Stock of Drugs and Sundries, suitable for a first-class Chemist's Shop, may hear of a Purchaser by addressing, with full particulars, to L.A.C., care of Mr. Bowmer, 50, Lincoln's-inn-fields.

TO DISPENSING ASSISTANTS.

**Wanted, by a Firm at the West-end**  
of London, a Dispensing ASSISTANT, to live out of the house.—Apply to Y. H., No. 1, Windsor-terrace, Maida-hill.

**Wanted, a Young Man to Dispense**  
and attend to a small Retail. He will have to Visit and take a case of Midwifery occasionally. High moral references indispensable.—Apply to J. T. S., 11, North-place, Kingsland-road.

**Wanted, an Out-door Assistant, to**  
Visit and attend Midwifery. One who is L.A.C. or M.R.C.S. preferred, but no objection to a Student who has attended two sessions, and has had experience in Midwifery. Salary, £80 or £100 per annum, according to the qualifications.—Address, Dr. Vincent, East Dereham, Norfolk.

**Wanted by an M.R.C.S. and L.A.C.,**  
aged twenty-five, a situation as In-door ASSISTANT to a General Practitioner. The advertiser has been two years House-Surgeon to a Hospital, and is well acquainted with Union and general practice. Salary required, £80 per annum. A permanent situation preferred.—Address, Medicus, 51, Gloucester-street, Queen-square, London.

**To be Disposed of immediately, on**  
very moderate terms, a respectable GENERAL PRACTICE, long established in the county of Hants, and presenting good prospects to any qualified Gentleman of address and experience prepared to take it at once.—Address, enclosing reference, Sigma, THE LANCET Office, 423, Strand, London.

TO COUNTRY PRACTITIONERS.

**A Gentleman, who has been accus-**  
tomed to a very extensive Country Practice, including a Union and several Clubs, wishes for a Re-engagement as Visiting and Dispensing ASSISTANT. Unexceptionable references given.—Address, stating terms, &c., to A. B. Z., Post-office, Northampton.

TO SURGEONS, &c.

**A Surgeon wishes to Dispose imme-**  
diately of his Practice and Retail in the suburbs of London, an opportunity offering itself of his taking a country practice. The shop is very neatly fitted. The Practice returning £200 per annum. Rent, £28. A very small sum required. An introduction will be given.—Apply, personally, to W. M., at Messrs. Preston and Sons', 84, Smithfield-bars.

TO SURGEONS AND OTHERS.

**To be Disposed of, a Private**  
Establishment in the Country for Insane Persons of the upper and middle classes of society. The house is beautifully situated in its own grounds, well furnished, and is of easy access by rail from all parts of the kingdom. To a medical practitioner this presents a most favourable opportunity, as there is a good opening for a General Practice, in addition to the business connected with the house. Sum required about £300.—For particulars apply to X. Y. Z., THE LANCET Office, 423, Strand, London.

**To the Medical Profession.—To be**  
Disposed of immediately, by private treaty, at Northwich, Cheshire, in consequence of the decease of the Proprietor, the Stock, Surgical Instruments, Fixtures, &c., of a Surgeon, together with a large Collection of Valuable Surgical Books, if required. Any Gentleman wishing to Commence Business will find this well worthy his attention, the late proprietor having had an extensive Practice for the last eleven years.—For particulars, and to treat for the same, apply to Mrs. Weston, Northwich; or to Mr. Thompson, Chemist, 12, Church-street, Liverpool.

Medical Transfer and Partnership.

30, Bucklersbury, London.

**Mr. Orridge, Medical Transfer Agent**

and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connection enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to RELINQUISH, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

**A Physician (M.D. Lond., and Univer-**

sity Medical Scholar) residing within convenient distance from University and King's Colleges, St. Mary's and St. George's Hospitals, will be happy to receive into his house, at Christmas, a Gentleman whose college studies require superintendence.—Address, M.D., Mr. Rice's Library, Mount-street, Grosvenor-square.

**Practice to be Sold in a Town in the**

West of England, realizing upwards of £400 a year, a Poor-Law Appointment, which may be certainly transferred, of about £100 a year, is part of the business. The Proprietor will take £200 down, and £200 additional subsequently from an immediate purchaser; who would find no difficulty in succeeding to the business. A Surgery furnished, with drugs, included.—Apply M.D., Gale, Baker, Warde and Co., Bouverie-street.

**A Gentleman in the West of England**

is desirous of placing his son with a Surgeon or Apothecary of steady habits and a good private practice in London, near one of the large hospitals, as an in-door Apprentice for five years (likewise a situation where his moral conduct could be attended to.) By stating premium and particulars would greatly oblige the Advertiser.—Address, A.H., Messrs. A. Evans and Company, Wholesale Druggists, Exeter.

TO PROFESSIONAL MEN.

**To be Let, part of a first-class**

RESIDENCE in Stratford-place; well suited for an Architect, Artist, Surgeon, Physician, or Solicitor.—Apply to Messrs. Foster, 54, Pall-mall.

**Book-cases to be Sold.—Two large**

glazed Mahogany BOOKCASES, that were taken with the furniture of a house at a valuation, to be Disposed of on most advantageous terms. One of them is an exceedingly handsome piece of furniture and cost when new 100 guineas.—Apply to Mr. Hammond, General Advertisement Office, 27, Lombard-street.

**Niam-Niams, or the Tailed Men of**

CENTRAL AFRICA, now to be seen for the first time in Europe, at DR. KAHN'S MUSEUM (top of the Haymarket.) Open as usual. Lectures to Gentlemen by Dr. SERRON, and to Ladies by Mrs. SERRON.—Admission 1s. N.B.—A Descriptive Pamphlet of the Niam-Niams, price Sixpence, with a Plain Engraving; coloured ditto, One Shilling.

**Wanted, a House-Surgeon to the**

SCARBOROUGH DISPENSARY.—Furnished apartments, coals, gas, and attendants. Salary, £80 a-year. The Election will take place on the 2nd January. Candidates are requested to forward Testimonials to the Secretary, Queen-street, Scarbro', of whom further particulars may be obtained.

**Birmingham and Midland Counties**

LYING-IN HOSPITAL AND DISPENSARY FOR THE DISEASES OF WOMEN AND CHILDREN.—Wanted, a RESIDENT SURGEON, whose duty will be to attend cases. He must be either a Member of the Royal College of Surgeons, or Licentiate of the Apothecaries' Company.

For particulars, apply to Mr. DAVID CORN, Secretary, Lying-in Hospital, Broad-street, Birmingham.

**Mr. G. Hind, F.R.C.S., resumed his**

DEMONSTRATIONS on the morning of the 15th of September, at the usual hour.

Class-room, 28, Newman-street, Oxford-street. Private residence, 9, South-recent, Bedford-square.

**University of London, &c.—A First**

CLASS B.A. and M.D. prepares Gentlemen, privately or in class, for the Matriculation, Medical, and Arts Examinations, the Fellowship Examinations, &c. Full MS. and printed notes forwarded. One Vacancy for a PRIVATE PUPIL, who may be Apprenticed.—Address A. Z., Ferriman's, 40, Albany-street, Regent's-park.

**University of London.—The follow-**

ing Works have been selected by the Examiners for the Examination in Logic and in Moral and Intellectual Philosophy, for the Degree of DOCTOR OF MEDICINE, in the year 1865:—

LOGIC.—Bacon's Novum Organum, Part I.  
PHILOSOPHY OF THE MIND.—Cousin's Analysis of Locke's Essay (being the third volume of his Cours de Philosophie).  
MORAL PHILOSOPHY.—Butler's Analogy, Part I. Stewart's Outlines of Moral Philosophy.

By order of the Senate,

Marlborough House, Dec., 1864.

R. W. BOTHMAN, Registrar.

# DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL.

PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY,  
AND PUT TO THE TEST OF CHEMICAL ANALYSIS.

**PURE AND UNADULTERATED.**

SOME time having now elapsed since the introduction of this Oil into Great Britain, Messrs. ANSAR, HARFORD and CO., Dr. DE JONGH'S Agents and Consignees, are desirous of expressing their best acknowledgments and great gratification at the speedy and extensive recognition by the Medical Profession of its merits as a PURE and GENUINE Medicine, so well known and highly appreciated on the Continent. They have reason to feel assured, that in every case where it has been tried it has afforded satisfaction, and they are led to this inference from the numerous communications conveyed to them of the surprising and successful results that have attended its administration, not only in many critical cases, but in other instances where ordinary Cod-liver Oil had been prescribed, and produced little or no benefit.

In order to ensure a fair trial of the powers of this Medicine, Medical Men are earnestly requested to caution their Patients for whom it is prescribed against frequent attempts to induce them to purchase a spurious or inferior Oil, on the representation that it is the same as Dr. de Jongh's, or equally efficacious. Dr. de Jongh's Agents are led to make this request, in consequence of having been informed of some discreditable impositions of this kind, as well as of the substitution of other Oils, though Dr. de Jongh's had been prescribed.

## LATEST TESTIMONIALS:—

**ARTHUR H. HASSALL, M.D., F.L.S.,**

MEMBER OF THE ROYAL COLLEGE OF PHYSICIANS, PHYSICIAN TO THE ROYAL FREE HOSPITAL,  
AUTHOR OF "FOOD AND ITS ADULTERATIONS," &c. &c.

"DEAR SIR,—I beg to return my acknowledgments for the copy of your Work on Cod-liver Oil, with which you have favoured me. I was already acquainted with it, and had perused it some time previously with considerable gratification, especially the chapter devoted to the consideration of the adulteration of Cod-liver Oil.

"I have paid, as you are aware, much attention to the subject of the adulteration of drugs. Amongst the articles examined, I have not overlooked one so important as Cod-liver Oil, and this more particularly, since it is a very favourite remedy with me, and is, moreover, so liable to deterioration by admixture with other, especially inferior, Fish Oils. I may state that I have more than once, at different times, subjected your Light-brown Oil to chemical analysis, and this unknown to yourself, and I have always found it to be free from all impurity, and rich in the constituents of bile.

"So great is my confidence in the article, that I usually prescribe it in preference to any other, in order to make sure of obtaining the remedy in its purest and best condition.

(Signed)

"I remain, yours faithfully,

**"ARTHUR H. HASSALL, M.D.,**

"Bennett-street, St. James's-street, 1st December, 1854.

"To Dr. De Jongh, the Hague."

*Extract from "THE DUBLIN MEDICAL PRESS," December 13, 1854.*

"Whatever scepticism may exist respecting the medicinal virtues of this remedy, no doubt can reasonably be entertained that this specimen [Dr. De Jongh's Light-brown Cod-liver Oil] possesses them; and this it is of importance to establish at a time when much impure and adulterated Oil is offered for sale, and freely accepted by practitioners as sufficient for the purposes of routine practice. It is well that practitioners should be enabled to secure for patients some genuine kind upon which they can place firm reliance in cases demanding all the advantages which this agent can afford.

"It follows that if the practitioner wishes to give his patient this remedy, he must take the trouble of aiding him to obtain it of a genuine quality; it will not do to write a prescription, and leave the bearer of it to find a person who will obey it honestly."

# Lectures OR DISEASES OF THE JOINTS.

*Delivered at St. Mary's Hospital.*

By WILLIAM COULSON, Esq.

SURGEON TO THE HOSPITAL.

## LECTURE IX.

### CHRONIC INFLAMMATION OF THE HIP-JOINT.

*(Concluded from p. 500.)*

SUCH extensive lesions as these cannot exist without being accompanied by distressing symptoms, although the severity of the latter is by no means a certain index of the extent of mischief which may have taken place in the interior of the joint. Many of the local and general symptoms already described continue, but in an aggravated form. The pain is severe during the day, and becomes still more distressing at night, disturbing the patient's rest or interrupting it altogether. The patient is unable to bear the slightest motion of the affected joint, and generally assumes a very awkward and characteristic posture in bed, bulging out the hip, and crossing one knee over the other to relieve the pressure of the head of the femur on the inflamed or ulcerated surface of the acetabulum. The nature and quantity of the discharge from the different sinuses which surround the joint vary in different cases. Sometimes we find a succession of abscesses, closing and breaking out at uncertain periods; at other times the secretion of pus is very profuse, and the patient quickly sinks in a state of hectic, or, as more commonly happens, he may struggle for a considerable time against the local disease, until some vital organ becomes affected, when death soon ensues. Scrofulous cases frequently terminate in this manner. As the constitutional powers become exhausted, a tendency to organic disease sets in, the lungs or abdominal viscera become the seat of scrofulous affections, and these prove the immediate cause of death. In some cases, the patient is suddenly cut off, at this stage, by an affection of the brain, which in young subjects is probably of a tubercular nature. I have witnessed cases of this kind where patients with disease of the hip-joint in its third stage were suddenly seized with cerebral symptoms, and died in a few days. Indeed, death may occur from cerebral complication at any period of the disease. Scrofulous children are frequently subject to the deposit of crude tubercles in the substance of the brain; these tubercles remain latent for a long time, and give rise to few or no symptoms by which their existence can be detected; but let any serious disease arise in another part of the frame, or any febrile excitement be produced, and inflammation, with softening of the cerebral tissue around the tubercle, sets in, or effusion of serum rapidly takes place into the ventricles of the brain. Mr. South has recorded a very interesting case, which illustrates this fact, in his translation of *Chelius' Surgery*. The patient, a child, ten years of age, had been lame in the right hip for five or six months, but had presented no other symptoms whatever of a disease of the articulation until a fortnight before his death, when he complained of violent pain on the slightest motion of the joint. At this period symptoms of effusion into the ventricles made their appearance, and after death tubercles were found in the substance of the brain. This case is peculiarly interesting to me, because it confirms the opinion which I had long maintained, that hip-disease usually commences with inflammation of the ligamentum teres and adjacent synovial membrane. On examining the joint, a small quantity of dirty, brown-coloured fluid escaped from the capsular cavity, the synovial capsule itself was thickened and soft, granular on the surface, and of a yellowish colour; the round ligament and the contiguous synovial membrane had been the seat of inflammation, their vessels were injected, the membrane was thickened, and a small quantity of lymph adhered to its surface.

But to return to our more immediate subject: the characteristic symptom of chronic hip-disease in its third stage is a gradual or sudden shortening of the affected limb, which had previously been elongated. The foot of the shortened limb is usually everted, though in some cases the foot has been turned inwards. The shortening of the limb is almost always real, not apparent; and on making careful measurement, in the way described in a former lecture, the affected limb will be found two, three, or more inches shorter than the

No. 1635.

sound one. Still this shortening may depend on position; thus in some cases we find that the pelvis on the affected side is elevated above its natural level, that the spinous process of the ilium is thrown backwards, that the thigh is flexed, and, at the same time, abducted; under these circumstances the limb will appear to be some inches shorter than the one on the sound side, and when it is firmly fixed in this position, there may be great difficulty in distinguishing the case from one of actual shortening. As for this latter condition, it may depend either on dislocation of the head of the femur, or ulcerative destruction of the cotyloid cavity, head, and neck of the thigh-bone. The shortening of the limb from dislocation upwards and backwards on the dorsum ilii requires no explanation; and you can also readily understand how the same effect may be produced when the head and neck of the femur are more or less destroyed by ulceration, and the cavity of the acetabulum deepened, for under these circumstances muscular action, in bringing the parts together, may shorten the limb to an extent equivalent to the angle formed by the neck of the bone in a healthy state, and to the amount of destruction in the acetabulum. It was formerly the custom to refer all cases of shortening of the limb during the third stage of hip disease to dislocation, but I am convinced that this displacement occurs much less frequently than is supposed. However this may be, it should be remarked that the displacement is either partial or complete, and that the former species of dislocation occurs more frequently than the latter. When the round ligament is destroyed, and the edges of the acetabulum ulcerated at its upper and outer part, the head of the bone rests on the ulcerated edge, without being completely separated from the cavity; but in some cases the rim of the acetabulum is intact, yet the head of the femur, or whatever remains of it, is found lodged on the dorsum of the ilium, and completely removed from the cotyloid cavity, as in examples of traumatic luxation, with considerable destruction of the soft and hard tissues which compose the joint. The mechanism of this species of secondary dislocation is easily understood, but we cannot so readily see how the femur is luxated in cases where the cavity of the acetabulum has been slightly or not at all injured. Many writers on diseases of the hip attempt to explain the displacement, by supposing that while the round ligament is destroyed, the head of the femur is gradually thrust outwards by deposits of pus, &c., in the acetabulum, until it has passed beyond the projecting margin of the cavity, when it is easily drawn upwards by the action of the glutæi muscles. But, it may be asked, if this be the efficient cause of displacement, why other joints as well as the hip are not subject to dislocation from collections of pus and lymph, &c., within their articular cavities? A more rational explanation can, I think, be found in the influence of the position which patients almost universally assume during this stage of hip disease. The thigh is flexed, the limb adducted, and turned inwards. In this position a slight effort suffices to luxate the head of the femur, provided the round ligament be destroyed, and the bonds of union between the articular surfaces relaxed.

It is not always easy to distinguish secondary dislocation of the femur on the ilium, and the numerous errors of diagnosis which have been committed in this matter, prove that the signs commonly laid down are not infallible guides. Thus, you will find it stated that the displacement now alluded to may be known by the shortening of the limb, accompanied by elevation of the trochanter major above its normal level, and turning of the foot and knee inwards. But all these symptoms may exist without any real displacement of the head of the bone from the articular cavity. This has occurred over and over again in practice. The limb may be shortened even to the extent of four inches, the great trochanter may be raised upwards and forwards to a considerable extent, while the knee and foot are turned inwards, and fixed in that position; the surgeon considers the case to be one of secondary dislocation, yet after death the head of the femur is found in the cavity of the joint. It therefore becomes a matter of interest to determine by what means we can distinguish these cases of apparent luxation from actual displacement of the bone, and avoid errors of diagnosis, which are always discreditable, even if they do not lead to errors in practice. The difficulty arises not so much from imperfection in our knowledge as from the fact that characteristic signs of distinction between the two sets of cases are often absent. Sometimes, however, the symptoms of true dislocation are evident, and there can be no excuse for overlooking it. Thus, in protracted cases, when the swelling has subsided and the patient becomes emaciated by the long continuance of the disease, the head of the femur can be distinctly felt resting on

the ilium and underneath the glutei muscles; indeed, if the head of the bone has not been much destroyed by ulceration, in these cases its shape can be traced with the fingers through the substance of the wasted muscles. The trochanter major may be elevated beyond the level of the anterior superior spinous process of the ilium, or when the pelvis is fixed and extension made, the head of the bone may perhaps be moved on the smooth surface of the ilium. In all these cases, secondary luxation evidently exists, and by attending to certain circumstances, you may even form a correct notion of the extent of destruction by which it is accompanied. For example, when the head of the femur can be moved on the dorsum ilii, we may conclude that the soft parts are extensively softened or destroyed, while no attempt at bony or ligamentous union has yet been made. If the shortened limb be rotated outwards, it is reasonable to infer that the head, and probably the neck, of the femur are completely destroyed; finally, the degree of rotation inwards, and the extent to which the limb admits of being rotated outwards, will afford some measure of the amount of destruction which has taken place in the head and neck of the bone. But you may ask, what course is to be pursued for clearing up the diagnosis in difficult cases? The point you have to determine is, whether the abnormal appearances of the limb—its shortening, rotation inward, and projection, with elevation of the trochanter major, depend on real displacement of the bone from the articular cavity, or on apparent shortening from an altered position. When the case is evidently one of a scrofulous nature, and when the shortening, with inward rotation of the limb, has already existed for several months, there can be little doubt but that it depends on displacement. On the other hand, when the affected limb can be brought into the same position as the sound one, by the means which I have pointed out in another lecture, and which I need not, therefore, describe to you now; and when the deformity of the limb is not suddenly reproduced after extension has ceased, then we may fairly conclude that luxation has not existed, but that the shortening depends on altered positions of the pelvis and limb.

Dislocation may also take place forwards into the obturator foramen, when the limb is lengthened, the knee bent, and the foot turned outwards, with the toes pointing to the ground. Many surgeons have questioned the existence of this form of secondary dislocation, but though extremely rare, some undoubted examples are on record. Portal examined the body of a patient affected with this species of luxation: the round ligament was not destroyed, yet the head of the femur rested on the inner and lower surface of the obturator foramen. Boyer also relates a case of the same kind. The Museum of the College of Surgeons contains a preparation, exhibiting dislocation into the foramen ovale from the effects of hip disease, and I have related a case in my work "On the Hip-Joint."

The history, gentlemen, which I have just given of chronic disease of the hip-joint is a general one, and applies to the great majority of cases which you will meet with in practice, but some cases differ from others, particularly during the early stage, and this difference probably depends on the nature of the tissue in which the disease has commenced. When the disease commences in the cartilages, pain is for a long time the only symptom which attracts attention, and it is usually referred to the knee rather than to the hip-joint; the wasting and flabbiness of the limb occurs earlier than in other forms, and they are more striking from the absence of effusion into or around the joint. Primary disease of the bone is rare after puberty: it is accompanied with little or no pain during the early stage, or until the disease has extended to the cartilages and soft parts, and even then it is less acute than when the malady has commenced in the other tissues of the joint. Suppuration is apt to exist around the joint rather than in it during the third stage, and the articular cavity seldom presents the same degree of destruction as the bone; hence dislocation rarely takes place until the head of the bone is completely destroyed, and when it does occur the shortened limb is rotated outwards. We have still to describe the diagnosis of hip disease and the treatment appropriate for each stage, but these points I shall reserve for my next lecture.

**RE-VACCINATION.**—M. Bayard, a French surgeon, has found much difficulty in re-vaccinating soldiers and other patients at the age of twenty-one. He believes there is not any degeneration of the vaccine virus, as has been suspected, as the same lymph was tried on children with the best success. Re-vaccination in adults seems rather to be interfered with by various other diseases—scrofula, syphilis, &c.—lying latent in the constitution.

## ON THE EMPLOYMENT OF COD-LIVER OIL IN PHTHISIS.

WITH CASES.

BY E. HEADLAM GREENHOW, M.D.,

PHYSICIAN TO THE BLANKIN-STREET DISPENSARY.

(Continued from p. 506.)

**CASE 11.**—Miss T—, aged nineteen, of decidedly strumous diathesis; her mother died of phthisis. Was consulted by her several years ago for enlarged cervical glands, with otorrhoea, which were cured by cod-liver oil and the iodide of iron, since which she has enjoyed good health.

February 16th, 1849.—Slight emaciation; constant languor and drowsiness, with diminished interest in her usual pursuits; cough and expectoration, the latter being occasionally tinged with blood; pain in left side; quickness of breathing; pulse 100; tongue furred; slight sweating of a morning; menstruation regular and normal; dulness of percussion-sound on both sides of thorax, but most decided on the left, in the apex of which lung there is also slight gurgling; respiratory murmur deficient on left side, of puerile character on right; weight, 6st. 10lb. Counter-irritation by means of small blisters, renewed every third day. Ordered, iodide of iron and Equorice powder, of each two grains; extract of gentian, one grain: make into a pill, to be taken twice a day; also two drachms of cod-liver oil twice a day. The dose of cod-liver oil to be increased to six drachms twice a day as soon as possible.

February 24th.—Decidedly better; cough and expectoration diminished; pulse 90; skin cool and soft; has more energy, and is now able to take the full quantity of oil prescribed; weight, 6st. 12lb.

Under the foregoing plan of treatment, which was steadily persevered in for several months, she gradually regained her flesh and strength until, by the end of April, her weight was 7st. 9lb. In July she reported herself as quite well, and free from cough and expectoration. At that period there remained a degree of dulness, more evident on the left than right side, and there was less resonance than natural on both; there was a slight blowing sound where the gurgling had been, but no gurgling or other rhonchus. About this period a brother from India came under my care, so that I had frequent opportunities of seeing her. She was apparently in good health, and able to enter into all the pursuits and amusements natural to her age. She continued well until the autumn of 1852, when, from exposure to cold, she had an attack of pneumonia, followed by hæmoptysis and other phthisical symptoms, under which she sunk in a few weeks.

**CASE 12.**—J. C—, aged twenty-two, has had cough and expectoration for some time; complains of loss of appetite, of vomiting, of occasional diarrhoea, and of debility; tongue furred; pulse 78, small and thready; emaciated; flattening of chest below right clavicle; dulness of resonance on percussion; expiratory murmur prolonged and harsh; heart-sounds abnormally distinct. This man improved very greatly from the oil, resumed his occupation, and for many months appeared to be cured. A subsequent return of complaint proved fatal.

**CASE 13.**—Mr. J. H—, aged thirty, had hæmoptysis some years ago, and once to a slight extent this spring. Has been habitually a dyspeptic, and occasionally has suffered much from gastrodynia.

June 28th, 1850.—Has had constant cough and expectoration for four months; great languor and debility; shortness of breath; dulness of resonance on both sides; respiratory murmur deficient in left apex, puerile at right; bronchophony on left side; pulse 90; tongue clean; bowels regular. Ordered, counter-irritation with the lotion of acet. cantharides,\* to take half an ounce of cod-liver oil three times a day.

In the course of two or three months this gentleman appeared to be perfectly cured. I have not seen him since, but have ascertained that he died last autumn of phthisis.

I here add the history of several cases strongly illustrative of the great benefit frequently derived from the employment of cod-liver oil in the treatment of consumption. Being unacquainted with their subsequent history, I am unable to decide whether they ought to be classed with the preceding cases, or to appear amongst those in whom the cure has stood the test of time:—

**CASE 14.**—D. H—, aged twenty-five. Has frequently

\* Acet. cantharides, half an ounce; acetic acid, one ounce and a half: mix.

suffered from catarrh. After feeling unwell, and suffering from cough, &c., for a week or ten days, had, on Sept. 13th, 1848, an attack of profuse hæmoptysis, which returned both on the 16th and 22nd instant. After the hæmoptysis and its immediate consequences were removed, symptoms of softening tubercles supervened. There was likewise much gastric derangement, with loathing of food, and tendency to diarrhoea. On October 10th he commenced taking the oil, together with compound infusion of roses. The physical signs at this date were dulness of resonance below left clavicle, with deficiency of respiratory murmur; imperfect pectoriloquy; dry crackling. There was likewise sweating at night, and some lymph-like matter had been observed in the expectoration. Under the use of counter-irritation by small blisters, and subsequently by tartar emetic, ointment, and constant perseverance with the oil, he apparently recovered; and, when he went from under my care in March, 1849, appeared quite well, and was able to resume his employment. His subsequent history is unknown.

CASE 15.—G. M.—, aged twenty-two.—August 10th, 1848—having been out of health for upwards of a year, has now suffered for a month from night sweats, to which, within a day or two, diarrhoea has also supervened. Occasional rigors, succeeded by hectic flush; pulse 120. Suffered formerly from pain in the left side of thorax, which was removed by blistering; much emaciated; breathing quickened; decided dulness in left infra-clavicular region; cavernous rhonchus; pectoriloquy; expectoration copious and purulent. To take half an ounce of cod-liver oil three times a day. This man improved very decidedly and rapidly, and after a few weeks had recovered strength and flesh; the diarrhoea and night sweats left him; his pulse became less frequent, and he almost lost the cough and expectoration. I then lost sight of him, and am unacquainted with his subsequent history.

CASE 16.—T. N.—, aged twenty, servant. Feb. 28th, 1849. Has been always subject to catarrh, and has had habitual cough for some time past; slight emaciation; dulness in right subclavian region, with deficiency of respiratory murmur, and abnormal distinctness of heart-sounds; skin hot and dry; tongue furred; pulse 100. Some remedies were recommended for his relief, but he refused to take the oil when it was ordered, and I did not see him again until April 11th, when he called on me by his master's desire. There was now, in addition to decided dulness on percussion, cavernous rhonchus and pectoriloquy in apex of right lung; pulse 120; emaciation much increased since he was last seen. To take half an ounce of cod-liver oil three times a day.

May 1st.—Is already much improved, and has gained flesh; pulse 100.

June 4th.—Has now scarcely any cough or expectoration, and is very much stouter; pulse 80 to 90; appetite good; physical signs as before.

This man continued under my notice until July, and persevered steadily in the use of the oil. He then appeared to be gradually recovering. The dulness on percussion remained, as did likewise the pectoriloquy, but the cavernous rhonchus was very decidedly diminished, its place being taken by cavernous respiration. I am not aware of his subsequent fate.

### 3. Those in whom the cure appears to be perfect.

CASE 17.—Emma M.—, aged twenty, maidservant; of phthisical family. November 22nd, 1849. Has had chronic cough for several months, and had not menstruated for three months, until a fortnight since, and then insufficiently; dyspnoea on exertion; languor; slight diarrhoea; pulse 90, soft and feeble; cough most troublesome in the morning; expectoration scanty; deficient resonance on both sides, but without marked difference between the two; heart-sounds abnormally distinct on right side; expiratory murmur prolonged in right infra-clavicular region, in which situation, too, there is almost constant uneasiness; suffers much from pain near the edge of ribs on right side; weight, 7st. 10lbs.; to take two drachms of cod-liver oil three times a day.

December 16th.—Has the catamenia to-day, but too scantily; pulse 86; skin cool; feels stronger, and has now but little cough, except of a morning; bowels regular, the diarrhoeal tendency having ceased; appetite good; tongue clean. To continue the cod-liver oil, and to take a pill containing iodide of iron and powdered liquorice root, of each two grains; extract of gentian, half a grain, three times a day.

18th.—Weight, 8st. 1lb.

January 13th, 1849.—Has materially lost ground during the past fortnight; the cough and expectoration being much in-

creased, and her weight reduced to seven stone and a half; pulse 96, small; no diarrhoea or night sweats; catamenia retarded three or four days; slight but unequivocal dulness on percussion of right infra-clavicular region as compared with left side. Ordered, six drachms of cod-liver oil, three times a day; continue the pill, with iodide of iron, three times a day.

25th.—Is again improving; pulse 96, feeble and small; weight, 7st. 8lbs.

February 9th.—Still has a good deal of cough; the catamenia, although still deficient and irregular as to the time of appearance, improving in quantity; is looking, and says she feels better; pulse 90, small; tongue clean; weight, 7st. 11lbs. Continue.

23rd.—Is progressing satisfactorily; weight, 7st. 12lbs. Continue.

March 14th.—Weight, 7st. 12lbs.; is looking much more robust; pulse 80; appetite good.

April 7th.—Not yet free from cough or expectoration; there is still dulness of resonance in right apex, with prolongation and distinctness of the sound of expiration. Continue.

May 8th.—Is going on favourably.

June 10th.—Cough and expectoration nearly gone; menstruates regularly; is perfectly free from pain and uneasiness in the infra-clavicular region, where formerly she had almost constantly more or less of both.

July.—Is tolerably well. To continue the cod-liver oil another month at least, but may discontinue the pills with iodide of iron.

Two years later this girl came again under my care, with cough, &c., for the cure of which similar treatment, with counter-irritation, was employed. She is alive, and in good health.

CASE 18.—Mrs. G.—, aged forty-five. Has been liable to bronchitis, and has several times had hæmoptysis, which has this day (August 3rd, 1848) returned in considerable quantity. Has not been free from cough for some months. On examination, the blood was found to be mixed with pus, leading to the inference that a small vomica had burst; is emaciated; dulness on percussion of right upper portion of thorax; bronchophony and sonorous rhonchus. The hæmoptysis, or rather expectoration tinged with blood, continued for some days. The dulness increased for some time, but I never could distinctly make out cavernous rhonchus. Once or twice I fancied its presence, but subsequent examinations failed to confirm the impression, and, when absent, there was no cavernous respiration. She was only seen very occasionally by me for a few months, during which she took, by my direction, cod-liver oil, and employed counter-irritation to the chest. She slowly but steadily improved; has had good health for the last two or three years, and was looking well when seen by me about a year since.

CASE 19.—A. B.—, aged eight years.—June, 1848. A tall, over-grown, delicate-looking child, of strumous family. Has been in bad health for some months; much emaciated; pulse 120; tongue clean; bowels regular; appetite good; short and frequent cough; dulness of resonance on right side, where the respiratory murmur is likewise harsh; a moderate amount of mucous rhonchus. Ordered, mercury with chalk, carbonate of soda, and powdered rhubarb, of each three grains: mix, and take twice a week before going to bed; also, cod-liver oil, two drachms, three times a day. Apply a blister to the sternum. Milk diet, with beef-tea for dinner. Tepid sponging twice a day.

This child gradually improved under the above treatment, slightly modified from time to time, the oil however being perseveringly continued. At the expiration of four months he was cured, and still continues quite well.

CASE 20.—Captain B.—, aged twenty-nine.—March 10th, 1850. Has been a good deal abroad, where he suffered from diarrhoea, and for some time, several years ago, from dyspepsia, for which he took a sea voyage with much advantage. Very tall, sallow, and thin; pulse languid, 76; tongue thinly but uniformly coated with a brown fur; bowels torpid; complains of great languor and debility, of feeling unequal to the most ordinary exertion, and of a constant craving and uneasiness at the stomach; urine high coloured; has had more or less of cough and expectoration for some months past; percussion sounds slightly dull; respiration normal; is a good deal emaciated. Ordered, trisnitrate of bismuth, eight grains; disulphate of quinine, one grain; extract of taraxacum, three grains: mix; make into two pills, to be taken three times a day. Nitric acid, twelve minims; simple syrup and tincture of oranges, of each six drachms; water, four ounces and a half: mix; and take one ounce three times a day. Mercury pill, four

grains; compound rhubarb pill, six grains: mix; make into two pills, to be taken before going to rest, and take a draught of senna, with sulphate of magnesia, the following morning.

24th.—Slight hæmoptysis supervened a few days ago, and still continues; blood florid and frothy. Apply blister to the chest, and continue.

31st.—The hæmoptysis has now ceased. There is manifest deficiency of resonance on left side, and likewise want of respiratory murmur; has a good deal of cough, accompanied by very scanty expectoration; in other respects he is much improved, his tongue being cleaner, and appetite good; feels stronger; pulse 76. Omit the bismuth pills, but to continue the nitric acid mixture, and take two drachms of cod-liver oil with each dose.

April 8th.—Much the same; still has a good deal of cough, the sputa, which is scanty, being occasionally streaked with blood. To increase the cod-liver oil to half an ounce for each dose.

20th.—Improved in all respects; cough less troublesome; there is now but little expectoration, and no tinge of blood; tongue clean; bowels torpid; pulse 72. Repeat the mercury pill and senna draught, and continue.

June 1st.—Has continued gradually to mend since last report; cough and expectoration nearly gone; there has been no recurrence of hæmoptysis; looks much stronger and better, and has gained flesh. Continue.

July.—Convalescent.

I have not seen him since, but had a message from him recently, stating that he continues quite well.

CASE 21.—Mr. K—, aged thirty-four. March, 1849. Has been what he terms asthmatic for the last twelve months; constant cough and expectoration of flocculent-looking mucopus; considerable emaciation; flattening of chest; dulness in right apex, with deficient respiratory murmur; puerile respiration on left side; night sweats; bowels regular; tongue furred; pulse from 96 to 100. Counter-irritation. Ordered, nitric acid, twelve minims; spirit of cinnamon, half an ounce; infusion of cuscuta to six ounces: mix, and take one ounce three times a day, with half an ounce of cod-liver oil.

He remained under my occasional observation for many months, and slowly but gradually improved. At the end of a year he was quite well, and is still alive. Of his present state of health I am ignorant; it was good when I last saw him.

CASE 22.—Miss R—, aged thirty.

July 21st, 1849.—Has suffered for two or three years from frequent short cough, and has repeatedly had slight hæmoptysis. None of the attacks of the latter have been severe, a tablespoonful being the largest quantity voided at one time; is very liable to what she terms bilious attacks, with diarrhoea; pulse 90, feeble; skin cold; tongue whitish in the centre, clammy, and reddish at the edges; appetite good; cough is accompanied by scanty expectoration; has frequent subclavian pain; chest somewhat flattened, and less expandible in left upper region; deficient resonance on percussion of left infra-clavicular space; bronchophony and coarse breathing in same situation; respiration elsewhere rather puerile; feels much relaxed, and perspires easily on taking exercise. To keep up irritation on the surface of the chest with the lotion of acet. cantharides, &c.; to take half an ounce of cod-liver oil twice a day. Infusion of Calumba, six ounces; nitric acid, eighteen minims; hydrocyanic acid, twelve minims; spirit of cinnamon, two drachms: mix; take one ounce twice a day. To take moderate exercise daily, and to sponge the chest, shoulders, &c., with salt and water, as cool as can comfortably be borne.

August 15th.—Looks and feels better, but has still a good deal of subclavian pain; physical signs as before; the sound of expiration on left side distinct and prolonged. Continue.

September 1st.—Is certainly better. To omit the Calumba, but continue the cod-liver oil, using syrup and water, pleasantly acidulated with nitric acid, as a vehicle. The oil was continued for eight months without intermission. In the following spring I advised removal to a milder climate, and afterwards, during the summer, to a bracing hilly district, where she passed the summer and autumn with very great advantage, returned home quite well, and is now in better health than for many years.

CASE 23.—The Rev. — B—, aged twenty-nine.

July 15th, 1850.—Has for several months laboured under cough and slight expectoration, with dyspnoea, and latterly uneasiness, scarcely amounting to pain, on the left side of the chest; has lost flesh materially; decided dulness, with indistinctness of respiratory murmur on left side; brochophony

in apex of left lung. Ordered, half an ounce of cod-liver oil twice a day; to discontinue his professional duties, and avoid exposure.

August 12th.—Severe pleurisy of left side suddenly supervened on this day, followed, three or four days afterwards, by effusion, although active treatment was promptly employed for its removal. I did not see him until a few days after the attack, and then found him suffering from great dyspnoea even when in the recumbent posture. The slightest attempt to raise him into the semi-erect position was followed by an increase of dyspnoea, verging on asphyxia, with great distress of countenance and constant cough; pressure at the epigastrium and along the margin of the left ribs causes great pain and cough. Urine high-coloured and loaded; passes wretched nights; pulse, 100, and feeble, when recumbent; is too rapid to be counted when he is elevated. Ordered, mercury with chalk, five grains; compound ipecacuanha powder, ten grains: mix; to be taken at bed-time. Mercurial pill, ipecacuanha powder, of each half a grain; extract of conium, three grains: mix into a pill, to be taken every four hours.

20th.—Pain and dyspnoea much relieved; cough less frequent; pulse 86; tongue cleaner; entire absence of resonance over lower two-thirds of left chest. Continue.

31st.—Dulness now extends over the whole of left side; feels better in other respects, but has intense dyspnoea on making the least exertion; pulse 90. Ordered, iodide of potassium, bicarbonate of potash, of each half a drachm; infusion of gentian, five ounces and a half; spirits of nitric ether, three drachms: mix, and take one ounce three times a day.

September 10th.—Being in a stationary condition, I requested him to resume the cod-liver oil in addition to the iodide of potassium mixture, which he is now to take only twice a day.

22nd.—Dulness in upper part of left side of chest somewhat lessened, and there is likewise slight return of expansion in corresponding portion of lung; pulse 84; dyspnoea diminished; looks better and feels stronger. To live generally. Continue.

October 6th.—Dulness of upper half of left thorax much diminished, and the lung permeable and expanding; breathing, better, but still easily hurried; pulse 94, small; appetite good. Ordered, liquor of taraxacum, one ounce; liquor of potassium, half a drachm; infusion of Calumba, four ounces and a half; tincture of hops, three drachms: mix, and take one ounce twice a day; with half an ounce of cod-liver oil.

At the expiration of several months I again saw him. He was much improved in general health, but had still slight dyspnoea and cough, together with dulness of the inferior part of left thorax, and impermeability of the lower portion of left lung. He was, nevertheless, able to take light duty, and continued to do so a few months ago, being then in a tolerably comfortable state of health.\*

CASE 24.—Miss L—, aged twenty-five.—July 3rd, 1849. Of phthisical family; has been losing flesh and feeling languid and indisposed for the last three months; her only complaint is of cough, accompanied by scanty expectoration, occasionally streaked with blood; pulse 90, feeble and small; tongue furred; looks pale and delicate; bowels regular; menstruation regular; sweats copiously towards morning; dulness of resonance, and deficiency of respiratory murmur in right subclavian region. Ordered, infusion of oranges, six ounces; nitric acid and dilute hydrocyanic acid, of each fifteen minims; spirit of cinnamon, two drachms: mix, and take one ounce three times a day. Soap liniment, eleven drachms; liquor potassæ, one drachm; croton oil, half a drachm: mix. Make an embrocation, and apply twice a day to the sternum.

13th.—Stationary. Take cod-liver oil, half an ounce, twice a day, with a dose of the above ordered mixture.

The oil was afterwards increased in quantity to an ounce twice a day, at which rate it was continued for four months, and afterwards for several months longer in smaller doses. She was cured, and continues well at the present date.

CASE 25.—Mrs. D—, aged thirty-three. Father died of phthisis.—July 10th, 1849. Had severe catarrh some months ago, since which she has never been free from slight cough; emaciated; pulse 84, languid; tongue clean; bowels regular; appetite good. Has had slight hæmoptysis for a few days, which has now ceased; expectoration sinks in water; dyspnoea on slight exertion; dulness on percussion, and deficiency of respiratory murmur below clavicle; respiration elsewhere of the puerile character. Ordered, acetic acid, one ounce and a half;

\* Whilst this article is in the press, I have received a note from this gentleman, giving a most satisfactory report of his state. He continues his professional duties at the present time.

aest. cantharides, half an ounce: mix, and make into a lotion; a piece of lint moistened with the lotion to be applied for ten minutes night and morning to the chest. Compound infusion of roses, six ounces; dilute sulphuric acid, half a drachm; ipecacuanha wine, one drachm; tincture of digitalis, one drachm and a half: mix, and take two spoonfuls every fourth hour.

July 16th.—Weight to-day, 7 st. 4½ lbs. Has had no return of hæmoptysis. Take half an ounce of cod-liver oil twice a day.

August 7th.—Chest in the same condition, there still being dulness, &c.; weight, 7 st. 7½ lbs. Take an ounce of cod-liver oil twice a day. Advised removal to a milder air.

October 4th.—Is in every respect much improved, and has continued the oil to the present date; weight, 8 st. 5 lbs. Became eventually quite well, and continues so.

CASE 26.—Miss H. C.—, aged thirty. Elder sister died of phthisis. June 23rd, 1848. A most delicate-looking person, and a good deal emaciated. Is much subject to dyspepsia, and had a very obstinate bronchitic attack last winter; frequent cough, with but little expectoration; tongue furred and slimy-looking; slight but evident deficiency of resonance below right clavicle, as compared with the other side; respiration coarse; sound of expiration distinct; mucous rhonchus on left side; has frequent subclavian pain on right side. For these symptoms, blistering, expectorants, and attention to the condition of the digestive organs, were perseveringly tried.

July 11th.—Somewhat improved in general health, but extremely feeble and much emaciated; has suffered from profuse night sweats of late; bowels regular; cough troublesome; expectoration mucopurulent, but by no means copious; pulse 80; dulness of resonance, &c., as before; bronchophony in right apex. To have animal food and a glass of bitter ale for dinner. To take two drachms of cod-liver oil three times a day.

22nd.—Is already improved both in strength and appetite; cough diminished. The dose of oil to be doubled.

26th.—Has retrograded; digestive organs much deranged, with loss of appetite and nausea; pulse 100; slight chilliness in the forenoon, succeeded by fever; night sweats; tongue much furred; cough increased. Ordered, bicarbonate of soda, one scruple; water, one ounce; syrup, one drachm; dilute hydrocyanic acid, three minims: mix, and take every four hours, with half an ounce of lemon-juice in a state of effervescence. Continue the cod-liver oil. Take of mercury pill, three grains; compound rhubarb pill, five grains; extract of hyoscyamus, three grains: make into two pills, to be taken at bed-time.

August 10th.—Has appeared to be improving for the last ten days, but to-day I find a return of hectic, with increase of cough, and extreme debility; emaciation increasing; pulse 110, small and thready. In addition to the night sweats, from which she has suffered for some weeks, there is now a tendency to diarrhoea; expectoration more copious; right side of chest less expansible than left; evident flattening below right clavicle; cavernous respiration; pectoriloquy.—Evening: Pulse 130; skin hot and dry. Ordered, infusion of cusparia, six ounces; bicarbonate of soda, two scruples; tincture of cinnamon, three drachms; tincture of opium, twelve minims: mix, and take one ounce three times a day.

After remaining almost stationary for some days, the hectic, night sweats, &c., still going on, and the pulse being rarely below 120 at the time of my daily visit, she began about the 18th to improve; the pulse fell to 100, and on the 21st to 90.

21st.—Ordered, citrate of quinine and iron, five grains; cinnamon water, one ounce: mix, and take twice a day. Continue the cod-liver oil. Advised her removal to a sheltered, dry situation a few miles in the country.

September 11th.—Much improved; pulse 80; no rigors or hectic; appetite and digestion better; is able to walk out daily; expectoration diminished; weight 7 st. 7 lbs.

October 9th.—Has steadily proceeded with the cod-liver oil and chalybeate. Cough and expectoration very much better; right side of chest decidedly flattened, and less expansive than left; pectoriloquy and cavernous breathing, both singularly distinct; weight 7 st. 12 lbs. Continue the cod-liver oil.

Having continued to improve steadily, though slowly, until the end of October, I then advised her to winter in Devonshire. She went there early in November, and continued taking the cod-liver oil till spring.

March 14th, 1849.—Reports herself as quite well, and able to walk two or three miles a day; is free from cough and expectoration, and weighs 8 st. 13 lbs. I saw her again in the summer of 1850, after she had spent two winters in Devonshire. She appeared perfectly well, and continues so at the present time.

## ON A CASE OF WOUND OF THE VAGINA, WITH SEVERE HÆMORRHAGE.

By ROBERT FOWLER, M.D. EDIN.

ON the morning of Feb. 23rd, 1854, a medical man in the neighbourhood called to speak to me respecting a case he had been attending since ten o'clock the night previous. He had sent the friends of the patient to the relieving officer to obtain an order for my attendance, but expressed a wish that I would go with him immediately, as the woman was in great danger, on account of profuse hæmorrhage from (what he supposed) a wound of the rectum. I directly (half-past ten A.M.) accompanied him, and found the woman perfectly blanched from loss of blood; the lips were quite pallid, the whole surface of body completely cold; pupils dilated; no pulse at the wrist, but the brachials beat feebly. It was with difficulty she could be roused from her lethargy, and when she spoke it was in a scarcely audible whisper. The bleeding had then ceased. On separating the buttocks, I could detect no external wound; and on examining the rectum digitally, the finger on withdrawal was quite free from any stain of blood. The source of the hæmorrhage was therefore still undiscovered. On separating the labia, I soon found that I was on the track of the wound, for the mucous membrane of the vulva, which was completely blanched, was quite moist with blood, which adhered in dried clots to the capillary appendices exterior. On searching further internally, my finger removed a small clot, and out gushed a dark-coloured stream (not in jets) of blood about the size of a crow-quill. Pressure by the finger immediately stopped it, and on examining as carefully as I could, I perceived that the stream came from a jagged wound about the size of a sixpence, at the junction of the superior and right lateral walls of the vagina, to the right, and just above the level of the meatus urinarius. A graduated compress of lint dipped in cold water was now applied, and kept in the vagina by two towels used as a T bandage. Sulphuric acid, twenty-five minims in water, every three hours; brandy, half an ounce, in cold water, every hour; all liquids to be given quite cold; hot bottles to the feet.

I now learnt that at nine o'clock the night previous, whilst at her brother's, in Lambeth-hill, Doctor's-commons, she had occasion to go to the out-door privy, and, in the act of sitting down, she came with full force on the upright wooden handle (having a blunted point) of the cover, which happened to be on. Without mentioning it to her brother, she walked more than a mile to her mother's house, in this parish. Bleeding continued from the lower part of her person the whole way, causing her to feel very faint, and compelling her to lean frequently against the walls of the houses. On her arrival, her whole under garments were completely saturated with blood.

The medical man, at a quarter-past ten P.M., found her in a complete state of collapse; no pulse either at the radials or brachials. He ordered hot bottles to her feet, and gave her hot brandy and water. She was extremely restless the whole night, the blood streaming from her whenever she got out of bed (which she would do) to pass urine.

23rd.—One P.M.: No bleeding; pulse just perceptible at wrist.—Five P.M.: Surface of body warmer, and says she feels better. Stomach rejects all fluids, which were directed to be given in very small quantities.—Nine P.M.: Radial pulse stronger; body warmer; sickness better. Catheter drew off six ounces of clear urine. On readjusting plugs, slight bleeding occurred. Elastic catheter kept in bladder.

24th.—Eleven A.M.: Better; body warmer; sickness abated; tongue very foul; pulse 120, stronger. Urine dribbled away all night, causing her great pain from soaking the lint. Ten P.M.: Voice stronger. Discontinued elastic catheter, desiring her to retain urine. Wound has a superficial slough.

25th.—Sore cleaning, and inclined to granulate. Unable to hold urine.

From this date she continued to improve, the sore healing nicely under a dressing of dry lint only, its progress being no doubt slightly retarded by the irritating contact of the urine, which for some days she was unable to retain during the short intervals between my visits. Slight rigors occurred on the 1st of March, but subsided after a calomel and jalap purge, followed by saline mixture.

March 8th.—Wound quite healed. Complaints of anæmic headache. Take one grain of sulphate of iron in one ounce of water, three times a day.

22nd.—I accidentally met her, and she told me that she had

had a small abscess on the labium, externally, which was now well. She complained of frequent desire to make water, with pain on doing so, and inability to retain the urine long. She had also a bearing down pain, but no prolapsus uteri. I had no opportunity of examining the condition of the vagina, as to whether there was any prolapse of its walls, or hernial tumour, or uterine prolapse, in its cavity.

I have brought this case forward on account of the rarity of the curious accident which was so nearly proving fatal; and also as an instance of the wonderful rallying powers of Nature after severe losses of blood. The source of the hæmorrhage must either have been from the extreme end of the pudic vein itself; which, in the position of the wound, might possibly be injured by a force compressing it against the pubic arch; or, if not from it, from one of the many veins which surround the vagina in a plexiform manner, previous to terminating in the branches of the internal iliac.

Bishopsgate-street Without, December, 1854.

### Medical Societies.

#### HARVEIAN SOCIETY.

THURSDAY, DECEMBER 7TH, 1854.

MR. COULSON, President, in the Chair.

MR. URE mentioned the particulars of a case of  
COMPOUND FRACTURE OF THE LEG,

which had been under his care in St. Mary's Hospital. A young and healthy-looking man, twenty-eight years of age, was brought into the hospital on the 24th of July, 1854, having shortly beforehand sustained a compound comminuted fracture of the right leg. About three inches above the instep was an irregular gaping wound, nearly two inches long and one inch broad, from which there was a discharge of blood. On gently introducing the finger, it was ascertained that the tibia was broken obliquely about its lower third, and lying bare in the wound; while the fibula was shattered an inch and a-half higher up. For the space of upwards of four inches above the wound, the integuments were completely separated from the subjacent structures. The accident was caused by the fall of a heap of clay and rubbish, weighing eight tons, upon the limb, while the man was standing with one leg before the other. When Mr. Ure saw the patient, not long after admission, his countenance was good; pulse 108, soft; surface of the body natural; he did not complain of pain. The prominent surgical features of the case were, comminuted fracture of both bones of the leg, a bleeding wound communicating with the fracture, and extensive separation of the integument from its cellular connexions. The hæmorrhage was stanchied by the introduction into the wound of a doesel of lint, soaked in a solution of perchloride of iron. Taking into consideration the age of the individual, the apparent soundness of his constitution, and the fact that the hæmorrhage had been stopped, Mr. Ure determined to use his best endeavours to save the limb. The fractured ends of the bone having been carefully adjusted, and a bandage applied, so as to maintain the loosened integument in apposition with the subjacent parts, the limb was placed on a double-inclined splint. The patient was ordered ordinary diet, with four ounces of sherry daily; ice to allay thirst; and an opiate at bed-time. On the 27th of July, as sloughing had commenced in the part, he was allowed, besides the wine, a pint of porter every day. On the 31st of July, the sloughing process had ceased, as shown by a liminary line round the margin of the wound; the surrounding integument appeared natural. The patient felt well in health; his countenance was cheerful; appetite good; sleep sound; skin cool; tongue clean; pulse soft, 120 in the minute. On the 3rd of August, about a square inch of denuded bone was visible in the cavity of the wound; the discharge from the latter was serous. The process of granulation was advancing steadily from the circumference towards the centre. By the 9th of August, the wound was nearly covered with granulations. The general health of the patient was satisfactory. The limb was placed in a suspensory fracture apparatus. On the following afternoon, the man was seized with acute pain of the right side, aggravated on full inspiration; the tongue was brown, but moist; there was urgent thirst; hot skin; the pulse was 108, full; the pain became so severe that night as to prevent sleep; the surface of the wound was rather dry and

glazed. This attack yielded to the application of leeches and cupping, followed by the exhibition of James's powder, so that in two days the man was convalescent. By the 24th of the same month, the sore was reduced to one-third of its original dimensions, and looked healthy. A month later, the sore was nearly cicatrized. The limb was encased in pasteboard with starched bandages, a small aperture being left, to permit the escape of any discharge. Before ten days were over, the man could move about the ward with the aid of crutches. About this period, a splinter of bone, of irregular shape, not above half an inch by a quarter of an inch in size, and half a line thick, exfoliated; after which the part rapidly healed. He left the hospital cured on the 2nd of November last. Mr. Ure expressed his conviction, that had the posterior tibial artery been wounded in this case, the limb could not have been saved. He adverted to the fact of the minute extent of exfoliation. Considering how much of the surface of the tibia had been laid bare, he deemed it a most fortunate circumstance that, within little more than three months after the receipt of a serious injury of this nature, the man was enjoying good health, and able to move about with tolerable ease.

MR. WEEDON COOKE exhibited a specimen of the uterus and bladder of a young married woman, aged twenty-nine, affected with scirrhus, in which was seen a large vesico-vaginal fistula. The disease commenced three years ago, after her confinement.

MR. W. J. ANDERSON brought forward a

#### NEW FORM OF PESSARY.

He, in the first instance, alluded to the old boxwood ball pessary, stating its good qualities, and the efficient support it affords in cases of procidentia uteri; and then pointed out some of its imperfections, showing that the cavity of the instrument often becomes filled with the vaginal and uterine discharges, as they do not pass through it, but between its external surface and the internal surface of the vagina; if it fitted firmly enough to prevent this, it must produce injurious pressure, and probably sloughing, if left in long enough. Such being the case, it occurred to him (Mr. Anderson) that an instrument might be made, of the same shape, able to give the same support, but sufficiently elastic to avoid all pain when passing in and out of the vagina, equally light, if not lighter, and incapable either of becoming saturated with the discharges, or of retaining them in its cavity. For this purpose, he showed a permanent air-ball pessary of indiarubber, made by Mr. Clarke, 225, Piccadilly, which was calculated to answer all the good purposes of the other, and avoid all its imperfections, it being light, elastic and firm, filling the vagina, without producing injurious pressure, and beautifully clean, from the fact of its being waterproof even to its string.

DR. SIEVEKING then read a paper on some

#### CASES ILLUSTRATIVE OF SOME POINTS CONNECTED WITH THE PATHOLOGY AND TREATMENT OF EPILEPSY;

and commenced by alluding to the centric and ex-centric nature of the complaint. He did not, however, look upon it as a disease, but as a symptom. Several illustrative cases were then mentioned, and especially one occurring after a mild attack of scarlatina, in which the fits were very severe, and were stopped by the employment of anodynes. A table of cases was next brought forward, to show the predominance of the affection of the left side during the fit. Dr. Sieveking then spoke of the use of the cotyledon umbilicus in the treatment of this affection, and brought forward several cases in proof of its beneficial effects. It was described as producing a slightly sedative and diuretic action, though its exact *modus operandi* has not yet been discovered; it, however, appeared to him to exercise some control over the disease, and, at the same time, was innocuous to the constitution of the patient.

#### WESTERN MEDICAL AND SURGICAL SOCIETY OF LONDON.

SATURDAY, DECEMBER 2ND, 1854.

DR. BARCLAY, Vice-President, in the Chair.

SEVERAL gentlemen were elected members of the Society.

DR. BAINES then read a paper on

#### DIURETICS, AND THEIR USES.

After some introductory remarks, he divided diuretics into two classes—the direct and the indirect. The direct were consi-

dered as local stimulants to the kidneys, their active principles being conveyed by the capillary circulation to the glands, and thereby exciting them to increased action. Some direct diuretics excite the same action by being excreted entire by the kidneys, as is the case with nitrate of potassa, which salt is always found to be thrown out of the system in the same proportion as it has been administered. Other salts of this class, however, experience some change and re-arrangement of elements, and are presented to the kidneys in different states to those in which they were administered. Thus the acetates of the alkalies invariably become converted into carbonates, and in this latter state of chemical combination produce their stimulating effects upon, and are excreted by, the renal organs. Analogous facts were mentioned as occurring during the administration of mercury, when the bile has been found to contain traces of the mineral; and also that ether and alcohol are found in the brain, an organ upon which their specific effects are produced. In the case of indirect diuretics, however, the case is different, their effects being caused through the system generally, rather than by any positive action on the glands in question. Some of these produce diuresis secondarily, the primary effect being manifested on the absorbent system generally, whereby the blood becomes charged with water, and the kidneys then are called upon to excrete it from the body. Mercury and iodine were adduced as examples of this class. Other indirect diuretics act primarily on the stomach, and secondarily on the kidneys, this end being accomplished either by lessening arterial action, and thereby promoting absorption, or by increasing the quality of the blood, and so causing the kidneys to share in the general improvement of the body. Examples of this kind of action were seen in the effects of digitalis, and in the preparations of iron. The beneficial effects of digitalis in cases of dropsy were then discussed, as was also the necessity of relieving the portal system, in cases where the liver and its veins are gorged and congested, before we could hope to rouse the renal glands to increased action. Colchicum, mercury, and taraxacum were instanced as examples of diuretics acting indirectly by relieving the portal congestion, if present. The circumstances modifying the action of these remedies were stated to be:—1. The state of the skin, a profuse perspiration preventing the establishment of a full diuresis. 2. Active catharsis suspends the operation of the kidneys, by diverting the fluid of the system from the kidneys to the intestinal glands; a good instance of the kind being seen in Asiatic cholera, where the kidneys do not and cannot act, simply because all the fluid of the body is evacuated by the stomach and the bowels. 3. No obstruction must exist in the course of the intestinal canal to prevent the flow of the medicine swallowed, as shown by Dr. Barlow. 4. If there be extensive disorganization of the kidney, the due secretion of urine cannot take place. 5. If the anasarca or ascites be very extensive, the pressure consequent upon it acting on the veins and lymphatics prevents the absorption of the remedies or of the fluid to be evacuated—in these cases tapping or puncturation of the limbs must first be resorted to, and then, by removing the pressure alluded to, allow of the removal of the dropsy by diuretics. The subject of the dilution of the saline diuretics was then alluded to, and as their absorption was considered to depend upon the ordinary principles of endosmosis and exosmosis, the opinion that, to be absorbed and so act as diuretics, these remedies must be so far diluted as to be below the specific gravity of the serum of the blood, was upheld; otherwise, in place of a diuretic action, a purgative effect would be produced. The effects of acetate and bitartrate of potassa were instanced as bearing out this view. Blood depuration by the kidneys was then considered, and viewed as possible in some cases. The various cases in which the blood in disease is, by means of the kidneys, thus depurated, were then mentioned. Thus in jaundice, where the flow of bile or its secretion is interfered with, the urine is often found charged with it, and by means of this secretion it is removed from the system. Again, in cases of portal congestion, the urine is often found loaded with purpura; and, in extensive pulmonary disease, Dr. Hassal has detected indigo in the urine, both of which compounds are highly rich in carbon. In health, the solid contents can scarcely be increased by the administration of diuretics, their effects being confined to the increase of the water only of the urine. Thus, if nitrate of potassa is given in a healthy state of the system, we shall find that in the urine secreted the amount of solids excreted only exceeds that under other circumstances by the amount of the salt exhibited, the whole of which passes out of the system by this secretion. This result, too, would be expected, when we remember that in health the two processes of repair and waste go on *pari passu* in direct

relation to the wants of the system, and that, consequently, we cannot expect to do more than increase the fluids, without affecting the amount of the solids, of the urine. But in disease, where the whole animal economy is involved, and suffering from the various effects of faulty assimilation in perverted nutrition, it is possible that some of the morbid elements may be removed by the action of diuretics, as we know the poison of lead is eliminated by the kidneys by the action of iodide of potassium. The diseases most likely to be thus benefited are gout, rheumatism, scrofula, and some, perhaps all, kinds of fever. In confirmation of this view, the treatment of rheumatism by acetate of potassa and nitrate of potassa, and the general good results obtained by the administration of the former salt in cases of ague, as reported by Dr. Golding Bird, was adduced. In the latter case, the quantity of solids excreted fluctuated with the occurrence or non-occurrence of the ague fits. The salts most likely to produce this effect in the system are those which are known to exert chemical changes in albumen and albuminous tissues.

After some discussion on several points, the Society adjourned until January 19th, 1855, when Dr. Cumming will read a paper on "A Case of Disease of the Heart, in which the Dropsy alternated with Symptoms of Mania."

### Reviews and Notices of Books.

*Lectures on the Physical Diagnosis of the Diseases of the Lungs and Heart.* By HERBERT DAVIES, M.D., Physician to the London Hospital, &c. &c. Second Edition. London. 1854. pp. 364.

WE are glad to draw the attention of our readers to this new issue of the very able treatise of Dr. Davies. For the student we know of no better manual, and the older practitioner will learn much that is interesting from the physiological portion of the "Lectures." It is perhaps the most facilely readable of all our manuals on the *spécialité* of which it treats. In addition to the alterations due to the progress of physical diagnosis during the last three years, the author has inserted a chapter in the present edition containing a *résumé* of the Morbid Anatomy and Corresponding Physical Signs of the Diseases of the Lungs, which will be found an admirable refresher to the memory. A lecturer on Medicine has here his notes ready-made for him; he wants, or should want, no further assistance in the class-room.

*Painless Tooth Extraction without Chloroform. With Observations on Local Anæsthesia by Congelation in General Surgery.* By WALTER BLUNDELL, Surgeon-Dentist. London. 1854. pp. 64.

THOUGH written in too party a spirit, Mr. Blundell's tract may be recommended to perusal as containing much interesting matter. Dr. Arnott's proposal to produce temporary annihilation of local sensation by intense cold was at first disregarded; but now almost every day furnishes us with some testimony of its value. We have no doubt the method here proposed will become still more general in respect to the minor and superficial operations, and it may be applicable, for aught we know, in the practice of dentistry. Nevertheless, we shall require far more evidence than at present exists in support of its power of curing (!) cancer, its availability where *deep* incisions have to be made, and of its *never-failing* immunity as respects the devitalization, &c., of the tissues, to which it is applied. Mr. Blundell has invented a particular apparatus for the production of intense cold, capable of producing it in very limited spots, and such as are difficult of access. Stumps and large molars are removed, according to the author, without the least inconvenience.

*Gas Poisons and their Remedy.* Reprinted from the *Mining Journal*. London. 1854. pp. 23.

LIKE the pamphlet just noticed, of too exclusive a tone, yet affording information every gas consumer should be acquainted with.

*A System of Instruction of Quantitative Chemical Analysis.* By Dr. C. REMIGIUS FRESenius. Second Edition. Edited by J. LLOYD BULLOCK, F.C.S. London: John Churchill, New Burlington-street. 1854.

THE name and fame of Fresenius as an analytical chemist are world-wide; the value of his two works "*On Analytical Chemistry*," the one on Qualitative, the other on Quantitative Analysis, have acquired a reputation as great as that of their author.

Most of the standard works on organic and inorganic chemistry, while they describe minutely the properties of the different substances, are usually very deficient in practical instruction and detail for performing the various analyses; and the student who is desirous of ascertaining the chemical constitution of any body is beset with perpetual doubts and difficulties in conducting his analysis, in consequence of this want of instruction. To supply this want the works of Fresenius were written, and they both abound with practical details of great value and of strict scientific accuracy. The English public are much indebted to Mr. Bullock for his judicious translation of the second of Fresenius' works on Analytical Chemistry, that on Quantitative Analysis. This work has been well appreciated in this country, as is shown by the fact that it has now reached a second edition.

*The Physician's, Surgeon's, and General Practitioner's Visiting List for 1855.* By JOHN SMITH & Co., Medical Stationers and Publishers, 52, Long-acre.

THIS is the ninth annual edition of this List, which has now, we believe, superseded anything of the kind in use by medical men. To those who have not yet made it their annual memorandum-book, we cannot do better than advise them to try it. Any practitioner must, by the daily use of this List, become more methodical and business-like in the conduct of his practice than without it; and although we would not say the best man of business is the best practitioner, we may very safely declare that no man can gain or conduct a large or successful practice in any department of medicine without the careful cultivation of habits of business, order, and precision. The "Lists" of the present year are suited for all practices, from a daily list of twenty-five to seventy-five patients a day. The Journal which accompanies the List also contains a valuable amount of information.

*The Practitioner's Pharmacopœia and Universal Formulary; containing 2000 Classified Prescriptions, selected from the Practice of the most eminent British and Foreign Authorities.* With an Abstract of the three British Pharmacopœias, &c. By JOHN FOOTE, M.R.C.S.E. London: Renshaw. 1855.

As an aid to the hard-worked medical practitioner, we can strongly recommend this volume of Mr. Foote's, the formulæ being well selected from the writings of Hunter, Abernethy, Sir A. Cooper, Chaussier, Paris, Babington, Ashwell, Budd, Schonlein, Hughes Bennett, Tyler Smith, Tanner, Clarke, Copland, Churchill, and others. Being arranged according to their physiological and pathological action, they are readily referred to, so that the medical man having made his diagnosis, has at once a large choice of remedies to select from. An important feature in the volume deserving of praise is the strict accuracy with which the formulæ have been given, a result that must have been attained by an amount of trouble only appreciable, perhaps, by those who have had to correct the press of a similar work.

In perusing the abstract of the three British Pharmacopœias, we have been forcibly reminded of the great absurdity of the present ridiculous system of having different formulæ for the three—in these days of steam—united portions of Great Britain. A prescription, prepared one day in London, and taken with benefit and mitigation of pain, may positively

become almost poisonous if made up a few hours subsequently in Edinburgh or Dublin. How much longer is this folly to be endured? If we must have three separate corporate bodies, three colleges for physicians, surely we may insist, without any great stretch of authority, that they shall pay such attention to the welfare of the public as a common code of pharmaceutical laws will alone realize.

*Microscopic Nature and Rational Medicine.* The substance of Two Letters addressed to Professor R——. By E. C. SWANN. London. 1854. pp. 16.

It is possible that in these days of microscopic investigation some of our readers may be deceived by the title of this brochure. We caution them that its pages are filled with the rankest doctrines of "globulism," or homœopathy.

*Medical Jurisprudence.* By A. S. TAYLOR, M.D., F.R.S. Fifth Edition. London: John Churchill, New Burlington-street.

ANY review of this work would fail to convey an accurate opinion of its extraordinary merits. It is a production which exhibits the results of immense labour. In a word, it may be said that this single book contains all that is known on the subject to which it relates. A due appreciation of this interesting, valuable, and useful volume requires that its pages should be carefully and deliberately consulted.

## THE WATER-SUPPLY AND SEWERAGE OF THE METROPOLIS.

To the Editor of THE LANCET.

SIR,—Your recent leading articles on the sewerage of London, and on the supply of pure water, lead me to think that you will give insertion to the enclosed letter, which I forwarded last week to Sir B. Hall.

Yours obediently,  
Parliament-street, Dec. 1854. EDWARDS CRISP, M.D.

To Sir B. HALL, Bart., President of the Board of Health.

SIR,—As a vestryman of St. Margaret's, Westminster, I feel it my duty to place before you the following question, and I believe it is one that materially concerns the public health. On the 30th of November, the joint vestries of St. Margaret and St. John met to consider the report of the Burial Board, which Board recommended a piece of ground in Gasnet-lane, Wandsworth, approved of by Lord Palmerston, provided it be deeply drained into the Thames. In other words, his Lordship advises us to bury our dead in swampy ground, and afterwards to drink the water!

I scarcely need comment upon the following statement of the Registrar-General respecting the water supply (p. 431, 1854):—"In the six districts supplied by the West Middlesex Company, the deaths from cholera were 15 in 10,000 inhabitants. In the twenty districts supplied by the New River, East London, and the Kent Companies, 48 in 10,000. For the twelve districts supplied with water taken between Battersea and Waterloo Bridges, 123 in 10,000."

I do not, Sir, ask for a reply to this letter, but leave you to deal with this grave matter as you think best; and probably Dr. Paris, the learned President of the College of Physicians, and President of the Medical Council, whose book "*On Cookery and Diet*" has gained him an European reputation, will tell you the effect such a cold infusion of human remains is likely to produce on the bodies of the living. The vestry rejected the report (the numbers being 21 to 16) on the ground of the injury likely to accrue to the public health, but the question is again to be considered on the 2nd of February.

I am, Sir, yours obediently,  
EDWARDS CRISP, M.D.

THE CURABILITY OF CANCER, in a local form, has been stated by Bouillaud and Velpeau; and recently, under the effect of the hot vapour of iodine by a special apparatus, a case of cancer was said to be cured in France.

## THE LANCET.

LONDON: SATURDAY, DECEMBER 30, 1854.

FROM the most probable accounts, it appears that the English military hospitals at Scutari at this moment contain—we cannot say accommodate—4000 sick and wounded soldiers; the hospitals at Balaklava, it is estimated, contain 3000 more; and if to these we add, on a very moderate calculation, 1000 patients still in the regimental hospitals in camp, or on board ship for transfer from the seat of war to the hospitals at Scutari, we find an appalling total of 8000 men, whose services are lost to the army, and whose lives are even in greater peril from the want of an efficient organization of the means of restoring health, than from the injuries or the diseases which have laid them low.

If we for a moment shut our eyes and steel our hearts against the aspect of so great and fearful a mass of human suffering, rendered more terrible by the consciousness that a large proportion of it is chargeable upon the want of energy and intelligence, a commercial country and an economical ministry may perhaps be induced to consider the financial and political cost of the miseries our soldiers are condemned to endure. The hazards of war, the devastation of disease, and the arrivals of reinforcements, keep up a continual fluctuation in the numerical strength of the army. We cannot learn, with any pretension to accuracy, its present aggregate force. But that the effective force now before Sebastopol is very large no one pretends. If it be a matter of such imminent and urgent need to support it by a band of 10,000 foreign mercenaries, that Ministers shrink from the responsibility of the further conduct of the war unless that aid be granted them, the English army must be small indeed. Does it, reduced by pestilence and death, now muster 24,000 men fit for active duty? Assume that it does, and we arrive at the conclusion that one-fourth of our army is withdrawn from service; has to be supported in inaction; being useless, is separated from the main body and the authority of the Commander of the Forces; and has to look for the prospect of restoration to health, and of return to the hardships, dangers, and glories of the campaign, to the skill, the devotion, and the arrangements of the medical department.

Skill and devotion are not wanting: but what shall we say of the arrangements, of the organization of the medical and surgical department under this great emergency and this terrible pressure? Of what avail is superhuman individual devotion in the presence of calamities so great? The care of 8000 men, disabled by sickness and wounds, would surely tax the energies of a vast and well-ordered administration. What must be the suffering, what the loss of life and money—we blush to set pounds sterling in the same account with the lives of brave men—occasioned by the absence of an effective and adequate administration?

Why is the medical department—that department upon which hang the lives of 8000 soldiers, the fourth of our army; nay, possibly, the success of the campaign and the honour of the British arms—inefficient and miserably inadequate to the discharge of duties of such magnitude and responsibility? Are

the surgeons too few in number, or deficient in zeal and skill? The War Minister tells us that there is one surgeon to every seventy-seven of force, and no one questions their individual efficiency. But is one surgeon to every seventy-seven men an adequate numerical proportion? Consider that one-fourth of the men require the active services of the surgeon. Setting aside, for the present, the patients still tended by the regimental surgeons, and confining our attention to the 7000 hospital patients, we find that these are attended by 280 hospital surgeons and assistants; that is, a proportion of one surgeon to twenty-five patients. But it is certain that a considerable deduction must be made from this number of surgeons, on account of sickness and the imposition of other duties. It is not unfair to conjecture, that every surgeon has an average of at least forty patients. Compare this view with the arrangements of our civil hospitals. In London there are thirteen general hospitals, containing about 3000 patients. These are ministered to by about 130 regular physicians and surgeons, assisted by perhaps 200 house-surgeons and dressers. In the civil hospitals, therefore, the proportion of medical officers to patients is about one in ten. It must, indeed, be admitted, that all these medical men do not devote the whole of their time to their hospital duties; but making all due allowance for this fact, and considering also the general perfection of the arrangements which time, ample means, and experience have wrought, it will still be obvious that the patients in our civil hospitals enjoy a far greater share of medical and surgical aid than falls to the lot of our sick and wounded soldiers. To this consideration must be added, the greater severity and acuteness of the cases which overcrowd our military hospitals; and that consequently each patient requires greater and more constant attention.

But if any further evidence were required to prove that the surgical staff is numerically defective, we should find it in the accounts daily reaching England of the exhausting and overwhelming labours which the surgeons have to undergo; of the insufficient attendance upon the sick and wounded; in the self-accusing fact, that the administration is insufficient for its duties—namely, the admission of external volunteer assistance; and in the remarkable fact, which we learn from *The Times'* hospital correspondent, that for want of time, or for the want of method, *no registration is kept of the causes of death*. It will be remembered that we have on several occasions insisted upon the necessity of carefully registering the causes of mortality. It is impossible to conceive that that management can be efficient which does not provide for this obvious and essential duty. Shall we add another consideration, a plea in the name of science? In the presence of this appalling amount of human misery, may we not still lament the waste of opportunities of improving knowledge—knowledge which, in its acquisition, is a stimulus and compensation to the man who loves his art; and in its application becomes a safeguard and a blessing to future sufferers!

Is this deplorable absence of all system, of all organization, of a responsible, controlling, guiding head, an evil that was not foreseen, and could not be avoided? Have we not had the experience of former wars, or are we unable to profit by it? If the teachings of past experience are despised, can we shut our eyes to the advantages of actual example? We are in strict alliance with the French, working side by side with them, enjoying day by day the opportunity of witnessing the

benefits attending their admirable administration of their medical department; and have we not the good sense to adopt that which we had not the foresight or the energy to initiate? We insist upon this, although the Secretary-at-War contends that the superior equipments and organization of the French ought not to be adverted to as a matter of reproach, on the singular ground that they had a lesser number of wounded and sick, and therefore less pressure upon their resources. The fallacy of this plea will be manifest to any one capable of reflection. Is it shown that either on the battle-field of Alma, or subsequently in our hospital accommodation and appliances, we had made due provision for the medical and surgical care of even an equal number of sick and wounded with that which the French were prepared for? Nay, was there any organization at all? And is there need of argument to show that the greater the concurrence of sanguinary engagements, the greater the raging of pestilence, the more numerous the casualties, the more terrible the wounds, the greater the number of patients, the greater, the more imperative, is the need of system, of adequate power, of extensive and expansive organization, to meet and to mitigate evils that cannot safely be postponed or neglected?

Circumstances so deplorable and discreditable to the nation, and calamities so ruinous and urgent, call for a vigorous and instant remedy. The Ministers have sent out a commission of inquiry. The public is not informed as to the extent of their powers of inquiry, and we are still less aware that they have any considerable powers of reform. What is wanted is almost dictatorial power. The need is great and pressing; the lives of brave men are too valuable to be thrown away while bureaux are deliberating and discovering insurmountable obstacles in the formalities and *convenances* of official procedures. It is the duty of Ministers to despatch some man eminent for talents and experience, capable of enforcing respect,—some man whom they can trust implicitly with full powers of action, that he may have liberty to remedy the evils he may discover.

THERE are many cases in our hospitals which it is of the utmost importance that all students should be familiar with, inasmuch as practical experience can alone render them competent to treat such cases hereafter, but which, under the present system of hospital management, are generally available for the instruction of the dressers only. There are three classes to which this remark especially applies: cases of fracture, of strangulated hernia, and of retention of urine. Everybody who is acquainted with the London hospitals knows full well that the primary and most important part of the treatment to which patients presenting with any of these lesions are subjected, is not conducted, or even directed, by either the principal or the assistant-surgeon. These are casualties which may and do come at all hours of the day and night, and unless a necessity for recourse to the knife appears, the hospital surgeon is not summoned to the case. No one, we presume, will deny that if there are any surgical emergencies in which it is of the utmost consequence to the patient that he should have a skilful and practised hand applied at the outset of the treatment, certainly the conditions of a strangulated intestine or an obstructed urethra present those emergencies. To whom, then, are our hospital patients in these circumstances entrusted? Without doubt, in three cases out of four, to a

well-read but untrained dresser or house-surgeon; to one who has seldom, if ever, witnessed the treatment of a similar case but when applied by a predecessor in office almost as inexperienced as himself. We do not stay to insist upon the diminished chances of the patient in such a predicament. We do not attempt to calculate the amount of irreparable injury inflicted by a heavy hand, unwarrantable force, or an ill-applied catheter. We will not recall scenes in which the patient has been surrounded by youthful aspirants for surgical triumph, each in succession striving to return the unyielding hernia, or to reach the occluded bladder. We could bear abundant witness to the fatal consequences of such management; but our purpose here is to show how great and important opportunities for the impartation of clinical instruction are lost in the sacrifice of these cases to those who painfully evidence their inability to deal with them, far less to teach their management to others. True, the patient may furnish the subject of an hour's *clinique* by the professor who first saw him when, dissolution impending, he was summoned to use the knife; or when an autopsy has revealed the antecedents of the case. True, it remains the professor's duty to explain and illustrate, as best he may, in the lecture room, how to manipulate a hernia or manage a catheter; but how does this recompense a student for his loss of an opportunity of witnessing the practical performance of his instructor in the hour of emergency, and of hearing from his lips those remarks which, at that instant, are called for upon the condition and progress of the case?

To the current management of fractures, also, objections of a similar kind arise. This large and important class of cases, presenting, however, for the most part emergencies of a less hazardous order than those just referred to, are mainly committed to the care of the resident dresser, and are only "looked to" by the surgeon at his visit. Yet few lesions exercise a greater influence over the subsequent career of a working man, and this because the manner in which the limb is treated mainly decides the alternatives of perfect soundness or permanent lameness. Rarely have pupils the good fortune to see a fracture reduced by an experienced hand, still more rarely to have their attention drawn to the practical management of the process, as modified by the nature of the injury, the region in which it is situated, and other collateral conditions. We cannot boast the efficiency of our clinical system while, with the exception of a few favoured dressers, the students derive their experience of hernia, urinary retention, and other such every-day but most important casualties, from the rare opportunities of witnessing the operations which accident throws in their way, or learn the treatment of fracture by crowding, in their mid-day promenade, the beds of those patients whose extremities they observe to be enveloped in bandages or other fracture apparatus.

Here, then, is a great field yet to be made available for the purposes of clinical instruction. That it has not hitherto been so indicates some radical defect in the system pursued. We do not hesitate to say that the evil may be traced to its root in an administration which limits the hospital staff to a number inadequate to perform the duties required. The same cause which ensures neglect and death in the camp and battle-field, gives constant occasion to the ills we deplore at home. Additional assistant-surgeons and physicians are required, and although not the best method, might be selected from the most

promising young men who, having quitted the school, are still pursuing their own education and professional advancement in a creditable manner. Neither the number nor the duties of the full surgeons require augmentation. Granted that it is necessary to secure the most experienced men to fill the highest offices; such are too much engaged to undertake additional labour. But there is at the present day a large class of young men rising up who would energetically and successfully turn to account the enormous supply of materials for clinical instruction which the metropolitan hospitals present, not only in the wards, but in the out-patient departments.

We are of opinion that the duty of superintending the cases of emergency alluded to, or a certain stipulated proportion of them, should be entrusted, for clinical purposes, to one, in rotation, of the three or four assistant-surgeons of the hospital, and not to the house-surgeon or dresser, whose fleeting term of office almost certainly ensures a supply of untrained and inexperienced officers in this very important department of the service. A board should be placed in a conspicuous situation within the entrance of the building, and every casualty of importance, with the name of the ward to which it is taken, should be posted immediately on its arrival; and a hospital bell should be rung, after the manner usually adopted for the lectures of the school, for the purpose of giving notice to all students living near, that a practical demonstration is about to take place. The assistant-surgeon of the week, having been summoned, should then undertake the early management of the patient; and, if an efficient officer, he would soon be surrounded by students, prepared to profit by his mode of conducting it, and to assist in matters of detail. Fractures do not always require the immediate application of the splint or starch bandage, and, when occurring at unseasonable hours, might often be temporarily supported until the first suitable period for demonstration arrives, when it should be put up in the presence of the students, either by the assistant-surgeon or by the dressers under his eye. In all cases, the nature of the casualty should be explained, and the grounds for the treatment decided upon be clearly stated. For cases in which a capital operation appears imminent, the assistant should request a consultation with the full surgeon, and either assist at or perform it, at his principal's option.

There is also another mode of conducting clinical studies, not surpassed, perhaps, by any for its utility to the student, which is equally applicable to the surgical and medical wards. In the former, it may be associated with demonstrations of the minor operations, but is particularly adapted to cases not requiring mechanical treatment; in the diagnosis of external tumours, and also of skin diseases, a class deserving especial attention in the out-patient department. In the medical wards, it is particularly useful in developing a practical acquaintance with the stethoscope, and with the physical diagnosis of diseases of the chest and abdomen. It consists in submitting a patient, who has not before been seen by the students, to the members of a small clinical class, and inviting them to examine it, during a short period, regulated according to the nature of the case. Each is then required to state briefly his diagnosis, after which the professor presents his own, giving the grounds on which it is supported, and pointing out the errors, if such there be, in the diagnoses of the class. It is impossible to over-estimate the value of this plan. By it the pupil is trained to a systematic method of examining

his patient, so as to arrive by the shortest possible route at the salient points of the case.

Many objections might doubtless be raised, and some little difficulties anticipated in the working of the scheme so briefly sketched, but we have no space to enter upon them here. Suffice it to say we have well and carefully matured the plan, and are prepared to meet them. The arrangement proposed would not detract from the value of the dressership as it now exists, while it would extend practical advantages innumerable to the aggregate body of students, the majority of whom cannot be officially attached to their hospital. Space warns us to reserve other suggestions, especially in relation to the management of out-door cases, for future consideration. One thing it is important for those who preside over our schools of medicine to bear in mind—viz., that clinical instruction is the requirement of the age; and the institution which best provides it will be the most successful in its results, and will be most likely to obtain the esteem and confidence of the profession.

THERE is no class of individuals on whom some clauses of the Militia Bill are calculated to inflict greater injury, than the surgeons attached to the various militia regiments. The position of these gentlemen is generally acknowledged to be one of extreme hardship. The Earl of DERBY recently took occasion, in the House of Lords, to express himself in the following terms:—

“You place your militia in a certain locality, and you form the force out of persons more or less in that locality. You then embody them, and, to a certain extent, you subject them to inconvenience; but they are embodied only for a short time, and they hope soon to return to their regular avocations. The next step you take is to send them out for five years to a foreign country, and, in that case, in what situation do you place the medical officer? He enters the regiment, and is content with the poor pay he receives, because he has an independent practice in the locality, but when you despatch the regiment to Malta or Gibraltar, he will either not go and you will have to send out an inferior man, or, if he does go, it will be to the ruin of his own private practice, which it is impossible to suppose he can regain when his period of service has terminated. He is entitled to no half-pay when he comes back again, and you therefore claim from that man the sacrifice of his connexion, his practice, his profession, and his means of livelihood; you send him abroad for five years, and at the expiration of that period you turn him loose upon the country to make his way as he can. Surely, you cannot expect that a medical man, a gentleman well informed and well educated, will consent to forego all the advantages of private practice to form part of a militia regiment on this footing, though he would be proud and happy to form a portion of the corps, if the objects for which the force was originally raised were adhered to?”

There can be no question that, in the present state of the public mind, an effort for redress upon the part of those chiefly interested in the matter will be attended with success. We are glad to perceive, from a circular which we have received, that the militia surgeons stationed in the neighbourhood of Dublin have already commenced an organization for effecting a change. We shall next week refer more fully to this subject.

**MEDICAL MEN FOR THE ARMY.**—The Royal College of Surgeons of Edinburgh have issued a notice to medical students, intimating that those whose course of study would be completed at the end of the present session, and who intend to apply for admission to the army medical service, may be admitted to examination for the diploma on or after the 16th of January, provided they produce a certificate from the Director-General, stating that it is his intention so to employ them if found competent. The examinations, however, will be as strict and comprehensive as if the candidates had finished their course of study.—*Glasgow Commonwealth.*

## Correspondence.

"Audi alteram partem."

## TO WHAT AGENT OR AGENTS ARE THE JEWS INDEBTED FOR THEIR REPORTED EXEMPTION FROM CHOLERA?

To the Editor of THE LANCET.

SIR,—Whilst reading, in THE LANCET of the 25th ult., Mr. C. Rodney Huxley's article "On the Treatment of Choleraic Diarrhoea by Olive Oil," I was struck with the following passage:—

"And so surely will it yet be learnt that the remarkable escape of the Jews in seasons of cholera is attributable to the frequent use of this oil. The fact is so notorious that I am surprised the subject has been passed over as little more than the result of accident."

Mr. Huxley, like many others whose views have been published in THE LANCET on the exemption of the Jews from attacks of cholera, attribute that exemption to the use of olive oil. For a time I was of the same opinion; but whilst searching for facts, for a certain purpose on this subject, I found that the members of the Jewish persuasion made great use of vinegar and lemon-juice, as well as of olive oil, with articles of diet. The information then obtained induced me to write, in a paper read by me before the Epidemiological Society, July 3rd, 1854, thus:—

"Perhaps it will be found, upon further inquiry, that the members of the Jewish persuasion of the present day are somewhat indebted to the use of vinegar and lemon-juice, as well as to olive oil, for their reported exemption from attacks of cholera. I possess a statement of the use made of both with articles of diet, which seems to throw a light upon the subject. The merit hitherto, as far as I know, has been given to olive oil, abstinence from spirituous liquors, as well as to the precautions taken with respect to animal food before cooked, and to the observance paid to the cleanliness of all cooking utensils."

At page 97 of THE LANCET for July 29th, 1854, will be found a letter of mine "On the Exemption of the Jews from Cholera," which refers to some observations of the editor in the preceding number in reply to questions asked by Mr. G. L. Spencer. On referring to these, Mr. Huxley will find that the subject has not been "passed over as little more than the result of accident." Mr. Huxley, or any other gentleman who maintains the same views as himself, would do great service to the cause of research, if he or they would endeavour further to prove that olive oil plays the prophylactic as well as remedial part in choleraic diarrhoea, or that state of derangement which precedes cholera. For my own part, I wish to learn of others, at the same time beg to state that, as far as the Jews are concerned, I am inclined to think that to the vegetable acids is partly due the exemption that sect claim from attacks of cholera.

I believe it is now generally understood that the inhabitants of cider counties, such as drink cider, are to a very great extent exempt from cholera, indeed, almost entirely so. Very few persons in cider districts make use of olive oil; but should it be proved that olive oil is the safeguard as regards the Jews, perhaps it may be found that butter, cream, lard, and the fat of very fat bacon, is that of those who reside in some cider counties, where they are plentifully supplied with such, and not to cider.

Olive oil, as a remedy against cholera, was highly lauded in 1849; perhaps many others are prepared to bear testimony as to its efficacy. That man would deserve great praise who could ensure his fellow-creatures safely against the invisible darts of the hidden foe, cholera. But will such an one be found? Why should we despair? The immortal Jenner left a shield to protect mankind against one of the foes to the human race, and might, perhaps, under Divine Providence, have been the means of saving many a child who now, as a man, is fighting the battles of his country, with a view to overcome a visible foe to ourselves and to our noble allies.

There is yet much of value to be gathered together as regards cholera in all its phases; but where is the storehouse to deposit the scattered grains? As far as the prophylaxis of cholera is concerned, to your readers I beg to offer myself as the recipient of their views, whatever they may be, which shall be so placed as to ensure attention with due regard to one and all.

Much gratification will be afforded me by being enabled to place in the hands of the Cholera Committee of the Epidemio-

logical Society whatever documents may be sent to my residence for that purpose, and the Cholera Committee will doubtless be pleased with numerous answers to one of the queries asked by that committee, viz.:—"Do you know any cases showing the value of prophylactic measures, medicinal dietetics, &c.? State the particulars of your experience."

I am, Sir, your obedient servant,

Berners-street, Nov. 1854.

J. H. TUCKER.

## SUPPRESSION OF ILLEGAL PRACTICE.

To the Editor of THE LANCET.

SIR,—In THE LANCET of Nov. 4th, 1854, appeared a letter from "Medicus," containing what appeared to me an excellent suggestion—viz., "that every medical man who loves his profession should be requested to send you the names of all those unqualified individuals practising in their locality." To do this would be little trouble to any one. Much advantage would be gained by having their names published: first, in making the public generally aware of the number of mean-spirited, shabby fellows who are sailing under false colours—obtaining money under false pretences—practising a lie, and destroying their health; secondly, it would have the effect of shaming some amongst ourselves, who (with sorrow must it be confessed) meet and consult with these men. For it is a fact, Sir, that some physicians are guilty of this miserable practice. They say, in excuse, "Oh! I did not know that the man was unqualified," or "He was in practice before 1815," knowing at the same time that such is not the case; or, at any rate, rather than inquire whether such be the fact or not, preferring to clutch their fees and gulp the shame, and remain in intentional ignorance. I am not supposing cases. Should you insert this, and it should meet their eyes, I hope they will take a hint, and amend their manners.

As a further means of carrying out the suggestion of "Medicus," why should not a society be formed expressly for the purpose of suppressing quackery and illegal practice? This can be done by means of a society only. Individuals cannot take the initiative, and commence a prosecution on their own account. They have not time, nor can they bear the notoriety of an information or suit. With a society it is different. I should say, let every medical man in the country be applied to individually for a subscription, (it need be a very small one), and have his name enrolled as a member, and a committee formed in London for carrying out the objects of the society, and I think we should soon see beneficial results. If you think this worthy of notice, you would oblige me by giving it a place in your journal.

I am, Sir, yours most obediently,

Dec. 1854.

MEDICO-CHIRURGUS.

## THE EAST INDIA COMPANY'S SERVICE.

To the Editor of THE LANCET.

SIR,—By the last mail I sent you a few remarks on the nature of the treatment medical men receive at the hands of the Hon. East India Company in India. I requested your impartial inquiry and warning to young men commencing life in the profession, against coming to India. Truth is all I desire between the employer and the employed. The unfairness of the dealings of the East India Company with their medical servants may be judged of by the purport of the memorials sent to the Court of Directors during the last five years. Until the medical branch is again put on an equal footing with the military branch of the service, let all young men beware. All that the service asks for is, an equal footing; but this they are denied. Until such is made the rule, a young man had far better come out to India as a cadet of infantry, even should he have obtained a diploma from a College of Surgeons. On another occasion I will enter more fully into proof of this, should I find that you are willing to discuss the interests of the service.

I remain, Sir, yours faithfully,

Bombay, November, 1854.

AMROUS.

UNIVERSITIES OF ABERDEEN.—Several petitions have been received by Lord Aberdeen with respect to the University of Aberdeen. Considerable difference of opinion, it appears, exists between "New" and "Old" Aberdeen as to various changes in the Faculties of Divinity, Law, &c.; but all agree that the Faculty of Medicine would be better managed in Edinburgh, London, or some large town, where facilities of hospitals, medical schools, &c., exist so much superior to those in the small towns of the far north.

## Medical News.

**ROYAL COLLEGE OF PHYSICIANS.**—At the usual quarterly meeting of the *Comitia Majora*, held on Friday, December 22nd, the following gentlemen, having undergone the necessary examinations for diploma, were admitted Members of the College:—

DR. LEARED, Finsbury-circus.  
DR. PRATT, Upper Southwick-street, Hyde-park.  
DR. SMITH, Norfolk-terrace, Westbourne-grove.  
DR. TUNALEY, Millbrook-place, Harrington-square.

Also—

DR. GRIFFIN, Killarney;  
DR. HENDERSON, Ramsgate;

were admitted Extra-Licentiatees.

**ROYAL COLLEGE OF SURGEONS.**—The following gentlemen having undergone the necessary examinations for the diploma, were admitted Members of the College at the meeting of the Court of Examiners on the 20th inst.:—

BROCK, WILLIAM KORTRIGHT, Army.  
COLLISON, JOHN BOWMER, Army.  
COOK, HENRY, Army.  
EWINGTON, CHARLES HENRY THOMAS, Army.  
FAUGHT, JOHN GEORGE, Army.  
LLOYD, EDMUND EYRE, Army.  
MICHAEL, JOHN, Army.  
MUSCHAMP, WILLIAM HENRY, Army.  
PERRY, GEORGE, Army.  
WOOD, JOHN, Army.

The following gentlemen were admitted Members on the 22nd inst.:—

BALL, JOHN WOODHOUSE, Measham, Derbyshire.  
BARRETT, FERREED SESSIONS, Kingston Baginbaze, near Abingdon.  
BENNETT, HENRY PHILIP, Army.  
BURN, EDWARD, Cheltenham.  
DUNMAN, GEORGE, Camberwell.  
HAMILTON, WILLIAM, Tarbert, county Kerry.  
HYDE, GEORGE CLARENCE, Army.  
PARKER, THEOPHILUS ROBERT BUSH, Clifton, near Bristol.  
READ, JOSEPH, Army.  
ROWLAND, HENRY MARSHALL, Newcastle-on-Tyne.  
STRONG, HENRY JOHN, Sloane-square, Chelsea.  
WILLIAMS, CLEMENT, Army.

**APOTHECARIES' HALL.**—Names of gentlemen who passed their examination in the science and practice of Medicine, and received certificates to practise, on—

*Thursday, December 21st, 1854.*

BROWN, ROBERT GIBSON, Whitby, Yorkshire.  
HOLTAM, CHARLES, Cleeve Prior, Worcestershire.  
JOHNSON, DAVID, Sedgley, Staffordshire.  
KEAL, WILLIAM, Oakham, Rutland.  
LONGE, EDWARD, Downham, Norfolk.  
MUSHET, JOHN GEORGE, Camden-town.  
NOWELL, JAMES, Bradford, Yorkshire.  
PORTER, HENRY, Peterborough.  
STONEHOUSE, CORNELIUS, Leeds.  
TOWLE, HENRY, Colston Bassett, Notts.  
WIKLEY, CHARLES, EDWARD, Leeds, Yorkshire.

**TESTIMONIAL TO MR. T. M. STONE, OF THE ROYAL COLLEGE OF SURGEONS.**—This gentleman, who, we believe, for nearly a quarter of a century has held office in the College of Surgeons, has just been presented with a substantial mark of the estimation in which he is held by the profession, having been invited to a dinner at the Freemasons' Tavern on Thursday the 21st inst., on which occasion the chairman, Henry Watson, Esq., F.R.C.S., presented Mr. Stone, in the name of the subscribers, with a massive silver salver, bearing the following inscription:—

“Presented, with a silver tea and coffee service, to THOMAS MADDEN STONE, on his retirement from the office of Librarian to the Royal College of Surgeons of England, by a few members of the profession, to mark their approbation of his ready and courteous attention in fulfilling the duties of his office, and as an expression of their appreciation of his worth. 21st December, 1854.”

The list of subscribers contains the names of some of the

most distinguished members of the profession, including members of the Council of the College of Surgeons, who must feel great pleasure in seeing one of their officers receiving so elegant a testimonial of professional approbation.

**UNIVERSITY OF EDINBURGH.**—It was proposed to divide the Natural History Chair in this University, lately held by Dr. Edward Forbes; but the Town Council, as well as the *Senatus Academicus*, have come to the conclusion that this change would not be advisable. Some excitement was caused when it was thought Professor Owen and Dr. Carpenter were candidates; but these gentlemen have felt more astonished themselves than any one else at the imaginative statement of the *Association Journal*. A reorganization of this ancient University is shortly expected.

**BRISTOL ROYAL INFIRMARY.**—A quarterly meeting was held at this institution, on the 15th instant. Subscriptions (now amounting to £8803) are encouraged from working men. Every two guineas given by the workmen of a factory, per or by some person, constitutes a per subscriber, with all the privileges; every donation of thirty guineas a per governor. It is objected to give the same privilege to clergymen sending £30 as the result of a charity sermon.

**THE ACADEMY OF MEDICINE IN PARIS** has done honour to the obstetric profession this year by devoting their Oration to a most laboured and brilliant discourse on the lives and works of Capuron, Desormeaux, Deneaux, and Baudeloque, in which the career of each of these eminent practitioners is traced out. The life of Capuron is perhaps unexampled in the pages of modern medical biography.

**THE FRENCH AND ENGLISH HOSPITALS IN THE EAST.**—The following extract is from a private letter, dated the 10th of November:—“The ships they continue to send the sick and wounded in from Balaklava are beyond all description. The *Avon* arrived with 200 a few days ago, having lost, I believe, about one-half on the passage. I ventured on board, and the stench very soon gave me a violent attack of diarrhoea. The men were without beds or blankets, with one assistant-surgeon and eight orderlies, who were taken ill directly the ship put to sea, so the poor fellows were obliged to take care of themselves. Everybody here is mad about it. One would have thought that they had had time to make some of the ships into floating hospitals. When these men arrived, although the authorities knew they were on their way, there were only seven beds ready. They landed some hundred in the last stage of dysentery, who had to sit and crouch all night in the cold wards without even blankets; the consequence is that to-day there have been about twenty more deaths than usual. The French and English hospitals form a striking contrast; the former is arranged on the most beautiful plan, and it is quite a pleasure to go over it. God knows how many lives might have been saved if there had been some management in ours. At this moment there are officers lying on mattresses placed on the floors, and close by the principal entrance to the hospital there are twenty good English iron bedsteads that Lady Stratford sent over for the hospital, which have been lying there for the last three weeks, and are now quite rusty.”—*The Times*.

**PATRIOTIC FUND.**—As an instance of the good feeling existing amongst students of medicine, as regards the object of the war, it is interesting to find the students of one medical school in Dublin—the Richmond—have subscribed £71 12s. 6d. to the patriotic fund.

**THE FRENCH HOSPITALS IN THE CRIMEA,** according to the *Moniteur*, are now in the highest state of organization. The French Director-General of Hospitals has returned to Constantinople, and is to have the decoration of the Legion of Honour for his success. “Having established,” says the Government paper, “that, under the fire of the enemy, as well as in the midst of the most deadly epidemics, the courage and devotion of the French medical service has never flagged; the hospitals at Pera now presenting models of arrangement and good management on the most extended scale.”

**INDUSTRIAL PATHOLOGY.**—Amongst the facts of this interesting study, we find there are a quarter of a million of the population living constantly underground in the darkness of mines. The average age of Sheffield workmen is thirty-five years; the average age of the “dry grinders” of needles very much under this figure. The chief disease amongst tailors is fistula; amongst bakers, scrofula and skin diseases; the latter are advised to rub their hands with oil, to prevent the flour insect and weevils irritating the skin. Follow-

melts' hands, it is said, are remarkably soft. The most dangerous part of the painter's trade is "flattening," white lead, turpentine, and closely-heated rooms generating colic: the remedy is sulphuric acid, cleanliness, tubs of water, and fresh air; and, as an antidote, the more frequent use of "white zinc" or "zinc lead." Pegged boots are superseding stitched, and relieving shoemakers of their sitting position. In the manufacture of lucifer-matches, heated or allotropic phosphorus is said to be not so dangerous to the jaw-bones as ordinary phosphorus.

**A NEW STATE.**—"Were you ever in the mesmeric state?" said a believer in the *Zoist* science. "I never was, stranger," was the reply. "I hail from the state of Indiana, but I lived six years in another state, Iowa."—*American paper*.

**OBITUARY.**—On the 5th inst., at his residence, Brierley-hill, Staffordshire, of disease of the heart, Mr. SAMUEL HUDSON, aged fifty years. He was universally respected, and his loss will be deeply felt.

**HEALTH OF LONDON DURING THE WEEK ENDING SATURDAY, DECEMBER 23RD.**—Twelve hundred and ninety-one persons—viz., 639 males and 652 females, were recorded in the London registers of deaths in the week that ended last Saturday. This is nearly the same number as was returned in each of the two previous weeks. In the ten weeks corresponding to last week of the years 1844-53, the average number of deaths was 1249, which, if a correction is made for increase of population, becomes 1374. The mortality of last week is therefore less than the estimated amount; but as the latter is increased by the influenza which prevailed in 1847, the present return is less favourable as regards the public health than the comparison appears to indicate. 316 persons, of whom 233 were children, died from diseases of the zymotic order, a number somewhat in excess of the ordinary mortality at this period. Scarlatina is less prevalent than it has been lately, if the deaths from it, which were 100, 95, and 79 in the last three weeks, may be received in evidence. From small-pox there died 20 children and 14 adults; from measles, 39 children; from hooping-cough, 41; and from fever, 60 persons.

Last week the births of 741 boys and 733 girls, in all 1474 children, were registered in London. In the nine corresponding weeks of the years 1845-53 the average number was 1429.

## BOOKS RECEIVED FOR REVIEW.

American Journal of Insanity.

Dr. James Bird's Letter to Sir Charles Wood on Examining Medical Boards for Indian Appointments.

Dr. J. Wilson's New and Infallible Mode of Treatment for Asiatic Cholera.

Dr. Evariste Warlomart, Du Pannus et de son Traitement.

Dr. James Arnott on Benumbing Cold as a Preventive of Pain and Inflammation from Surgical Operations.

Dublin Hospital Gazette.

Dr. Alfred S. Taylor's Manual of Medical Jurisprudence, Fifth Edition.

Dr. John Snow on the Modes of Communication of Cholera. Portrait of Mr. William Sands Cox.

## TERMS FOR ADVERTISING.

The following is the Scale of Charges for Advertisements:—

For 7 lines and under.....	£0 4 6	For half a page .....	£2 12 0
For every additional line ...	0 0 6	For a page .....	5 0 0

Advertisements which are intended to appear in *THE LANCET* of any particular week, should be delivered at the Office not later than on Wednesday in that week.

The circulation of *THE LANCET* far exceeds that of any other Medical Journal in the world.

## TERMS OF SUBSCRIPTION TO "THE LANCET."

One Year ... ..	£1 14 8
Six Months... ..	0 17 4
Three Months ... ..	0 8 8

To be paid in Advance.

Post-office Orders to be addressed to EDWARD THOMAS, *THE LANCET* Office, 493, Strand, London, and made payable to him at the Strand Post Office.

## TO CORRESPONDENTS.

**Borough Prison.**—A fee, under such circumstances, should undoubtedly be paid; but the summons upon which our correspondent attended the inquest being a summons for an ordinary and not for a medical witness, he cannot recover at law. We cannot think, however, that the coroner will withhold the fee under all the circumstances of the case.

**A. B.**—Next week.

## AN EXPERIMENT ON TEMPERATURE.

To the Editor of *THE LANCET*.

SIR,—Could you kindly inform me, through the medium of "*Answers to Correspondents*" in your journal, whether the sun's rays would have the same effect upon the thermometer placed in vacuo as upon one equally exposed to the sun's influence, and surrounded by the atmosphere. To make plain what I mean, take two air-pumps; place a thermometer under each. Exhaust one; leave the other unexhausted. Place the two in the sun. Would the temperature indicated by each thermometer remain the same?—I am, Sir, yours obediently,  
Stoke Newington, December, 1864. J. D.

*Dr. Webster* will find his request has received attention.

The Report of the meeting of the medical practitioners at Islington, held in consequence of the unjust treatment of the medical officer of the Workhouse and Infirmary by the trustees of that parish, was not delivered until five o'clock on Thursday evening. Its insertion at that late period was utterly impossible.

## LITHOTOMY KNIFE AND STAFF.

To the Editor of *THE LANCET*.

SIR,—In *THE LANCET* of the 23rd instant is a description of a lithotomy knife and staff, said to be invented by Mr. Roper. In the year 1829 or 1830, I invented a knife and staff precisely similar to them, and had them made by Evans and Co., St. Paul's-church. I then lived at Worthing, Sussex, and, being much engaged, I sent the instruments by the late Mr. G. Stone, surgeon, of Cripplegate, to the late Sir Astley Cooper for his opinion of them. He condemned them as *utterly useless*. About six or seven years after that I saw in *THE LANCET* a statement, said to have been made by Sir A. Cooper at one of the hospitals while visiting Scotland, that he had seen a knife and staff just invented by his friend, Mr. Lee, (I think that was the name, but am not quite sure), which for the future would render the most difficult and dangerous operation in surgery *safe and easy*. He then described the very instruments which I had sent to him six or seven years before, and which he had condemned. Much surprised and hurt at such conduct from so great a man, and one who had always professed great friendship for me, I sent a statement of the affair to *THE LANCET*, requesting an explanation from Sir Astley, and the Editor remarked that certainly the conduct of Sir A. Cooper required explanation. However, he took no notice of it. I regret I cannot at this moment recollect the *dates*, and cannot refer to *THE LANCET*, as, just before I left Worthing, about three years ago, I sent all *THE LANCETS*, from the first number, to the Literary Institution of that town. I think it was about March or April, 1833. I believe the reason Sir Astley Cooper gave for condemning the knife was, that the knob would probably break off within the groove.

If there be any merit in the knife and staff, therefore, it is due to me as the inventor. I am, Sir, your obedient servant,  
Croydon, December, 1864. H. J. GORE, M.D.

*Dr. H. H. Broughton.*—The subject shall receive attention in due time.

*A Subscriber* and others, who have addressed us on the subject of the militia surgeons, are thanked.

*A Visitor.*—We have not attended the exhibition since the return of the curious little creatures to the metropolis. On an early occasion we will go to the Linwood Gallery, and give our attention to the peculiar points mentioned.

## MILITIA SURGEONS.

To the Editor of *THE LANCET*.

SIR,—I have the misfortune to be a militia surgeon. When I accepted my commission, I flattered myself that, though not over-paid, I should not be over-worked; but you shall judge. I have the entire medical care of 30 officers, 681 rank and file, of whom 102 passed through hospital last month, 161 women and children, many of whom reside away from barracks. I have alternate weeks to visit the military cells, and attend the sick there; to pass recruits; to inspect prisoners; to make regimental inspections each week; and, to crown the whole, to be always at hand, and be liable to be called out, as I frequently am, at all hours of the day and night. I have my daily, weekly, and monthly returns to make, and, in consequence of the scarceness of surgeons in the line regiments, I have frequently to take their duties when they are absent. I have to live at an expensive mess, to subscribe to its funds, as well as to those of an equally costly band. I have been thus circumstanced for three months; no assistant-surgeon has yet been procured, and I doubt if one will ever be found at the present terms of remuneration.

Do you not think that, under my present circumstances, Government ought either to grant me part of the pay of the vacant assistant-surgeonship, that I may be enabled to employ the assistance of a civil practitioner, or give some prospect of a small pension per diem for a limited period, to prevent my finding myself at the disembodiment of the regiment entirely out of pocket, and my services unrecognised?—I am, Sir, yours obediently,  
December, 1864. M.D.

In consequence of the Index appearing in the present number, we are compelled to postpone the publication of Dr. Andrew Clark's letter "*On the Microscopic Recognition of Tubercular Matter in the Sputum*;" also Mr. W. P. Brookes' admirable letter relative to the Services of the Army and Navy Surgeons in the East, and numerous articles in type.

A NUMBER of other correspondents next week.

COMMUNICATIONS, LETTERS, &c., have been received from — Dr. Andrew Clark; Dr. H. J. Gore, (Croydon); Dr. Webster; Mr. W. P. Brookes, (Much-Wenlock); A Thirty Years' Subscriber; Mr. B. Sloper, (Aberdare); Mr. R. Bell, (Cockermouth, with enclosure); Dr. Whyte, (Naples); Mr. J. Langford, (St. Clement's, with enclosure); Mr. W. H. Horn, (Salford); Mr. J. McBean, (University of St. Andrew's, with enclosure); L.S.A. (with enclosure); Mr. Jas. Thin; J. D.; Dr. H. H. Broughton; A Subscriber; A Visitor; &c. &c.

 Leack, Mr., obliging offer, 324

## LEADING ARTICLES.

The inquest on Alfred Richardson, 11; Sir John Forbes' scheme of Medical Reform, &c.; the Vaccination Amendment Act, &c.; Suppression of illegal practice: the conduct of the governing bodies, 12; the opening of the Universities of Oxford and Cambridge to dissenters, 12; the inquest on Alfred Richardson, 35; the Amended Vaccination Bill, 35; Dr. Cormack's late vote, 36; the state of the naval medical service, 37; claim to grant medical degrees and licences to practise, by the University of Durham, &c.; the Medical Graduates Bill (University of London), 38; the report of the Poor-Law medical relief committee, &c.; the late inquest, and its effects upon the profession, 50; the Medical Graduates (University of London) Bill: the extraordinary conduct of the Scotch Corporations, 52; the inauguration of the statue of Dr. Charlesworth at Lincoln, &c.; the medical profession and the recent inquest, 84; the late verdict, and its consequences, &c.; conduct of our contemporaries — the *Medical Gazette* and the *Journal* of the Association, 85; the claims of the Indian medical service, 86; inquest on the body of Alfred Richardson, who had died after the operation of lithotomy: verbatim report of the summing up of the coroner, 87; the

commission on Captain Childe: anomalous state of the laws relating to lunacy, 105; the Birmingham borough gaol, and the cruelties practised there, 107; the Royal Maternity Charity: the statement of the committee, &c.; abolition of the Board of Health, 108; the Norwich County Lunatic Asylum, and its mismanagement, 127; the tactics of our contemporaries, 128; proposed drainage of the Woolwich marshes, 130; the new Board of Health: appointment of Sir Benjamin Hall, &c.; final success of the University of London Medical Graduates Bill, 131; the trial at Mildenhall, &c.; the adulteration of food, &c.; tactics of our contemporaries, 149; the medical evidence on the trial of Ann Brough for the Escher murders, 150; appointment of Sir Benjamin Hall to the presidency of the Board of Health, 151; the new regulations respecting the medical service of the East India Company, 152; the new medical examining board of the East India Company, &c.; is a free medical press desirable? 173; persecution at St. Bartholomew's Hospital, 174; cholera in Newcastle: commissioners' report, 176; the new India examining board, 197; evils of indiscriminate gratuitous advice, 198; the Morpeth Board of Health and Mr. O'Connor, &c.; the cholera, 217; the Board of Health and the prevailing epidemic, &c.; gratuitous medical practice: the means of reducing it within proper limits, &c.; the relations of medical practitioners to boards of guardians: the Huddersfield board and Mr. Tatham, 218; address to students, 241; danger of treating cholera by castor oil, 243; "returns" issued by the President of the Board of Health, &c.; the returns of cholera issued by the Board of Health, 261; cholera theories: the irrationality and danger of treating cholera with castor oil, &c.; the new medical examining board of the East India Company, 262; on the improvement of the ventilation of coal-mines, 281; the treatment of cholera by castor oil: newspaper medical prescribing, 282; medical Bloomerism in Edinburgh, &c.; the Board of Health, and cholera in Clerkenwell, 283; the introductory lectures, 299; the treatment of cholera by castor oil, 300; the necessity of extending the powers and the organization of the Board of Health, 318; defective supply of medical officers in the army and navy, 319; termination of the services of the inspectors of the Board of Health, 320; the necessity of consolidating and extending the organization of the Board of Health, 337; deficiency of medical attendance at the seat of war, 338; neglect of the sanitary condition of the army and navy by the authorities, 339; labours and heroism of the surgeons at Alma: neglect of the authorities to acknowledge their merit, 358; the necessity of extending the organization and powers of the Board of Health: the prevention of small-pox one of its natural duties, 359; medical arrangements of the army, 360; prosecution for illegal practice, &c.; necessity of military medical officers being responsible, 361; Lord Raglan's censure upon the medical department of the army, 382; defective state of the lunacy laws, 383; the army and navy medical departments, 384; assumption of medical titles, 385; responsibility of medical practitioners: the case of Read v. Sweetnam, 402; shortcomings of the Vaccination Extension Act, 403; the use and abuse of chloroform, 404; the medical practitioners and the board of guardians of Croydon, 405; surgeons for the public service, &c.; the necessity of a public inquiry into the organization of the medical department of the army and navy, 423; the water supply and sewerage of the metropolis, 424; evils inflicted on the profession by illegal practitioners, 425; the case of the Rev. E. Holmes: alleged abuse of the lunacy laws, 445; the late regulations of the Royal College of Surgeons respecting the diploma, 447; forthcoming list of subscribers to the Medical Benevolent

College, 446; sailing assistant-surgeons in the army, 46; publication of Mr. Syme's clinical lectures on surgery in *THE LANCET*, for 1855, 468; the Norfolk and Norwich magistrates, and their lunatic asylum, 46; the Society of Apothecaries and the public medical service, 464; Bethlehem Hospital and secret government, 46; surgeon-soldiers: Mr. Wilson at Inkermann, 487; statement of the Council of the Royal Medical and Chirurgical Society, 46; construction of a town and sanatorium for Indian invalids, 488; the assistant-surgeons of the navy and the war, 489; analytical sanitary proceedings at Birmingham, 46; appointment of the new medical Indian board, 513; the use and dangers of chloroform, 513; value and importance of clinical instruction, 46; Poor-Law guardians of Islington and their medical officer, 514; lunacy certificates and Poor-Law medical officers, 515; the army medical department—the Ministerial explanations: thorough inquiry necessary, 543; the scope and practice of clinical teaching, 538; the water supply and sewerage of the metropolis, 534; defective state of the organization of the medical department of the army in the Crimea, 549; the extended application of clinical teaching, 550; militia surgeons, 551

Lecture on Polarized Light (review), 401; on Respiration (review), 260  
Lectures on Education (review), 126; on the Physical Diagnosis of the Diseases of the Lungs and Heart (review), 547

## LECTURES.

## BRAUMONT, MR. W. R.:

Clinical lecture on a case of traumatic carotid aneurism, delivered at the Toronto General Hospital, Canada, 75, 77

## BISHOP, MR. JOHN:

Lettsomian lectures on surgery, delivered before the fellows of the Medical Society of London.

Lecture I.—Diseases of the bones; physical properties of bone; elasticity and strength; influence of their organic and inorganic constituents; theory of Dr. Stark examined and refuted; flexibility of bones; rickets; mollities ossium; caries, or ulceration of bone; psoas abscess, 325, 328, 371  
Lecture II.—Inflammation of bone; on necrosis; organic changes of the bones in this disease; their origin hypothetical; mode of formation of the new, and of the throwing off of the dead, bone; necessity for the removal of the dead bone by surgical aid, discussed; on exostosis, osteophytes, and soft tumours of bones; difficulties of their diagnosis, 431—433

Lecture III.—Fractures of the bones; on fractures and reparation of bone; unequal effects of falls in the production of fracture; on the formation of primary and secondary callus; on fractures of difficult reunion; theory of Sir Astley Cooper; his views shown to be erroneous; on the fractures of the neck of the femur, of the patella, and of the olecranon and coronoid processes; some remarks on fractures attended with difficult diagnosis; conclusion, 521

## COULSON, MR. WILLIAM:

Lectures on diseases of the joints delivered at St. Mary's Hospital.

Lecture VII.—Abscesses of joints: acute and chronic; serofulous character; perforation of the capsule of the joint; treatment, 185; changes taking place during the existence of abscess; diagnosis of ankylosis; treatment; secondary luxation; ankylosis, 186; excision of the heads of bones; amputation, 187

Lecture VIII.—On suppurative of the joints from infection of the blood; inflammatory condition of the joints mistaken for rheumatism; sometimes attends gonorrhoea and stricture; from simple and severe operations; on lithotripsy; on flooding, 271; glan-

-dars, 272; state of the joints; general symptoms, 347; suppurative inflammation; purulent synovitis; local treatment, 349

Lecture IX.—Chronic inflammation of the hip-joint, 486, 491

## CRITCHETT, MR. G.:

Lectures on diseases of the eye, delivered at the Medical School of the London Hospital.

Lecture VI.—Treatment of ulcer of the cornea in its various stages; acute and spreading; glassy; vascular; advantage of issues; corneal opacities; cornitis; its history; pursues a different course; treatment; expectant; a severer form occasionally seen; its symptoms; treatment, 23—25

Lecture VII.—Serous fluid beneath superficial layers of cornea, first described by Mr. Tyrrell; treatment; conical cornea; peculiar appearance; mechanical treatment; aquo-capsulitis, or corneo-iritis; seat of the disease; symptoms; history; constitutional treatment; results; diseases of anterior chamber; hypopion; various causes; blood in anterior chamber; abnormal accumulations of fluid in anterior chamber, 119, 120

Lecture VIII.—Affections of sclerotic and iris; "sclero-iritis," "iritis;" reasons for not considering "scleritis" a separate disease; peculiar affection described by Mr. Dalrymple; "sclero-iritis," or "rheumatic iritis," age most liable; symptoms; local character of the pain; appearance of the eye; arrangement of vessels; state of the iris; constitutional symptoms; rheumatic diathesis; causes; prognosis; liability to relapse; treatment; constitutional; very diversified in different stages; local treatment; question of belladonna; order in which remedies should be used; catarrhal complication, 205—207

## HALL, DR. MARSHALL:

Lecture on zoönosis, or the law of animal life, delivered at the Smithsonian Institution, Washington, 1—3

Three lectures on the spinal system and its diseases.

Lecture I.—The anatomy, principle of action, and pathology, of the spinal system, 391—393

Lecture II.—The pathology and modes of death in diseases of the spinal system, 411—412

Lecture III.—The modes of death and the therapeutics in diseases of the spinal system, 451

## SOLLY, MR. SAMUEL:

Introductory address delivered at St. Thomas's Hospital, 287

## THOMPSON, DR. THEOPHILUS:

Lettsomian lectures on medicine, delivered before the Medical Society of London, during the Session of 1853-54.

Lecture I.—On pulmonary consumption as a local disease (*with engravings*), 3; minute anatomy of the lungs; seat and nature of tubercle; three varieties of hemoptysis and their causes; relation of tubercle to epithelium, 4; changes in the expectoration detected by the microscope assisting the diagnosis, and indicating the progress of pulmonary disease, 5; the spirometer, 6

Lecture II.—Alleged liability of blue-eyed individuals; influence of temperament; proportion of hair on the chest; muscular irritability; appearance of the gums and of the teeth; peculiarities of pulse; venous circulation; indigestion; hasty and abortive development as characteristic of the consumptive diathesis; relation between insanity and consumption, 45—47

Lecture III.—Palliative treatment; night perspiration; diarrhoea; cough; adaptation of treatment to the element of the disease and to its different stages; digitals; animal and vegetable oils: sperm, seal, malabar, cod, sunflower; cecoa-nut oil shown to have properties analogous to that from cod-liver; introduction of oil by the skin; on the correction of hereditary tendency to phthisis and scrofula; conclusion, 97—99

Lee, Dr. R., on the ganglia of the uterus, 305, 349, 413, 473

—Mr. H., cases under the care of, 415, 436;

—Pathological and Surgical Observations (review), 444

Leeds General Infirmary, regulations, 249

—Medical School, introductory lectures, 289

—School of Medicine, regulations, 249

Lees, Dr., on albuminuria, 10

Lethby, Dr., the London gas, 49

Lettsomian lectures on medicine, 3, 45

Lewis, Dr., answer to Mr. H. Day, 364; on the nature, cause, and treatment of cholera, 256

L'Huile de Foie de Morue (review), 83

Licentiate in midwifery, 42, 494

Life assurance, abatement of income-tax on, 117

—companies and the medical profession, 41, 132

Ligament lately discovered, radio-ulnar, 406

Lightfoot, Mr. W., Economic Life Office, 367

Limagne, M., injection of iodine in strata in amo, 122

Lincoln, inauguration of the statue of Dr. Charlesworth at, 53

Lip, plastic operation for restoration of the, 598

Liston monument in Scotland, 80

Lithograph of Mr. E. D. Grainger, 306

Lithotomy and lithotripsy instruments, 406

—knife and staff, 379

—peculiar case of, 128

Liverpool College of Chemistry, regulations, 249

—Northern Hospital, regulations, 268

—Royal Infirmary, School of Medicine, 248

—surgeons, 322

Local anaesthesia, 540; in operation on the eye, 388

Lock Hospital, Edinburgh, non-admission of students to, 370

Logie, Sir John Spencer, 453

London gas, the, 49

—health of, during the week, 4, 48, 34, 96, 117, 140, 162, 184, 203, 226, 246, 263, 286, 323, 345, 367, 390, 410, 436, 450, 471, 496, 540, 564

—Hospital and Medical School, regulations, 236

—Hospital College, inauguration dinner, 302; introductory address, 294

—Hospital, treatment of cholera, 103

—hospitals, progress of cholera in the, 264

—Medical Society, Lettsomian lectures, 3

Lonsdale, Mr. E., analysis of cases of deformity, 483; on the treatment of club-foot, 326, 362

Lord, Mr. C. F. G., testimonial to, 540

Lord Palmerston and the removal of nuisances, 429

—Raglan's censure upon the medical department of the army, 362

Lunacy certificates and Poor-Law medical officers, 514

—laws, alleged abuse of the, 445; anomalous state of the, 106; defective state of the, 668

Lunatic Asylum, Norwich, 139, 463

Land, Dr. E., on a new method of injecting, 26

Luxton, Mr. W., observations on cholera, 420

Lying-in Hospital, Birmingham, 139

Lyttelton, Lord, Vaccination Amendment Act, 91

## M

MacKenzie, Dr., effects of syphilis, 747

—syphilitic disease of the placenta, 406

Mackinlay, Dr. J., treatment of cholera with calomel, 352

Macnurdio, Mr., case under the care of, 376

MacLagan, Dr., life and character of Dr. Abercrombie, 215

MacLise's Surgical Anatomy (review), 473

MacLoughlin, Dr. D., premonitory symptoms in cholera, 283, 320

Macnamara, Mr. G. H., case of extensive cut throat, 122

Madge, Dr., Diseases of the Foetus in Utero (review), 298

Madras, mortality and sickness in the armies at, 196  
 "Mahamurre," or Indian plague, 317  
 Maidstone Infirmary, 96  
 Malabar coffee, 310  
 Malignant disease of the principal viscera, 399  
 ——— tumour on the neck, 101  
 Malpighian bodies of the spleen in the alligator, 448  
 Man and monkey, 381  
 Manchester meeting of the Provincial Medical Association, 264  
 ——— Royal Infirmary, abuses at the, 41, 49  
 ——— School of Medicine, 495; regulations, 249  
 Mamma, on puerperal, 484  
 Manslaughter by a druggist's assistant, 269  
 Manual of Pathological Anatomy (review), 443  
 ——— of Practical Therapeutics (review), 147  
 ——— of the Practice of Medicine (review), 196  
 Margate, the Royal Sea-bathing Infirmary, 429  
 Margulies, Dr., ophthalmic douche bath, 531  
 Marischal College and University, Aberdeen, 254, 479  
 Marshall, Mr. E., treatment of cholera by sugar, 298  
 Marshes of the Thames, 106  
 ———, proposed drainage of the Woolwich, 130  
 Marylebone County Court, *Clark v. Blaett*, 225  
 ———, patriotic fund at, 479  
 Maternity Charity, the Royal, report of committee, 107, 112, 133  
 Matthews, Mr. W. C., beerine in diarrhoea, 191  
 Measles, cholera in the, 96  
 Meadows, Mr. H. M., calomel in cholera, 270  
 Meade, yellow fever on board the, 480  
 Medical arrangements of the army, 360, 409; attendance at the seat of war, deficiency of, 338; Benevolent College, 95, 132, 243; Benevolent College, forthcoming list, 448; Benevolent College *versus* the Association Journal, 498; Benevolent College, Kent, 42; Bloomerism in Edinburgh, 282; College, Bombay, 95; department of the army, 505; department of the army, Lord Raglan's censure of the, 392; department of the army and navy, 384, 469; Directories, the, 448; evidence on the trial of Ann Brough, 150; examiners of the East India Company, 179, 260; Formulae (review), 298; *Gazette* and the *Journal of the Association*, 85; Graduates Bill, 38, 52, 98, 94, 114, 181, 215; honour, 429; house-to-house visitation, 322; Library, Oxford, 519; men on board emigrant ships, 322; news, 21, 42, 73, 95, 116, 139, 181, 188, 203, 225, 269, 285, 302, 321, 345, 366, 390, 410, 429, 450, 470, 494, 519, 539, 553; officers, defective supply of in the army and navy, 319; officers in the navy, 111; officers of Glasgow and the sanitary committee, 43; practice, gratuitous, 317; practitioners, responsibility of, 493; practitioners and the board of guardians of Groydon, 405; press, is a free, desirable? 173; profession and life assurance companies, 41, 182; profession, effects of the late inquest on the, 84; profession, House of Commons, 42; profession, scheme of a bill for regulating the, 13; reform, 139; Reform Bills, the, 188; Reform Bill, the new, 137; Reform, Sir J. Forbes's scheme of, 11; Reform, University of Durham, 18; School of Bordeaux, 367; service, claims of the Indian, 86; service, state of the naval, 37; Society of London, deputations, 157; Society of London, meeting, 322; staff in the Black Sea, 323; staff of the army, 496; Student's Daily and Hourly Guide, 180; titles, assumption of, 385; vacancies, 540; Jurisprudence (review), 548; men for the army, 551

#### MEDICAL SOCIETIES.

EPIDEMIOLOGICAL SOCIETY.—On the use of vegetable and mineral acids in the treatment, prophylactic and remedial, of epidemic disorders of the bowels, 33; Dr. Babington's address, the cholera, 420; on the salubrity of Birmingham, its suburbs and neighbourhood, and particularly the comparative

immunity of that town from Asiatic cholera and other epidemic diseases, 530

HARVEIAN SOCIETY.—First meeting of the session; the president's inaugural address, 418; compound fracture of the leg; new form of pessary; cases illustrative of some points connected with the pathology and treatment of epilepsy, 546

MEDICAL SOCIETY OF LONDON.—Some remarks upon the nature of the disease called cholera, 339; injection of the cellular tissue in cholera; excision of the knee-joint; cholera blood; on cholera, 355; the uterus of a female; excision of the ankle-joint; the treatment of inveterate gonorrhoea and gleet, 335; syphilitic disease of the placenta; epilepsy and delirium tremens; extraction of a tobacco-pipe from behind the ear; on tumours of the upper jaw, 406; a case of difficult labour; co-existence of two specific diseases; aneurism of the aorta, without symptoms; on certain functional disorders of the nervous system, particularly of the spinal cord, which simulate organic disease; obstruction and perforation of the colon; arsenic in spasmodic asthma; the oesthectic condition in children, 439; inversion of the uterus; injection of ovarian cysts with iodine; on counteraction, 459; a bone in the throat; inversion of the uterus at six months' pregnancy, followed by reduction and recovery; condition of a joint after re-section; on puerperal mania, 483; arrest of development; an egg-cup in the ileum; poisoning by essence of almonds; new broth for the sick; a placenta with double membranes, &c.; on a prevailing form of chronic pneumonia, 508; lithotomy knife and staff, 529

NORTH LONDON MEDICAL SOCIETY.—Case of spurious cataract in a woman; case of dysmenorrhoea in a young woman; case of sudden death from thyoid asthma in a child five months old, 23; on some cases of obstetric practice, 83; peritonitis caused by impaction of hardened sybala in the vermiform appendix; a calculus extracted from the scrotum; painless labour; renal disease, causing prolepsis ani, and simulating calculus in the bladder; treatment of certain forms of constipation, 387

PHYSIOLOGICAL SOCIETY.—On the Malpighian bodies of the spleen of the alligator and crocodile, and on the weight of the spleen as compared with the body in these animals; on the presence or absence of blood in the arteries after death, 442; on some of the physiological opinions of Paracelsus; on the immediate cause of coma and insensibility, 529

ROYAL SOCIETY.—On the frequent occurrence of indigo in human urine, and on its chemical, physiological, and pathological relations, 443

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.—Case of distortion of the spine, with observations; rotation of the vertebrae as a complication of lateral curvature; on the pathological changes occurring in certain devitalized tissues; case of deformity in an infant; on the development and significance of vitæo ureola, bade urinaria, and on certain fungoid and other organic products generated in alkaline and albuminous urine; an example of the concurrent development of cancer and tubercle, 9; on gout and rheumatism; the differential diagnosis and the nature of the so-called rheumatic gout; two cases of aneurism of the ophthalmic artery, consequent on injury of the head, cured by ligature of the common carotid artery; on water-strapping as a surgical appliance, and a proposed substitute for the ordinary sticking-plaster, 82; English statistics of heaping-cough; a pathological inquiry into the effects of syphilis upon the uterine organs, and the relation and practical importance of various uterine abnormalities; on some points of pathology and physiology, 147; first meeting of the session, 417; a case of successful operation for congenital capsular cataract on a female, aged twenty-two, who had been blind from birth; on inguinal

tumour, associated with symptoms of strangulated hernia, and absence of the testicle on the affected side, 488; on three forms of the charcoal respirator, for purifying the air by filtration from the various kinds of effluvia, miasmata, and noxious gases and vapours; an analysis of three thousand cases of various kinds of deformities admitted at the Royal Orthopaedic Hospital, Bloomsbury-square, with brief remarks on some of the more interesting points connected with their nature and treatment, 462; on dislocation of the femur upwards beneath the crural arch; on a plastic operation for the restoration of the lower lip; case of complete dislocation backwards of the tibia at the knee-joint, 578

WESTMAN MEDICAL AND SURGICAL SOCIETY.—First meeting of the session, 357; some cases of typhoid fever, 481; on tumours, 469; diuretics and their uses, 546

Medico-Ethical Society, Huddersfield, 246

Medullary cancer of the ilium, 379, 397

Melbourne University, 96

Membranes, placenta with double, 508

Memoranda of some cerebral affections of children, 169, 375

Memoir on Strangulated Hernia (review), 466

Meteorological condition of the atmosphere during the week, 43, 117, 140, 323, 496; report on St. Thomas's Hospital, 312

Metropolis, water supply and sewerage of the, 424

Metropolitan bills of mortality, 141; Free Hospital, treatment of cholera, 214; vacancy at the, 366; population, sanitary state of the, 426; Sewers Bill, 158; water supply and sewerage of the, 534

Microscope, value of, in cancer, 507

Microscopic Nature and Rational Medicine (review), 548

Microscopical recognition of tuberculous matter, 468, 461

Middlesex Hospital and Medical School, regulations, 237; introductory address, 295; treatment of cholera at the, 145

Midwifery, licentiates in, 42, 494

Mildenhall, County Court, 136; the trial at, 181  
 Miles, Mr. H. C., the late Dr. Roupell and the "Third Year's Student," 361, 388

Military appointments, 21; and naval intelligence, 269; medical officers, necessity for their being responsible, 361; militia surgeons, 469

Militia Bill, House of Commons, 539; surgeons' retiring allowance, *ib.*

Mineral and vegetable acids in diarrhoea, 33  
 Ministerial explanations on the army, 532

#### A MIRROR OF THE PRACTICE OF MEDICINE AND SURGERY IN THE HOSPITALS OF LONDON.

CHARING-CROSS HOSPITAL.—Hydrophobia, death, autopsy, 214, 274; addition to the case of hydrophobia, 318

GUY'S HOSPITAL.—Popliteal aneurism treated by compression of the femoral artery, 47; purpura hemorrhagica, death, autopsy, 353; malignant disease of the principal viscera, 399; amputation at the ankle-joint, 456; death from chloroform, 482; anæmalous effects of phlebitis, post-mortem appearances in the case of death from chloroform, 506

KING'S COLLEGE HOSPITAL.—Excision of the knee-joint; Mr. Ferguson's case of incarnated hair-pin in the bladder; present state; an analogous case in the United States of America; peculiar case of lithotomy; singular nucleus for, and unusual size of, the calculus (with an engraving), 123; hydrophobia; death, autopsy, 211; medullary cancer of the ilium, presenting very strong pulsations, 379, (concluded) 397; treatment of stricture of the urethra by the external incision; excision of the elbow-joint; stricture of the urethra of twenty years' standing; external incision without guide, 435; the causes of scurvy in armies; the value of the microscope in cancer, 507; cases of external incision for stricture of the urethra, 415

- LONDON HOSPITAL**—Epithelial cancer invading the pinna of the ear, after the fall of a horn, developed upon a wart in the same locality (*with an engraving*), 32; fatty tumour of the thigh; local anæsthesia by means of Dr. James Arnott's freezing mixture; removal of the tumour, 335; follicular tumour involving the nasal bones, nasal processes of superior maxillary bone, and the septum of the nose; removal; death from pneumonia; autopsy (*with engravings*), 480
- ROYAL FREE HOSPITAL**—Painters' drop-wrist; good and rapid effects of the iodide of potassium, 314; fracture of the femur and humerus in a cancerous person, followed by union, 399
- ST. BARTHOLOMEW'S HOSPITAL**—Compound fracture of the radius near the elbow; dislocation of both bones backwards, and simple fracture of the radius near the wrist; recovery, with an ankylosed elbow-joint, 31; cancer of the penis; amputation; mode of keeping the urethra patulous; ununited fracture of the femur; Dieffenbach's pegs; amputation fourteen weeks after the use of the pegs; second report, 81; fibroid recurring tumour over the right patella, 353; diagnosis of fracture, 506
- ST. GEORGE'S HOSPITAL**—Encephaloid deposit in the parotid and chain of cervical glands; encephaloid tumour developed over and in the parotid gland; death; autopsy, 102; idiopathic peritonitis; death; autopsy, 124; amputation of the thigh; hæmorrhagic diathesis; cystic tumour of the breast; removal of the tumour, which had recurred for the eighth time, 334; enlargement of the prostate gland; bladder dilated, hypertrophied, and sacculated; perforation of the enlarged prostate by the catheter; stricture of the urethra; false passage; abscess in the prostate gland; death; necropsy, 437
- ST. MARY'S HOSPITAL**—Case of non-malignant tumour, of considerable size, situated on the lateral part of the neck (*with an engraving*), 101; fracture of the femur; non-consolidation of the fragments; eventual union by means of Mr. Winchester's apparatus (*with an engraving*), 315; external division in stricture of the urethra, 437; amputation at the ankle-joint (*with an engraving*), 457; cases of external incision for stricture of the urethra, 415
- ST. THOMAS'S HOSPITAL**—Mr. Simon's case of verruce of the glans and prepuce, second crop; removal of a certain portion of the glans, 81; myeloid tumour developed within the ramus of the left lower jaw; removal of the whole half of the inferior maxilla; death from erysipelas, 376; two cases of strangulated inguinal hernia; operation; opening of the sac; recovery, 478
- UNIVERSITY COLLEGE HOSPITAL**—Strangulated femoral hernia; operation; temporary inguinal anus; recovery, 8; retention of urine; death from chloroform, 354; encephaloid cancer developed in the head of the tibia; amputation above the knee, 378; strangulated crural hernia; operation; discovery of two distinct sacs, 479
- Mismanagement of the Norwich County Asylum**, 127
- Modes of death and therapeutics in diseases of the spinal system**, 391, 411, 451
- Modus operandi of mercury in the cure of cholera**, 166
- Moffat, Dr. W. K.**, and **Wells (review)**, 215
- Molloy, Dr. R.**, observations on cholera, 456

## REVIEWS AND NOTICES OF BOOKS.

- Remarks on the Hill Diarrhoea and Dysentery, with Brief Notices of some of the Himalayan Sanatoria. By Alexander Grant, Esq., Surgeon to the Governor-General of India, and Secretary to the Medical Board, Calcutta, 33; Orr's Circle of the Sciences: a Series of Treatises on the Principles of Science, with their Application to Practical Pursuits. Vol. I. Organic Nature, 34; Anatomical and Physiological Observations. Part I. By John Struthers, M.D., Fellow of the Royal College of Surgeons of Edinburgh, 48; L'Huille de Foie de Morue, envisagée sous tous les rapports comme Moyen Thérapeutique. Par L. J. de Jongh, Docteur-Médecin à La Haye, 83; Recherches Cliniques sur les Eaux Bonnes. Par Edouard Caze-nave, Docteur en Médecine de la Faculté de Paris, &c., 103; Female Physiology; a Treatise on the Diseases of Women, their Causes, Symptoms, and Means of Cure: with Hints on the Management of Health during Pregnancy and in the Lying-in room, &c., forming a complete Ladies' Guide. Illustrated with fifty engravings on steel. By Thomas James Sturt, *ib.*; A Treatise on Hooping-Cough: its Complications, Pathology, and Terminations. By George D. Gibb, M.D., 125; Lectures on Education, delivered at the Royal Institution of Great Britain: On the Importance of the Study of Physiology as a Branch of Education for all Classes. By James Paget, F.R.S.; On the Importance of the Study of Economic Science as a Branch of Education for all Classes. By W. B. Hodgson, LL.D., 126; A Manual of Practical Therapeutics, considered chiefly with reference to articles of the Materia Medica. By Edward John Waring, M.R.C.S.E., H.E.I.C.S., 147; A Treatise on the Diseases of the Lungs, having especial reference to Consumption; including Diagnosis and Treatment. By Anthony William Clarke, M.D., 148; On Some of the Diseases of Women admitting of Surgical Treatment. By Isaac Baker Brown, F.R.C.S., 171; Clinical Lectures on Paralysis, Diseases of the Brain, and other Affections of the Nervous System. By R. B. Todd, M.D., F.R.S., 195; A Manual of the Practice of Medicine. By

- T. H. Tanner, M.D., L.R.C.P., 196; On the Ferns of Great Britain. Illustrated by John E. Sowerby, Esq. The Descriptions and Synonyms by Charles Johnson, Esq., Botanical Lecturer at Guy's Hospital, &c.; Clinical Hand-book of Auscultation and Percussion; an Exposition from First Principles of the Method of Investigating Diseases of the Respiratory and Circulating Organs. From the German of Weber. By John Cockle, A.M., M.D., F.R.C.S., 214; Sketch of the Life and Character of Dr. Abercrombie. Read before the Harveian Society of Edinburgh, at the Annual Festival, April 12th, 1854. By Douglas MacLagan, M.D., F.R.S.E., &c., 215; Moffat: its Walks and Wells. With Incidental Notices of its Botany and Geology. By Wm. Keddle. And Report on, and Chemical Analysis of, its Mineral Wells. Prefaced by General Remarks on Water, &c., &c. By John Macadam, F.R.S., S.A., &c.; Harrogate and its Resources; Chemical Analysis of its Medicinal Waters. Report addressed to the Chairman of the Harrogate Water Committee. By A. W. Hofmann, F.R.S., &c. With an Appendix on the Modes of their Administration by the Committee, &c.; Three Lectures on the Correlation of Psychology and Physiology. Delivered in the Chatham-street School of Medicine. By Daniel Noble, M.D., 260; A Lecture on Respiration; being the sixth of a series of plain and simple Lectures on the Education of Man. By Thomas Hopley, &c.; *Dissectio Medica Inauguralis de Febre Flava & Contagione Vindicans, &c. &c.*, eruditiorum examini subicit Gualterius McGee &c.; Practical Observations on Conical Cornea, and on the Short Sight and other Defects of Vision connected with it. By J. Nottingham, M.D., F.R.C.S., &c., 280; The Diseases of the Fœtus in Utero, (not including Malformations,) with an Outline of Fœtal Development. By Henry Madge, M.D., M.R.C.S., 298; On the Triple Aspect of Chronic Disease; having especial reference to the Treatment of Intractable Disorders chiefly affecting the Nervous and Muscular System. By Wm. Bayes, M.D., &c.; Medical Formulae: Reprinted from the "Manual of the Practice of Medicine." By T. H. Tanner, M.D., &c.; Bethlehem Hosp. Report, 1854, 316; Notes on Spa and its Chalybeate Springs. By Thomas Catler, M.D., 317; A Discourse on Medical Botany. By Earl Stanhope: being the Substance of unpublished Addresses delivered by him to the Medicobotanical Society, of which he was President, &c.; The Science and Art of Surgery. By John Erichsen, Professor of Surgery in University College, and Surgeon to University College Hospital, 335; Poisoned Wounds: their Distinctive Features and Classification; with Remarks upon the Classes, and a Special Treatise on those resulting from the Bites of Venomous Reptiles, &c. Being a Report of a Committee to the Medical Association of Missouri. By A. F. Jeter, M.D., 357; On the Pathology of Delirium Tremens, and its Treatment without Stimulants or Opium. By Alexander Peddle, M.D., F.R.C.P., &c., 357; Transactions of the Pathological Society of London. Vol. V. Including the Report of the Proceedings for the Session 1853-54, 379; On the Special Treatment of Pulmonary Consumption and Hooping-Cough. By John Hastings, M.D., 400; Lectures on Polarized Light; together with a Lecture on the Microscope. Delivered before the Pharmaceutical Society of Great Britain, and at the Medical School of the London Hospital. By the late Jonathan Pereira, M.D., F.R.S.E., F.L.S., 401; The Climate of the Island of Madeira, and the Errors and Misrepresentations of some recent authors on the Subject considered, in a Letter addressed to George Lund, M.D., By James Mackenzie Bloxam, &c.; Transactions of the Pathological Society of London. Vol. V. Including the Report of the Proceedings for the Session 1853-54 (continued), 421; Das Klima von Italien und seine Heilwirkungen, bei Lungenschwindsucht, von Dr. T. H. Burgess. Aus dem Englischen übersetzt und unter Berücksichtigung der für Lungenschwindsüchtige geeignetsten Aufenthaltsorte in Deutschland mit Zusätzen versehen, von Dr. R. Hagen, 422; Principles of Comparative Physiology. By W. B. Carpenter, M.D., 422; Macleise's Surgical Anatomy, parts V. and VI., &c.; A Manual of Pathological Anatomy. By C. Handfield Jones, M.B., F.R.S., and Edward H. Sieveking, M.D., 443; History of the Epidemic Yellow Fever at New Orleans, &c., in 1853. By E. D. Fenner, M.D., 444; Pathological and Surgical Observations, including a short Course of Lectures delivered at the Lock Hospital, and an Essay on the Surgical Treatment of Hemorrhoidal Tumours. By Henry Lee, F.R.C.S., &c., &c.; A Practical Compendium of the Recent Statutes, Cases, and Decisions, affecting the office of Coroner; comprising the New Enactments relating to the Poor, Police, Registration, General Board of Health, Removal of Nuisances, Prevention of Disease, Sewers, &c.; also the Laws and Decisions in relation to Burial Clubs, Klottous Assemblies, Steamboat Navigation, Railroad Travelling, Collisions, &c.; the Explosions of Steam-boilers, Mines and Gas; and Cases of Poisoning. With Precedents of Inquisitions and Practical Forms. By William Baker, Esq., one of the Coroners for Middlesex, 460; The Parish; its Obligations and Powers, its Officers and their Duties: with Illustrations of the Practical Working of this Institution in all Secular Affairs. By Toulmin Smith, Esq., Barrister-at-Law, &c.; On the Topical Medication of the Larynx in Certain Diseases of the Respiratory and Vocal Organs. By Ebenezer Watson, A.M., M.D., 486; A Memoir on Strangulated Hernia, from Cases occurring in the London Hospital. By Nathaniel Ward, F.R.C.S., &c.; A Few Practical Observations on the Injuries Incidental to Warfare. The substance of Three Lectures addressed to the Officers and Privates of the Royal London Militia. By G. Borlase Childs, F.R.C.S., Surgeon to the Corps, &c.; Transactions of the Pathological Society of London. Vol. V. including the Report of the Proceedings for the Session of 1853-54 (concluded), 509; Chemistry, Theoretical, Practical, and Analytical, as applied to the Arts and Manufactures. By Dr. Sheridan Muspratt, M.R.I.S.A., 521; The Book of Prescriptions, containing 2900 Prescriptions, collected from the Practice of the most eminent Physicians and Surgeons, English and Foreign. By Henry Beasley, &c.; Lectures on the Physical Diagnosis of the Diseases of the Lungs and Heart. By Herbert Davies, M.D., Physician to the London Hospital, &c. &c. Second Edition, 547; Painless Tooth Extraction without Chloroform. With Observations on Local Anæsthesia by Congelation in General Surgery. By Walter Blundell, Surgeon-Dentist, &c.; Gas Poisons and their Remedy. Reprinted from the *Mining Journal*, &c.; A System of Instruction of Quantitative Chemical Analysis. By Dr. C. Remigius Fresenius. Second Edition. Edited by J. Lloyd Bullock, F.C.S., 548; The Physician's, Surgeon's, and General Practitioner's Visiting List for 1855. By John Smith & Co., Long-acre, &c.; The Practitioner's Pharmacopœia and Universal Formulary; containing 2000 Classified Prescriptions, selected from the Practice of the most eminent British and Foreign Authorities. With an Abstract of the three British Pharmacopœias, &c. By John Foote, M.R.C.S.E., &c.; Microscopic Nature and Rational Medicine. The substance of Two Letters addressed to Professor R—. By E. C. Swann, &c.; Medical Jurisprudence. By A. S. Taylor, M.D., F.R.S. Fifth Edition, &c.

## Z

Zoonomia, or the law of animal life, lecture on, 1

END OF THE SECOND VOLUME FOR 1854.

**Water Filter for the Pocket, with**  
**DRINKING-CUP AND INSTRUCTIONS**, and will filter any quantity of Water. Size, 4 inches by 2. Price 3s. 9d.  
**J. SOLOMON**, Wholesale Optician, and Photographic Depôt, 23, Red Lion-square.

**The Eye Douche, for applying Lotion**  
 to or bathing the Eye, is self-acting, simple, and portable. The immediate relief obtained from its use particularly recommends it to the notice of all who are much engaged in reading, writing, or designing; it has been employed with the most favourable results by patients under the care of **Haynes Walton, Esq.**, Surgeon to the Central London Ophthalmic Hospital. Price 20s.; carriage paid to any railway station.

Manufactured by **WILLIAM T. COOPER**, 26, Oxford-street, London.

**COOPER'S LAVEMENT APPARATUS** is the most perfect ever invented; the possibility of air entering the bowels is prevented, and the labour of pumping is avoided; being constructed entirely of metal, without valves, it cannot become out of order, which renders it particularly suitable for use in the country or in foreign climates. Price 35s. Enema Apparatus from 10s.; Superior Reservoir Apparatus from 27s.—Each instrument in mahogany box with lock and key.

Manufactured by **WILLIAM T. COOPER**, 26, Oxford-street, London.

**THE CORK RESPIRATOR** is the lightest cheapest, and most efficacious ever produced; allows free respiration, and from being easily applied and removed, is specially adapted for the use of Invalids, or Ladies attending evening meetings or places of amusement. Price 3s., free by post.

Wholesale only of **WILLIAM T. COOPER**, 26, Oxford-street, London.

Illustrated Catalogues free by post.

**Hooper's Waterproof Sheeting, for**  
 protecting Bedding from Sloughing Sores, Incontinence of Urine, Hemorrhage, &c.

**Mr. Hooper** has succeeded in obtaining Waterproof Sheeting, at a great reduction in price, soft, and inodorous; it is not affected by Urine, Heat, nor Cold, Acids, nor Alkalies, and may be washed as family linen.

Also, **IMPROVED INVALID URINALS**, with Valves, for sitting, lying, or travelling, in any position.

FOR EPILEPSY.

**COTYLEDON UMBILICUS.**—The introduction of this valuable agent has proved a valuable discovery. The satisfactory accounts **Mr. Hooper** has received have induced him to pay great attention to its collection and preparation. He cautions medical men against the use of worthless preparations, passed off for his, and as prepared for **Mr. Salter, &c.** **Mr. Hooper** has instructions to state that **Mr. Salter** has never used any but that obtained from him. A copy of **Mr. Salter's** reports in the "Medical Gazette" sent free by post.

**GALUM APARINE (HOOPER'S) FOR CUTANEOUS DISEASES, PSORIASIS, &c.**—**Dr. Winn**, of Finsbury-square, having published in "The Medical Gazette," October 4th, 1861, an account of the peculiar properties of the Galium Aparine in Cutaneous Diseases, Leprosy, Psoriasis, &c., **Mr. Hooper** has given his attention to preparing it in various forms. **Dr. Winn** finds the inspissated juices the most efficient preparation, which can be had from **Mr. Hooper**, or direct through the Wholesale Houses.

**HOOPER**, Operative Chemist, Pall Mall East, and Grosvenor-street.

**Mr. Hooper's Water Mattresses or**  
**BEDS, and CUSHIONS for AIR or WATER**, for placing on an ordinary Bedstead. Being made of India-rubber, without the admixture of cloth materials, leakage is avoided. (Extract from **THE LANCET**, Jan. 25, 1861.)

**CUSHIONS FOR BED-SORES.**  
 —Whether threatened with Sloughing, or in which Sloughing has taken place, Fractures, Diseased Joints, Spasms, Lassitude, Typhoid and other Fevers, Rheumatic Affections, Dropsy, Coldness of the Stomach and Feet, Consumptive and all Bed-ridden Patients. They are simply to be placed on an ordinary bedstead. These Cushions and Beds are not affected by Heat or Cold, and will bear water at any temperature.

I have in several instances employed **Mr. Hooper's Water Cushions and Mattresses**; they have in all cases afforded great relief and comfort, and have proved much more convenient and manageable than the Water Bed.

**JON. PARRIS, M.D.**, Physician to the London Hospital.

Infirmary, Chichester, March 21, 1862.

Sir,—We are all much pleased with your Cushions, and still more so with the Mattresses.

Yours truly,

**THOS. NEWHAM**, House-Surgeon.

**HOOPER**, 7, PALL MALL EAST, and 65, GROSVENOR-STREET.

TO THE SURGICAL AND MEDICAL PROFESSION.

**W. F. Durroch, late Smith, begs to**  
 inform the Profession, that he continues to MANUFACTURE SURGICAL INSTRUMENTS of every description, and that he has attained the highest reputation by the approval and patronage of the most eminent practitioners and lecturers for the improvements made in various articles. Gentlemen favouring him with their orders may rely on having their instruments finished in the best and most modern style. Surgical and Medical Instruments made to drawings, and kept in repair. Established 1798. No. 2, New-street, St. Thomas-street, (near the Hospital,) in Southwark.

Superior dissecting instruments and equally moderate in price, well worth the inspection of the student.

**SPECULUM ANI**, made by **W. Durroch**, for **John Hilton, Esq.**, may be had at a moderate price.

**Surgical Instruments, and every**

Implement necessary for Surgeons and Druggists, can be had (warranted best quality and moderate prices), Retail as well as Wholesale, from the Manufacturer, **JAMES ARNOLD**, 35, WEST SMITHFIELD, St. Bartholomew's Hospital, London.

**Every excellence which the**

Surgeon can require—viz., Lightness, Durability, Strength, and Economy—is realized by **HUXLEY'S SURGICAL STOCKINGS, KNEE-CAPS, ANKLETS, &c.**

**H. and Co.** have much pleasure in informing the Profession that they have perfected an ABDOMINAL BELT of new construction, which, acting diagonally, is not liable to displacement; its weight is only four ounces. Price 13s. Diagrams and particulars forwarded by post. Every kind of Surgical Stocking made. Spiral Stockings at a great reduction. Measure required for Stocking: Circumference at A, B, C, D, and E; length from A to D, and D to E.

**HUXLEY and CO.**, 8, Old Cavendish-street, late 5, Vere-street, Oxford-street.

**Mr. Bourjeaud's Registered Elastic**

APPLIANCES, acting spirally, and free from Seams, to be obtained only at No. 11, DAVIES-STREET, BEEKELEY-SQUARE, opposite Mivart's Hotel, London; and 17, Rue des Beaux Arts, Paris.

At home from One till Five. FIG. 1. FIG. 2.

**FIG. 1. BELT AND AIR-PAD FOR PROLAPSUS UTERI OR ANI.**—**Mr. Bourjeaud** begs to state that the apparatus here figured has been found extremely useful in cases of prolapsus uteri or ani, and with patients, especially females, who require support for the perineum. The compressing agent is a caoutchouc bag, filled with air; it is in the diagram hanging loose in front of the patient, and is fixed in its place by the strips of elastic tissue, the free extremity of which is seen. The latter is fixed to the lower and posterior margin of the belt, and by the elasticity of the bag and straps sufficient compression is made, and not the slightest uneasiness is experienced. This is a most valuable adjunct to surgical and obstetrical practice, and is highly appreciated by the most eminent members of the profession.

**FIG. 2.** This is a most useful belt, called the ABDOMINAL SUPPORTER. It is made of varying strength, to suit the peculiarities of patients, and is most useful during gestation or after parturition, to forestall the uncomfortable state called pendulous abdomen. During gestation, it relieves the veins from the pressure of the distended womb, and thus prevents swelling of the legs; and after the birth of the child it is most valuable to those ladies who are anxious for the look of their waists. This belt is most useful in cases of dropsy, especially when ovarian, as the pressure may be increased so as to conduce, in favourable cases, to the absorption of the fluid. **Mr. Bourjeaud** cannot too strongly recommend this belt to corpulent people: they will find it a real comfort.

**CAUTION.—Have the QUALITY of the GOLD STATED on the INVOICE, and REDRESS is OBTAINABLE in a COUNTY COURT.**—WATHERSTON and BROGDEN beg to announce that they have TAKEN SPACE in the CRYSTAL PALACE, with the view of giving universal publicity to the principle of SELLING GOLD CHAINS by weight and workmanship. To those who have not yet tested its value, the following examples will be found useful, showing the relative prices paid for Labour in the purchase of a genuine and of a spurious Gold Chain:—

Genuine Gold Chain.		
Assumed cost of gold chain, of equal weight...	£10	0 0
Intrinsic value, if the gold is of 15 carats .....	7	0 0
Left, for labour and profit.....	£3	0 0

Electro-Gilt, or Polished Zinc Gold Chain.		
Assumed cost of gold chain, of equal weight...	£10	0 0
Intrinsic value, if the gold is of 7½ carats .....	3	10 0
Left, for labour and profit .....	£6	10 0

Difference, 115 per cent.

WATHERSTON and BROGDEN, Goldsmiths, Crystal Palace, Central Transept, No. 23, Gallery of Precious Metals.—Manufactory, No. 16, Henrietta-street, Covent-garden, London. Established A. D. 1798. N.B. Assays made of Chains and Jewellery for 1s. each.

RICHARD FORD, 38, POULTRY, LONDON.

## To Professional Men and others.—

The Oxford Mixed Doeskin Trousers, price 21s. The Stratus Cloth Vest, price 10s. 6d. Stock for choice, or to measure.

S. BATTAM, Coat and Trousers Maker, 100, Tottenham-court-road, four doors south of Schoolbred and Co's.

Patterns of the material and Directions for Measuring sent free per post.

## R. T. Pigram, Practical Tailor, and

Inventor of the Indicator of the Human Figure, whereby a perfect fit is secured, respectfully invites the attention of the public to his mode of art, since none can doubt the importance of an easy and exact adjustment of wearing apparel. Superior Trousers at 17s. 6d. per pair.

R. T. PIGRAM, 51, Lamb's Conduit-street, Foundling Hospital.

## Assistant-Surgeons.—Gentlemen

receiving Medical Appointments in the Army, Navy, or H.B.I.Co.'s Service, can obtain every requisite for a complete Outfit, made with due regard to comfort, elegance, durability, and correctness of regulation, at a great reduction from the usual charges, at

L. PHILLIPS, 38, WEST STRAND, LONDON.

the oldest established Naval and Military Outfitting Warehouse in the United Kingdom. Patronised by the Lords of the Admiralty and the principal Medical Officers of the three Services. Detailed lists of the articles required on taking up a Commission, with prices affixed, and every necessary information, may be obtained on application.

## Abstract regarding Economy in

CLOTHES.—From *The Times* of October 30th, 1854.

"Every yard of Cloth sold at THE LONDON CLOTH ESTABLISHMENT is sold at the WHOLESALE PRICE, and Gentlemen purchasing Cloth at the London Cloth Establishment (if they wish) have it made up on the premises at the expense only of the workmen's wages, in addition to the price of the trimmings."

### THE ECONOMY OF THIS SYSTEM

Is Proved by the saving of from thirty to fifty per cent. in the price of every garment; besides the very obvious advantage of selection from such a stock, with the guarantee of a superior fit, good taste, and the best work. The Proprietors refer with satisfaction to the high character which their "Tyrian Dye" Black Cloths and Doeskins have obtained; they never change colour, and will (without injury) bear the application of the strongest acids.

LONDON CLOTH ESTABLISHMENT, No. 16, Coventry-street.

## Samuel Brothers,

29, LUDGATE-HILL.

Inventors and Sole Manufacturers of the

SYDENHAM TROUSERS, at 17s. 6d.

Unequalled for superior style, fit, quality, perfect ease, and gracefulness, so requisite for gentlemanly appearance, and so rarely obtained.

Patterns sent free on application.

SAMUEL BROTHERS' Stock of OVERCOATS for the present Season is worthy of your inspection.

## Patent Mincing and Sausage-making

MACHINE.—Price, £2 2s., is particularly adapted for Private Families. Its recommendations are, cleanliness, simplicity, durability, and great saving of time. It will mince two pounds per minute, and, being all metal, is easily cleaned; neither heat nor cold will injure it. Medical Gentlemen will find the above Machine worthy of their notice and recommendation for the use of Invalids. Already it has been patronized by several members of the Profession, and has given the greatest satisfaction. Post-office order to Samuel Nye for £2 2s., and 1s. for packing-case, will receive immediate attention.

79, Wardour-street, Soho.—Prospectus sent free.

## Royal Polytechnic Gas Fire.—

BACHHOFFNER and DEFRIES'S PATENT.—The Public is respectfully informed that arrangements have now been made for the supply of this unique and beautiful mode of Warming Private Houses, Shops, Public Buildings, &c. Smoke, dust, ashes, and accidents from fire are effectually prevented by its use, while it presents all the comfort and appearance of an open coal fire, securing, at the same time, perfect ventilation. To be seen in action at DEFRIES'S Office, 146, Regent-street, London.

## Exhibition Stove—Rettie's Patent

ECONOMIC.

CAUTION.—Several Medals were given for piracies on the above Stove.

E. M. and M. RETTIE can forward to Scotland or Ireland, or any part of England, the above, suitable for CHURCHES, Hospitals, Private Buildings, Drying-rooms, Manufacturing purposes, Ships, Hot-houses, &c. Prices from £3 3s. to £20 each, burning only from two lbs. to eight lbs. of coal per day, and warming buildings from six to thirty rooms, and no pipes required throughout the building, nor risk of fire—giving a pure, warm air, and aiding the ventilation; as now used in Her Majesty's Treasury, Royal Mint, Tolls Commissioners, the Arctic Vessels, and in Churches, Prisons, Schools, Public and Private Buildings.

All communications, post-paid, to Mr. Rettie, Consulting Engineer, (by letter,) 7, Brompton-road, (stamp enclosed,) when Circulars of the newest improvements for Curing damp Houses and Smokey Chimneys, Sanitary Inventions in Self-acting Sewer-traps, Kitchen-sinks for streets and buildings—the only means for preventing Cholera and Fever.—The New "Nonpoll Gas Burners."

## Warming and Ventilating, by Hot

AIR, CHURCHES, HOSPITALS, TOWN HALLS, and other PUBLIC BUILDINGS.—J. BOLLEVE, C.E., 55, King William-street, City of London, respectfully solicits the attention of the Nobility, Gentry, Clergy, &c., to the following Testimonial, and begs to say he will attend personally any appointment:—

Eardiston House Worcestershire, March 1st, 1854.

SIR,—I am much pleased in being able to give you a justifying account of your Calorifere. Since I burn nothing but coke in it, the change has been quite surprising. I must say, that now I have a very high opinion of your machine, and find it a great comfort in my house, the cost of warming it was one shilling per day.

To J. Bolleve, Esq.

WM. SMITH, (Sir, Barrow.)

## Purification of Linen.—Prevention of

Disease.—J. BOLLEVE, 55, King William-street, City, London, solicits the attention of the nobility and gentry to his CALORIFERE, for drying by hot air all the family linen, avoiding any contamination with those of unhealthy persons, and thus removing the most shocking cause of disease.

From his Grace the DUKE OF BEDFORD, Woburn Abbey, Sept. 24th, 1853.

SIR,—His Grace the Duke of Bedford has desired me to say, his Grace has received your letter inquiring about the Calorifere (drying machine) put up in the Laundry at Woburn Abbey in May, 1852, by Mr. Bolleve. In answer to that inquiry, I have to state, that nothing can exceed it in effect and economy. I sent to the Laundry for the man who has the management of it, and he says, they can dry off the linen in much less time than they could with the old stove, without dust or dirt of any kind in the Laundry. They can obtain any degree of heat they wish for, and that at a great saving of fuel.

I am, Sir, your obedient servant,

J. Bolleve, Esq.

J. PALFREMAN, House Steward.

## Metal Bed-Pan,

Price 6s.—Acknowledged to be the most convenient in form, and much more durable than any now in use.

To be had of the Manufacturer, J. LAWRENCE, 20, Great Charlotte-street, Blackfriars; of Messrs. Gale, Palmer, Warde, and Oldfield, Bowditch-street, Fleet-street; and of Messrs. Leadbitter and Hollon, York.

Orders from the Country must be accompanied by a Remittance.

**Oysters.**—Chaloner and Co., 43, Bell-yard, Temple-bar, still continue to supply the BEST NATIVE OYSTERS at 6s. per Barrel.—Established upwards of fifty years.—Fish of every description forwarded to order.

**Soyer's Aromatic Mustard.**—"M. Soyer has just brought out a New Mustard, which possesses a most beautiful bouquet; and which is entirely free from adulteration."—THE LANCET.

Sole Agents: Messrs. CROSS and BLACKWELL, 21, Soho-square, London.

**To Invalids and those desirous of**

**PRESERVING HEALTH.**—The Sanitary Commission instituted by THE LANCET having pronounced the Cocoa purchased at 15, Rathbone-place, Oxford-street, to be "entirely free from deleterious admixture," the attention of the public is directed to EDMONDS and CO.'S HOMEOPATHIC COCOA.

Edmonds and Co., Tea Dealers, &c., 15, Rathbone-place, Oxford-street.

**Pure as well as Fine Tea.**—

Tea, when pure, is well-known to produce a most wholesome beverage; the impolicy of allowing it to be coloured by the Chinese is fully set forth by the Analytical Sanitary Commissioners, in THE LANCET, and also in THE TIMES, (October 6th, 1852.) The fact, therefore, is now familiar to most, that artificial colour is used to give the Spring crop and the spent Autumn gathering the same appearance. If this practice were discontinued, a twofold benefit would arise; first, the fine qualities would have all the fragrance and strength unimpaired; and, secondly, the inferior faded leaves could not then be passed off as good, causing the flat, insipid infusion, so frequently the subject of complaint. The uncoloured Tea imported from China, by HORNIMAN and Co., London, is perfectly pure; the Green, from the absence of the usual artificial colouring, is of a natural olive hue. The Black, and also the Green, are exclusively of the Spring product from young and vigorous plants, which yield not only more strength, but the full degree of fragrance which FINE TEA, when purely natural, and seasonably selected, alone possesses; ONE TRIAL induces a continued preference. The prices are REDUCED:—

Finest Congou, 3s. 6d. Finest Lapang Souchong, 4s. and 4s. 8d.  
Fine and Pure Green, 3s. 4d., 4s., and 4s. 8d.

HORNIMAN and CO., Wormwood-street, London, Importers of the most approved Teas in general use, but free from the objectionable artificial colour on the surface.

Agents in London, PURSELL, 60, Cornhill; and ELPHINSTONE, 227, Regent-street, and 368, Oxford-street.

Sold by authorized Firms in all Towns, in 1 lb., ½ lb., and ¼ lb. packages only.

THE BEST FOOD FOR CHILDREN, INVALIDS, AND OTHERS.

**Robinson's Patent Barley, for making**

superior Barley Water in Fifteen Minutes, has not only obtained the Patronage of Her Majesty and the Royal Family, but has become of general use to every class of the community, and is acknowledged to stand unrivalled as an eminently pure, nutritious, and light Food for Infants and Invalids; much approved for making a delicious Custard Pudding, and excellent for thickening Broths or Soups.

ROBINSON'S PATENT GROATS, for more than thirty years, have been held in constant and increasing public estimation as the purest farinæ of the oat, and as the best and most valuable preparation for making a pure and delicate GRUEL, which forms a light and nutritious supper for the aged, is a popular recipe for colds and influenza, is of general use in the sick chamber, and alternately with the Patent Barley, is an excellent food for Infants and Children.

Prepared only by the Patentees, ROBINSON, BELLVILLE, & Co., Purveyors to the Queen, 64, Red Lion-street, Holborn, London.

The proprietors of ROBINSON'S PATENT BARLEY and PATENT GROATS, desirous that the public shall at all times purchase these preparations in a perfectly sweet and fresh condition, respectfully inform them that every packet is now completely enveloped in the purest Tin-foil, over which is the usual and well-known paper wrapper.

Sold by all respectable Grocers, Druggists, and others, in Town and Country, in Packets at 6d. and 1s., and in Family Cansisters at 2s., 5s., and 10s. each.

**Adnam's Improved**

PATENT GROATS AND BARLEY.

THE ONLY EXISTING PATENT.

And Strongly Recommended by the Medical Profession.

**TO INVALIDS, MOTHERS, AND FAMILIES.**—The important object so desirable to be obtained, has at length been secured to the Public, by J. and J. C. ADNAM, Patentees, who, after much time and attention, have succeeded, by their Improved Process, in producing preparations of the purest and finest quality ever manufactured from the Oat and Barley.

To enumerate the many advantages derived by the Public from the use of the Improved Patent Groats, is not the intention of the Patentees, suffice it to say that, by the process of manufacture, the acidity and unpleasant flavour so generally complained of in other preparations is totally obviated, and very superior Gruel speedily made therefrom. It is particularly recommended to those of consumptive constitutions, Ladies, and Children; and the healthy and strong will find it an excellent Luncheon or Supper.

The Barley being prepared by a similar process, is as pure as can be manufactured, and will be found to produce a light and nourishing Food for Infants and the Aged; and to contain all the necessary properties for making a delicious pudding. It has also the distinguishing character for making very superior Barley Water, and will be found a most excellent ingredient for thickening Soups, &c.

**CAUTION.**—To prevent errors, the Public are requested to observe that each Packet bears the Signature of the Patentees, J. & J. C. ADNAM.

To be obtained Wholesale at the Manufactory, Maiden-lane, Queen-street, London; and Retail in Packets and Cansisters, at 6d. and 1s. each, and in Cansisters for Families, at 2s., 5s., and 10s. each, of all respectable Grocers, Druggists, &c., in Town and Country.

**Recherché Wines.**—Sherry: A very

fine Sherry, (Amontillado and Montilla,) Brown and Pale, for Cash, at 42s. per dozen; £21 per quarter-cask; £42 per hogshead; £84 per butt.

PORT.—Very fine old dry Wine (Vintage 1827, 1830, 1832, 1834), lately imported: from the Wood at 48s., 54s., 63s., and 68s. per dozen.

First Class Champagne, (Ay, Arize, Pierry, Verzenay, and Sillery,) Sparkling and Still Moselle, Sparkling, Still, and Red Hocks, and Bordeaux Wines, at very moderate prices.

These Wines are patronized and recommended by several eminent Physicians, and are especially recommended to Connoisseurs. Samples and List of Prices forwarded on application.

H. H. HAMMICK, Importer, 11, Pall-mall, London, opposite the "Travellers' Club."

**Pale India Ale and Stout, 4s. 6d.**

per dozen quarts; 2s. 9d. per dozen pints. Scotch Ale, 5s. 6d. per dozen quarts. Delivered free within four miles of London, and carriage free to all railway stations in England at 6d. per dozen extra.

WOOD & WATSON, 16, Clement-lane, City.

**Allsopp's Pale Ale.**—Medical gentle-

men who recommend this ale as an article of diet to their patients are respectfully requested to inform them at the same time, that they may rely on procuring ALLSOPP'S PALE ALE in its genuine state, in either cask or bottle, by addressing their orders to NATHANIEL EASTTY, wine and beer merchant, 132, Upper Thames-street.

The Beers are warranted the products of Malt and Hops, and the constituents of pure water, and not any other ingredient, organic or inorganic, as per analysis of Professor Thomas Graham, F.R.S., University College, London, and A. W. Hofmann, Ph.D., F.R.S., Professor of the Royal College of Chemistry, and of the Analytical Sanitary Commission, published in THE LANCET, Saturday, May 15, 1852, No. 30, Vol. 1st, upon ALLSOPP & SONS, EAST INDIA BITTER PALE ALE in Bottle, selected from the Stock of NATHANIEL EASTTY, 132, Upper Thames-street, London.

**Funeral Extortion avoided, by Exe-**

cutors and bereaved Relatives of deceased Noblemen, Gentlemen, Tradesmen, and others, sending in the first instance to SHILLIBEER'S OFFICE, CITY ROAD, near Finsbury-square, or to 12, NORTH STREET, QUADRANT, BRIGHTON, instead of employing their Upholsterer, or the nearest Undertaker, who, not possessing the needful requirements, resort to the Funeral Furnishers, to hire them, and consequently inflict twofold profits.

Shillibeer's Establishment combines under one charge, to any scale of pomp and humility desired.

Funerals of every class, and the most varied description of conveyances, old and new styles, and first-rate equipments, at charges so moderate as to defy competition. Catholic Fittings from Paris. No extra charge within ten miles. A Nobleman's Funeral, Thirty Guineas; Gentleman's, from Ten Guineas; Tradesman's, 23; Artisan's, 24 and upwards. Originated in 1842.

**Army and Navy Surgeons can be**

supplied with the best SURGICAL INSTRUMENTS cheaper than any other house in the trade, at PRATT'S, 420, Oxford-street. Travelling Urinals, from 12s.; Brass Enema Syringe in Case, 7s. 6d.; Elastic Stockings, 5s.; Case of Amputating Instruments, 23 15s.; Pocket Case, 30s.; Tooth Instruments, from 25s.

PRATT, Surgical Instrument Maker, 420, Oxford-street.

**Niam-Niams, or the Tailed Family of**

CENTRAL AFRICA, now to be seen for the first time in Europe, at DR. KAHN'S MUSEUM (top of the Haymarket.) Open as usual. Lectures to Gentlemen by Dr. SEXTON, and to Ladies by Mrs. SEXTON.—Admission 1s.

N.B.—A Descriptive Pamphlet of the Niam-Niams, price Sixpence, with a Plain Engraving; coloured ditto, One Shilling. To be had at the Museum, and per post free, 4d. extra.

**Western General Dispensary, New**

ROAD, ST. MARYLEBONE.—Notice is hereby given, that the Half-yearly Meeting of the Governors of this Institution will be held at the Dispensary house, on Wednesday, the 31st of January, 1855, when a PHYSICIAN will be elected in the room of Dr. McIntyre, resigned. The ballot will be opened at three, and closed at five o'clock. Candidates must be Fellows or Licentiates of the Royal College of Physicians of London, and are required to forward their Qualifications and Testimonials, directed to the Secretary, on or before the 8th of January.

December 20th, 1854.

By Order,

J. MARTIN, Secretary.

PRACTICAL MIDWIFERY.

**General Lying-in Hospital, York-**

ROAD, LAMBETH.—This Hospital receives Two HOUSE SURGEONS, who attend all the Cases, both in and out of the Hospital, under the superintendence of the Physicians. Gentlemen wishing to hold this Office are required to have attended Two courses of Lectures on Midwifery. The Office is held for three months, and the fee required for that time is twenty guineas, including Board. Further particulars may be ascertained at the Hospital.

By order of the Weekly Board,

W. WARREN HASTINGS, Secretary.

22nd December, 1854.

**Salford and Pendleton Royal Hos-**

PITAL AND DISPENSARY, LANCASHIRE.—Wanted, an ASSISTANT to the HOUSE-SURGEON, whose duties will consist in Dispensing the Medicines, attending to the patients in the absence of the House-Surgeon and visiting the home-patients in the out-districts. One who has attended the whole or part of his lectures and hospital practice, and served an apprenticeship to a surgeon, will be preferred. Salary, £20 a year. Applications and testimonials to be sent in on or before the 4th of January next.

W. HENRY HORN, House-Surgeon and Secretary.

# MEDICAL BENEVOLENT COLLEGE.

The Council have the gratification of announcing that the Right Honourable the EARL OF CARLISLE has kindly consented to preside at the Third ANNIVERSARY FESTIVAL of this Institution, on WEDNESDAY, the 28th of FEBRUARY next, at the LONDON TAVERN, Bishopsgate-street.

The Council desire to remind their Medical brethren that, as this Festival will precede the opening of the College in June next, it is of the utmost importance that it be numerously and influentially attended. They therefore especially invite the earnest and extensive co-operation of the Profession on this occasion. The Medical Benevolent College will be essentially a Medical Institution; it is for the Members of the Profession to see that the young plant is developed into vigorous and sturdy manhood.

Much yet remains to be done, but with a long pull, a strong pull, and a pull altogether; the ensuing year will not pass away without seeing the completion of the Medical Benevolent College, the first symbol of the real and living unity of the Profession.

*The first list of Stewards will be published at an early period.*

\*\* Gentlemen willing to become Stewards are requested to send in their names to the Secretary, at the Office, 37, Soho-square; and Gentlemen desirous of obtaining the aid of their friends or influential parties, may obtain, on application, all the necessary papers relating to the Institution.

By order of the Council,

EDWARD HENRY SIEVEKING, M.D., Honorary Secretary.  
HERBERT WILLIAMS, Assistant-Secretary.

Office, 37, Soho-square, 21st December, 1854.

**Mr. G. Hind, F.R.C.S., resumed his DEMONSTRATIONS** on the morning of the 15th of September, at the usual hour.

Class-room, 29, Newman-street, Oxford-street. Private residence, 9, South-crescent, Bedford-square.

**King's College, London.—The Council** have an ASSISTANT-SURGEONCY in the HON. EAST INDIA COMPANY'S SERVICE at their disposal. Students of the College who Matriculated in the Winter Session, 1849-9, or subsequently thereto, are eligible.—Full particulars may be obtained by application to Dec. 15th, 1854. J. W. CUNNINGHAM, Secretary.

**Society for the Relief of Widows and ORPHANS of MEDICAL MEN in LONDON and ITS VICINITY.** (Founded, 1788)—63, Berners-street, Oxford-street.

The Members are reminded that a Court of Directors will be held on Wednesday, January 17th, 1855, at which Candidates for admission into the Society can be proposed. It is desirable that the form of proposal be filled up and forwarded to the Secretary a few days before the Meeting. All legally qualified Medical Practitioners, residing in any part of the County of Middlesex, or within seven miles of the General Post Office, St. Martin's-le-Grand, are eligible, and the benefits of the Society are restricted to the families of deceased Members of not less than two years standing. The annual Dinner will take place on Saturday, February 3rd. CHARLES R. WALSH, Secretary.

**Staffordshire General Infirmary.—**

HOUSE SURGEON and SECRETARY Wanted.—The office of HOUSE SURGEON and SECRETARY having become Vacant by the Resignation of Mr. R. HALL BAKEWELL, Candidates are requested to send in their Testimonials, addressed to the "Board of Management of the Staffordshire General Infirmary, Stafford," on or before Wednesday, the 10th of January, 1855. They will be required to be unmarried, and Members of one of the Royal Colleges of Surgeons of London, Edinburgh, or Dublin, and legally qualified Apothecaries. Friday, the 12th of January next, is hereby appointed for the Examination of the Testimonials of Candidates, and for their personal appearance before the Board of Management of the Infirmary. The Salary is £100 for the first year, increasing £10 a year until it reaches £140. Furnished Apartments, together with Coals, Gas, Washing, and Board, will be provided by the Institution. The successful Candidate will be required to enter upon his duties immediately after he is appointed. Further particulars may be obtained upon application to Mr. Bakewell, at the Infirmary.

It is particularly requested that Governors will have the kindness to forbear pledging themselves till after the selection of Candidates by the Board of Management, in accordance with the subjoined Rules:—

"43. That on the day so appointed, the Board of Management (five Members at least, being present) investigate the testimonials and qualifications of the several Candidates, and select the names of not less than two, and not more than three, who in their judgment shall appear best qualified for the vacant office, and for whom only the ballot shall be taken at the General Board of Governors, which shall not be held until after the expiration of ten days from the announcement of the decision of this Board to the various Candidates. After the selection of Candidates by the Board, a form of proxy shall be sent to each Governor, which form only shall be received by the General Board, at which the election takes place.

"44. That all elections of Physicians, Surgeons, and House Surgeon, be ultimately vested in Special General Boards, and be determined by ballot; and that Governors and Ladies (having the qualification of Governors) be allowed to vote by proxy, such proxy to be delivered, signed in the handwriting of the party, by a Governor retaining his title to vote; but no person shall act as proxy for more than three Governors at the same time; and all previous questions relative to such elections, as well as all questions respecting any other affairs of the Infirmary, shall be decided by a majority of Governors present. No Governor shall be entitled to more than one vote in behalf of his own benefaction and subscription, in cases where the Governor is both a benefactor and subscriber."

By Order,

Staffordshire General Infirmary,  
Stafford, Dec. 21st, 1854.

R. HALL BAKEWELL,  
House Surgeon and Secretary.

TO THE PROFESSION.

**Mr. Bowmer, M.R.C.S. Eng., 50,** LINCOLN'S INN-FIELDS, continues to assist Gentlemen in the Purchase and Sale of Practices, Negotiation of Partnerships, and other important transactions of a similarly confidential nature, upon moderate terms. Practitioners can be supplied with ASSISTANTS, adapted to their requirements, upon application, free of expense. Assistants wishing to secure engagements may register their names, &c., personally, or by letter.

Attendance from 11 till 4.

**For Disposal, Medical Practice, in a** fine agricultural district (a western county), near a pretty village, and station of a trunk Railway. An excellent opening for a Gentleman recently commenced.—Address, for further information, L.S.A., Post-office, Leeds.

**To be Disposed of, a long established** and respectable GENERAL PRACTICE, (the proprietor retiring,) in a large manufacturing town in the West Riding of the county of York.—All particulars may be obtained of Messrs. Butterfield and Clark, Wholesale Druggists, York.

MEDICAL.

**For immediate Disposal, in the vicinity** of one of the most important towns in England, a small but very select PRACTICE. To a Gentleman of some private means this would be found a very eligible opening. Satisfactory reasons will be given for the present possessor retiring, and the fullest information will be afforded, by application to Mr. Arthur Lloyd, 63, Fleet-street, London.

**Birmingham and Midland Counties** LYING-IN HOSPITAL and DISPENSARY FOR THE DISEASES OF WOMEN and CHILDREN.—Wanted, a RESIDENT SURGEON, whose duty will be to attend cases. He must be either a Member of the Royal College of Surgeons, or Licentiate of the Apothecaries' Company. For particulars, apply to Mr. David Core, Secretary, Lying-in Hospital, Broad-street, Birmingham.

**Wanted, a House-Surgeon to the** CARDIFF INFIRMARY. He must be a Member of the College of Surgeons of London, Edinburgh, or Dublin, and a Licentiate of Apothecaries' Hall, London. Salary, £100 per annum, with apartments in the house, coals, and candles.—Testimonials and applications to be addressed to the Committee of the Glamorganshire and Monmouthshire Infirmary, care of Mr. Granger, at the Cardiff Infirmary. The Election will take place on Thursday, 8th day of January, 1855.

TO THE MEDICAL PROFESSION.

**Billericay Union.—Notice is hereby** given, that the Board of Guardians of this Union will, at their Meeting to be held on Tuesday, the 2nd day of January next, proceed to the Election of a MEDICAL OFFICER, to attend the Poor in the under-mentioned District for the year ending Michaelmas, 1855, at the following rate of Salary:—District of Brentwood.—Parishes of Brentwood, South Weald, Shenfield, Ingrave, East Horndon, Childerides, West Horndon, and Little Warky.—population, 6773. Salary, £80 per annum. In addition to the above Salary, the following extras will be paid:—Surgical operations as per General Consolidated Order of the Poor-Law Commissioners of the 29th July, 1847. Midwifery cases, within two miles, at 10s. per case; beyond two miles, at 15s. per case. All Medicines, Leeches, and Medical and Surgical applications (trusses excepted) must be provided by, and at the expense of the Medical Officer. Vaccination cases, within two miles, at 1s. 6d., beyond two miles, 2s. 6d. per head for each successful case. Candidates must send their application in writing, (with testimonials as to qualifications and fitness) under cover, directed to me, at Billericay, on or before the 1st day of January next.

HENRY SAW, Clerk.

Billericay, Essex, 20th December, 1854.

# Messrs. Lane and Lara, MEDICAL AGENTS AND ARBITRATORS, AND LUNATIC ASYLUM REGISTRARS,

14, JOHN STREET, ADELPHI.

(Established A.D. 1888.)

Commission on Transfers charged only to Vendors; permanent Assistants provided without expense to Principals, and every other description of business transacted for the Profession at a fixed and moderate cost. A postage stamp must be enclosed in every communication requiring an answer.

Office hours from 12 till 4.

## Partnership. — An M.R.C.S. and

L.A.C., not over thirty years of age, with gentlemanly manners and good address, may invest £900 in a first-class watering-place GENERAL PRACTICE. A nett Income of £500 a year may be fairly calculated on as a commencement.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

## Unlimited Introduction. — Price

£300, with immediate and entire possession, a GENERAL PRACTICE in a large and central manufacturing town, yielding over £500 a-year. The purchaser will have the option of taking a separately conducted Retail, yielding between £400 and £500 per annum, at valuation. The vendor is retiring from the Profession, but will continue to reside in the place.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

## Lunatic Asylum.—For Sale, in the

immediate neighbourhood of a large and wealthy town, a handsome FREEHOLD HOUSE, with nearly four acres of ground, licensed for the reception of insane patients of both sexes. Price £2800, to include furniture and fixtures, or may be had at a valuation, nothing being required for goodwill.

Apply to Messrs. LANE & LARA, 14, John-street, Adelphi.

## From ill-health, Wanted to Sell or

Exchange, a bona-fide GENERAL PRACTICE of £900 per annum, highly respectable, with very low expenses, and a most commodious residence in a populous town. Terms, half-a-year's purchase.

Address M. R., care of Messrs. LANE & LARA, 14, John-street, Adelphi.

## A Medical Assistant, aged thirty,

who has had the sole charge of a Dispensary near five years, wishes to engage with a County Practitioner. Can visit in the absence of the Principal.—Address, Medicus, 84, Upper-street, Islington.

MEDICAL.

## Wanted, a qualified Assistant to

Visit, Dispense, and keep the Books. Salary £50 a year. References required.—Apply to Mr. Joseph Dakin, High-street, Poplar.

## Wanted to Dispose of a Medical

PRACTICE, producing about £250 a-year. As from serious indisposition an immediate Sale is desirable, a small sum will be taken.—Apply by letter, post-paid, to H. S., Post-office, Balham-hill, near Clapham.

## Wanted, a Practice, capable of re-

turning £500 to £700 a-year, in a good neighbourhood; the manufacturing districts or a large town objected to.—Address, M.D., THE LANCET Office, Strand, London.

## Wanted immediately, in large Iron

Work Practice, an Out-door ASSISTANT, (Qualified), to Visit, Dispense, &c. A Welchman would be preferred, or a Gentleman who has been accustomed to a Mining Practice. None but Licentiates of the Hall need Apply.—Apply A. S., 4, East-terrace, Cardiff.

MEDICAL.

## Wanted immediately, an Out-door

Visiting and Dispensing ASSISTANT fully competent to practise all the Branches of the Profession, and of unexceptionable character.—Address, Medicus, Post-office, Durham.

MEDICAL.

## Wanted, by a Medical Gentleman,

unqualified age, Thirty-five, a Situation as out-door Visiting and Dispensing ASSISTANT, in town or country. Has had great experience in town and country Practice, Midwifery, &c., and can produce high testimonials. Address, W. Fowler, Surgeon, Maldstone.

## Wanted, by a Married Medical Man of

standing and experience, a PRESCRIBING or GENERAL PRACTICE, of from £100 to £500 a year, not in London. The Advertiser can give, and will expect, the highest references. None need apply whose Practice will not bear the strictest investigation. Principals only treated with.—Address, stating annual value, premium, and locality, to A. B. C., 38, Duke-street, Grosvenor-square, London.

## To the Medical Profession.—To be

Disposed of immediately, by private treaty, at Northwich, Cheshire, in consequence of the decease of the Proprietor, the Stock, Surgical Instruments, Fixtures, &c., of a Surgeon, together with a large Collection of Valuable Surgical Books, if required. Any Gentleman wishing to Commence Business will find this well worthy his attention, the late proprietor having had an extensive Practice for the last eleven years.—For particulars, and to treat for the same, apply to Mrs. Weston, Northwich; or to Mr. Thompson, Chemist, 12, Church-street, Liverpool.

## Medical Transfer and Partnership.

30, Bucklersbury, London.

## Mr. Orridge, Medical Transfer Agent

and Referee, in offering his services to the Profession, takes leave to point out that the instrumentality of his extensive connexion enables him to afford particular advantages in the furtherance of their respective objects both to gentlemen about to relinquish, (either wholly or in part,) and also to those about COMMENCING practice.

He has the satisfaction of being permitted to give reference to the testimony of practitioners of the first respectability, between whom he has been concerned professionally, in proof of the sincerity of his endeavours to conduct these transactions in an honourable and equitable manner.

Mr. Orridge's Agency embraces the Transfer and Valuation of every description of Medical Property. He may be consulted at his Office between the hours of Eleven and Four, or elsewhere by appointment.

## Purchase Required.—Mr. Orridge

will be happy to be favoured with the Confidence of any Gentleman practising in some large Town easily reached from London, whose receipts are not less than £1000 yearly, and who may wish to Retire after two or three years' Partnership Introduction.—Communications addressed to 30, Bucklersbury, will be confidentially received.

## Purchase Required.—Mr. Orridge

will be happy to be favoured with the Confidence of a Practitioner at the West-end of London, or in some good Town easy of access, who may desire a PARTNER for not less than ten or fourteen years. The Share accorded to be at least £500 per annum. Two years' purchase will be given.—Apply to Mr. ORRIDGE, 30, Bucklersbury.

MEDICAL.

## Mr. Orridge is instructed to Transfer

a GENERAL PRACTICE in a Western County, returning about £700 per annum, inclusive of Appointments. The Residence is a very good one, situate in one of the most delightful spots in the kingdom. A short introduction will be given. Premium, £400.—Apply to Mr. ORRIDGE, 30, Bucklersbury, London.

## Medical Partnership.—Mr. Orridge

is instructed to Transfer the HALF-SHARE of a highly respectable Rural PRACTICE, within twenty-five miles of London, with succession to the whole at the end of ten years. Receipts about £1200 yearly. £1000 to be paid on entrance, and the residue at the end of the term.—Address to F.B.C.S., care of Mr. ORRIDGE, 30, Bucklersbury.

MEDICAL.

## Mr. Orridge is instructed to Transfer

the Succession to a small respectable PRACTICE (with ample field for extension), in a Borough Town, about 100 miles from London. The entrance money will be moderate.—Apply at 30, Bucklersbury.

TO MEDICAL ASSISTANTS.

## A General Practitioner in the coun-

try is in immediate want of a Visiting and Dispensing ASSISTANT. Terms liberal, references required.—Apply by letter to A. B., Post-office, Long Sutton, Lincolnshire.

TO MILITIA SURGEONS.

## An M.D. will take the duty of any

full Surgeon ordered to the Mediterranean, who can effect the Transfer of his Appointment, which will be resigned upon the regiment returning home. Address, M.D., care of H. Manning, Esq., 13, Brompton-crescent, London.

TO SURGEONS.

## For Sale, at less than half the original

cost, an elegantly-fitted SHOP, well stocked, where a Practice and Retail of seven years' standing, but neglected for the last few months, might soon be regained, and extended to any amount.—Apply, Medicus, Mr. Wood's, 30, Felix-terrace, Liverpool-road, Islington.

TO SURGEONS.

## To be Disposed of immediately, a

good PRACTICE, near one of the most flourishing Towns in the West Riding of York. Appointments worth £100 per annum.—For further particulars apply to B. Fell, Chemist, Huddersfield.

TO SURGEONS AND CHEMISTS.

## A capital Counter Practice, in a

populous district near London, with a neatly-arranged SHOP, to be SOLD a bargain. An introduction given. Premium, £100, including Fixtures, Stock of Drugs, &c., the present Proprietor about entering on another engagement.—Address, A. B., 118, High-street, Shoreditch.

## A Gentleman wishes to obtain a

Situation for his Footman. The young man is Twenty-one years of age, and 5 ft. 10 in. in height; and can be recommended in the strongest possible terms for sobriety, honesty, civility, activity, and cleanliness in person and at his work. Upwards of fifteen months' unexceptionable character.—Address, post-paid, A. Z., THE LANCET Office, 423, Strand.

## Middlesex Hospital.—Medical Stu-

dents will meet with every accommodation, and can have the use of a handsome sitting-room with fire and candles, a comfortable bed-room, an excellent breakfast of ham, eggs, or chop, and the perusal of the morning papers, for 3s. per day, including attendance, boot cleaning, &c., at Mr. Stacey's, 2, Berners-street, Oxford-street.

*On the 1st of January, 1855, Fasciculus I., Imperial Folio, with Coloured Plates, 5s.*

## MEDICAL ANATOMY.

By FRANCIS SIBSON, M.D., F.R.S.,

PHYSICIAN TO ST. MARY'S HOSPITAL.

TO BE COMPLETED IN TEN FASCICULI.

The Work is issued at a remarkably low price, the Publisher confidently relying on an extensive sale to remunerate him for the large outlay necessary for its production.

The Drawings are taken from original *Post-mortems*; the graphic character of the Plates cannot fail to convey an intelligent knowledge of the condition of the Viscera in health and disease.

LONDON: JOHN CHURCHILL, NEW BURLINGTON STREET.

---

*On the 1st of January, 1855, Fasciculus VII., Second Edition, with entirely new Plates, price 5s.*
